197 I. REINWARDTIA'NA (Blum. bijdr. p. 720.) leaves elliptic-oblong, acuminated, rounded at the base, entire, smooth above, and downy beneath; peduncles few-flowered, shorter than the petioles; sepals bluntish, clothed with silky villi: outer ones

the largest. ♃.?⌒. S. Native of Timor. Convólvulus ovàtus, Reinwardt, mss. to Blume.

Reinwardt's Ipomœa. Pl. twining.

198 I. LANCEOLA'TA; downy: leaves lanceolate, entire, obtuse; peduncles 1-flowered; bracteas large, forming an involucrum to the flower.—Native of Sierra Leone, in humid places.

Lanceolate-leaved Ipomœa. Pl. twining.

199 I. QUINQUEPARTÌTA (Rœm. et Schultes, syst. 4. p. 247.) glabrous; leaves ovate-oblong, very blunt, emarginate, mucronate, glabrous; peduncles many-flowered, bifid, usually shorter than the leaves; sepals ovate, rusty, equal. ♃.?⌒. S. Native of the Island of Santa Cruz. Conv. quinquepartìtus, Vahl, eclog. 2. p. 14. Conv. ovalifòlius, West, besk. st. cruz. p. 271. Very nearly allied to *Conv. parviflòrus*, Lam., the *Conv. micrántha*, Rœm. et Schultes. Stem and branches rather canescent. Corolla campanulate, glabrous, deeply 5-cleft.

Five-parted-flowered Ipomœa. Pl. tw.

200 I. NEVISIE'NSIS; stems herbaceous; leaves scattered on longish petioles, attenuated, acute, rounded at the base; peduncles axillary, solitary, 3-5-flowered, twice longer than the leaves; flowers middle-sized, pale blue. ♃.⌒. S. Native of the Island of Nevis, among bushes, where it is called the *Jumbee vine*. Conv. Nevisiénsis, Ham. prod. p. 24. Allied to *Conv. verticillàtus*, and *C. nodiflòrus*. Perhaps a species of *Jacquemóntea*.

Nevis Ipomœa. Pl. twining.

201 I. SECU'NDA; leaves ovate-lanceolate, silky beneath, on short petioles; racemes secund, crowded, lateral and terminal, panicled. ♃.⌒. S. Native of Sierra Leone, on the mountains, very common. Flowers small, white.

Secund-flowered Ipomœa. Pl. twining.

202 I. ARENA'RIA (Rœm. et Schultes, syst. 4. p. 247.) stem decumbent; leaves oblong, emarginate, lobed or entire at the base; peduncles 1-flowered, twin or solitary, length of petioles; sepals oblong, equal; corolla tubular. ♃.⌒. S. Native of the Azores, and Island of Santa Cruz. Conv. arenàrius, Vahl, symb. 1. p. 18. and 3. p. 32. Willd. spec. 1. p. 862. Habit of *Conv. Imperàti*, but smoother, the leaves more crowded, and the tube of the corolla gradually widened upwards, 1½ inch long.

Sand Ipomœa. Pl. tw.

203 I. MATAXOCA'RPA; leaves oblong, glabrous, rather coriaceous, mucronate; peduncles 2-flowered, shorter than the leaves; sepals ovate; capsule cylindrical, silky. ♃.?⌒. S. Native of New Granada, Bertero. Convólvulus mataxocárpus, Spreng. syst. 1. p. 606.

Heavy-fruited Ipomœa. Pl. twining.

204 I. LACHNÆ'A; leaves oblong-lanceolate, mucronate, densely woolly on both surfaces; racemes axillary, imbricate, leafy. ♃.?⌒. S. Native of Hispaniola. Convólvulus lachnæ'us, Spreng. syst. 1. p. 606.

Woolly Ipomœa. Pl. twining.

205 I. PTEROCA'RPA; leaves petiolate, oblong-lanceolate, acuminated, mucronate, attenuated at the base; peduncles 2-flowered; calycine segments cordate-ovate, acuminated, running into the pedicels. ⊙.⌒. S. Native of Guadaloupe. Conv. pterocárpus, Bert. ex Coll. hort. rip. 37. Corolla middle-sized, white. Stamens bearded at the base.

Wing-fruited Ipomœa. Pl. twining.

† *Doubtful, or hardly known species.*

206 I. MAMMÒSA (Choisy, in mem. soc. phys. gen. 6. p. 475.) leaves cordate, repand, acuminated; peduncles 2-3 flowered; tubers of roots aggregate. ♃.⌒. G. Native of Cochinchina, in fields, and Australasian Islands. Conv. mammòsus, Lour. coch. p. 108. Conv. chrysorhìzus, Forst. pl. esc. ins. p. 55.? Batátta mammòsa, Rumph. amb. 9. t. 131. Stems slender. Leaves glabrous. Flowers lateral, white, campanulate. Tuber pale brown, hairy, ovate-oblong, white inside, edible, and more esteemed than the sweet potatoe.

Nippled Ipomœa. Pl. tw.

207 I. KADSU'RA (Choisy, l. c.) stem decumbent, radicant, striated, glabrous; leaves cordate-ovate, acute, entire, 7-nerved, glabrous, pale beneath, a hand long; petioles length of leaves. ♃. G. Native of Japan, where it is called *Karami Kadsura* by the natives. Convolvulus in plantis obscuris, Thunb, jap. p. 350.

Kadsura Ipomœa. Pl. creeping.

208 I. PANDURÆFÓRMIS (Choisy, l. c. p. 476.) leaves cordate, entire, fiddle-shaped, acuminated; flowers shining, yellow; peduncles long, generally 2-flowered; calyx and fruit smooth. ♃.⌒. G. Native of Cochinchina, in hedges. Conv. panduràtus, Lour. coch. p. 107. but not of Lin.

Fiddle-shaped-leaved Ipomœa. Pl. tw.

209 I. COMPRE'SSA (Guss, in ind. sem. hort. Bocc. 1825. p. 7.) stem compressed; leaves cordate-ovate, entire; peduncles 1-flowered, shorter than the leaves. ⊙.?⌒. S. Native of the East Indies. Plant villous.

Compressed-stemmed Ipomœa. Pl. tw.

210 I. CUSPIDA'TA (D. Don, prod. fl. nep. p. 98.) leaves cordate, quite entire, cuspidate, downy: hind lobes rounded; peduncles many-flowered, exceeding the leaves; sepals linear, acute, pilose; corolla rose-coloured; style very short. ⊙.⌒. G. Native of Nipaul.

Cuspidate-leaved Ipomœa. Pl. tw.

211 I. MURUCOÌDES (Rœm. et Schultes, syst. 4. p. 248.) arboreous; leaves lanceolate, acuminated, glabrous, villous on the nerves beneath; peduncles generally 3-flowered; calyx clothed with silky tomentum. ♄. S. Native country unknown. Stem angularly furrowed, downy. Leaves ½ foot long, and hardly 2 inches broad. Corolla white. Perhaps the same as *I. arboréscens*, Kunth. Peduncles terminal.

Murucoa-like Ipomœa. Tree.

212 I. AURÌTA (Rœm. et Schultes, syst. 4. p. 301, under *Convólvulus*.) twining; glabrous; leaves auriculately-hastate; hind-lobes rounded, obtuse, emarginate; peduncles 1-flowered.—Native of Porto Rico.

Eared-leaved Ipomœa. Pl. twining.

213 I. NEMORÒSA (Rœm. et Schultes, l. c. p. 303, under *Convólvulus*,) twining; leaves digitate, quinate, entire, acuminated, rather pilose; stems, peduncles, and calyxes hairy. ♃.⌒. S. Native in shady places, about Cumana.

Grove Ipomœa. Pl. twining.

214 I. FRONDÒSA (Rœm. et Schultes, l. c. p. 303, under *Convólvulus*,) stems creeping, twining a little; leaves oblong, obtuse, mucronate; flowers axillary, racemose. ♃.⌒. S. Native about Havannah, among rubbish.

Leafy Ipomœa. Pl. creeping.

215 I. DENTICULA'TA (Rœm. et Schultes, syst. 4. p. 303, under *Convólvulus*,) stem erect; leaves elliptic, denticulated, silky beneath; flowers axillary, sessile.—Native of America, Vahl.

Denticulated-leaved Ipomœa. Pl. erect.

216 I. SCA'BRA (Willd. rel. ex Rœm. et Schultes, syst. 4. p. 789.) hairy, scabrous; leaves cordate, 3-lobed; peduncles 3-flowered. ⊙.⌒. S. Native country unknown.

Scabrous Ipomœa. Pl. twining.

217 I. BAHIE'NSIS (Willd. l. c.) leaves cordately-hastate, acuminated, glabrous; peduncles 3-flowered; sepals membranous, blunt, glabrous; seeds woolly.—Native of Brazil, Hoffmannsegge. Conv. Bahiénsis, Spreng. syst. 1. p. 598. Ipomœ'a eriospérma, Bertero.

Bahia Ipomœa. Pl. twining.

218 I. TUBULÒSA (Willd. l. c.) leaves cordate, acuminated;

peduncles 1-flowered; tube of corolla cylindrical, elongated; limb undivided; bottom of stem, and underside of leaves, as well as the peduncles, muricated.—Native of tropical America. Perhaps a species of *Quámoclit*.

Tubular-flowered Ipomœa. Pl. twining.

219 I. símplex (Thunb. prod. p. 36.) leaves lanceolate, entire; flowers solitary. ♄. ◠. G. Native of the Cape of Good Hope. Conv. simplex, Spreng. syst. 1. p. 607.

Simple Ipomœa. Shrub twining.

Species only known by name.

1 I. hispídula, Ledeb. ind. sem. hort. dort. 1822. p. 11.—2 I. supérba, Ledeb. l. c.—3 I. Sinénsis, Fisch. cat. hort. gor. p. 28.

Cult. All the species of *Ipomœ'a* are very showy when in blossom, and much admired. The shrubby and perennial herbaceous kinds require the same treatment as that recommended for *Exogònium*, see p. 264; and the annual species as those of *Pharbìtis*, see p. 263.

XV. JACQUEMO'NTIA (named by Choisy, after Victor Jacquemont, who lately travelled in the East Indies in search of objects of natural history, where he died.) Choisy, in mem. soc. phys. gen. 6. p. 476.—Convólvulus and Ipomœ'a species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx of 5 sepals. Corolla campanulate. Style one; stigmas 2, ovate, flattened. Ovarium 2-celled, 4-ovulate. Capsule 2-celled.—Herbs or sub-shrubs, natives of South America.

1 J. cœru'lea (Choisy, l. c.) plant prostrate, rather creeping; leaves ovate, emarginate, quite glabrous; peduncles equal in length to the petioles, twice trifid; pedicels 1-flowered. ↄ. S. Native of Guinea. Convólvulus cœrùleus, Schum. pl. guin. p. 101. Root simple. The 3 outer calycine segments roundish, the 2 inner small. Corolla campanulate, blue, entire. Stigmas thickish, entire, recurved. Seeds naked. Said to be allied to *Conv. ovalifòlius*.

Blue-flowered Jacquemontia. Pl. prostrate.

2 J. azu'rea (Choisy, l. c.) stem, petioles, nerves, and margins of leaves downy; leaves oblong-cordate; peduncles long, fasciculately many-flowered. ↄ. ? ◠. S. Native of South America. Conv. azùreus, Rich. act. soc. hist. nat. par. p. 107. Desr. in Lam. dict. 3. p. 554. Stem rather villous at top. Leaves subsinuated, glaucescent beneath. Sepals acute. Corollas small, blue.

Azure-flowered Jacquemontia. Pl. tw.

3 J. capita'ta; pilose; leaves cordate, entire, acute; peduncles hardly longer than the petioles; flowers capitate, involucrated; sepals narrow, lanceolate. ⊙. ? ◠. S. Native of Senegal. Conv. capitàtus, Desr. in Lam. dict. 3. p. 554. Leaves 2 inches long, length of petioles. Peduncles bearing each a dense villous head of involucrated sessile flowers. Bracteas 6-7, unequal, length of calyxes.

Capitate-flowered Jacquemontia. Pl. tw.

4 J. micra'ntha; leaves cordate-oblong, mucronate, rather downy; peduncles many-flowered, corymbose, short, somewhat verticillate. ↄ. ? ◠. S. Native of St. Domingo, on hills, among rocks. Conv. micránthus, Desr. in Lam. dict. 3. p. 556. Pers. ench. 1. p. 177.—Burm. amer. p. 83. t. 94. f. 2.—Plum. mss. 2. t. 62. Stems slender. Leaves bluntish, mucronate. Corollas small, campanulate, purplish, deeply 5-cleft, ex Plum. Capsule 4-celled; seeds fulvous, angular, ex Desr. l. c.

Small-flowered Jacquemontia. Pl. tw.

5 J. nodiflòra; rather tomentose; leaves ovate or subcordate; peduncles bifid, many-flowered, shorter than the leaves. ♄. ◠. S. Native of the Island of Santa Cruz. Conv. nodiflòrus, Desr. in Lam. dict. 3. p. 557. Vahl, eclog. 2. p. 14. Pers. ench. 1. p. 177. Conv. albiflòrus West, besk. over. st. croix. p. 271. Leaves hoary beneath, with a short acumen. Peduncles divided above the middle into many short branches; bracteas subulate. Sepals scarious on the edges, equal, oblong, pale rusty, rather villous. Corollas white, campanulate; limb 5-cleft, crenulated. Corymbs 12-20-flowered.

Knot-flowered Jacquemontia. Shrub tw.

6 J. penta'ntha; glabrous; leaves ovate-cordate, acuminated, rather repand; peduncles umbellately 5-flowered; flowers nearly sessile; calyxes ciliated. ♄. ◠. S. Native of tropical America? Conv. pentánthus, Jacq. coll. 4. p. 210. icon. rar. 2. t. 316. Willd. spec. 1. p. 855. Stem terete, glabrous. Leaves rather villous on the edges while young. Bracteas lanceolate, acuminated. Outer sepals larger, drawn out into a point, with reflexed sides: inner ones lanceolate, acuminated. Corolla campanulate, blue, with a paler star; lobes of limb roundish, acuminated. Lobes of stigma oblong.

Five-flowered Jacquemontia. Shrub tw.

Cult. All the species are free flowerers, and of easy culture, requiring only common care. The annual species should be treated in the manner recommended for the species of *Pharbítis*, see p. 263; the twining, shrubby species should be treated in the manner recommended for *Calonýction*, see p. 265.

XVI. CONVO'LVULUS (from *convolvo*, to entwine; twining habit of most of the species.) Choisy, in mem. soc. phys. gen. 6. p. 477.—Convólvulus species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx of 5 sepals. Corolla campanulate. Style 1; stigmas 2, linear-cylindrical, often revolute. Ovarium 2-celled, 4-ovulate. Capsule 2-celled.—Herbs or sub-shrubs.

Sect. I. Orthocau'los (from *ορθως, orthos*, straight; and *καυλος, kaulos*, a stem; in reference to the stems being straight, never trining.) Stems erect or prostrate.

§ 1. *Leaves entire, ovate-oblong, spatulate, lanceolate, or linear.*

* *Shrubby or herbaceous perennial plants. Peduncles* 1-2-3-4-*flowered.*

1 C. pluricau'lis (Choisy, in mem. soc. phys. gen. 6. p. 477.) stems suffruticose, villous, many rising from the same root; leaves linear, dilated at apex, sessile, much crowded at the base; flowers 2-3 together, axillary, nearly sessile; sepals linear, acuminated, acute. ↄ. S. Native of the East Indies, at Buxor, Hurdnear, Bhagulpur, and Vikram, on mountains in the south of Hindostan. Evólvulus ferrugíneus, Wall. cat. no. 1316. Conv. spicæfòlius, Ham. herb. Stems simple. Leaves bluntish, villous or ciliated. Flowers rising from the base to the top of the stem, forming a spike. Corolla glabrous, twice longer than the calyx. Every part of the plant is hairy.

Many-stemmed Bind-weed. Pl. ½ foot.

2 C. microphy'llus (Sieb. ex Spreng. syst. 1. p. 611.) stem branched, suffruticose at the base; leaves linear, sessile, villous, as well as the branches, which are twiggy; peduncles 1-flowered, about equal in length to the leaves; sepals acute. ♄. H. Native of Egypt.

Small-leaved Bind-weed. Shrub small.

3 C. erina'ceus (Ledeb. in litt. ex Meyer. verz. pflanz, p. 102.) plant silky, stems much branched, shrubby at the base; branches and branchlets very long and spreading; leaves linear; cauline ones elongated: of the branches and branchlets minute: peduncles solitary, generally 1-flowered, about equal in length to the bractless flowers; sepals elliptic, silky, as well as the 5-cleft corolla. ♄. H. Native of Caucasus in the loose sand

towards the Caspian sea, and Sallian, near the Karavansarai Eszek.

Erinaceous Bind-weed. Shrub dwarf.

4 C. ERIA'NTHUS (Willd. herb. ex Spreng, syst. 1. p. 610.) stems decumbent, branched, woolly; leaves linear, elongated, attenuated at the base, nearly naked; peduncles elongated, 1-flowered; sepals acute, and are, as well as the corollas, woolly outside. ♃. H. Native of North America.

Woolly-flowered Bind-weed. Pl. decumbent.

5 C. ROTTLERIA'NUS (Choisy, 1. c.) stem simple, biennial; leaves linear, acute, almost sessile, clothed with rusty hairs on both surfaces; peduncles 2-flowered, at first short, but at length elongated; sepals ovate, acuminated, very acute: outer ones rather the longest, hairy; corolla very small. ♃.? G. Native of Madura. Rétzia pilòsa, Rottl. herb. ex Wall. cat. no. 6669. Stems very leafy the first year, clothed with rusty hairs, as well as the peduncles, branchlets, and leaves. Corolla tubular, clothed with rusty hairs outside at apex, ending in 5 taper points. Ovarium glabrous. Nearly allied to *Conv. lineàtus*.

Rottler's Bind-weed. Pl. $\frac{3}{4}$ foot.

6 C. LINEA'TUS (Lin. spec. p. 224.) root creeping; floriferous stems erect, simple, corymbose at top; leaves lanceolate, petiolate, acute, silky, villous, lined; peduncles 1-2-flowered, shorter than the leaves; sepals rather foliaceous, silky; corolla hairy outside. ♃. H. Native of Spain, Italy, by the Mediterranean Sea, and of Greece. Sibth. et Smith, fl. græc. t. 199. Conv. spicæfòlius, Desr. in Lam. dict. 1. p. 549.—Mor. hist. 2. p. 17. sect. 1. t. 4. f. 2. bad.—Barrel. icon. t. 311.—Triumf. obs. 91. t. 90. f. 2. —Tourn. cor. p. 1. Leaves narrowed at the base. Peduncles bibracteate. Flowers pale reddish purple.

Lined-leaved Bind-weed. Fl. June, July. Clt. 1714. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

7 C. BESSE'RI (Spreng syst. 1. p. 610. Led. fl. alt. 1. p. 226.) leaves spatulate, running into the petioles, silky, lined; peduncles very short, mostly 2-flowered; sepals ovate, acute; stem suffruticose. ♄. H. Native of Siberia, in sandy places, at the river Bekum, near Loktewsk; and of Podolia. Conv. lineàtus, Bieb. fl. cauc. 1. p. 146. Bess. enum. pl. volh. p. 43. no. 1352.

Besser's Bind-weed. Shrub small, $\frac{1}{4}$ to $\frac{1}{2}$ foot.

8 C. GERA'RDI (Rœm. et Schultes, syst. 4. p. 294.) root creeping; stem villous, weak; branches very short; leaves lanceolate, dilated and obtuse, silky; peduncles axillary and terminal, 2-flowered, shorter than the leaves; sepals small, ovate, acute, silky; corolla villous outside. ♃. H. Native of Spain, and the south of France. Ger. prov. p. 317. no. 3. Conv. lineàtus, Desr. in Lam. dict. 3. p. 553, exclusive of the synonymes. D. C. fl. fr. no. 2750. Conv. Cneòrum β, Gouan, hort. monsp. p. 94.—Barrel, icon. t. 311.—Munting, p. 29. t. 110.—Tourn. inst. p. 84. Stems rather angular. Lower leaves approximate. Calyx with 2 small bracteas under it. Corolla middle sized, a little spreading, rufescent.

Gerard's Bind-weed. Fl. June, July. Clt.? Pl. $\frac{1}{4}$ foot.

9 C. INTERME'DIUS (Lois. not. p. 40. journ. de bot. 2. p. 264.) root creeping?; stems erect, simple; leaves lanceolate, downy; peduncles axillary and terminal, 1-2-flowered, about equal in length to the leaves; bracteas twin, longer than the calyx. ♃. H. Native of France, near Avignon. C. lineàtus, β, Poir. suppl. 3. p. 474. D. C. fl. fr. suppl. p. 423. Very like *C. lineàtus*, but differs in being clothed with short down, not silky, and the stems 8-10 inches, and more, high. It is also allied to *C. Cantábrica*, but the stems are not branched, as in that plant, and the peduncles are shorter. Corollas purple or white.

Intermediate Bindweed. Pl. $\frac{3}{4}$ foot.

10 C. SCOPA'RIUS (Ait. hort. kew. 1. p. 213.) stem shrubby; branches twiggy; leaves linear, rather pilose; peduncles generally 3-flowered; calyx silky; sepals ovate, acute. ♄. G. Native of Teneriffe, on the mountains near the town of Santa Cruz. Willd. spec. 1. p. 872. Vent. choix. t. 24. Habit of a species of *Spártium* or *Genista*. Stem terete, glabrous. Leaves short, remote. Racemes terminal, somewhat secund. Corolla white, hairy outside. Wood hard and white, with radiating stripes; and is, perhaps, according to Lin. the *Lignum Rhodium* of the shops. Capsule 1-celled, 1-seeded, dehiscing at the base.

Broom-like Bind-wood. Fl. Aug. Sept. Clt. 1733. Shrub.

11 C. FRONDÒSUS (Willd. herb. ex Spreng. syst. 1. p. 610.) leaves oblong-subspatulate, obtuse, mucronulate, clothed with stellate down when young, as well as the branches; peduncles usually 4-flowered, shorter than the leaves; sepals glabrous, acutish. ♄. F. Native country unknown.

Leafy Bind-weed. Pl. erect, suffruticose.

12 C. ŒNOTHEROÌDES (Lin. suppl. 157.) shrubby, erect; leaves linear, canescent; peduncles axillary, erect, 1-flowered: sepals lanceolate, glabrous, hoary. ♄. G. Native of the Cape of Good Hope. Willd. spec. 1. p. 872. Habit of *Œnothèra mollissima*. Stem terete, reddish. Peduncles at the tops of the stems. Bracteas subulate, recurved. Corolla funnel-shaped, large, fulvous.

Evening-Primrose-like Bind-weed. Shrub erect.

13 C. HELIANTHEMIFÒLIUS (Poir. dict. 3. p. 465.) shrubby, villous; leaves sessile, small, narrow-lanceolate, acute; flowers small, almost solitary; calyx villous; sepals lanceolate, acute. ♄. G. Native of America. Conv. mínimus, Vittm. summ. pl. 1. p. 434. Gmel. syst. veg. 1. p. 341.—Plum. amer. mss. t. 6. f. 47.—Tourn. cor. 84. Plant densely clothed with cinereous down or villi. Stem divided from the base into many short, spreading branches. Peduncles filiform, villous, length of leaves, 1- rarely 2-flowered. Corolla blue.

Sun-rose-leaved Bind-weed. Shrub $\frac{1}{2}$ foot.

14 C. HOLOSERÍCEA (Bieb. fl. taur. 1. p. 147. cent. pl. ross. t. 24.) the whole plant clothed with shining, silky hairs; leaves linear-lanceolate, bluntish; peduncles usually 1-flowered, longer than the leaves; sepals ovate, acute: the 3 outer ones inflately gibbous in the disk. ♃. H. Native of Tauria, on calcareous mountains, along with *C. saxátilis*. C. procúmbens, Pall. ind. Bracteas linear, about equal in length to the calyx. Flowers a little larger than those of *C. Doryćnium*. Corolla milk-coloured, silky outside.

Silky Bind-weed. Fl. June, July. Clt. 1824. Pl. prostrate.

15 C. DORY'CNIUM (Lin. spec. 224.) stem shrubby, dichotomously panicled; branches stiff; flowers sessile, solitary, terminating the branches lateral, and in the forks of the branches; leaves lanceolate, villous, sessile; sepals nakedish, obtuse, mucronate. ♄. H. Native of the Levant; Candia, near Canea; and on road sides, about Corinth. Willd. spec. 1. p. 871. Desr. in Lam. dict. 3. p. 548. Sibth. et Smith, fl. græc. t. 201.—Tourn. inst. p. 84. Habit different from other species of *Convólvulus*. Corolla campanulate, spreading, villous outside, 3-4 times longer than the calyx, rose roloured.

Dorycnium-like Bind-weed. Fl. June, July. Clt. 1806. Shrub $1\frac{1}{2}$ foot.

16 C. SUFFRUTICÒSUS (Desf. atl. 1. p. 175. t. 48.) suffruticose, villous; stems ascending; leaves narrow-lanceolate, acuminated, peduncles 1-flowered, 3 times longer than the leaves; sepals villous, ovate-oblong, acute. ♃. H. Native of Atlas, near Tlemsen; and of Greece. Smith, prod. fl. græc. 1. p. 135. This species differs from *C. Cantábrica*, in the stem being suffruticose; in the corolla being twice or thrice larger, beset with spreading, not adpressed hairs. Corolla pale red or white. Stems tufted. Bracteas setaceous.

Suffruticose Bind-weed. Shrub 1 foot.

17 C. CANTA'BRICA (Lin. spec. 225.) plant beset with spread-

ing hairs; stems branched, prostrate; leaves oblong-lanceolate, acute; sepals narrow, very villous; peduncles usually 2-3-flowered. ♃. H. Native of the south of Europe, north of Africa, and of Tauria. Willd. spec. 1. p. 869. Bieb. fl. taur. 1. p. 147. Smith, prod. fl. græc. 1. p. 135. Jacq. fl. austr. t. 296.—Mor. hist. 2. p. 17. sect. 1. t. 4. f. 3.—Tourn. inst. p. 83. and 84. This species is readily distinguished from *C. lineàtus*, *C. saxátilis*, and *C. holosericeus*, by the hairs being spreading, and by the narrow, very villous sepals. Corollas pale red.

Var β, terréstris (Lin. spec. 224.) leaves linear, silky; peduncles generally 3-flowered; calyx hairy, mucronate. ♃. H. Conv. terréstris, Dalech. hist. 1425. Bauh. hist. 2. p. 160.

Var. γ; stem erect. ♃. ⌒. H. Ait. hort. kew. ed. 2d. vol. 1. p. 336.

Cantabrian Bind-weed. Fl. Aug. Sept. Cit. 1680. Pl. ½ o 1 foot, prostrate.

18 C. palu'stris (Cav. icon. 6. p. 80. t. 600. f. 2.) stems slender, terete, erect, branched, pilose; leaves sessile, linear-lanceolate, hairy; flowers solitary, minute, rather tomentose; sepals ovate-lanceolate, villous. ♃.? S. Native of Mexico, in the vicinity of Acapulco, in marshy places. Poir. suppl. 3. p. 465. Leaves an inch long, and a line broad. Peduncles bibracteate. racemose. Corolla yellow, rather tomentose outside, campanulate, 3 times longer than the calyx, ending in 5 obtuse lobes or crenæ.

Marsh Bind-weed. Pl. 1 foot.

19 C. Pe'rsicus (Lin. amœn. acad. 2. p. 341.) tomentose; leaves oval, obtuse, on very short petioles; peduncles 1-flowered, length of leaves; sepals ovate: inner ones smaller. ♃. H. Native of Persia, on the shores of the Caspian Sea; and in the sand, by the Euxine Sea, near Fanar. Willd. spec. 1. p. 874. Desr. in Lam. dict. 3. p. 549. Bieb. fl. taur. 1. p. 148. —Gmel. sib. 3. p. 36. t. 7. Stems thickness of a writing-quill, terete. Stigmas linear, thickish. Corolla white.

Persian Bind-weed. Pl. 1 foot?

20 C.? trine'rvis (Thunb. fl. jap. p. 85. Willd. spec. 1. p. 860.) stems filiform, glabrous, simple; leaves opposite, petiolate, ovate-oblong, glabrous, 3-nerved; peduncles very short, generally 1-flowered, seldom 2-flowered. ♃. H. Native of Japan. Leaves paler beneath. Sepals lanceolate-setaceous, glabrous, one-half the length of the corolla. Corolla purple. Stigmas capitate. A species of *Ipomœ'a*, or a distinct genus, with opposite leaves.

Three-nerved-leaved Bind-weed. Pl. tw. or erect.

21 C. Amma'nni (Desr. in Lam. dict. 3. p. 549. Bunge, pl. chin. in mem. acad. petersb. 5. p. 46. Led. fl. alt. 1. p. 226.) plant clothed with silky hairs; stems procumbent; leaves linear, or oblong-linear; peduncles 1-flowered, length of leaves, spreading; bracteas equal in length to the calyxes; sepals ovate, acute. ♃. H. Native of Siberia, at the rivers Jenezee, Tscharysch, Kan, Ulegumen, and Tschuga, and throughout the Kerghisean steppe, and at Lake Baikal; and of the north of China, in sterile, gravelly places. Willd. spec. 1. p. 870.—Amm. ruth. p. 5. no. 6.—Gmel. sib. 4. p. 95. no. 51. Peduncles furnished with 2 linear bracteas in the middle. Corolla marked by 5 silky lines outside, disposed in a stellate manner, white, with purple lines.

Ammann's Bind-weed. Pl. ½ foot.

22 C. spinòsus (Lin. suppl. 137. Willd. spec. 1. p. 871. Bunge, enum. pl. chin. in mem. acad. petersb. 5. p. 47.) shrubby; the whole plant beset with white, glittering, silky hairs; leaves spatulate-lanceolate, or oblong, silky, sessile; peduncles elongated, 1-flowered; floriferous branches erectish, spiny. ♄. H. Native of Siberia, on sandy hills; at the river Irtysch; and of the north of China. Conv. fruticòsus, Pall. itin. 2. p. 734. t. M. Stem branched at top; branches horizontal, stiff, terminated each by a small, erect, whitish flower. The rudiments of branchlets in the axils of the leaves, and branches are changed into spines. Plant somewhat flexuous, hardly climbing. Limb of corolla 5-cleft.

Var. β; calyx quite glabrous. ♄. H. Native of Persia, Desr. in Lam. dict. 3. p. 548. Conv. spinòsus, Burm. fl. ind. p. 47. t. 19. f. 4.

Spiny Bind-weed. Pl.

23 C. tragacanthoìdes (Turcz. dec. p. 22. Choisy, in mem. soc. phys. gen. 6. p. 478.) shrubby; stems diffuse, branched; branches spiny at length; leaves linear; flowers terminal, nearly sessile, bractless; sepals ovate, abruptly acute, 3 times shorter than the corolla. ♄. H. Native of Mongolia, at Zzagan-Balgassu. Nearly allied to the 2 preceding, but differs from the first in the branches being at length spinescent, in the flowers being larger, and in the form of the sepals; and from the second in the more dwarf habit, in the linear leaves, and in the flowers terminating the stems among the branches. Corolla purple.

Tragacanth-like Bind-weed. Shrub.

24 C. hy'strix (Vahl, symb. 1. p. 16. Willd. spec. 1. p. 871.) shrubby, much branched, stiff, diffuse; branchlets silky, spinescent; leaves sessile, oblong, silky; flowers sessile, usually solitary, rarely twin; calyx hairy; 2 outer sepals oblong, stiff, larger than the inner 3. ♄. G. Native of Arabia, at Dakhi. Conv. spinòsus, Forsk. cat. arab. p. 106. no. 121. Leaves small. Bracteas 2, at the base of the calyx, oblong, acutish, reflexed. Corolla small, hairy.

Porcupine Bind-weed. Shrub 1 foot.

* * *Flowers capitate, or umbellate. Shrubby or herbaceous perennial plants.*

25 C. cneòrum (Lin. spec. 224.) stem shrubby, branched; leaves lanceolate-obovate, clothed with silky tomentum; flowers capitate on short peduncles; bracteas, some of them, as large as the leaves, and are, as well as the calyxes, hairy. ♄. F. Native of Spain, Crete, and Syria, and the Island of Samos, on rocks. Sibth. et Smith. fl. græc. t. 200. Curt. bot. mag. 459.—C. argénteus, Desr. in Lam. dict. 3 p. 552.—Tourn. inst. p. 84.—Mor. hist. 2. p. 11. sect. 1. t. 3. f. 1.—Barrel, icon. rar. 4. p. 470.—Bocc. mus. 2. p. 79. t. 70.—Dorýcnium, Clus. hist. 2. p. 254. —Cneòrum album folio argenteo molli, Bauh. pin. p. 463. Plant clothed with silky silvery down. Leaves sessile, attenuated at the base, mucronate. Corollas white or pale red, hairy outside.

Widow-Wail-like Bind-weed. Fl. May, Sept. Clt. 1640. Shrub 1-3 feet.

26 C. saxa'tilis (Vahl, symb. 3. p. 33.) very hairy; stems erect; leaves linear; flowers capitate; sepals acuminated. ♃. H. Native of Spain, on hills, France, Italy, Tauria. Bieb. fl. taur. 1. p. 146. Lepeyr. abr. p. 101. Conv. lanuginòsus, Desr. in Lam. dict. 3. p. 551, exclusive of the syn. of Bocc. t. 70, and Barrel, t. 470. Conv. cneòrum, Hablitz, taur. p. 147. Conv. pusíllus, Pall. ind. taur.—Bocc. mus. t. 96. Tourn. inst. p. 84. Corolla white, purplish, and villous outside. Heads of flowers girded by 5 unequal leaves or bracteas. Stem clothed with white tomentum.

Var, β, humílior (Rœm. et Schultes, syst. 4. p. 295.) Conv. lanuginòsus, β, Desr. in Lam. dict. 3. p. 551. Conv. capitàtus, Cav. icon. 2. p. 72. t. 189. descr. p. 97.—Tourn. cor. p. 1. Stem erect.

Var. γ; stems half a foot high, declinate. ♃. H. Conv. saxátilis, Bieb. fl. taur. 1. p. 147. Conv. Dorýcnium, Pall. ined.

Stone Bind-weed. Fl. Ju. Aug. Clt. 1796. Pl. ½ foot.

27 C. lana'tus (Vahl, symb. 1. p. 16.) shrubby; old branches leafless, sterile, spinose, rather villous; leaves lanceolate, obtuse, tomentose; flowers capitate, involucrated; sepals ovate-lanceolate. ♄. F. Native of Lower Egypt, on Mount Sinai;

and of Candia, on dry hills. Willd. spec. 1. p. 871. Sibth. et Smith, fl. græc. t. 202. C. cneòrum, Forsk. cat. ægypt. p. 63. no. 106. C. seríceus, Burm. ind. p. 49. t. 19. f. 3.?—Tourn. cor. 1. Flower-bearing branches simple from the base of the old ones, very hairy. Leaves sessile. Floral or involucral leaves 6, a little broader than the rest, very hairy. Peduncles axillary, shorter than the leaves, hairy. Corolla villous outside, white or reddish.

Woolly Bind-weed. Shrub 1-2 feet.

28 C. salvifòlius (Sieb. pl. cret. ex Link. enum. 1. p. 201.) stem shrubby, branched; leaves oblong-lanceolate, bluntish, nearly sessile, veiny, clothed with woolly villi; flowers in lateral, involucrated, sessile fascicles; bracteas ovate; sepals foliaceous, lanceolate. ♄. F. Native of Palestine.

Sage-leaved Bind-weed. Fl. May, Sept. Clt. 1825. Pl.

29 C. secu'ndus (Desr. in Lam. dict. 3. p. 555.) plant clothed with rusty tomentum; stem flexuous, a little branched; leaves sessile, lanceolate, unilateral on the branches; heads of flowers secund, numerous, nearly sessile; flowers sessile, or on very short pedicels. ♃. H. Native of the Levant, about Damascus. Stem terete. Leaves furrowed from nerves an inch long. Flowers 5-6 in a head. Bracteas intermixed with the calyxes, and a little longer than them. Corolla rather villous outside, size of those of *C. cneòrum*.

Secund-leaved Bind-weed. Pl. ½ to 1 foot.

30 C. oleifòlius (Desr. in Lam. dict. 3. p. 552, exclusive of var β.) shrubby, silky; leaves linear-lanceolate; flowers capitately umbellate, terminal, involucrated; sepals lanceolate. ♄. H. Native of the Levant. Dorýcnium, Pýrosp. Alp. exot. p. 73. This species is very nearly allied to *C. cneòrum;* but it differs, in the sepals being twice longer, and lanceolate. Leaves acutish, 1½ inch long, and 2-3 lines broad.

Olive-leaved Bind-weed. Shrub 1-2 feet.

31 C. linea'ris (Curt. bot. mag. 289.) erect, shrubby; leaves linear, acute, clothed with silky hairs; flowers terminal, umbellately panicled; calyx hairy. ♄. F. Native of Spain and South of France. Willd. spec. 1. p. 809. Conv. oleifolius, β, Desr. in Lam. dict. 3. p. 552. D. C. fl. fr. suppl. no. 2752. Conv. Tournefórtii, Sieb.—Tourn. cor. p. 1. Plant silvery. Flowers 3-6 together on long peduncles, girded by 3-4 bracteas, which are hardly longer than the calyxes. Corollas very pale red.

Linear-leaved Bind-weed. Fl. Ju. July. Clt. 1770. Shrub ½ to 1½ foot.

32 C. prólifer (Vahl. eclog. 1. p. 18.) shrubby, erect; leaves linear, silky beneath; heads of flowers terminal, and in the forks of the branches; bracteas ovate, very hairy outside. ♄. F. Native of South America. Habit of *C. Cantábrica*. Branches filiform, glabrous at bottom, and tomentose above, bifid at apex. Superior leaves remote: lower ones crowded, glabrous above. Heads of flowers size of a filbert. Bracteas 3 times broader than the leaves, acuminated, glabrous inside. Flowers solitary in the axils of the bracteas.

Proliferous Bind-weed. Shrub erect.

33 C. flóridus (Lin. suppl. 136.) plant shrubby, prostrate, hoary; leaves linear-lanceolate, rather pilose; thyrse terminal, pyramidal, panicled; sepals ovate, concave, acute. ♄. G. Native of Teneriffe, on rocks. Jacq. coll. 1. p. 62. icon. rar. t. 34. Ait. hort. kew. 1. p. 224. Willd. spec. 1. p. 873. Very like *C. cneòrum*. Leaves attenuated at the base. Peduncles branched, rising from the axils of the superior leaves, the whole forming a large, ovate, thyrsoid panicle. Flowers very numerous, small. Corolla pale red, or whitish, hairy outside.

Flowery Bind-weed. Fl. Aug. Sept. Clt. 1779. Shrub prostrate.

* * * *Annual plants.*

34 C. pilosellæfòlius (Desr. in Lam. dict. 3. p. 551.) plant villous; axillary branches floriferous; leaves spatulate-lanceolate, sessile; peduncles elongated, many-flowered (few-flowered, ex Willd.), loosely racemose. ⊙. H. Native of the Levant, Willd. spec. 1. p. 870.—Tourn. cor. 1. Leaves and stems green, but pilose. Peduncles 4-6-flowered; bracteas small, lanceolate. Sepals ovate, acute, villous, twice longer than the corolla. Corolla small, campanulate. The Conv. ramosus, incanus, foliis pilosellæ, Tour. cor. 84, is probably a syn. of this, and therefore *Conv. linearifòlius*, Mill. dict. no. 28.

Pilosella-like Bind-weed. Pl. prostrate.

35 C. trícolor (Lin. hort. cliff. p. 19.) stem declinate, terete, beset with small, soft, white hairs; leaves ovate-lanceolate, or spatulate, hairy, ciliated; peduncles 1-flowered, bibracteate, longer than the leaves; sepals ovate-lanceolate, acute. ⊙. H. Native of Sicily, Spain, Portugal; on the hills of Ajuda, near Lisbon; and of the North of Africa. Willd. spec. 1. p. 874. Link, fl. port. 1. p. 368. Curt. bot. mag. t. 27. St. Hil. 18. t. 3.—Knip. cent. 5. no. 26.—Mor. hist. 2. p. 17. sect. 1. t. 4. f. 4. Corolla rather large, with a yellowish throat, a blue limb, the rest white. This is a very common annual in gardens. There is also a variety with almost white flowers.

Three-coloured-flowered Bind-weed. Fl. July, Sept. Clt. 1629. Pl. 1 foot.

36 C. Shera'rdi (Pursh. fl. amer. sept. 2. p. 30.) trailing, downy; leaves elliptic, retuse at both ends, mucronate; flowers solitary, nearly sessile. ⊙. H. Native of Carolina, Catesby. Nearly allied to *Conv. trichosánthes*.

Sherard's Bind-weed. Pl. trailing.

37 C. trichosa'nthes (Michx. fl. bor. amer. 1. p. 137.) plant trailing, downy; leaves lanceolate-oblong, linear or oblong, obtuse, mucronate, nearly sessile; peduncles 1-5-flowered, longer than the leaves; sepals ovate, acute; corolla short, campanulate, hairy outside. ⊙. H. Native from Virginia to Georgia, in sandy woods. Pursh. fl. 1. p. 143. Flowers small, white. Capsule ovate, downy.

Var. α, pàtens (Desr. in Lam. dict. 3. p. 547. ill. 1. p. 453.) plant filiform, erectish; leaves linear, mucronate; peduncles spreading, longer than the leaves, usually 2 flowered. ⊙. H. C. aquáticus, Walt. fl. carol. p. 94.

Var. β, tenéllus (Lam. ill. 1. p. 459. Pursh, fl. 1. p. 143.) twining; leaves oblong-elliptic, obtuse, mucronate, nearly sessile; peduncles longer than the leaves, usually 2-flowered. ⊙. H. C. humistràtus, Walt. fl. carol. p. 94. Plukn. alm. t. 166. f. 4.

Hairy-flowered Bind-weed. Pl. trailing.

38 C. pentapetaloìdes (Lin. syst. 3. p. 229.) plant prostrate, filiform; stems rather hairy at top; lower leaves petiolate, spatulate-lanceolate, obtuse, nearly naked, lined, ciliated: upper ones linear-cuneiform, sessile; peduncles short, 1-flowered, rather pilose. ⊙. H. Native of Majorca, Calabria, and the Grecian Islands. Willd. spec. 1. p. 867. exclusive of the syn. of Jacq. Sibth et Smith, fl. græc. t. 197. C. prostràtus, Forsk. descr. p. 203. Roth, beytr. 1. p. 121. abhandl. p. 11. no. 10. t. 3. catalec. bot. 1. p. 392. p. 22.—Tourn. inst. p. 83. Herb very like *C. trícolor*, but smaller. Bracteas very small. Corolla form of that of *Conv. lineàtus*, but 3 times smaller, bluish, with a yellow throat, and a semi 5-cleft limb.

Five-petalled-like-flowered Bind-weed. Fl. June, July. Clt. 1789. Pl. trailing.

39 C. meona'ntha (Link, et Hoffm. fl. port. 1. p. 369.) stems angular, downy at top, ascending; leaves lanceolate, sessile, with a few scattered hairs; peduncles 1-flowered, longer than the leaves; calyx with a few scattered hairs; sepals oval,

acutish. ⊙. H. Native of Portugal, in calcareous places about Coimbra. C. trícolor, β. mìnor, Brot. fl. lus. 1. p. 268. Leaves narrowed at the base. Bracteas obsolete. Corolla pale blue, with a yellowish bottom. Very nearly allied to *C. trícolor*, but differs in the corollas being smaller, paler, in the obsolete bracteas, and hairiness.

Small-flowered Bind-weed. Fl. June, July. Clt.? Pl. ½ to 1 foot.

40 C. strícTus (Lehm. sem. hort. hamb. 1823. p. 17. pug. 1. p. 15.) stems nearly simple, straight, villous; lower leaves obovate-spatulate: superior ones lanceolate, spreadingly pilose; sepals unequal, foliaceous; bracteas shorter than the calyx; peduncles 1-flowered, villous, shorter than the leaves. ⊙. H. Native of Egypt. Calyx woolly. Corolla funnel-shaped, white; tube length of calyx; limb pale rose-coloured at the plicæ. Capsule ovate, pilose at apex, length of calyx.

Straight Bind-weed. Fl. June, Aug. Clt. 1822. Pl. ¼ to ½ foot.

41 C. undula'tus (Cav. icon. 3. p. 39. t. 277. f. 1. ann. des cienc. nat. 3. p. 17.) stems prostrate, terete, rather villous; leaves spatulate, obtuse, sessile, pilose; flowers axillary, solitary, sessile; sepals oblong-ovate, acute, villous. ⊙. H. Native of Tunis, near Sbiba; in the Island of Cyprus; also near Tangier; Spain, about the canal near Madrid. C. hùmilis, Jacq. coll. 4. p. 209. t. 22. f. 3. C. evolvuloìdes, Desf. fl. atl. 1. p. 176. t. 49. Sibth. et Smith, fl. græc. t. 198. C. ciliàtus, Roth, catalec. 1. p. 39. 2. p. 22. Pers. ench. 1. p. 180. Willd. enum. 1. p. 205. C. decúmbens, Ortega. Stems reddish. Leaves villous, usually undulated, spatulate, ex Desf. Corolla longer than the calyx, with a red and white limb, and a yellow tube, ex Cav. blue, ex Desf. blue, with a white throat, ex Smith. Capsule villous.

Undulated-leaved Bind-weed. Fl. June, Oct. Clt. 1816. Pl. prostrate.

§ 2. *Leaves cordate. Annual plants.*

42 C. Sículus (Lin. spec. p. 223.) stems trailing; leaves cordate-ovate: superior ones acute, all hairy; peduncles 1-flowered, shorter than the leaves; bracteas lanceolate, below the calyx; sepals hairy, ovate, acute. ⊙. H. Native of Sicily; Spain, in Valencia; Island of Hieris; Peloponnesus; Candia, in shady mountains; as well as of Mauritania and Teneriffe. Willd. spec. 1. p. 866. Lam. dict. 3. p. 540. Sibth. et Smith, fl. græc. t. 196. Ker. bot. reg. 445.—Bocc sic. p. 89. t. 48.—Tourn. inst. 83. Stems filiform, angular, beset with adpressed hairs above, and spreading ones at bottom. Corolla small, blue, with a white throat. Stem twining a little.

Sicilian Bind-weed. Fl. June, Aug. Clt. 1640. Plant ½ to 1 foot.

43 C. elonga'tus (Willd. enum. 1. p. 205.) leaves cordate-ovate, cuspidate; peduncles 1-2-flowered, longer than the leaves; bracteas linear-subulate, shorter than the pedicels; calyxes ciliated. ⊙. H. Native of the Canaries. Ker. bot. reg. t. 498, C. pseùdo-Sículus, Cav. descr. p. 97. Very like *Conv. Sículus*, but differs in the leaves being broader; in the bracteas not being close to the calyx. Corolla white, having the tube yellow inside. Stems twining a little.

Elongated-peduncled Bind-weed. Fl. July, Aug. Clt. 1815. Pl. 1 foot.

44 C. unilatera'lis (Rœm. et Schultes, syst. 4 p. 284.) stems decumbent, diffuse; leaves cordate, acuminated; peduncles secund, very long; flowers subumbellate; sepals equal, ovate, bluntish. ⊙.? S. Native of Peru, on sandy hills; as between Santa Rosa and Yazo, in the valley of Canta. C. secúndus, Ruiz. et Pav. fl. per. 2. p. 10. t. 117. f. 6. Poir. suppl. 3. p. 472. but not of Desr. in Lam. dict. Leaves petiolate, as long as broad, white beneath, acute or obtuse, with an emarginate point. Pedicels bracteate; bracteas small, subulate. Corolla rather large, blue. Stamens exserted. Stigmas flat.

Unilateral-flowered Bind-weed. Pl. decumbent.

45 C.? ebractea'tus (Desr. in Lam. dict. 3. p. 541.) stem slender, twining a little; leaves cordate-sagittate, blunt behind; peduncles 1, rarely 2-flowered, bractless, shorter than the petioles; outer sepals the broadest. ⊙. H. Native country unknown. Pers. ench. 1. p. 180. Very similar to *C. Sículus* at first sight; but the leaves and whole plant are larger, and beset with short white hairs. Corolla small, white. Stigmas 2, globular. Perhaps a species of *Ipomœ'a*.

Bractless Bind-weed. Pl. trailing.

§ 3. *Leaves cordately lobed, or hastate. Annual and perennial plants.*

46 C. Impera'ti (Vahl, symb. 1. p. 17.) glabrous, trailing, creeping; leaves panduriform or entire, emarginate, cordate at the base; peduncles 1-flowered, length of leaves, sometimes twin; sepals ovate, obtuse, rather transparent. ♃. H. Native along the Mediterranean Sea; and of the kingdom of Naples and Mauritania. Willd. spec. 1. p. 896. C. stoloníferus, Desr. in Lam. dict. 3. p. 553. Cyr. pl. rar. fasc. 1. p. 14. t. 5. Ipomœ'a stolonífera, Poir. dict. 6. p. 20. C. sinuàtus, Petagn. inst. bot. 2. p. 553.—Mor. hist. 2. sect. 1. p. 15. t. 7.—Barrel. obs. p. 33. icon. 856.—Convolvulo Marino Imperati, no. 671. p. 767. Leaves usually lobately palmate, ex Pentagna, l. c. Bracteas small. Corolla large, campanulate, cream-coloured. Plant lactescent. Very like *Calystègia soldanélla*.

Imperati's Bind-weed. Pl. creeping.

47 C.? sagitta'tus (Thunb. prod. 35.) glabrous; stems filiform, prostrate; leaves lanceolate-sagittate: hind lobes acute, deflexed; peduncles 1-flowered, longer than the leaves.—Native of the Cape of Good Hope. Willd. spec. 1. p. 877. Sepals ovate, obtuse, concave, equal, glabrous. Corollas small, clothed with rusty villi outside.

Sagittate-leaved Bind-weed. Pl. trailing.

48 C.? hi'rtus (Mill. dict. no. 10. Willd. spec. 1. p. 875.) stem and petioles pilose; leaves cordate and subhastate, villous; peduncles many-flowered; pedicels naked; flowers alternate, pedicellate, having a small lanceolate bractea on each pedicel.—Native of the East Indies.

Hairy Bind-weed. Fl. June, Aug. Clt. 1806. Pl. twining.?

49 C. Cape'nsis (Willd. spec. 1. p 877.) stems ascending, glabrous; leaves linear, hastate at the base: lobes divaricate, small, glabrous, semibifid; peduncles 1-flowered, length of leaves; stems decumbent, villous; sepals ovate, acuminated, equal.—Native of the Cape of Good Hope. C. hastàtus, Thunb. prod. p. 55. Corolla large, downy outside.

Cape Bind-weed. Pl. trailing.

50 C. subloba'tus (Lin. suppl. p. 135.) procumbent, pilose; lower leaves cordate: superior ones repandly toothed at apex; flowers capitate, usually 3 in a head, surrounded by a 6-leaved involucrum. ⊙. H. Native of India. Willd. spec. 1. p. 877. Corolla large.

Sublobate-leaved Bind-weed. Pl. procumbent.

51 C.? edu'lis (Thunb. jap. p. 84.) stem creeping, angular: leaves cordate, entire, or 3-lobed, glabrous. ♃. G. Native of Japan, Willd. spec. 1. p. 875. Tubers large, fleshy, as in *Batàtas edùlis*, or sweet potatoe, eatable, of a very pleasant flavour. Perhaps only a variety of *Batàtas edùlis*.

Edible-rooted Bind-weed. Pl. creeping.

§ 4. *Leaves pinnate, jagged, or palmate. Annual and perennial plants.*

52 C. platyca'rpos (Cav. icon. 5. p. 55. t. 482.) stems prostrate, villous; leaves pinnate: leaflets sessile, often 3-lobed at apex, cuneate at the base; racemes terminal; pedicels distant, 1-flowered; sepals villous, nearly linear. ⊙.? G. Native of Mexico, about Chalma. Poir. suppl. 3. p. 472. Corolla campanulate, twice longer than the calyx, scarlet, divided even to the middle, into roundish segments, lined with green. Stamens villous at the base, with red filaments and yellow anthers. Stigmas subulate. Capsule roundish, compressed, 2-celled, 2-valved, divided by a dissepiment. Seeds black, dotted, 2 or more in each cell, fixed to the dissepiment. Perhaps a new genus.

Broad-fruited Bind-weed. Pl. prostrate.

53 C. lacinia'tus (Desr. in Lam. dict. 3. p. 546. exclusive of β.) stems slender, terete; leaves finely jagged, somewhat bipinnate; segments capillary, 2-3-cleft; peduncles longer than the leaves, 1-flowered, rarely 2-flowered; sepals ovate, obtuse, mucronate, rather scarious. ⊙.? G. Native near Monte Video. Cav. icon. 5. p. 479. f. 2. Bracteas linear. Corolla campanulate, white, twice as long as the calyx. Seeds black, naked. Leaves similar to those of *Quámoclit vulgàris*, glabrous or silky from pili.

Jagged-leaved Bind-weed. Pl. 1-2 feet.

54 C. lasia'nthus (Cav. icon. 5. p. 53. t. 479. f. 1.) stems numerous, simple, prostrate, terete, tomentose; leaves palmately jagged, tomentose: segments 7, unequal: middle one largest, all pinnatifid; peduncles 1-flowered, longer than the leaves; sepals concave, coriaceous, scarious, ovate, acuminated, very villous. ⊙.? G. Native of Chili, about Talcahuana. Poir. suppl. 3. p. 463. C. laciniàtus, β, Lam. dict. 3. p. 546. Bracteas linear, acute. Corolla white, campanulate, nearly funnel-shaped, villous outside; segments of the limb obtuse, ending in a small bristle each. Capsule globose.

Woolly-flowered Bind-wind. Pl. prostrate.

55 C. multífidus (Thunb. prod. p. 35.) leaves palmate; lobes 7, linear, entire; peduncles 1-flowered; stems decumbent. ↄ. G. Native of the Cape of Good Hope. Willd. spec. 1. p. 877.

Multifid-leaved Bind-weed. Fl. June, Aug. Clt. 1822. Pl. dec.

56 C. obtusílobus (Michx. fl. bor. amer. 1. p. 139.) plant prostrate, glabrous; leaves thick, sinuately lobed; lobes rounded, obtuse: the middle lobe large and emarginate; peduncles 1-flowered; sepals oblong-oval; corolla short, campanulate. ↄ. H. Native of Georgia and Florida, on the sandy beach. Pursh. fl. amer. sept. 1. p. 144. Pers. ench. 1. p. 82. Lower leaves sometimes not lobed, but repand. Calyx bractless, ex Michx.

Blunt-lobed-leaved Bind-weed. Pl. prostrate.

57 C. littora'lis (Lin. spec. p. 227.) stems creeping; leaves large, oblong, lobately palmate, fleshy; peduncles 1-flowered, rarely 2-flowered, shorter than the leaves. ↄ. S. Native of Crabe's Island, near Porto Rico, by the shore. Willd. spec. 1. p. 878. Desr. in Lam. dict. 3. p. 546. Plum. spec. 1. ed. Burm. amer. 90. f. 2.—Plum. mss. vol. 2. t. 5. Stems much branched. Petioles rather long. Corolla rather large, white, campanulate, with a spreading, somewhat fringed limb. Capsule clothed with white silky villi.

Sea-shore Bind-weed. Pl. creeping.

Sect. II. Strophocau'los (from στροφαω, *strophao*, to twist; and καυλος, *kaulos*, a stem.) Stems twining.

§ 1. *Leaves sagittate or hastate, or cordately or sagittately hastate.*

58 C. arve'nsis (Lin. spec. p. 218.) stems angular, striated; leaves sagittate, somewhat auricled; peduncles usually 1-flowered, bibracteate about the middle; sepals ovate-roundish; corolla white or rose-coloured. ↄ. ◠. H. Native throughout Europe, in sandy fields, and by road sides; as well as of China, Cochinchina, some parts of the East Indies, and Persia; and of Virginia, in meadows; very common in Britain. Willd. spec. 1. p. 844. Pursh, fl. amer. sept. 1. p. 144. on the authority of Gronovius, fl. virg. p. 27. Smith, engl. bot. t. 312. Curt. lond. fasc. 2. t. 13. Oed. fl. dan. t. 459. Bull. herb. t. 269. Drev. et Hayn. t. 24. Hayn. term. bot. t. 12. f. 1. a. Plenck, off. t. 104. Conv. Chinénsis, Ker. bot. reg. t. 322. Conv. Malcólmi, Roxb. in Wall. fl. ind. 2. p. 55. Conv. Màhur, Ham. herb. Conv. divaricàtus, Wall. cat. no. 1422. 1 and 2. Conv. hastàtus, Delisle, descr. ægypt. p. 55. C. prostràtus, Schmidt, fl. boh. no. 195. Root creeping extensively under ground, difficult to extirpate. Leaves smoothish. Bracteas in the middle of the peduncles, or near their top. Flowers sweet-scented.—There is a variety with 2-flowered peduncles. Leaves varying in shape, obtuse or acute, having the hind lobes also acute, obtuse, or angular.

Var. α, *eréctus* (Ledeb. fl. alt. 1. p. 224.) glabrous; stem erect, neither procumbent nor twining; leaves hastately-triangular: lobes acuminated, or 2-lobed; peduncles mostly 2-flowered, bibracteate, about equal in length to the leaves: having one of the pedicels bracteate, and the other naked; sepals mucronate. ↄ. H. Native of Siberia, on the stony banks of the rivulet called Tinguriuk, and the river Katunga, to the north; but has not been observed elsewhere. Flowers rose-coloured or white, with the margins reddish.

Var. β, *volùbilis* (Led. l. c.) glabrous; stems twining; leaves sagittately triangular: hind lobes acute, 2-lobed at bottom; peduncles exceeding the leaves, mostly 2-flowered, bibracteate, having one of the pedicels naked; sepals roundish, mucronate. ↄ. ◠. S. Native of Siberia, on mountains near Alexandrowsk.

Var. γ, *vulgàris* (Ledeb. l. c. p. 225.) plant rather villous; stems sometimes erect, sometimes prostrate or twining; leaves sagittate or hastate; lobes oblong: terminal one elongated, roundish, and mucronate at the apex: lateral ones somewhat 2-lobed, or somewhat serrated below; peduncles exceeding the leaves more or less, 1-3-flowered, bibracteate; pedicels bractless; sepals roundish, ciliated, hardly mucronate. ↄ. ◠. H. Native of Siberia, frequent in fields.

Var. δ, *angustàtus* (Ledeb. l. c.) stems twining; leaves hastate: lobes rounded at the apex: terminal one elongated, oblong, mucronate: lateral ones furnished with a straight stretched out angle; peduncles usually 1-flowered, longer than the leaves, bibracteate above the middle; sepals rounded at the apex, somewhat emarginate, sub-mucronate. ↄ. ◠. H. Native of Siberia, in dry places; at the rivers Ulegumen and Katunga.

Var. ε, *sagittàtus* (Ledeb. l. c.) rather pilose; stems twining a little; leaves sagittate; lobes broad-lanceolate: terminal one mucronate; peduncles 1-flowered, bibracteate, equal in length to the leaves; sepals sub-mucronate. ↄ. ◠. H. Native of Siberia, in dry places, very rare. C. sagittæfòlius, Fisch. hort. gorenk. 1810. p. 28.? Bieb. fl. cauc. suppl. 3. p. 137.—Gmel. sib. 4. p. 96. no. 54. t. 48. f. 1.

Corn Bind-weed. Fl. June, Sept. Britain. Pl. tw.

59 C. emargina'tus (Link. enum. 1. p. 201.) leaves hastately sagittate: hind lobes emarginate or bicuspidate; peduncles axillary, 2-3-flowered; calycine segments ovate, acute. ↄ. ◠. H.

Native country unknown. Stem quadrangular. Young leaves hoary: adult ones with a few adpressed hairs, as well as the calyx. Bracteas linear under the calyx. Corolla red.

Emarginate-lobed Bind-weed. Fl. June, Aug. Clt. 1817. Pl. tw.

60 C. bicuspida'tus (Fischer, ex Link, enum. p. 201.) leaves hastate: hind lobes bicuspidate; peduncles axillary, 1-flowered; calycine segments obtuse, emarginate, somewhat apiculated. ♃. ⌒. H. Native of Dauria. Stem glabrous, quadrangular. Leaves with a lanceolate middle lobe, and recurved hind or lateral ones, scabrous on the margins. Peduncles longer than the leaves, bearing a linear bractea above the middle. Calyx glabrous. Corolla red.

Bicuspidate-lobed Bind-weed. Fl. June, July. Clt. 1818. Pl. tw.

61 C. auricula'tus (Desr. in Lam. dict. 3. p. 540. exclusive of the synonymes); leaves linear-hastate, acuminated: hind lobes entire; peduncles 2-flowered. ♃. ⌒. S. Native of the Isle of France. Pers. ench. 1. p. 177. Nearly allied to *C. arvénsis*, and probably only a variety of it; but differs from the common form of that species, in the leaves being narrower, more oblong, in the peduncles being 2-flowered, nearly the length of the leaves, and in the bracteas being nearer the calyx. Root creeping.?

Auricled-leaved Bind-weed. Pl. tw.

62 C. Córsicus (Rœm. et Schultes, syst. 4. p. 256.) leaves ovate-hastate, rounded at the apex, somewhat emarginate: hind lobes obtuse. ♃. ⌒. H. Native of Corsica. Nearly allied to some varieties of *C. arvénsis;* but differs in the shorter petioles, broader leaves, shorter, thicker peduncles. Superior leaves smaller, and sessile. Probably only a variety of *C. arvénsis.*

Corsican Bind-weed. Pl. tw.

63 C. incarna'tus (Vahl, eclog. amer. 2. p. 12.) leaves sagittate-oblong, acuminated, glabrous: hind lobes divaricate, acute, entire; peduncles 1-flowered, longer than the petioles; bracteas at the base of the peduncle; sepals lanceolate, acute. ♃. ⌒. S. Native of Curaçoa. It differs from *C. arvénsis*, to which it is nearly allied, in the hind lobes of the leaves being ovate, acute; in the bracteas being at the base of the peduncles; in the flowers being larger, &c. Corolla large, purple, campanulate.

Flesh-coloured-flowered Bind-weed. Pl. tw.

64 C. Mechoaca'nna (Willd. anleit. selb. p. 93.) leaves ovate and lobed, hastate; peduncles thick, 1-flowered. ♃. ⌒. S. Native of Brazil; and Mechoaca, in New Spain. Root thick, marked under the name of *Mechoacanna.* Conv. Mechoàcan, Vittm. summ. 1. p. 434. Conv. Jetiaúcu, Pis. bras. with a figure. Conv. Jatiaúca, Gmel. 1. p. 339. with the following description: "Nearly allied to *C. sèpium.* Root bifid, brown outside. Stem many-angled. Leaves cordate-eared, deep green, nerved beneath. Corolla white or pale red, purple inside. Seeds brown."

Mechoacan Bind-weed. Pl. tw.

65 C. atriplicifòlius (Poir. suppl. 3. p. 467.) hairy; leaves on short petioles, sagittate, truncate behind; peduncles axillary, hairy, very long, forked at top, each fork bearing a flower; calyx villous: outer sepals the longest, lanceolate, acute, mucronate. ♃. ⌒. H. Native of Syria, La Billardiere. Hairs on stems and peduncles rufescent. Peduncles furnished with 2 subulate bracteas at the fork, and 2 longer ones on each pedicel. Corolla white, twice as long as the calyx.

Atriplex-leaved Bind-weed. Pl. tw.

66 C. acetosellæfòlius (Desr. in Lam. dict. 3. p. 564.) muricated; leaves hastately 3-lobed: lateral lobes roundish-angular; peduncles short, usually 2-flowered; sepals short, ovate, bluntish. ♃. ⌒. S. Native of the Isle of France. Conv. lapathifòlius, Spreng. syst. 1. p. 604. Glabrous, as in *Ipomœ'a triloba*, to which it is nearly allied in habit. Stems terete, and are, as well as the petioles and peduncles, rough from black acute tubercles. Leaves almost panduriform. Corolla small, campanulate, twice longer than the calyx.

Acetosella-leaved Bind-weed. Pl. tw.

67 C. inca'nus (Vahl, symb. 3. p. 23.) clothed with silky tomentum; leaves lanceolate-sagittate, obtuse, a little toothed at the base; peduncles 2-flowered, length of leaves; sepals ovate, acute: outer ones villous. ♃. ⌒. S. Native of South America. Willd. spec. 1. p. 847. Stems terete. Petioles short. Leaves 1½ inch long; hind lobes rounded. The longest pedicel bibracteate in the middle. Bracteas setaceous. Corolla villous outside. Capsule glabrous, globose.

Hoary Bind-weed. Pl. tw.

68 C. hasta'tus (Forsk. descr. p. 203.) stem pilose; leaves lanceolate-hastate; peduncles axillary, twin, 2-flowered; sepals acuminated, spreading at apex. ♃. ⌒. H. Native of Egypt. Vahl, symb. 1. p. 15. Willd. spec. 1. p. 849. Conv. hastifòlius, Poir. suppl. 3. p. 467. Petioles one-half shorter than the leaves. Leaves 2 inches long, glabrous above and villous beneath, with rounded auricles, which are sometimes unidentate behind. Peduncles shorter than the petioles, villous.

Halbert-leaved Bind-weed. Pl. tw.

69 C. Scammònia (Lin. spec. p. 218. Roy. ludgb. 427.) glabrous; stem angular; leaves cordate-sagittate, truncate behind; peduncles terete, generally 3-flowered, longer than the leaves; sepals loose, glabrous, ovate, repand, obtuse, with a reflexed point. ♃. ⌒. H. Native of Syria, Mysia, Cappadocia; and of the Island of Rhodes, in hedges. Mill. fig. t. 102. Plench. off. t. 92. Sibth, et Smith, fl. græc. t. 192. Woodv. med. bot. 1. p. 13. t. 5. Sweet, fl. gard. n. s. 2. t. 173. Conv. Syrìacus, and Scammònia Syrìaca, Tourn. inst. 83.—Morr. hist. 2. p. 12. sect. 1. t. 3. f. 5.—Lob. icon. 620. f. 1. Corollas large, campanulate, cream-coloured, or very pale red. The roots of Scammony, which are very long and thick, when fresh contain a milky juice. This is obtained by removing the earth from the upper part of the roots, and cutting off the tops obliquely. The milky juice which flows out is collected in a small vessel sunk in the earth at the lower end of the cut. Each root furnishes only a few drachms; but the produce of several roots is added together, and dried in the sun. This is the true and unadulterated Scammony. It is light, of a dark grey colour, but becomes of a whitish yellow when touched with the wet finger. It is shining in its fracture, has a peculiar nauseous smell, and bitter, acrid taste, and forms, with water, a greenish milky fluid. In this state of purity it seldom reaches us, but is commonly mixed with the expressed juice of the root, and even of the stalks and leaves, and often with flour, sand, or earth. The best to be met with in the shops comes from Aleppo, in light, spongy masses, having a heavy, disagreeable smell, and a shining ash-colour, verging to black, friable, and easily powdered; powder of a light grey, or whitish colour. An inferior sort is brought from Smyrna, in more compact, ponderous pieces, with less smell, not so friable, of a darker colour, not so resinous and full of sand and other impurities. This last is said to be the produce of *Periploca Scammònium*, and of the *Cynánchum A'rghil.* Resin is the principal constituent of Scammony. Sixteen ounces of good Aleppo Scammony give eleven ounces of resin, and three ounces and a half of watery extract. Scammony is an efficacious and powerful purgative. It may be given triturated with sugar, or with almonds, and becomes sufficiently safe and mild in its operation. It may be also given to strengthen other purgatives, in small quantities, as with powdered rhubarb, &c. The common dose of Scammony is from 3 to 12 grains; but when mixed with other purgatives, ½ to 1 grain is sufficient.

Scammony Bind-weed. Fl. July, Aug. Clt. 1596. Pl. tw.

70 C. Sibthórpii (Rœm. et Schultes, syst. 4. p. 285.) leaves cordate-hastate, acuminated, pilose, angular at the base; peduncles generally 1-flowered; capsule hairy. ♃. ⌒. H. Native of the Island of Samos, and other Grecian Islands, in vineyards and corn-fields. C. sagittifòlius, Sibth. et Smith, fl. græc. t. 193. but not of Michx. — Tourn. cor. p. 1. — Bocc. mus. t. 35. Flowers white, or reddish white; sepals hairy, ovate, acute. Very nearly allied to *C. Scammònia*.

Sibthorp's Bind-weed. Fl. July, Aug. Clt. 1823. Pl. twining.

71 C. Loureíri; stem branched, suffruticose, slender, pilose; leaves sagittate-oblong, somewhat truncate at the base; corollas yellow, plicate, undivided; peduncles long, terete, usually 4-flowered; bracteas lanceolate. ♄. ⌒. S. Native of Cochinchina, in woods. C. Scammònia, Lour. coch. p. 106.

Loureiro's Bind-weed. Shrub tw.

72 C. Bonarie'nsis (Cav. icon. 5. p. 54. t. 480. f. 2.) stems filiform, downy; leaves hastate, cuneated at the base, terminating each in a bristle; peduncles generally 3-flowered, shorter than the leaves. ♃. ⌒. G. Native of Buenos Ayres, in plains. Poir. suppl. 3. p. 470. Leaves petiolate; middle lobe linear, very long, 2 inches, obtuse, 2 lines broad: lateral ones very short, with a tooth outside. Calyx length of the tube of the corolla. Corolla small, white, variegated with red veins; segments of the limb acute.

Buenos Ayrean Bind-weed. Pl. tw.

73 C. erube'scens (Sims, bot. mag. 1067. R. Br. prod. p. 482.) plant rather pilose; leaves hastate: hind lobes toothed or cut: intermediate one lanceolate or linear, toothed or quite entire; peduncles 1-3-flowered, shorter than the leaves; sepals equal, ovate, mucronulate, spreading; capsule erect, 2-valved; seeds scabrous. ♂. ⌒. G. Native of New South Wales, about Port Jackson; and of Van Diemen's Land. C. rubéscens, Poir. suppl. 3. p. 466. Corollas small, red. Nearly allied to *C. althæoìdes* and *C. bryoniæfòlius*.

Reddish-flowered Bind-weed. Fl. July, Sept. Clt. 1803. Pl. tw.

74 C. remòtus (R. Br. prod. p. 483.) rather pilose from adpressed hairs; leaves hastate, linear-oblong, entire; peduncles 1-flowered; sepals equal, ovate, mucronulate; seeds scabrous. ♃. ⌒. G. Native of New Holland, on the South coast.

Remote-leaved Bind-weed. Pl. tw.

75 C. genicula'tus (Lehm. sem. hort. hamb. 1826. p. 17. pug. 1. p. 15.) radical leaves hastately-cordate, very blunt; cauline leaves hastately-lanceolate, acute: auricles or hind lobes angularly toothed; peduncles 1-flowered, length of leaves, jointed and bracteate in the middle, and thickened above; calycine segments reflexed at apex, mucronulate. ⊙. ⌒. G. Native of Australia. Stem angular, pilose. Leaves downy. Bracteas linear-lanceolate. Corolla pale red, glabrous, 5-lobed, silky underneath at the plicæ; lobes rounded. Capsule size of a pea.

Jointed-peduncled Bind-weed. Fl. July, Aug. Clt. 1826. Pl. tw.

76 C. quinqueflòrus (Vahl, symb. 3. p. 31. Willd. spec. 1. p. 862.) stems downy, terete; leaves sagittately ovate, attenuated, glabrous, hoary, crenately sub-repand; peduncles generally 5-flowered, length of leaves; sepals oblong, obtuse, mucronate, rather villous. ♃. ⌒. S. Native of the Island of Bourbon. Hind lobes of leaves erect, truncated behind and unidentate. Peduncles downy: upper ones 3-flowered. Lobes of corolla bearded at top. Probably a species of *Ipomœ'a*.

Five-flowered Bind-weed. Pl. tw.

77 C. ru'ber (Vahl, eclog. 2. p. 12.) glabrous; stems terete; leaves sagittate, emarginate: hind lobes oblong, very blunt, divaricate, quite entire; peduncles length of leaves, bearing about 4 flowers in an umbel, which are at first sessile, but at length pedicellate, involucrated by 2 ovate membranous leaves; sepals unequal, glabrous: 2 outer ones larger, mucronate. ♃. ⌒. S. Native of Tropical America. Stem beset with piliferous dots. Leaves 2 inches long. Bracteas oblong at the base of the pedicels. Corolla purple. Perhaps a species of *Ipomœ'a*.

Red-flowered Bind-weed. Pl. tw.

78 C. crenatifòlius (Ruiz. et Pav. fl. per. 1. t. 118. f. a.) stems terete, downy; leaves sagittate, acute, crenated; peduncles long, 10-11-flowered, umbellate, involucrated at the base. ⊙. ⌒. S. Native of Peru, along with *C. Hermánniæ*. Poir. suppl. 3. p. 470. Leaves petiolate, 3-4 inches long, crenate at the base, but generally entire from the middle to the apex. Bracteas on the pedicels, small, subulate. Corolla middle-sized; lobes acute, pilose at apex. Stamens exserted. Stigmas flat.

Crenate-leaved Bind-weed. Pl. tw.

79 C. Cherle'ri (Agardh, ex Rœm. et Schultes, syst. 4. p. 261.) glabrous; stems prostrate, angular; leaves hastately 3-lobed: lobes linear, very narrow; peduncles 1-flowered, length of leaves; sepals truncately rounded. ♃. ? ⌒. H. Native near Malaga. Middle lobe of leaves 3-4 lines longer than the lateral ones, obtuse, mucronate. Bracteas short, downy. Corolla 3 times longer than the calyx.

Cherler's Bind-weed. Pl. tw.

80 C. rufe'scens (Choisy, in mem. soc. phys. gen. 6. p. 479.) plant of a rufous rusty colour; leaves hastately cordate, acute at the apex, mucronulate, with sinuated edges: auricles crenately-lobed; peduncles short, 1-3-flowered; sepals ovate, acuminated, equal. ♃. ⌒. H. Native of the Nilligherry mountains. Stem terete. Sepals ciliated: outer ones downy outside. Petioles villous. Capsule glabrous. Nearly allied to *C. atriplicifòlius* and *C. crenàtus*.

Rufescent Bind-weed. Pl. tw.

81 C. pannifòlius (Salisb. par. p. 20. Ait. hort. kew. edit. 2d. vol. 1. p. 328.) canescent; leaves cordately hastate, hairy; peduncles generally 3-flowered; bracteas linear, distinct from the calyx; sepals hairy, oblong, acute; corollas large, pale red. ♄. ⌒. G. Native of the Canary Islands. Ker. bot. reg. 222.

Cloth-leaved Bind-weed. Fl. June, Sept. Clt. 1805. Shrub twining.

82 C. lanuginòsus (Vahl, symb. 3. p. 23. Willd. spec. 1. p. 847.) stem beset with rust-coloured hairs; leaves on short petioles, cordate-oblong, somewhat hastate, clothed with very soft, rusty, silky tomentum: auricles bidentate; peduncles 3-flowered, pilose; the 3 outer sepals very hairy, ovate, acuminated. ♃. ⌒. H. Native of the Levant. The two lateral pedicels bibracteate, and the middle one bractless. Bracteas lanceolate. Corolla nearly as in *Conv. Scammònia*, yellowish, with a lanceolate purple ray outside of each lobe, clothed with yellowish villi.

Woolly Bind-weed. Pl. tw.

83 C. ? cordifòlius (Thunb. prod. p. 35.) downy; leaves cordately hastate, acuminated, toothed: hind lobes acute, divaricate, glabrous, hairy beneath; peduncles bifid, umbellate, length of leaves. ♃. ? ⌒. G. Native of the Cape of Good Hope. Willd. spec. 1. p. 857. Flowers small. Sepals ovate, acuminated, glabrous. Corolla pale blue.

Heart-leaved Bind-weed. Pl. tw.

84 C. hirsu'tus (Bieb. fl. taur. 1. p. 442. cent. pl. ross. 66.) plant clothed with white hairs; leaves cordate, acute, subhastate: auricles angularly toothed; peduncles usually 3-flowered, longer than the leaves; sepals nearly equal, ovate-lanceolate, acuminated. ♃. ⌒. H. Native of the South of Tauria,

on arid hills by the Black Sea, near Gursuph. C. Scammònia, Bieb. fl. cauc. 1. p. 145. Habit of *C. arvénsis*. Bracteas subulate. Corollas size of those of *C. Scammònia*, hairy, the plicæ yellow outside, and the angles purplish.

Hairy Bind-weed. Fl. July, Aug. Clt. 1824. Pl. tw.

§. 2. *Leaves cordate, lobed.*

85 C. fla'vus (Willd. spec. 1. p. 852.) smoothish; leaves cordate, repandly sublobate; peduncles much longer than the leaves: superior ones 3-flowered: lower ones bifid, many-flowered. ♃. ⌒. S. Native of the East Indies. Evólvulus hederàceus, Burm. ind. 77. t. 30. f. 2. Leaves acuminated, rather scabrous: superior ones obtuse. Lower peduncles bifid, with 3-flowered branches, and a flower in the fork, scabrous from tubercles. Corolla small, yellow.

Yellow-flowered Bind-weed. Pl. tw.

86 C. calystegioìdes (Choisy, in mem. soc. phys. gen. 6. p. 480.) quite glabrous; leaves cordate-hastate, 5-lobed; middle lobe very long: lateral ones sometimes toothed; peduncles 1-flowered, equal in length to the petioles; outer sepals largest. ♃. ⌒. G. Native of China. C. Scammònia, Lour. coch. p. 106.? Stem terete, striated. Leaves 1-2 inches long. Middle lobe lanceolate, acute. Corolla campanulate, hardly an inch long.

Calystegia-like Bind-weed. Pl. tw.

87 C. díchrous (Rœm. et Schultes, syst. 4. p. 263.) hairy; stems terete; leaves subcordate, 3-lobed, hoary beneath; peduncles many-flowered, longer than the petioles; sepals narrow, acute. ☉.?⌒. S. Native of Senegal. C. bícolor, Desr. in Lam. dict. 3. p. 564. Habit of a species of *Rùbus*. Stem beset with blackish dots, and long stiff hairs. Lobes of leaves ovate, acute. Peduncles dichotomous. Bracteas twin, subulate at the forks. Corollas small.

Two-coloured Bind-weed. Pl. tw.

88 C. angula'ris (Lin. mant. 203.) stems downy; leaves villous, cordate, 5-angled, entire; peduncles many-flowered, length of leaves; sepals pilose, acute. ☉.?⌒. S. Native of Java. Willd. spec. 1. p. 853. Burm. ind. 46. t. 19. f. 2. Leaves rather scabrous. Corolla campanulate, 3 times larger than the calyx, orange-coloured.

Angular-leaved Bind-weed. Pl. tw.

89 C. tomentòsus (Lin. spec. 222.) stems terete, white, woolly; leaves cordate, deeply 3-lobed, clothed with white tomentum; peduncles secund, many-flowered. ☉.?⌒. S. Native of Jamaica. Desr. in Lam. dict. 3. p. 564. Willd. spec. 1. p. 861.—Sloan. jam. p. 55. hist. 1. p. 154. t. 98. f. 2.—Plukn. alm. 115. t. 167. f. 4. Corolla campanulate, purplish. Conv. tomentòsus of Lour. is certainly distinct.

Tomentose Bind-weed. Pl. tw.

90 C. varia'bilis (Cham. et Schlecht. in Linnæa, 5. p. 116.) pilose; leaves deeply-cordate, acuminated, entire, or angularly toothed at the base, or hastately 3-lobed, beset with adpressed hairs, especially beneath: but the hairs on the stems and peduncles are spreading; peduncles longer than the leaves, cymose, many-flowered, 2-7; pedicels short, nearly glabrous, muricated; sepals elliptic, nearly glabrous, mucronately-acuminated: outer ones ciliated with long hairs. ♃.?⌒. G. Native of Mexico, near Hacienda de la Laguna. Corolla large, rose-coloured, nearly $1\frac{1}{2}$ inch in diameter.

Variable-leaved Bind-weed. Pl. tw.

91 C. trílobus (Thunb. prod. p. 35.) leaves cordate, villous, 3-lobed; lobes ovate, acute; peduncles 1-flowered. ♃.?⌒. G. Native of the Cape of Good Hope.

Three-lobed-leaved Bind-weed. Pl. tw.

§. 3. *Leaves quinate, pedate, palmate, or jagged.*

92 C. angustíssimus (R. Br. prod. p. 482.) rather pilose; leaves cordate, tripartite; lateral lobes bifid or trifid: the middle one the longest, narrow-linear, channelled; pedunceles 1-flowered; sepals equal, oval, mucronulate; capsule nutant, 2-valved; seeds scabrous. ♃.⌒. H. Native of Van Diemen's Land. Very nearly allied to *C. erubéscens*.

Very narrow-lobed-leaved Bind-weed. Pl. tw.

93 C. althæoìdes (Lin. spec. 222.) plant canescent, pilose; lower leaves cordate, deeply crenated: superior ones pedatifid: middle lobe long, pinnatifid; peduncles usually 1-flowered; sepals ovate, acute. ♃.⌒. H. Native of the South of Europe, North of Africa, Levant, Spain, &c. Willd. spec. 1. p. 862. Sibth. et Smith, fl. græc. t. 194. Tenor. fl. neapol. 1. p. 58. Wulf. in Jacq. coll. 1. p. 316. Desr. in Lam. dict. 3. p. 564. C. argyræ'eus, D. C. fl. fr. suppl. p. 423.—Barrel. icon. t. 312.—Tourn. inst. p. 85. Leaves shining, silvery. Peduncles longer than the leaves. Corolla pale red or lilac, large, spreading, entire.

Var. β, hùmilis; plant more dwarf, greener, almost glabrous; leaves more divided; peduncles all 1-flowered. ♃.⌒. H. Native of the South of France.

Althæa-leaved Bind-weed. Fl. June, Sept. Clt. 1597. Pl. tw.

94 C. hasta'tus (Nutt. in amer. phil. trans. n. s. 5. p. 194.) leaves hastately pedate, silky: intermediate segment sub-lanceolate, much larger than the rest; peduncles mostly 2-flowered, much longer than the leaves; sepals downy, imbricate, oval, obtuse, tinged with purple. ♃.⌒. H. Native on the high hills of the Red River, contiguous to the confluence of the Kiamesha. Stem downy. Leaves clothed with short hoary and silky down; the first ones simply hastate; the rest palmate; commonly producing on each side at base 2 lateral, reflexed-toothed, or entire lobes; the central one more than double their length, and twice their breadth. This species differs but little from *C. althæoìdes*.

Hastate-leaved Bind-weed. Pl. tw.

95 C. Ita'licus (Rœm. et Schultes, syst. 4. p. 266.) hairy; radical leaves cordate, wrinkled, repand-toothed, or lobed: cauline ones palmately cut; peduncles longer than the leaves, 2-3-flowered. ♃.⌒. H. Native of Naples and Italy, in hedges; and of the North of Africa. Conv. hirsùtus, Tenore, fl. neap. prod. p. 15. fl. neap. 1. p. 60. t. 15. syn. p. 34. C. althæoìdes, D. C. fl. fr. no. 2747. suppl. 423. Plant less silky, and much greener than *C. althæoìdes*. Flowers pale red.

Var. β; leaves less hairy; peduncles generally 1-flowered. ♃.⌒. H. Rœm. et Schultes, syst. 4. p. 266.

Var. γ; plant more erect; leaves less divided, more hairy. ♃.⌒. H. Rœm. et Schultes, l. c.

Italian Bind-weed. Fl. July, Aug. Clt. 1820. Pl. tw.

96 C. tenui'ssimus (Sibth, et Smith, fl. græc. t. 195.) leaves pedate, silky, shining: lobes linear, obtuse; radical leaves cordate, crenated; peduncles 1-flowered. ♃.⌒. H. Native of Candia, and about Athens, on the higher hills; also of Zante. C. althæoìdes, β, Lin. spec. 222. C. althæoìdes, Desr. in Lam. dict. 3. p. 565. Conv. Ægýpticus, Vesl. ægypt. 73. t. 74. Conv. elegantíssimus, Mill. dict. no. 22. C. althæoìdes, Curt. bot. mag. 359.—Munting, p. 28. f. 137.—Tourn. inst. p. 85. C. seríceus, Forsk. descr. p. 204. Flowers pale red or rose-colour. Very like *C. althæoìdes*.

Very slender Bind-weed. Fl. June, Oct. Clt. 1597. Pl. twining.

97 C. bryoniæfòlius (Sims, bot. mag. t. 943.) downy; lower leaves cordate, obtuse, crenated, or toothed; upper leaves some-

what palmately 7-lobed: middle lobe long, toothed, or lobed; peduncles long, 1-flowered, articulated; sepals ovate, acute. ♃. ⌒. G. Native of China. Plant rather hispid, green. Bracteas subulate. Corolla large, reddish purple.

Bryony-leaved Bind-weed. Fl. July, Aug. Clt. 1802. Pl. tw.

98 C. Fa'lkia (Jacq. hort. schroenbr. 2. t. 198.) root perpendicular; stems numerous, much branched; leaves petiolate, ovate-cordate, deeply jagged, rather pilose on both surfaces; peduncles hairy, very long, 1-flowered; calyx villous; sepals ovate, concave, acute: outer ones broader. ♃. ⌒. G. Native of the Cape of Good Hope. Poir. suppl. 3. p. 462. Leaves 1-2 inches long. Bracteas lanceolate, acute. Corolla campanulate, with a short white tube, and a flat, 5-lobed, pale flesh-coloured limb, rather hairy outside. Stigmas thick, cylindrical, obtuse.

Falkia Bind-weed. Pl. twining.

99 C. alceifòlius (Lam. ill. no. 2096.) hairy; leaves all deeply jagged, somewhat palmate; peduncles few-flowered, longer than the leaves. ♃.? ⌒. G. Native of the Cape of Good Hope. Flowers red?.

Alcea-leaved Bind-weed. Fl. July, Aug. Clt. 1823. Pl. twining.

100 C. Thunbe'rgii (Rœm. et Schultes, syst. 4. p. 268.) stems tomentose; cauline leaves palmately and hastately jagged, hairy; peduncles articulated, usually 1-flowered, length of leaves, or shorter; sepals lanceolate, acuminated. ♃.? ⌒. G. Native of the Cape of Good Hope. Segments of leaves acute; middle one the longest, and sinuated.

Thunberg's Bind-weed. Pl. tw.

101 C. macroca'rpus (Lin. spec. 222.) leaves palmately pedate, 5-parted; peduncles 1-flowered. ⊙. ⌒. S. Native of Martinico. Desr. in Lam. dict. 3. p. 544. Willd. spec. 1. p. 864. C. frutéscens, Mill. dict. no. 13. t. 56.—Plum. ed. Burm. amer. p. 80. t. 91. f. 1. Root thick, fleshy, turnip-formed. Lobes of leaves entire, acute; the lateral ones not so deep. Peduncles articulated in the middle, winged. Sepals concave, roundish. Corolla large, purplish, having the margin sinuated. Capsule globose, angular, size of a walnut, inclosed in the calyx. Seeds round, black, villous, size of filberts.

Large-fruited Bind-weed. Fl. July, Aug. Clt. 1752. Pl. tw.

102 C. quinquefòlius (Lin. syst. 170. spec. p. 166.) stem hispid; leaves digitate, glabrous; leaflets 5-toothed; peduncles smooth, 3-7-flowered. ⊙. ⌒. S. Native of tropical America. Desr. in Lam. dict. 3. p. 566. Willd. spec. 1. p. 865. Vahl. eclog. 2. p. 15. Plukn. alm. 116. t. 167. f. 6.—Plum. ed. Burm. t. 91. f. 2.—Plum. mss. 2. t. 55. therefore Conv. pentaphýllus, β, Lin. spec. 166. Willd. spec. 1. p. 866. Conv. palmàtus, Mill. dict. no. 8. Sepals oval-oblong. Corolla campanulate, white, 5-toothed.

Five-leaved Bind-weed. Fl. July, Aug. Clt. 1752. Pl. twining.

103 C. gla'ber (Aubl. guian. 1. p. 138. t. 53.) quite glabrous; leaves digitately quinate; leaflets petiolulate, attenuately acuminated, quite entire; peduncles branched, divaricate, many-flowered; sepals long, firm, smooth, acute. ♃. ⌒. S. Native of Cayenne. Willd. spec. 1. p. 866. Desr. in Lam. dict. 3. p. 566. Corolla white, with a long tube, and spreading limb; lobes of limb rounded. Lobes of stigma acute.

Glabrous Bind-weed. Fl.? Clt. 1806. Pl. tw.

104 C. eriospe'rmus (Desr. in Lam. dict. 3. p. 567.) glabrous; leaves digitate; leaflets generally 8, linear, very narrow; racemes small, somewhat secund in the forks of the branches, a little longer than the leaves; sepals obtuse; seeds very hairy. ♄. ⌒. S. Native of St. Domingo. Branches grey. Corolla cylindrical, purplish. Capsule ovate, smooth. Hairs on the seeds white, silky.

Woolly-seeded Bind-weed. Shrub tw.

105 C macroca'lyx (Ruiz. et Pav. fl. per. 2. p. 10. t. 118. f. a. Poir. suppl. 3. p. 471.) glabrous; leaves quinate; leaflets unequal, oblong-lanceolate, quite entire; peduncles very long, racemosely forked; sepals ovate-lanceolate. ♃. ⌒. G. Native of Peru, in groves. Bracteas of the pedicels subulate. Calyx large, purplish, spreading. Corolla white; having the tube length of the calyx, and the lobes of the limb hardly acute. Stamens exserted. Stigmas flat, ex icon.

Large-calyxed Bind-weed. Pl. tw.

106 C. Chile'nsis (Pers. ench. 1. p. 180.) downy; leaves deeply 5-parted; segments linear, unequal, diverging, acute: middle one long, rather undulated: the rest short, marked by the tooth in the middle; peduncles 1-flowered, shorter than the leaves, bearing 2 small bracteas at apex; calyx villous. ⊙.? ♃.? ⌒. F. Native of Chili. Corolla campanulate, spreading, red; tube a little longer than the calyx; segments of the limb ovate, mucronate. Lobes of stigma elongated. Seeds black. Capsule globose.

Chili Bind-weed. Pl. tw.

107 C. apocynoìdes (Cham. et Schlecht, in Linnæa, 5. p. 117.) herbaceous, clothed with villous, stellate down, intermixed with short, black, glandular hairs; the hairs on the upper surface of the leaves 3-parted; leaves ternate: leaflets oblong-ovate, acuminated, acute; peduncles longer than the leaves, 3-7-flowered; sepals ovate, long-acuminated, acute. ⊙. ⌒. G. Native of Mexico, near Hacienda de la Laguna. Corolla small, half an inch long, short, blue.

Apocynum-like Bind-weed. Pl. tw.

108 C. heptaphy'llus (Willd. act. am. nat. cur. 4. p. 196. Rœm. et Schultes, syst. 4. p. 271.) glabrous; leaves digitate; leaflets 4, linear-lanceolate: the 2 outer ones bipartite: peduncles generally 1-flowered. ⊙.? ⌒. S. Native of the East Indies.

Seven-leaved Bind-weed. Pl. tw.

§. 4. *Leaves cordate or subcordate, entire. Peduncles many-flowered.*

109 C. nummula'rius (Vahl, eclog. 1. p. 13.) villous; leaves cordate, mucronate; peduncles many-flowered, longer than the leaves; sepals ovate; bracteas lanceolate. ⊙. ⌒. S. Native of South America. Stems terete. Leaves nearly like those of *Lysimàchia némorum*. The 3 outer sepals foliaceous, broadly ovate, acuminated, villous: the 2 inner ones smaller, oblong, acuminated. Corolla campanulate, entire.

Moneywort-leaved Bind-weed. Pl. tw.

110 C. ramosíssima (Poir. suppl. 3. p. 468.) leaves cordate, quite entire; stem filiform; peduncles many-flowered, umbellately cymose; bracteas subulate. ⊙.? ⌒. S. Native of Peru, towards Pozuzo. Conv. cymòsus, Ruiz. et Pav. fl. per. 2. p. 9. t. 117. f. b. Pers. ench. 1. p. 178. Stem much branched. Hairs deciduous. Leaves on long petioles, acuminated, 2-3 inches long, shining above. Peduncles bifid, 5-17-flowered. Stamens exserted. Stigmas flat.

Much-branched Bind-weed. Pl. tw.

111 C. Canarie'nsis (Mill. dict. no. 16. Lin. spec. p. 121.) stems terete, villous; leaves cordate, downy, oblong, acute; peduncles many-flowered, longer than the petioles; calyx villous; segments acute. ♃. ⌒. G. Native of the Canary Islands. Desr. in Lam. dict. 3. p. 556. Willd. spec. 1. p. 858. Sims, bot. mag. t. 1228.—Comm. hort. 2. p. 101. t. 51.—Plukn. alm. 114. t. 325. f. 1. Leaves permanent, soft, white beneath.

Corolla middle-sized, purplish-violet, hairy outside, at length almost flat. Stigmas filiform.

Canary-Island Bind-weed. Fl. June, Sept. Clt. 1690. Shrub tw.

112 C. subglobòsus; stems villous; leaves cordate, acute, downy; peduncles short, many-flowered, capitulate; corolla subglobose, campanulate, connivent. ♃. ⌒. G. Native of Cochinc'ina, in hedges. C. Canariénsis, Lour. coch. p. 108. Flowers w ite.

Subglobose-flowered Bind-weed. Shrub tw.

113 C. viola'ceus (Vahl, symb. 3. p. 29.) stems, peduncles, and calyxes villous; leaves smoothish, or a little hairy, ovate-cordate, acuminated; peduncles elongated, bifid, many-flowered, 3-4 times longer than the leaves; the 2 outer sepals cordate: the third lanceolate: and the 2 interior ones glabrous, mucronate, much smaller than the outer ones. ⊙. ? ⌒. S. Native of the Island of Santa Cruz. Willd. spec. 1. p. 856. Leaves an inch long. Bracteas linear-lanceolate at the base of the pedicels. Corolla campanulate, violaceous, with 5 paler rays. Stigmas reflexed.

Violaceous-flowered Bind-weed. Pl. tw.

114 C. tilia'ceus (Willd. enum. 1. p. 204.) glabrous; leaves cordate, acuminated: hind lobes divaricate; peduncles axillary, racemosely corymbose, longer than the leaves; sepals oblong-lanceolate, mucronate, glabrous. ♃. ⌒. S. Native of Brazil. Leaves 2 inches long. Nearly allied to *Conv. acuminàtus*, but the leaves are never 3-lobed; and the bracteas are wanting on the proper peduncles; and the sepals are different.

Lime-tree-leaved Bind-weed. Fl. June, Aug. Clt. 1820. Pl. tw.

115 C. multiva'lvis (R. Br. prod. p. 483.) leaves ovate, acuminated, subcordate, entire, downy; corymbs pedunculate; sepals unequal, acute; capsules erect, many-valved; seeds roughish, with narrow margins. ♃. ⌒. S. Native of New Holland, within the tropic.

Var. α; leaves downy on both surfaces, hardly cordate; capsule a little longer than the calyx.—Conv. corymbòsus, Forst. prod. but not of Lin.

Var. β; leaves smoothish, subcordate; capsule shorter than the sepals, which are acuminated.

Many-valved capsuled Bind-weed. Pl. tw.

116 C. cilia'tus (Vahl, eclog. 2. p. 13.) stems downy; leaves cordate-ovate, acuminated, with subciliated, villous edges; heads of flowers pedunculate, very hairy, involucrated. ♄. ⌒. S. Native of Cayenne. C. villòsus, Pers. ench. 1. p. 177. no. 13. Poir. suppl. 3. p. 471. Habit of *C. Guianénsis*. Leaves 2 inches long, glabrous above, rather villous beneath, of a shining yellow colour. Peduncles downy, twice longer than the petioles. The 2 outer bracteas large, ovate-lanceolate under the head of flowers, the rest lanceolate, length of calyx, all very hairy from rusty pili, as well as the subulate sepals.

Ciliated-leaved Bind-weed. Fl. June, Aug. Clt. 1820. Shrub tw.

117 C. crini'tis (Desr. in Lam. dict. 3. p. 568.) leaves cordate, nearly naked; heads of flowers very hairy, on long peduncles, involucrated: capsule smooth. ♃. ⌒. S. Native country unknown.

Long-haired Bind-weed. Pl. tw.

118 C. parviflòrus (Vahl, symb. 3. p. 29. Choisy, in mem. soc. phys. gen. 6. p. 480.) downy; leaves cordate-ovate, very acute, glabrous; peduncles a little higher than the petioles, umbellately many-flowered; sepals equal, ovate, very acute. ⊙. ⌒. G. Native of India, as in Ava, Prome, Dindygul, Dumraong, &c.; also of the Islands of Java and Timor. Roxb. in Wall. fl. ind. 2. p. 51. Ipomœ'a parviflòra, Pers. ench. 1. p. 183. Ipomœ'a paniculàta, Burm. ind. p. 50. t. 21. f. 3. Conv. quinquenérvius, Ham. herb. C. asclepiádeus, Wall. mss. Ipomœ'a Timoriénsis, Blum. bijdr. p. 711.? Leaves hardly villous on the nerves beneath. Bracteas linear, villous. Corolla a little longer than the calyx, tubular, 5-lobed at apex, glabrous, blue: lobes acute, white. Capsule and seeds glabrous. Stigmas twisted, cylindrical.

Small-flowered Bind-weed. Pl. tw.

119 C. verticilla'tus (Lin. spec. 220. H. B. et Kunth, nov. gen. amer. 3. p. 98.) leaves ovate-oblong, somewhat cordate, acuminately mucronate, smoothish above, and clothed with canescent tomentum beneath; corymbs dichotomous, axillary, nearly sessile, shorter than the leaves; sepals smoothish, roundish, obtuse, nearly equal. ♃. ⌒. S. Native of tropical America; as near Caraccas. Ipomœ'a verticillàta, Lin. amœn. acad. 5. p. 394. Conv. spiràlis, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 302.—Plum. icon. t. 94. f. 2. Flowers small, white. Stigmas terete, revolute.

Verticillate Bind-weed. Pl. tw.

120 C. polya'nthes (Cham. et Schlecht, in Linnæa, 5. p. 117.) shrubby; stems terete, clothed with scattered, somewhat adpressed, short, white, stellate, 2-3-parted hairs; leaves oblong-ovate, cordate, long-acuminated, discoloured, sparingly pilose above, and clothed with short, dirty, yellow tomentum beneath; peduncles many times dichotomous, downy, cymose: every branch furnished with a lanceolate, acute bractea; flowers fascicled; sepals unequal, broad-ovate, short-acuminated: outer ones the largest, and pilosely tomentose on the back and margins. ♄. ⌒. G. Native of Mexico, near Hacienda de La Laguna. Leaves 3 inches long, and $1\frac{3}{4}$ broad. Corolla funnel-shaped, blue, 8 lines long. Perhaps the same as *C. violàceus*, Vahl.

Many-flowered Bind-weed. Shrub tw.

§. 5. *Leaves cordate or subcordate, usually repand or crenated, rarely entire. Peduncles* 1-3-*flowered.*

121 C. farinòsus (Lin. mant. 2. p. 203.) branches terete, mealy; leaves cordate, acuminated, repand, wrinkled above, and veiny beneath, very blunt and emarginate behind; peduncles longer than the leaves, 3-flowered. ♄. ⌒. G. Native of Madeira; and of Mysia and Peloponnesus, in hedges frequent. Jacq. hort. vind. 1. t. 35. Sal. par. lond. t. 45. Petioles mealy. Stipulas hardly any. Calyx terete, close. Corolla small, thrice larger than the calyx, somewhat flesh-coloured, acute, 5-cleft.

Mealy Bind-weed. Fl. May, June. Clt. 1777. Shrub tw.

122 C. Herma'nniæ (Lher. stirp. 4. p. 67. t. 33.) tomentose, white; leaves cordate-oblong, obtuse; peduncles 2-flowered, longer than the petioles; sepals ovate, acuminated, downy, nearly equal; limb of corolla acute. ♃. ⌒. G. Native of Peru, in arid places. Ruiz. et Pav. fl. per. 2. p. 10. Cav. desc. 98. Conv. crenàtus, Jacq. coll. 2. p. 277. icon. rar. t. 315. Desr. in Lam. dict. 3. p. 558. Leaves oblong-lanceolate, cordately sagittate at the base, obtuse, mucronate, crenately repand. Corolla small, white; limb crenulated; lobes acute.

Hermann's Bind-weed. Fl. Aug. Sept. Clt. 1799. Pl. twining.

123 C. Massòni (Dietr. gart. nachtr. 2. p. 377. Rœm. et Schultes, syst. 4. p. 279.) leaves oblong, subcordate, acute; stems suffruticose, smooth; peduncles 3-flowered and many-flowered. ♄. ⌒. G. Native of Madeira. C. suffruticòsus, Ait. hort. kew. ed. 2d. vol. 1. p. 330. Ker. bot. reg. 133. C. Dryándri, Spreng. syst. 1. p. 597. Corollas pink.

Masson's Bind-weed. Fl. June, Sept. Clt. 1690. Shrub twining.

124 C. suberòsus (Willd. enum. suppl. p. 10.) downy; leaves cordate, acute, entire; peduncles axillary, furnished with linear bracteas in the middle; sepals ovate, obtuse, a little reflexed,

glabrous, ciliated. ♄. G. Native country unknown. Corolla white, with 5 hairy purple plicæ outside.

Corky Bind-weed. Shrub tw.

125 C. pilòsus (Willd. act. am. nat. cur. berol. 4. p. 196.) leaves roundish-cordate, acuminated, pilose above; peduncles usually 3-flowered. ♃.? ◠. S. Native of the East Indies. Stems hairy.

Pilose Bind-weed. Pl. tw.

126 C. eròsus (Desr. in Lam. dict. 3. p. 558.) tomentose; leaves cordate-oblong, obtuse, erose; peduncles length of leaves, 2-flowered. ♃. ◠. G. Native of Monte Video. C. crenàtus, β. Lam. ill. no. 2073. Perhaps only a var. of *C. Hermánniæ.*

Erose-leaved Bind-weed. Pl. tw.

127 C. plica'tus (Desr. in Lam. dict. 3. p. 559.) tomentose; leaves cordate, acute, angularly serrated, wrinkled, plicate; peduncles usually 2-flowered. ♃. ◠. G. Native of the Cape of Good Hope. This species is intermediate between *C. crenàtus* and *C. eròsus.* Stigmas elongated.

Plicate-leaved Bind-weed. Pl. tw.

128 C. Va'hlii (Rœm. et Schultes, syst. 4. p. 280.) clothed with rather silky tomentum; leaves cordate-oblong, very blunt, crenulated; peduncles 1-flowered, length of leaves; sepals nearly equal, oblong, acutish: 2 inner ones glabrous. ♃.? ◠. S. Native of Brazil. C. crenàtus, Vahl, symb. 3. p. 31. Hind lobes of leaves straight, oblong, obtuse. Corolla one half longer than the calyx, silky, with 5 villous lines outside; lobes bearded at apex.

Vahl's Bindweed. Pl. tw.

129 C. rupe'stris (Willd. spec. 1. p. 846.) glabrous, except the undersides and edges of the leaves, which are finely pilose when examined by a lens; leaves oblong-lanceolate, acute, bluntly cordate; peduncles 1-flowered, nearly the length of the leaves; sepals ovate, acute, rather pilose. ♄. ◠. H. Native of Siberia. Bracteas setaceous, in the middle of the peduncles. Leaves 2 inches long. Corolla size of those of *Conv. tricolor*, violaceous, flat, 5-plicate; plicæ downy outside. It differs from *C. Sibíricus*, in the leaves not being acuminated, in the peduncles being 1-flowered, in the corollas being twice the size, and violaceous.

Rock Bindweed. Shrub tw.

130 C. fruticulo'sus (Desr. in Lam. dict. 3. p. 451.) glabrous; stems terete; leaves linear-lanceolate, sub-cordate at the base, on short petioles; floriferous branches very leafy; peduncles longer than the petioles, but hardly the length of the flowers. ♄. ◠. G. Native of the Canary Islands. Bracteas subulate, unequal. Calyx glabrous. Corolla small, with rather deep segments, and 5 purple stripes.

Shrubby Bindweed. Shrub tw.

§. 6. *Leaves ovate or oblong, and lanceolate or linear.*

131 C. chenopodioìdes (Desr. in Lam. dict. 3. p. 544.) villous; leaves ovate, serrately sinuated; flowers solitary, nearly sessile; sepals ovate, acute. ♃. ◠. S. Native country unknown. Leaves hardly an inch long. Bracteas small, filiform. Corolla narrow, probably tubular.

Goose-foot-like Bindweed. Pl. tw.

132 C. tene'llus (Desr. in Lam. dict. 3. p. 559.) stems filiform; leaves oblong-elliptic, obtuse, mucronate, nearly sessile, sometimes emarginate at the base; peduncles longer than the leaves. ♃.? ◠. H. Native of Carolina, Fraser. Willd. spec. 1. p. 861.—Plukn. alm. 114. t. 166. f. 4. Peduncles bearing 2 subulate bracteas at apex. Corolla small, campanulate.

Tender Bindweed. Pl. tw.

133 C. Havane'nsis (Jacq. obs. 2. p. 45. f. 3.) glabrous; leaves oblong, shining; peduncles 1-flowered, shorter than the flower. ♃.? ◠. S. Native of Cuba, about Havannah. Jacq. amer. pict. t. 264. Lam. ill. 462.—Vittm. summ. pl. 1. p. 435. Stem much branched. Leaves obtuse, quite entire. Corolla small, white; tube hardly longer than the calyx; limb erectish; segments long, acute, spreadingly reflexed. Anthers hastate.

Havannah Bindweed. Pl. tw.

134 C. Guiane'nsis (Aubl. guian. 1. p. 136. t. 52.) branches terete, purplish, villous; leaves oblong, and are, as well as the calyxes, tomentose; peduncles elongated, villous; flowers capitate; sepals acute. ♃. ◠. S. Native of Cayenne and Guiana. Vahl, symb. 3. p. 28. Desr. in Lam. dict. 3. p. 554. Corolla small, white or bluish, larger than the calyx: lobes acuminated. Stigmas reflexed.

Guiana Bindweed. Fl. June, Aug. Clt. 1820. Pl. tw.

† *Doubtful species.*

1 C. dia'nthus (Gmel. spec. 1. p. 343.) leaves truncately rounded at base; peduncles generally 2-flowered.—Native of deserts, about Cairo. C. biflòrus, Forsk. fl. ægypt. arab. p. 203. Delisl. descrip. ægypt. p. 55.

Two-flowered Bind-weed. Pl. tw.

2 C. betonicifòlius (Mill. dict. no. 20.) leaves cordate-sagittate; peduncles 1-flowered. ⊙.? ◠ H. Native of the North of Africa. Convolvulus exoticus betonicæ folio, flore magno albo, fundo purpureo, cat. hort. par. Peduncles long, slender.

Betony-leaved Bind-weed. Pl. tw.

3 C. ròseus (Mill. dict. no. 18.) leaves cordate, acuminated; peduncles 2-flowered. ⊙. ◠. S. Native of Jamaica. Conv. Americànus hirsùtus, folio acuminato, flore amplo roseo, Houst. mss. Petioles and peduncles very long. Calyx deeply parted. Corolla large, rose-coloured. Seeds large, woolly.

Rose-coloured-flowered Bind-weed. Pl. tw.

4 C. gla'ber (Mill. dict. no. 11.) leaves ovate-oblong, glabrous; peduncles 1-flowered; calyx 10-parted. ⊙. ◠. S. Native of Barbadoes. Stems slender. Flowers large, purple.

Glabrous Bind-weed. Pl. tw.

5 C. aristolochiæfòlius (Mill. dict. no. 9.) leaves hastately lanceolate: auricles rounded; peduncles many-flowered. ⊙. ◠. S. Native of Carthagena. Flowers racemose, yellow. Capsule trigonal, 3-celled; cells 3-seeded. Perhaps a species of *Pharbìtis.*

Aristolochia-leaved Bind-weed. Pl. tw.

6 C. cymòsus (Thunb. ex Rœm. et Schultes, syst. 4. p. 303.) stem creeping; leaves ovate-oblong, acute, mucronate, shining but fulvous and tomentose beneath; cymes sessile, terminal, many-flowered; sepals acute, silky. ♃. S. Native of Sierra Leone. Conv. Senegámbiæ, Spreng. syst. 1. p. 610.

Cymose-flowered Bind-weed. Pl. creeping.

7 C. sphærostígma (Cav. icon. 5. p. 54. t. 481.) leaves cordate, acuminated, rather villous; umbels pedunculate; calyx hairy; stigmas twin, divaricate.—Native of the Philippines. Corolla campanulate, small, pale red: lobes acute. Capsule 4-valved, 2-celled; cells 2-seeded. Perhaps a species of *Ipomæ'a*, or a new genus.

Round-stigmaed Bind-weed. Pl. tw.

† † *The 3 following names occur in append. to Salt's Abys. p. 475, but without any definition.*

1 C. cirrhòsus. 2 C. conge'stus. 3 C. pilòsus.

What are Conv. armàtus, Forsk. descrip. de l'egypt. t. 18. Delile, desc. egypt. p. 55, as also is Conv. Forskæ'li, natives of Egypt.

Cult. The hardy species of this genus are mostly beautiful

plants when in blossom; common garden soil and a dry situation, suit them best. They are increased by dividing at the root, or by seed. For culture of the stove species, see *Ipomœ'a*, p. 283.

XVII. ANISE'IA (from *ανισος, anisos*, unequal; in reference to the sepals or segments of the calyx being unequal in size and shape.) Choisy, in mem. soc. phys. gen. 6. p. 481.—Convólvulus, Ipomœ'a, and Calystègia species of authors.

Lin. syst. *Pentándria, Monogy'nia.* Sepals 5, disposed in 2-3 series; the 2 exterior sepals the largest, and inserted lower down, and also running down the peduncle; the 3d or intermediate sepal, and the 2 interior ones smaller, and inserted higher upon the peduncle. Corolla campanulate. Style one. Stigma capitate, 2-lobed. Ovarium 2-celled, 4-ovulate. Capsule 2-celled; cells 2-seeded.—Creeping or diffuse herbs, rarely twining.

1 A. calycìna (Choisy, l. c. p. 482.) stem pilose, twining; leaves oblong-cordate, acuminated, very acute, glabrous, petiolate; peduncles hardly the length of the petioles, 1-3-flowered; sepals with villous edges: exterior ones sagittate; corolla tubular. ♄. ◠. S. Native of the interior parts of India, as at Cawnpore, where it was collected by General Hardwicke. Conv. calycìnus, Roxb. in Wall. fl. ind. 2. p. 51. Conv. Hardwíckii, Spreng. syst. 4. p. 60. Stems terete. Leaves 1-2 inches long. Petioles pilose. Peduncles villous, furnished with small, acute bracteoles at the apex. Corolla white. Seeds villous, particularly on the angles.

Large-calyx Aniseia. Shrub twining.

2 A. Afze'lii; downy; leaves cordate-sagittate, acuminated: hind lobes obtuse; peduncles 3-4-flowered; calyx foliaceous, involucriform; bracteas lanceolate. ⊙.? ◠. S. Native of Sierra Leone, in humid places. Corolla yellow, with a brown bottom, 5-lobed, with acute segments.

Afzelius's Aniseia. Pl. twining.

3 A. me'dium (Choisy, l. c.) stems glabrous; leaves sessile, linear-lanceolate, hastately acuminated, auriculately toothed at the base; peduncles shorter than the leaves, 1-flowered; exterior sepals sagittately cordate. ⊙. ◠. S. Native of the East Indies, Java, and Madagascar. Conv. mèdium, Lin. spec. 218, exclusive of the syn. of Rheed; but not of Wall. nor Willd. Desr. in Lam. dict. 3. p. 542. Conv. Javanénsis, Garc. herb. ex Burm. fl. ind. p. 43. Stems and peduncles angular. Auricles of leaves stem-clasping. Leaves glabrous. Bracteas ovate, acuminated. Auricles of outer sepals rounded or toothed; the 2 inner sepals acute. Corolla yellow, a little longer than the calyx. What is *Conv. mèdium*, Lour.?

Intermediate Aniseia. Pl. tw.

4 A. uniflòra (Choisy, l. c. p. 483.) stem glabrous or pilose at the apex, prostrate; leaves oblong, on very short petioles, mucronate at the apex, glabrous; peduncles equal in length to the petioles, 1-flowered; outer sepals joined obliquely at the base. ♃. S. Native of the East Indies, as of Silhet, Malabar, and Goalpara; also of Java. Conv. uniflòrus, Desr. in Lam. dict. 3. p. 544. Burm. ind. 47. t. 21. f. 2. Conv. emarginàtus, Vahl, symb. 3. p. 23. Ipomœ'a uniflòra, Rœm. et Schultes, syst. 4. p. 247. Conv. Rheèdii, Wall. in fl. ind. 2. p. 70. Wight, ill. ind. bot. p. 17. t. 8. Conv. Béntiru, Ham. herb. Ben-tiru-Tali, Rheed, mal. 11. p. 111. t. 54. Stem terete, radicant. Leaves 1-2 inches long; lower ones sometimes emarginate. Peduncles nutant, beset with brown hairs, and usually furnished with 2 linear, villous bracteas at apex. Corolla white, exceeding the calyx a little, clothed with brown hairs outside. Capsule glabrous, but clothed with silky hairs inside.

One-flowered Aniseia. Pl. prostrate.

5 A. biflòra (Choisy, l. c.) stem pilose; leaves cordate-oblong; peduncles twin, shorter than the petioles; outer sepals cordate-oblong. ⊙. H. Native of China. Ipomœ'a biflòra, Pers. ench. 1. p. 183. Conv. biflòrus, Lin. spec. 168. but not of Forsk. Stems terete. Petioles pilose. Peduncles hairy, approximating nearly into one at the base. Corolla white, campanulate, small. Stigma purple.

Two-flowered Aniseia. Pl. erect or diffuse.

6 A. barlerioìdes (Choisy, l. c. p. 284.) stems elongated, downy; leaves oblong, attenuated at the apex, usually obtuse, entire at the base, or hardly cordate, on very short petioles; peduncles 1-flowered, exceeding the petioles; outer sepals oblong-lanceolate, acute; corolla long, tubularly funnel-shaped. ♃. G. Native of India, as of Gorackpur, Sukanagur, Kamaon, Mysore, &c. Conv. oblóngus, Wall. cat. no. 1382. Conv. subacaúlis, and Conv. barlerioìdes, Ham. herb. Wall. cat. no. 2256. Stems beset with grey or yellow down. Root thick, twisted. Leaves often mucronate, 1-2 inches long, clothed with adpressed hairs on both surfaces. Peduncles and petioles downy. Calyx villously downy. Corolla with an entire plicate limb, smoothish, 2-3 times longer than the calyx.

Barliria-like Aniseia. Pl. diffuse.

7 A. salicifòlia (Choisy, l. c. p. 482.) glabrous; leaves lanceolate, serrated, on short petioles; calyx angular. ♃. S. Native of St. Domingo. Conv. salicifòlius, Desr. in Lam. dict. 3. p. 542. Leaves acute at both ends, 3-4 inches long. Peduncles 1-flowered, shorter than the leaves. Bracteas small, subulate, under the tops of the peduncles. Sepals large, acute at both ends.

Willow-leaved Aniseia. Pl. diffuse.

8 A. Martinice'nsis (Choisy, l. c.) glabrous; stems terete, creeping; leaves elliptic; peduncles 1-flowered, longer than the leaves: the 3 outer sepals ovate, acute, very large, and very loose: the 2 inner ones much smaller, lanceolate, acuminated. ♃. S. Native of Martinico, in shady, inundated places. Conv. Martinicénsis, Jacq. amer. p. 26. t. 17. pict. p. 19. t. 29. Willd. spec. 1. p. 878.—Loefl. itin. p. 231. Leaves 2 inches long. Bracteas small. Corolla white.

Martinico Aniseia. Pl. creeping.

Cult. Elegant plants when in blossom. See *Calonyction*, p. 264, for the culture of the perennial, herbaceous kinds; and *Pharbìtis*, p. 263, for the annual species.

XVIII. POLYME'RIA (from *πολυς, polys*, many; and *μερις, meris*, a part; in allusion to the stigma being divided into many parts.) R. Br. prod. p. 488. Choisy, in mem. soc. phys. gen. 6. p. 484.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped, plicate. Style one; stigmas 4-6, acute. Ovarium 2-celled; cells 1-seeded. Capsule 2-4-valved, 1-celled, 1-2-seeded.—Diffuse or creeping, non-lactescent herbs, natives of Australia. Peduncles axillary, bi-bracteate. This genus differs from *Convólvulus*, in the greater number of stigmas, and the cells of the ovarium being only 1-seeded.

1 P. calycìna (R. Br. prod. p. 488.) sepals unequal: outer ones cordate at the base; seeds glabrous. ♃. G. Native of New South Wales, and New Holland, within the tropic.

Var. α; leaves oblong, obtuse, smoothish. ♃. G. Native of New South Wales, about Port Jackson.

Var. β; leaves oblong-linear, clothed with very fine down. ♃. S. Native of New Holland, within the tropic.

Large-calyxed Polymeria. Pl. creeping.?

2 P. pusílla (R. Br. l. c.) sepals equal; leaves cordate, somewhat emarginate; peduncles 1-flowered; seeds rather villous. ♃. S. Native of New Holland, within the tropic.

Var. α; leaves ovate, obtuse.

Var. β; leaves sub-hastate, linear.

Small Polymeria. Pl. creeping.

3 P. quadriva'lvis (R. Br. l. c.) sepals equal; leaves cordate, obtuse, glabrous above, but downy on the veins beneath; peduncles 1-flowered; capsule 4-valved, 2-seeded; seeds tomentose. ♃. S. Native of New Holland, within the tropic.

Four-valved-fruited Polymeria. Pl. creeping.

4 P. lana'ta (R. Br. l. c.) sepals equal; leaves cordate, obtuse, mucronulate, woolly on both surfaces, as well as the seeds; peduncles 1-flowered. ♃. S. Native of New Holland, within the tropic.

Woolly Polymeria. Pl. creeping?.

5 P. ambígua (R. Br. l. c.) sepals equal; leaves cordate-oblong, obtuse, mucronulate, smoothish above, and woolly beneath; peduncles 1-3-flowered. ♃. S. Native of New Holland, within the tropic.

Ambiguous Polymeria. Pl. creeping.

Cult. The species of *Polymèria* will grow in a mixture of sand and loam; and they are easily increased by separating the creeping, rooted shoots, or by cuttings.

XIX. CALYSTE'GIA (from καλυξ, *calyx;* and στεγω, *stego*, to cover; in reference to 2 large opposite bracteas which inclose the flower.) R. Br. prod. p. 483. Choisy, in mem. soc. phys. gen. 6. p. 485.—Convólvulus species of Lin. and other authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, inclosed within 2 foliaceous bracteas. Corolla campanulate, 5-plicate. Style one; stigma 2-lobed: lobes terete or globose. Ovarium 2-celled; cells 2-ovulate. Capsule 1-celled from the shortness of the dissepiment.—Lactescent, glabrous, twining, or prostrate herbs. Peduncles solitary, 1-flowered.

1 C. se'pium (R. Br. prod. p. 483.) leaves sagittate or cordate, very acute: hind lobes obtuse or truncate, entire; bracteas cordate, keeled, acute, longer than the calyx, but one half shorter than the corolla; peduncles tetragonal, exceeding the petioles; sepals acute. ♃. ⌒. H. Native throughout Europe, in hedges; also of Caucasus, and on the banks of the river St. Laurence; New South Wales, south coast of New Holland, and Van Diemen's Land. Very common in Britain. Conv. sèpium, Lin. spec. 1. p. 218. Willd. spec. 1. p. 844. Œd. fl. dan. t. 458. Smith, engl. bot. t. 313. Curt. fl. lond. 1. t. 13. Stev. and Church. med. bot. 1. p. 11. t. 2.—Plenck. off. t. 91. Mayerhoffer, fl. mon. t. 27. Conv. Tuguriòrum, Forst. prod. no. 74, is hardly distinct. Flowers white, sometimes tinged with red. Roots creeping much, and difficult to extirpate; and, like the roots of most perennial convolvulaceous plants, are purgative in a greater or less degree. A pill composed of one ounce and a half of the extract of this root, two drachms of aloes, and one drachm of ginger, acts with certainty and ease in doses of 10 grains, and might be substituted in most cases for the compound extract of colocynth, where economy is required. Haller affirms, that the expressed juice, if taken in the quantity of 20 or 30 grains, possesses the virtues of scammony: hence it is sometimes called German scammony, and is recommended by Dr. Mason Good, as a hydrogogue purgative in dropsies.

Var. β, incarnàta; corollas pale red; white, with a red border, or beautiful crimson, as figured in bot. mag. no. 732. ♃. ⌒. H. Native of North America, from Canada to Carolina, in hedges, and among bushes, sometimes trailing on the ground. Conv. rèpens, Michx. fl. bor. amer. 1. p. 137. Lin. spec. 1st. p. 158. ed. 2d. p. 225.—Gron. virg. p. 28.

Var. γ, marítima (Gouan. monsp. p. 27.) leaves narrower, more fleshy, nearly lanceolate.

Hedge Calystegia, or Common Bind-weed. Fl. Ju. Sept. Britain. Pl. tw.

2 C. subvolu'bilis; stems erect at bottom, smoothish, but twining at top, and rather villous; lower leaves mucronate, cordately sagittate: with the hind lobes roundish; superior leaves acuminated, hastate; peduncles erect, longer than the leaves; bracteas broad-cordate, acute, rather hairy, one half longer than the calyx; sepals ovate, acute. ♃. ⌒. H. Native of Dahuria, in stony, mountainous places. Conv. subvolùbilis, Bunge, in Led. fl. ross. alt. ill. t. 205. fl. alt. 1. p. 222. Root creeping. Corolla pale red, larger than that of *C. sèpium.*

Somewhat-twining Calystegia. Pl. twining.

3 C. pellìta; twining, villous; leaves ovate-oblong, mucronate, somewhat cordate at the base; peduncles about equal in length to the leaves; bracteas cordate, acute, villous, one half longer than the calyx; sepals elliptic, acuminated, ciliated, villous. ♃. ⌒. H. Native of Siberia, near Irkutsk. Conv. pellìtus, Led. fl. ross. alt. ill. t. 206. fl. alt. 1. p. 223. Hind lobes of leaves drawn out, rounded, and mucronate.

Clothed Calystegia. Pl. twining.

4 C. sylve'stris (Rœm. et Schultes, syst. 4. p. 183.) leaves cordate-sagittate: hind lobes angularly truncate, approximate; peduncles nearly terete; bracteas ovate, obtuse or emarginate, concave, swollen, keeled, longer than the calyx; sepals obtuse. ♃. ⌒. H. Native of Hungary, about Mehadia, near the hot baths of Hercules. Conv. sylváticus, Willd. enum. 1. p. 202. Waldst. et Kit. pl. rar. hung. 3. p. 290. t. 261. Schultes, œst. fl. 2. ed. 1. p. 381. Very nearly allied to *C. sèpium.* Corollas large, white.

Wild Calystegia. Fl. June, Sept. Clt. 1815. Pl. tw.

5 C. Luca'na; leaves sagittate: hind lobes entire; peduncles tetragonal, longer than the leaves; bracteas ovate-oblong, acuminated, clasping the calyx; corolla with a long cylindrical tube. ♃. ◡. H. Native of Lucania, in woods. Convólvulus Lucànus, Tenore, fl. neap. prod. append. 5. 1826. Tube of corolla 2-3 inches long; limb white, red below. This species differs from *C. sèpium* in the tube of the corolla being cylindrical, and twice as long, in the bracteas being concave, and clasping the calyx, not flat.

Lucania Calystegia. Pl. tw.

6 C. Dahu'rica (Sims, bot. mag. 2609, under *Convólvulus.*) stems tomentose; leaves glabrous, oblong-cordate, having the margins and nerves on the under side tomentose; peduncles tetragonal, tomentose; bracteas broad-ovate, acute, longer than the calyx; sepals lanceolate, acute, the 2 outer ones broadest. ♃. ⌒. H. Native of Dahuria. Corolla of a rosy purple colour. Roots creeping.

Dahurian Calystegia. Fl. July, Aug. Clt. 1826. Pl. tw.

7 C. Catesbya'na (Pursh, fl. amer. sept. 2. p. 729.) tomentose; leaves oblong-sagittate, acuminated; peduncles 1-flowered, shorter than the leaves; bracteas oval, obtuse, longer than the calyx. ♃. ⌒. H. Native of Carolina. Conv. Catesbæ'i, Spreng. syst. 1. p. 603. Flowers large, purple.

Catesby's Calystegia. Pl. tw.

8 C. paradóxa (Pursh, fl. amer. sept. 2. p. 729.) trailing, tomentose; leaves oblong, cordately sagittate, acute; peduncles elongated, 1-flowered, longer than the leaves; bracteas linear, remote from the flower; calyxes naked, glabrous, acuminated. ♃. H. Native of Virginia or Carolina. Conv. paradóxus, Spreng. syst. 1. p. 608. Flowers large, white.

Paradoxical Calystegia. Pl. trailing.

9 C. soldane'lla (R. Br. prod. p. 483, in a note.) trailing, glabrous; leaves rather fleshy, reniform, entire, or a little angular; peduncles angular: angles winged; bracteas large, ovate, blunt, mucronate, generally shorter than the calyx. ♃. H. Native of many parts of Europe, along the sea coast; and along the Euxine sea, in Tauria. Found in several places along the coast of Britain. Conv. soldanélla, Lin. spec. p. 226. Smith, engl. bot. t. 314. Regnault, bot. t. 402. Plenck, off. t. 93. C. marítimus, Lam. fl. fr. 2. p. 265.—Lob. icon. t. 602. f. 2. Flowers large, pale red, with 5 longitudinal, yellowish plicæ. Seeds angular.

FIG. 30.

The sea bindweed abounds on sea-coasts, where the inhabitants gather the tender stalks, and pickle them. It is considered rather of a cathartic quality.

Soldanel a-leaved Calystegia. Fl. June, July. Britain. Pl. trailing.

10 C. margina'ta (R. Br. prod. p. 483.) trailing, glabrous; leaves sagittate, veiny, acute: hind lobes acutish, and a little toothed; bracteas obtuse, one half longer than the corolla; peduncles angular, shorter than the petioles: angles marginate, undulated. ♃. G. Native of New South Wales, about Port Jackson.

Marginate-peduncled Calystegia. Pl. trailing.

11 C. renifórmis (R. Br. l. c.) prostrate, glabrous; leaves reniform, sub-repand, thickish; peduncles nearly terete; bracteas cordate, length of calyx. ♃. F. Native of New South Wales, about Port Jackson; and of Chili, about Conception. Hook. et Arn. Beech. voy. pt. bot. p. 35. Sweet, fl. gard. 2. t. 181. Conv. renifŏrmis, Spreng. syst. 1. p. 609. Very nearly allied to *C. soldanélla*, but differs in the peduncles being nearly terete, &c. Corolla pale red.

Reniform-leaved Calystegia. Fl. June, Aug. Clt. 1822. Pl. prostrate.

12 C. hedera'cea (Wall, fl. ind. 2. p. 94.) glabrous; stems angular; radical leaves ovate-sagittate, of the stem deeply 3-lobed; peduncles 1-flowered, angular; corolla hardly an inch long. ⊙. ⌒. G. Native of Nipaul, Penang. Conv. Wallichiànus, Spreng. syst. 4. p. 61. Corolla pale purple.

Ivy-like Calystegia. Pl. tw.

13 C. grandiflòra; glabrous; leaves cordate, acuminated, mucronate; auricles rounded, entire on the angles; peduncles 1-flowered, angular, nearly as long as the leaves; bracteas cordate, acuminated, twice as long as the calyx. ♃. ⌒. S. Native of Guayaquil. Convol. grandiflòrus, Ruiz. et Pav. in herb. Lamb. Corolla large, purple.

Great-flowered Calystegia. Pl. twining.

14 C. tomentòsa (Pursh, fl. amer. sept. 1. p. 143.) erect, tomentose; leaves oblong-lanceolate, acuminated, cordate: hind lobes obtuse; peduncles 1-flowered, elongated; bracteas ovate, acute; sepals lanceolate; stem floriferous below. ♃. H. Native from Canada to Virginia, on dry rocky hills. Conv. stáns, Michx. fl. amer. bor. 1. p. 136. Flowers large, white.

Tomentose Calystegia. Fl. June, July. Clt. 1818. Pl. 1 foot.

15 C. spithamæ'a (R. Br. prod. 483, in a note. Pursh, fl. amer. sept. 1. p. 143.) erect, downy; leaves subcordate-oval, obtuse; peduncles 1-flowered, shorter than the leaves; bracteas ovate, acute; stem floriferous above. ♃. H. Native from Pennsylvania to Carolina, on dry hills. Hook. exot. fl. t. 97. Conv. spithamæ'us, Lin. spec. 225. Willd. spec. 1. p. 873. Flowers white, middle-sized.

Span Calystegia. Fl. July, Aug. Clt. 1796. Pl. ½ to 1 foot.

Cult. The species are elegant when in blossom, and are of the most easy culture. They will grow in any common garden soil, and are easily increased by pieces of the roots, or by seeds. The *C. soldanélla*, a native of the sea-shore, thrives best if watered with salted water now and then.

XX. SHUTERE'IA (named after Dr. Shuter, who collected many plants in the neighbourhood of Madras.) Choisy, in mem. soc. phys. gen. 6. p. 486.—Convólvulus, Ipomœ'a, and Calystègia, species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx of 5 unequal sepals. Corolla campanulate. Style one; stigma 2-lobed: lobes ovate, flattened. Capsule 1-celled, 4-seeded. — Herb twining.

1 S. bícolor (Choisy, l. c. p. 486.) stem villous; leaves ovate-cordate, entire, or usually sinuately angular; peduncles usually 1-flowered, bracteate, exceeding the leaves; outer sepals large, involucrating the flower. ⊙. ⌒. S. Native of the East Indies, as of Coromandel, Pegu, Ava, Nopalry, Courtall, Rangoon, Straits of Sunda, &c. Conv. bícolor, Roxb. hort. beng. p. 14. Vahl. symb. 3. p. 25. Sims, bot. mag. 2205. Wall. fl. ind. 2. p. 57. Ipomœ'a bícolor, Sweet, hort. brit. p. 287. Calystègia Keriàna, Sweet, hort. brit. p. 287. Conv. sublobàtus, Lin. suppl. p. 135, ex Wall. Conv. involucràtus, Ker, bot. reg. 318, but not of Beauv. Conv. bracteàtus, and C. bícolor, Herb. madr. Conv. Malabar, and C. geméllus, Russ. herb. Leaves 1-3 inches long, glabrous, villous or hairy. Peduncles villous: Bracteas attenuated at both ends, downy, close to the flower. Outer sepals villous; inner ones linear lanceolate, glabrous, all remaining round the fruit at length. Corolla villous outside, yellow; bottom of the bell deep purple. Capsule hairy, 4-seeded, rarely 2-3-seeded by abortion.

Var. β, bracteàta; peduncles shorter; leaves nearly entire, and hastately 3-lobed. ⊙. ⌒. S. Conv. bracteàtus, Vahl, symb. 3. p. 25. Ipomœ'a bracteàta, Rœm. et Schultes, syst. 4. p. 227.

Two-coloured-flowered Shutereia. Fl. Ju. Aug. Clt. 1818. Pl. tw.

Cult. This is a beautiful plant when in blossom. The seeds of it should be raised on a hot bed in spring; and the plants, when of sufficient size, should be planted into separate pots, and trained to sticks, and then placed in a stove or greenhouse, where they will blossom, and ripen their seed. A few plants may be tried out in the open border, in a warm, sheltered situation.

XXI. SKINNE'RIA (named in honour of Capt. Thomas Skinner, of the East India Company's Service, who lately visited the fountains of the rivers Jumna and Ganges, and Himalaya.) Choisy, in mem. soc. phys. gen. 6. p. 487.—Convólvulus species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx of 5 sepals. Corolla small, and as if it were urceolate. Style one; stigma capitate, 2-lobed. Ovarium 1-celled, 4-ovulate. Capsule 1-celled.—Tufted herbs.

1 S. cæspitòsa (Choisy, l. c.) stems herbaceous, diffuse; leaves linear-lanceolate, entire, on short petioles; peduncles sometimes simple, sometimes loosely brachiate, many-flowered; sepals ovate, obtuse; corolla veiny, pale yellow. ♂ S. Native of the East Indies, as of Gualpara, Dinagapore, Rungpore, Tavoy, &c. Conv. cæspitòsus, Roxb. in Wall. *fl. ind. 2. p. 70.*

Conv. praténsis, Ham. herb. ex Wall. cat. no. 1357. Conv. Benthàmii, Wall. cat. no. 1393. Stems glabrous or villous. Branches usually beset with rufous hairs. Leaves glabrous, 2-3 inches long. Petioles generally hairy. Sepals glabrous. Corolla glabrous, yellowish, hardly plicate at apex. Capsule and seeds glabrous, rarely 2-3-seeded by abortion.

Tufted Skinneria. Pl. diffuse.

Cult. For culture and propagation see *Pharbìtis*, p. 263.

XXII. PORA'NA (probably from *πορευω, porewo*, to extend from the rambling branches.) Burm. fl. ind. p. 51. t. 21. f. 1. Schreb. gen. no. 286.—Lam. ill. t. 186. Juss. gen. p. 420. ed. Usteri, p. 400. Dinètus, Sweet, fl. gard. t. 127.

Lin. syst. *Pentándria, Monogýnia.* Calyx middle-sized, of 5 sepals, increasing wonderfully and unequally after florescence, Corolla campanulate, or tubularly funnel-shaped. Style one, entire or semi-bifid; stigmas capitate. Ovarium 1-celled, 2-4-seeded. Capsule 1-celled, usually 1-seeded.—Climbing herbs, nearly all natives of India.

1 P. volu'bilis (Lin. syst. p. 200. Burm. ind. l. c.) suffruticose, twining; leaves cordate, acuminated, glabrous; panicles dense-flowered; sepals ovate, obtuse, glabrous, equal; corolla 5-cleft, exceeding the calyx a little. ♄. ⌒. S. Native of Bengal, Sirmore, and the Straits of Sunda. Lam. ill. t. 186. Wall. fl. ind. 2. p. 40. Stems terete, glabrous, smooth or covered with white warts. Lobes of corolla obtuse, yellow, veined. Stigmas slender, glabrous. Flowers numerous, small, white, scentless.

Twining Porana. Fl.? Clt. 1823. Shrub tw.

2 P. acumina'ta (Beauv. fl. d'ow. 1. p. 65. t. 49.) suffruticose, twining; leaves ovate, acuminated, glabrous; panicles dense-flowered; sepals ovate, obtuse, villous; corolla 5-parted, 2-3 times higher than the calyx. ♄. ⌒. S. Native of Guinea, in the kingdom of Waree. Stem glabrous, smooth. Leaves 1½ inch long, and 1 broad. Panicles elongated, naked, branched. Bracteas pressed to the calyx, small, acute, villous. Flowers small, white; lobes of corolla ovate, acute, veiny, ciliated, and villous inside. Stigmas slender, globose.

Acuminated-leaved Porana. Shrub twining.

3 P. racemòsa (Roxb. fl. ind. 2. p. 41. Coll. append. 3. p. 48. mem. act. tur. 33. p. 160.) plant herbaceous, twining; leaves cordate, acuminated, glabrous or downy; panicles loose-flowered; sepals lanceolate, villous, acute, after inflorescence becoming ovate, scarious, glabrous; corolla exceeding the calyx much. ⊙. ⌒. H. Native of Nipaul, Kamaon, and Silhet. P. dichótoma, Ham. mss. ex D. Don, prod. fl. nep. p. 99. P. cordifòlia, Ledeb. ind. sem. hort. dorp. suppl. 1824. p. 6. Dinètus racemòsus, Sweet, brit. fl. gard. t. 127. Stems terete or angular, glabrous, smooth or strigose. Leaves 3-4 inches long, with a wide recess at the base. Panicles composed of racemes, leafy. Flowers small, white. Corolla funnel-shaped, glabrous; segments of the limb ovate, acute.

FIG. 31.

Racemose-flowered Porana. Fl. July, Nov. Clt. 1823. Pl. twining.

4 P. panicula'ta (Roxb. cor. t. 235. fl. ind. 2. p. 39.) suffruticose, twining, clothed with hoary tomentum; leaves cordate, acuminated, glabrous above, and hoary beneath; panicles large, much branched; sepals linear-subulate, unequal after florescence, 3 of which are acute and scarious; corolla 3 times higher than the calyx. ♄. ⌒. S. Native of India, as of Bengal, ruins of Gowr, Ramajahl hills, Saharampore, Hurdwar, Silhet, Kamaon, banks of the Irrawaddi, &c. P. tomentòsa, Lesch. mss. Dinètus paniculàtus, Sweet, hort. brit. p. 289. P. cordàta, Gaur. Stems terete. Leaves 3 inches long, and 1½ broad. Panicles leafy. Bracteas at the base of the pedicels. Flowers very small, pure white. Corolla tubularly campanulate. Stigma capitate, 2-lobed. Capsule glabrous, compressed, containing only 1 seed, which fills the capsule.

Panicled-flowered Porana. Fl.? Clt. 1823. Shrub twining.

5 P. grandiflòra (Wall. in Roxb. fl. ind. 2. p. 43.) plant herbaceous, twining; leaves cordate, acuminated, aristate, scabrous above, and usually glabrous beneath; panicles loose-flowered; sepals linear-lanceolate, acute, increasing much after florescence; corolla more than an inch long. ⊙. ⌒. H. Native of the East Indies, as of Katumanda, Shivapoor mountains, Hutowdal, Nepaul, Chandigherry, &c. Stem angular, branched, glabrous, or hairy. Leaves 2-6 inches long, and 1-3 broad. Panicles racemose, axillary, hardly branched. Bracteas small, filiform. Sepals smoothish or ciliated. Corollas funnel-shaped, rose-coloured; limb 5-plicate, entire, glabrous. Capsule membranous, containing one ovate-spherical, glabrous seed.

Great-flowered Porana. Pl. twining.

Cult. The shrubby species of *Porana* are well adapted for training on rafters or pillars, in a stove, or warm part of a greenhouse; a mixture of loam, peat, and sand, is the best soil for them; and cuttings will strike root readily in the same kind of soil, under a hand-glass. The annual species are hardy, and grow fast when planted in a sheltered situation, and soon make a good covering for a temporary arbour; or they may be trained on branches of trees; their flowers are produced in great profusion in autumn.

XXIII. DUPERREY'A (named in compliment to Louis Isidore Duperrey, an officer in the French navy, who collected many specimens of plants for Gaudichaud, during his hydrographic voyages.) Gaud. in Freyc. voy. pt. bot. p. 452. t. 63.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, propped by 2 smaller bracteas, increasing much after florescence, membranous, reticulately-nerved, and spreading. Corolla somewhat funnel-shaped, plicately 5-lobed. Stamens inclosed. Ovarium 1-celled? Style exserted; stigma large, thick, trigonally cordiform. Capsule elliptic, indehiscent, membranous, 1-seeded. Seed fixed to the bottom of the cell, sessile, elliptic. Albumen mucilaginous.—A small shrub, with narrow, alternate leaves; axillary, solitary, pedicellate, bluish flowers, the whole forming a leafy raceme.

1 D. seríca (Gaud. l. c.) ♄. G. Native of New Holland, on the west coast, in Shark's Bay.

Silky Duperreya. Shrub small.

Cult. For culture and propagation, see *Bonàmia*, p. 300.

XXIV. NEUROPE'LTIS (*νευρον, neuron*, a nerve; and *πελτη, pelte*, a buckler; in reference to the nerved bractea, which props the fruit.) Wall. fl. ind. 2. p. 43. Choisy, in mem. soc. phys. gen. 6. p. 491.

Lin. syst. *Pentándria, Digýnia.* Calyx of 5 permanent sepals. Corolla funnel-shaped, 5-parted, flat. Styles 2; stigmas fleshy, reniform. Capsule 1-seeded, large, dilated, membranous, propped by a floral leaf.—Weak, erect, spreading shrubs.

1 N. racemòsa (Wall. fl. ind. 2. p. 43.) woody; stem glaucous, cinereous, dotted with white; leaves ovate, entire, approxi-

mate, acute at both ends, petiolate, coriaceous; racemes axillary, erect; bractea roundish, surrounding the capsule. ♄. S. Native of Penang, where it was collected by W. Jack. Young branches downy Leaves numerous, 3-4 inches long, downy beneath. Racemes 4 or more from the same axil, 1-3 inches long.

Racemose-flowered Neuropeltis. Shrub.

2 N. ova'ta (Wall. cat. no. 1323. Choisy, l. c. p. 492.) woody; stem white, rugose, beset with white dots; leaves oblong-lanceolate, with revolute edges, but not coriaceous; bractea ovate, surrounding the capsule, which is about the size of the fruit of *Tìlia*. ♄. S. Native of the Burmann Empire, at Amherst. Leaves 3-4 inches long, glabrous on both surfaces. Racemes shorter than the leaves. This species is very nearly allied to the first; but differs, in the leaves being oblong-lanceolate, not ovate, coriaceous; in the bractea surrounding the fruit being ovate, not roundish, and in the capsule being larger.

Ovate-bractead Neuropeltis. Shrub.

Cult. For culture and propagation see *Bonàmia*, p. 299.

XXV. PREVO'STEA (named after M. Prevost, of Geneva.) Choisy, in mem. soc. phys. gen. 6. p. 492.—Calycábolos, Willd. —Dufoùrea, H. B. et Kunth, nov. gen. amer. 3. p. 113.—Dethardíngia, Nees, et Mart. in nov. act. bonn. 11. p. 79.—Reinwárdtia, Spreng. syst. 1. p. 598.

Lin. syst. *Pentándria, Digýnia.* Calyx of 5 sepals, the 2 outer ones large, and involving the flower. Corolla funnel-shaped, with a plicate limb. Ovarium 2-celled; cells 2-seeded. Styles 2, or style one, deeply bipartite; stigmas capitate. Capsule 2-celled; cells 1-2-seeded.—Twining shrubs, natives of South America. Leaves entire. Peduncles many-flowered, axillary and terminal, panicled. Corollas white.

1 P. gla'bra; leaves glabrous; peduncles axillary, many-flowered; outer sepals green. ♄. ◠. S. Native of the Missions of the Orinoco, on the banks of the Cassiquares, near San Francisco Solano. Dufoùrea glàbra, H. B. et Kunth, nov. gen. 3. p. 114. Reinwárdtia glàbra, Spreng. syst. 1. p. 863. Shrub much branched; branches terete. Leaves obovate, obtuse, mucronate, cordate at the base, $2\frac{1}{2}$ inches long, full of pellucid dots. Corollas white.

Glabrous Prevostea. Shrub twining.

2 P. serícea; leaves silky beneath; panicles terminal; outer sepals coloured. ♄. ◠. S. Native of New Granada, near the town of Mariquita, at the altitude of 400 hexapods. Dufoùrea serícea, H. B. et Kunth, nov. gen. 3. p. 114. t. 214. Reinwárdtia serícea, Spreng. l. c. Young branches clothed with silky down. Leaves ovate-elliptic, obtuse, mucronate, cordate at the base, glabrous above, but clothed with yellowish, silky down beneath, 3-4 inches long, and 2 broad, dotted. Corollas white.

Silky Prevostea. Shrub tw.

3 P. hetera'ntha; villous; leaves cordate-ovate, acute, rather angular; peduncles 3-flowered, about equal in length to the leaves; sepals unequal, 3 outer ones larger, green. ♃. ◠. S. Native of Brazil. Dufoùrea heteránthа, Mart. in nov. act. bonn. 11. p. 79. Convólvulus Mártii, Spreng. syst. 1. p. 598. Corolla blue. Style undivided. Perhaps Ipomœ'a Weinmánni, Rœm. et Schultes, is a species of *Prevóstea*.

Variable-flowered Prevostea. Shrub twining.

Cult. For culture and propagation see *Poràna*, p. 298.

XXVI. BREWE'RIA (named in memory of Samuel Brewer, who is much praised by Dillenius, in his Historia Muscorum.) R. Br. prod. 487. Choisy, in mem. soc. phys. gen. 6. p. 487.

Lin. syst. *Pentándria, Digynia.* Calyx of 5 equal sepals. Corolla funnel-shaped, or campanulate, plicate. Style one, bifid; stigmas 2, capitate. Capsule 2-celled, valvate; girded by the calyx, which is scarcely changed; cells 2-seeded.—Diffuse, non-lactescent herbs. Leaves entire. Flowers axillary, nearly solitary. This genus is intermediate between *Ipomœ'a* and *Evólvulus*. It differs from *Poràna* chiefly in the calyx not being changed in the fruit-bearing state, and in habit. It differs also from *Bonàmia*, by the same reason.

§ 1. *Leaves cordate at the base.*

1 B. Roxbu'rghii (Choisy, in mem. soc. phys. gen. 6. p. 493.) stem branched; branches rusty; leaves ovate-cordate, sub-acuminated, rusty; peduncles hardly equal in length to the petioles, 3-many-flowered; sepals ovate, acuminated or ovate-roundish, nearly equal. ♄. S. Native of the East Indies, as of Silhet, Penang, Amherst, Tavoy, Travancore, Courtall, Shreenugur, &c. Convólvulus semidígynus, Roxb. in Wall. fl. ind. 2. p. 47. Conv. ferrugíneus, Herb. madr. Leaves 2-3 inches long, and $1\frac{1}{2}$ broad. Peduncles and petioles downy. Outer sepals villous. Corollas villous, rufescent. Capsule glabrous, crowned by a tuft of hairs. Seeds black, angular, glabrous.

Roxburgh's Breweria. Shrub diffuse.

2 B. corda'ta (Blum. bijdr. p. 722.) plant tomentose; leaves cordate, acuminated, villous; peduncles umbellately 3-5-flowered at the apex; sepals acuminated, the 2 outer ones the largest. ♃. S. Native of Java, about Buitenzorg. Nearly allied to *B. pannòsa*. Styles unequal.

Cordate-leaved Breweria. Pl. diffuse?

3 B. pannòsa (R. Br. prod. p. 488.) tomentose; leaves ovate, sub-cordate, pannosely tomentose; sepals unequal: outer ones ovate, somewhat acuminated; styles unequal, combined at bottom. ♃. S. Native of New Holland, within the tropic.

Cloth-leaved Breweria. Pl. diffuse.

4 B. me'dia (R. Br. l. c.) plant rather villous; leaves lanceolate, obtuse at the base, and somewhat cordate; styles unequal, combined at the base. ♃. S. Native of New Holland, within the tropic.

Intermediate Breweria. Pl. diffuse.

5 B. Madagascarie'nsis (Choisy, in mem. soc. phys. gen. 6. p. 493.) Native of Madagascar. Nothing more is known of this species to us, but the name.

Madagascar Breweria. Pl. diffuse.

§ 2. *Leaves ovate or linear, entire.*

6 B. e'legans (Choisy, l. c. p. 494.) stem branched, elongated; older leaves ovate-elliptic, obtuse, emarginate: younger ones narrower, almost linear; peduncles 1-3-flowered, straight, generally exceeding the younger leaves; sepals cuneate-lanceolate, very acute; corolla showy, campanulately funnel-shaped, ♃. S. Native of the Burman Empire, at Prome. Conv. élegans, Wall. cat. no. 1392. Stems smoothish or downy. Leaves near 2 inches long, and hardly an inch broad, smoothish and green above, but clothed with rusty down, particularly on the veins beneath. Peduncles, pedicels, and bracteas downy. Corolla $1\frac{1}{2}$ inch long, downy on the tube outside.

Elegant Breweria. Pl. diffuse.

7 B. linea'ris (R. Br. prod. 488.) plant villous; leaves lanceolate-linear, complicate; styles equal, combined at the base. ♃. S. Native of New Holland, within the tropic.

Linear-leaved Breweria. Pl. diffuse.

8 B. linifòlia (Spreng. syst. 1. p. 614.) leaves scattered, linear, smoothish; stem scabrous, simple; peduncles corymbose. ♃. S. Native of Monte Video, Sello.

Flax-leaved Breweria. Pl. erect.

9 B. evolvuloìdes (Choisy, l. c.) stem suffruticose, branched; leaves ovate-lanceolate, sessile, small, glabrous; flowers solitary, axillary, on short peduncles; corolla small. ♄. S. Native of India? Root woody, yellow. Stems quite glabrous. Leaves

3 lines long, and hardly a line broad. Corolla funnel-shaped, twice longer than the calyx. Capsule glabrous; cells 1-seeded by abortion.

Evolvulus-like Breweria. Shrub 1½ foot.

10 B. Burche'llii (Choisy, l. c. p. 493.) Native of the Cape of Good Hope. Nothing is known to us of this plant, but the name.

Burchell's Breweria. Pl.

11 B. specta'bilis (Choisy, l. c.) Native of Madagascar. Nothing is known to us of this plant but the name.

Showy Breweria. Pl.

Cult. For culture and propagation see *Bonàmia*, below.

XXVII. BONA'MIA (in honour of M. Bonami, author of a Flora of the environs of Nantes in 1782.) Pet. Th. veg. d'afr. 1. p. 17. t. 5. Rœm. et Schultes, syst. 4. p. xli. Choisy, in mem. soc. phys. gen. 6. p. 495.

Lin. syst. *Pentándria, Monogýnia.* Calyx of 5 equal concave sepals. Corolla tubularly campanulate, 5-lobed. Stamens and style exserted. Style bifid; stigmas capitate. Capsule 2-celled; cells 2-seeded. Seeds arillate. A shrub, native of Madagascar.

1 B. Madagascarie'nsis (Pet. Th. veg. d'afr. fasc. 1. p. 17. t. 5. nov. gen. mad. no. 28. t. 5. Rœm. coll. p. 202.) leaves sinuated, ovate, acuminated, undulated, at length glabrous; corymbs panicled, terminal, dense; calyx villous. ♄. S. Native of Madagascar, at Foul-point. Shrub weak, elegant. Branches terete, pilose while young. Corollas white; segments of the limb ovate, acute. Arillus of seed pulpy, pale red.

Madagascar Bonamia. Shrub 5-6 feet.

Cult. This elegant shrub is worth cultivating in every collection of stove plants. A mixture of loam, peat, and sand, will answer it well, or any light rich soil; and cuttings will strike root readily under a hand-glass, in heat.

XXVIII. CRE'SSA (from Cressus, appertaining to the Isle of Crete, now Candia.) Lin. gen. no. 313. Juss. gen. p. 134. ed. Usteri, p. 150. Lam. ill. 183. f. 1. R. Br. prod. p. 490. Choisy, in mem. soc. phys. gen. 6. p. 495.—Anthýllis, Alp. cent. 157. t. 156. Magn. char. 212.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-parted, or of 5 sepals. Corolla funnel-shaped, 5-cleft. Stamens exserted. Styles 2; stigmas capitate. Ovarium 2-celled; cells 2-seeded. Capsule 2-celled, 1-4-seeded.—Dwarf, downy, branched herbs. Leaves scattered, crowded, quite entire. Flowers sub-spicate, solitary in the axils of the superior leaves, bi-bracteate.

1 C. I'ndica (Retz. obs. 4. p. 24. Wall. cat. no. 2260.) diffuse; leaves ovate, sessile, acute, crowded, obtuse at the base, clothed with cinereous or hoary down; flowers in the axils of the superior leaves, nearly sessile, forming a spike or head; tops of corolla bearded. ♃. H. Native of the East Indies. Said to be hardly distinct from *C. Crética*, of which, perhaps, it is only a variety.

Indian Cressa. Pl. diffuse.

2 C. Cre'tica (Lin. spec. 325.) stem usually diffuse; leaves ovate, sessile, obtuse at the base, hairy, white; calyxes rather silky; flowers in the axils of the upper leaves, forming a head; corolla more or less bearded outside. ⊙. H. Native of the provinces of France, Italy, Candia. Willd. spec. 1. p. 1320. D. C. fl. fr. no. 2753. Sibth. et Smith, fl. græc. t. 256. C. humifùsa, Lam. dict. fl. fr. 2. p. 268. Lin. amœn. acad. 1. p. 135. Anthýllis, Alp. cent. 157. t. 156.—Plukn. alm. 236. t. 43. f. 6. Branches hairy. Calycine segments ovate. Corolla white: segments obtuse, rufescent at top, inside. Capsule 1-seeded.

Cretan Cressa. Fl. July, Sept. Clt. 1822. Pl. ½ foot.

3 C. austra'lis (R. Br. prod. p. 490.) leaves lanceolate-elliptic, nearly sessile; stem erect. ⊙. H. Native of New Holland, within the tropic. Corolla more or less bearded outside. Capsule 1-seeded

Southern Cressa. Pl. ½ foot.

4 C. Truxille'nsis (H. B. et Kunth, nov. gen. 3. p. 93.) branches clothed with silky, hoary down; stems elongated, procumbent; leaves sessile, oblong, bluntish; flowers in the axils of the upper leaves. ♃. S. Native of Peru, near Truxillo, among the sea sand. Calyx clothed with silky down; sepals obovate, elliptic, obtuse, equal. Corolla white, hardly equal in height to the tube of the calyx; segments ovate, acute. Capsule 4-seeded.

Truxillo Cressa. Pl. procumbent.

† *Doubtful species.*

5 C. Ara'bica (Forsk. ægypt. 54. no. 81.) stem shrubby, diffuse, glabrous; leaves ovate-oblong, sessile, villous; peduncles axillary, length of leaves.—Native of Egypt, in the Taas mountains. Lam. dict. 2. p. 181. Leaves obtuse, mucronate, ½ an inch long. Sepals ovate-lanceolate, 3 times shorter than the corolla. Corolla campanulate; limb 5-toothed. Styles 2, diverging; stigmas capitate.

Arabian Cressa. Shrub ½ foot.

6 C. multiflòra (Willd. rel. ex Rœm. et Schultes, syst. 6. p. 207.) corollas bearded; capsule 4-seeded; leaves oblong, hoary on both surfaces; flowers subspicate.—Native of South America, Humb. et Bonpl.

Many-flowered Cressa. Pl.

7 C. serícea (Willd. l. c.) leaves lanceolate, acute, hoary, silky beneath; peduncles 1-flowered, axillary.—Native of South America. Humb. et Bonpl.

Silky Cressa. Pl.

8 C. arena'ria (Willd. l. c.) stem much branched, panicled; leaves ovate-elliptic, hairy.—Native of South America. Humb. et Bonpl.

Sand Cressa. Pl.

Cult. For culture and propagation see *Evólvulus*, p. 302.

XXIX. EVO'LVULUS (from *evolvo*, to turn, in the same sense as *Convólvulus*, which this genus resembles in habit.) Lin. gen. no. 385. Juss. gen. p. 134. edit. Usteri, p. 149. R. Br. prod. p. 489. Choisy, in mem. soc. phys. gen. p. 496.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-parted, or of 5 sepals. Corolla sub-rotate, campanulate or funnel-shaped, plicate. Styles 2, bifid; stigmas simple. Ovarium 2-celled; cells 2-seeded. Capsule 2-celled, valvate.—Non-lactescent, prostrate or creeping, rarely erect herbs. Leaves entire. Peduncles axillary, 1-few-flowered; pedicels bibracteate. The *Cladóstyles* of Humb. et Bonpl. differs from *Evólvulus*, in the valveless capsule, and number of ovula.

1 E. hirsu'tus (Lam. dict. 3. p. 538. ill. t. 216. f. 2. but not of H. B. et Kunth.) procumbent; leaves ovate-oblong, nearly sessile, distant, hairy from bristles on both surfaces; peduncles 1-flowered, equal in length to the leaves, also exceeding them. ♃. S. Native of the East Indies, as of Pondicherry, Kamaon, south of Hindostan, &c. E. seríceus, Wall. cat. no. 1315. Corolla blue.?

Hairy Evolvulus. Pl. procumbent.

2 E. alsinoìdes (Lin. fl. zeyl. p. 76. spec. p. 392.) elongated, villous; leaves ovate or oval, blunt at both ends, petiolate, glabrous above, and hairy beneath; peduncles usually 1-2-flowered, 4-bracteate; capsule deflexed. ♃. S. Native of the East Indies, as at Pegamew, Mungger and Ceylon, Straits of Sunda; and of New Holland, within the tropic. Burm. zeyl. 9. t. 6. f. 1., and 19 t. 9. Conv. alsinoìdes, Knip. cent. xi. no. 34.

Vistnu-Glandi, Rheed. mal. 11. p. 131. t. 64. Flowers blue. In Ceylon, this plant has the name of *Visnugarandi*, from the Malabar deity Visnu and Garandi, which signifies the dysentery. It is reputed to be a sovereign remedy in that disorder, ex Burm.

Chickweed-like Evolvulus. Fl. June, July. Clt. 1733. Pl. procumbent.

3 E. villòsus (Ruiz. et Pav. fl. per. 3. p. 30. t. 235. f. b.) diffuse, villous; branches ascending; lower leaves ovate-elliptic: uppermost floral ones minute; peduncles 1-2-flowered, longer than the leaves. ♃. S. Native of Peru, on sandy hills; and of New Holland, within the tropic. R. Br. prod. p. 489. Nearly allied to *E. alsinoìdes*. Bracteas subulate. Corolla blue, spreading. Calyxes ciliated.

Var. β, *lanceolàtus* (Poir. dict. 3. p. 459.) leaves lanceolate, nearly glabrous; peduncles 1-flowered, shorter than the leaves. ♃. S. Corolla pale blue, rather large.

Villous Evolvulus. Pl. procumbent.

4 E. nummula'rius (Lin. spec. p. 391. Swartz, obs. p. 118.) stems branched, beset with short hairs, creeping, downy; leaves roundish-oval, retuse or emarginate; flowers solitary or 3 together, pedunculate, shorter than the leaves. ♃. S. Native of Jamaica and Barbadoes, in meadows; as well as on the banks of the Mississippi. Lam. dict. 3. p. 539. Jacq. amer. pict. t. 260. f. 23. Conv. nummulàrius, Lin. spec. ed. 1st. 157.—Sloane, jam. hist. 1. p. 157. t. 99. f. 2. Leaves hardly larger than those of *Anagállis tenélla*. Calyx hairy. Corolla pale blue, but white, ex Swartz. Peduncles capillary, downy.

Money-wort-leaved Evolvulus. Fl. Oct. Clt. 1816. Pl. trailing.

5 E. veronicæfòlius (H. B. et Kunth, nov. gen. amer. 3. p. 117. t. 215.) stems creeping, pilose; leaves petiolate, nearly orbicular, somewhat retuse, cordate, smoothish; peduncles 1-flowered, about equal in length to the leaves. ♃. S. Native of New Granada, in temperate places, near Guadua. Nearly allied to *E. nummulàrius*. Calycine segments oblong-lanceolate, acuminated, equal, with pilosely ciliated edges. Young leaves pilose on the nerves beneath. Peduncles pilose. Corolla pale blue; limb 5-toothed. Capsule 1-celled, 1-3-seeded.

Speedwell-leaved Evolvulus. Pl. creeping.

6 E. linifòlius (Lin. spec. 392. syst. 299. amœn. acad. 4. p. 306.) erect, villous; leaves linear-lanceolate, nearly sessile; peduncles 1-3-flowered, a little longer than the leaves; styles 4, approximating by pairs. ⊙. S. Native of Jamaica, St. Thomas's; and New Holland, within the tropic. Lam. ill. t. 216. f. 1. Conv. linifòlius, Kniph. cent. 11. no. 26.—Brown. jam. p. 152. t. 10. f. 2. Leaves canescent. Corolla rather tubular, blue, small.

Flax-leaved Evolvulus. Fl. Aug. Sept. Clt. 1782. Pl. ½ ft.

7 E. decu'mbens (R. Br. prod. p. 489.) plant prostrate, villous; leaves linear-lanceolate, nearly sessile; peduncles usually 1-flowered, a little longer than the leaves; styles 2, bipartite. ⊙.? S. Native of New Holland, within the tropic. Corollas blue?

Decumbent Evolvulus. Pl. decumbent.

8 E. Java'nicus (Blum. bijdr. p. 724.) leaves linear-lanceolate, sessile, clothed with silky villi; peduncles 1-flowered, bibracteate, length of leaves; stems woody at bottom. ♃. S. Native of Java, on the top of Mount Gede.

Java Evolvulus. Fl. February. Pl. trailing?

9 E. de'bilis (H. B. et Kunth, nov. gen. et spec. 3. p. 115.) stems elongated, filiform, procumbent, pilose; leaves on short petioles, oblong, somewhat acuminated, silky from hairs on both surfaces; peduncles usually 2-flowered, much exceeding the leaves. ♃. S. Native at the foot of the Andes, about Quindiu, near Ibague; of Mexico, near Jalapa, and near Hacienda de la Laguna. E. filifòrmis, Willd. herb. Nearly allied to *E. linifòlius*. Root woody, creeping. Peduncles and pedicels clothed with silky down. Capsule 2-seeded. Corolla unknown.

Weak Evolvulus. Pl. procumbent.

10 E. seríceus (Swartz, prod. p. 55. fl. ind. occ. 1. p. 576.) stems filiform, glabrous, or downy, procumbent; leaves lanceolate, sessile, silky beneath; peduncles short, 1-flowered. ⊙. S. Native of Jamaica, in arid, sandy places; and of Mexico, near Jalapa. Brown. jam. p. 153. no. 3. t. 10. f. 3. Very like *E. linifòlius*. Leaves acutish, 3-nerved. Calyx silky outside; segments lanceolate, acute, with recurved tops. Corolla white, with a short tube, and a 5-parted, spreading limb; segments acute. Anthers blue. Capsule silky, 2-celled, many-seeded.

Silky Evolvulus. Pl. procumbent.

11 E. azu'reus (Schum. pl. guin. p. 166.) pilose; leaves ovate-lanceolate, acute, silky beneath; stems procumbent, filiform; peduncles 1-flowered, with a bibracteate joint towards the flower; calyx villous, with lanceolate segments. ⊙. S. Native of Guinea. Corolla rotate, blue, size of those of *Anagállis cærùlea*. Capsule globose, glabrous, 1-celled, 4-seeded. Styles 4. Stigmas simple.

Azure-blue Evolvulus. Pl. procumbent.

12 E. cuspida'tus (H. B. et Kunth, l. c. p. 116.) stems procumbent, clothed with silky villi; leaves nearly sessile, oblong, cuspidately mucronate, clothed with silky villi on both surfaces, hoary; flowers nearly sessile, shorter than the leaves. ♃. S. Native about the Orinoco, in sandy places near Angostura and Villa Farrera. Calyx clothed with silky villi; segments lanceolate, acuminately subulate, equal. Corolla unknown. Perhaps the same as the preceding.

Cuspidate-leaved Evolvulus. Pl. procumbent.

13 E. Commersònii (Rœm. et Schultes, syst. 6. p. 197.) stems slender, shrubby at bottom; leaves small, linear-lanceolate, silky beneath: lower ones lanceolate-oval; flowers axillary, almost sessile, solitary. ⊙.? S. Native of Monte Video. E. seríceus, Poir. dict. 3. p. 586. Pers. ench. 1. p. 288. Flowers white.

Commerson's Evolvulus. Pl. procumbent.

14 E. inca'nus (Pers. ench. 1. p. 288. H. B. et Kunth, nov. gen. 3. p. 116.) stems tufted, diffuse, silky; leaves on short petioles, oblong-lanceolate, somewhat falcate, clothed with silky, silvery down on both surfaces; peduncles 1-flowered, equal in length to the leaves, or longer. ♄. S. Native of Quito, among rubbish on the banks of the river Guallabamba. E. seríceus, Ruiz. et Pav. fl. per. 3. p. 30. t. 252. f. 1. Calyx clothed with silvery, silky down; segments lanceolate-subulate. Corollas blue. Capsule 1-4-seeded.

Hoary Evolvulus. Pl. procumbent.

15 E. arge'nteus (R. Br. prod. 489.) plant diffuse, hoary; branches elongated, undivided; leaves lanceolate-ovate, nearly sessile, acute, silvery; peduncles 1-flowered, about equal in length to the leaves. ⊙.? S. Native of New Holland, within the tropic, on the sea shore. Very nearly allied to *E. incànus*; but the leaves of that species are broader, ovate, and petiolate.

Silvery Evolvulus. Pl. diffuse.

16 E. holoseríceus (H. B. et Kunth, l. c. p. 116.) procumbent; leaves sessile, oblong, acute, glabrous above, silvery and silky beneath; flowers axillary, sessile. ♄. S. Native of New Granada, in fields; in La Culsta de Toluca; and near Ibague. Stem beset with silky hairs, as well as the calyx. Corolla blue.

Whole-silky Evolvulus. Pl. procumbent.

17 E. angusti'ssimus (H. B. et Kunth, l. c. p. 116.) stems rather procumbent, clothed with silky down; leaves sessile, linear-lanceolate, acuminately cuspidate, glabrous above, and clothed with silky hairs beneath; flowers almost sessile, shorter than the leaves. ♃. S. Native along with *E. cuspidàtus*.

Calyx hairy; segments lanceolate, acuminated. Corolla pale blue. Ev. virgàtus, Willd. rel. is probably the same.

Very narrow-leaved Evolvulus. Pl. procumbent.

18 E. Nuttallia'nus (Rœm. et Schultes, syst. 6. p. 198.) erect; leaves linear-oblong, clothed with silky tomentum or hairs on both surfaces; peduncles short, 1-flowered. ♃. F. Native on the banks of the Missouri, and the high hills of Red River, near Kiamesha; also in Florida, and about the banks of the Platte; and of Mexico. E. argénteus, Pursh, fl. 1. p. 187. Nutt. gen. amer. 1. p. 174. but not of R. Br. Flowers purple, coming out about the middle of the stem. Sepals partly linear, and acuminated.

Nuttall's Evolvulus. Fl. May, June. Clt. 1821. Pl. erect.

19 E. latifòlius (Ker. bot. reg. 401.) suffruticose, villous, erect at bottom; branches diffuse; leaves nearly sessile, oblong-cordate, acuminated; fascicles of flowers nearly sessile, generally 3-flowered; sepals linear-lanceolate, pilosely ciliated. ♃. S. Native of Brazil. Corollas white, rotate. Styles 2, bipartite.

Broad-leaved Evolvulus. Fl. June, July. Clt. 1819. Pl. diffuse.

20 E. capita'tus (Nees et Mart, in act. bonn. 11. p. 80.) erect, hairy; leaves sessile, lanceolate; flowers capitate, terminal. ⊙. S. Native of Brazil, about Barra da Varada, in fields. Plant hoary. Leaves sessile, hoary beneath, 1½ inch long. Flowers in small villous heads, involucrated by 5-6 ovate-elliptic bracteas. Calycine segments unequal, villous. Corolla reddish, somewhat funnel-shaped, twice longer than the calyx; limb large, 5-angled, plicate, villous outside.

Capitate-flowered Evolvulus. Pl. 1 foot.

21 E. glomera'tus (Nees et Mart. in act. bonn. 11. p. 81.) procumbent, villous; leaves oblong, attenuated at the base; heads of flowers axillary and terminal, leafy. ♄. S. Native of Brazil, about Tamburil and Valos, among bushes. Leaves 6-9 lines long, on short petioles: lower ones obtuse: superior ones acutish. Heads of flowers sessile, mixed with oblong-lanceolate or lanceolate, villous bracteas. Calycine segments lanceolate, acuminated. Corolla somewhat funnel-shaped, blue; limb 5-lobed, dilated.

Glomerate-flowered Evolvulus. Shrub procumbent.

† *Doubtful species.*

22 E. arbu'sculus (Poir. suppl. 3. p. 459.) plant hispid; leaves small, almost sessile, ovate-lanceolate; flowers lateral and terminal, on short peduncles; stem much branched, filiform. ♄. S. Native of St. Domingo. Leaves hairy. Calyx hardly pilose; segments acute. Corolla white, twice longer than the calyx.

Arbusculous Evolvulus. Shrub.

23 E. Acapulce'nsis (Willd. rel. ex Rœm. et Schultes, syst. 6. p. 199.) leaves lanceolate, villous, sessile; stem branched at the base; peduncles usually 2-flowered, length of leaves. ⊙. S. Native of Mexico, about Acapulco.

Acapulco Evolvulus. Pl. procumbent.

24 E. macrophy'llus (Willd. rel. l. c.) stem erect, branched; leaves ovate-oblong, mucronate, tomentose; corymbs axillary. ♄. S. Native of South America. Humb. et Bonpl.

Long-leaved Evolvulus. Shrub erect.

Cult. The species of *Evólvulus* are pretty little plants, of easy culture. They all do well in a light sandy soil, or a mixture of sand and peat. They are all readily increased by seed, which ripen in abundance.

XXX. CLADOSTYLES (from κλαδος, *klados*, a branch; and στυλος, *stylos*, a column; in reference to the branched style.) Humb. et Bonpl. pl. æquin. 1. p. 202. t. 57. H. B. et Kunth, nov. gen. amer. 3. p. 118.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-parted. Corolla rotately-campanulate; limb 5-cleft. Styles 2, bipartite; stigmas simple. Capsule 1-celled, 1-seeded, not dehiscent.—An erect herb; with alternate, entire leaves, and terminal loose panicles of small yellow flowers.

1. C. panicula'ta (Humb. et Bonpl. l. c.) ⊙. S. Native of New Granada, near Turbaco. Stem branched, rather rough from adpressed, scattered hairs. Leaves sessile, lanceolate, acute, mucronate, narrowed at the base, beset with adpressed hairs on both surfaces, 1 inch long, and 3-4 lines broad. Flowers on long pedicels.

Panicled-flowered Cladostyles. Pl. 2 feet.

Cult. For culture and propagation see *Evólvulus*, above.

XXXI. WILSO'NIA (named in memory of John Wilson, author of a synopsis of British plants in Ray's method.) R. Br. prod. p. 490. Choisy, in mem. soc. phys. gen. 6. p. 496.

Lin. syst. *Pentándria, Monogýnia.* Calyx urceolate, pentagonal, 5-toothed. Corolla funnel-shaped, imbricate in æstivation. Style bifid; stigmas capitate. Ovarium small, 2-seeded. —An humble, prostrate, much branched, downy shrub. Leaves imbricated in 2 rows, small, thickish, sessile. Flowers axillary, sessile, solitary, bractless.

1 W. hu'milis (R. Br. l. c.) ♄. G. Native of New Holland, on the south coast.

Dwarf Wilsonia. Shrub prostrate.

Cult. This is a singular and beautiful prostrate shrub, worth cultivating in every collection. A mixture of sand, loam, and peat, is the best soil for it; and it will be easily propagated by cuttings or by seeds.

Tribe III. DICHO'NDREÆ (this tribe contains plants agreeing with *Dichóndra* in having distinct carpella.) Choisy, in mem. soc. phys. gen. 6. p. 497. Embryo cotyledonous. Carpella distinct.

XXXII. DICHO'NDRA (from δις, *dis*, double; and χονδρος, *chondros*, a grain; in reference to the double capsule.) Forst. gen. p. 39. t. 20. Lam. ill. t. 183. R. Br. prod. 491. Juss. gen. 129. ed. Usteri, p. 144. H. B. et Kunth, nov. gen. 3. p. 119. —Sibthórpia spec. Lin.—Steràpha, Gært. fruct. 2. p. 81. t. 94. —Demidòfia, Gmel. veg. 458.—Anónymos, Walt. fl. car. 1. p. 110.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-parted. Corolla subrotate or campanulate; limb flat, 5-parted. Ovaria 2, 2-seeded. Styles 2, basilar; stigmas capitate or thick. Capsules 2, utricular, 1-seeded.—Humble, creeping, downy, non-lactescent herbs. Leaves cordate or reniform, entire, petiolate. Peduncles axillary, 1-flowered, without bracteas.

1 D. re'pens (Forst. gen. p. 39. t. 20.) leaves reniform or roundish-cordate, glabrous above and downy beneath; calyx exceeding the corolla a little. ? ♃. F. Native of America, New Holland, Van Diemen's Land; and of the East Indies, on Mount Taong-Dong, Ava, &c. Lam. ill. t. 183. Ruiz. et Pav. fl. per. 3. p. 22. Sibthórpia evolvulàcea, Lin. suppl. p. 288. Steràpha reniformis, Gærtn. fruct. 2. p. 81. t. 94. Leaves sometimes retuse or emarginate, ex R. Br.

Creeping Dichondra. Fl. July, Aug. Clt. 1803. Pl. cr.

2 D. rotundifòlia (Link. enum. 1. p. 249.) stems procumbent, hairy; leaves on long petioles, reniform, emarginate, repandly crenated, of the same colour on both surfaces, hairy; calyxes ciliated, hairy. ♃. F. Native of Persia.

Round-leaved Dichondra. Fl. June, Aug. Clt. 1816. Pl. trailing.

3 D. Carolinia'na (Michx. fl. bor. amer. 1. p. 136.) leaves

reniform, rounded, not emarginate, the same colour on both surfaces, downy beneath; calyxes villous, closed. ♃. H. Native of South Carolina, by way-sides about Charlestown; and on the banks of the Mississippi, near New Orleans. Pursh, fl. 1. p. 187. D. rèpens, β. Poir. suppl. 2. p. 470. D. rèpens, Nutt. in amer. phil. trans. n. s. 5. p. 195. Anónymos rèpens, Walt. fl. carol. 1. p. 110. Demidòfia rèpens, Gmel. syst. veg. p. 458. Plant small, creeping. Flowers small, green.

Carolina Dichondra. Fl. June, Aug. Clt. 1812. Pl. creeping.

4 D. seri'cea (Swartz, fl. ind. occ. 1. p. 556. icon. t. 10.) leaves reniform, retuse at the apex, glabrous, or downy above, silky and silvery beneath; calyx exceeding the corolla a little. ♃. F. Native of Jamaica, and near Santa Fe de Bogota; and of Mexico, about Jalapa. D. rèpens, δ. serícea, Poir. suppl. 2. p. 470. This species comes very near *D. rèpens;* and only differs in the leaves being smaller, white, and silky beneath, not of the same colour on both surfaces.

Var. β; leaves reniform, emarginate, nerved and silky beneath. ♃. F. Native of Peru. D. rèpens, Ruiz. et Pav. fl. per. 3. p. 23. D. rèpens Peruviàna, Poir. suppl. 2. p. 471.

Silky Dichondra. Fl. June, Aug. Clt. 1793. Pl. creeping.

5 D. arge'ntea (Willd. hort. berol. 2. p. 81. t. 81. enum. 1. p. 297.) leaves broadly reniform, cuneated at the base, retuse at the apex, silky and silvery on both surfaces; corolla exceeding the calyx. ♃. F. Native of Mexico, near Guanaxuato and Zelaya; also near Honda. H. B. et Kunth, nov. gen. 3. p. 120.

Silvery-leaved Dichondra. Fl. June, Aug. Clt. 1818. Pl. prostrate.

† *Doubtful species.*

6 D. repa'nda (Willd. rel. ex Rœm. et Schultes, syst. 6. p. 209.) leaves reniform, repand, villous. ♃. F. Native of South America. Humb. et Bonpl.

Repand-leaved Dichondra. Pl. creeping.

7 D. cymbalariæfòlia (Willd. rel. l. c.) leaves reniform, 7-lobed, downy beneath. ♃. F. Native of?

Cymbalaria-leaved Dichondra. Pl. creeping.

Cult. These are pretty little creeping plants, generally having the leaves silvery on the under sides. *D. rèpens, Caroliniàna* and *rotundifòlia* grow well in the seams between flat stones in front of a stove or green-house; and even the other species will do in a similar way through the summer. All grow well in pots in a mixture of peat, loam, and sand; and are easily increased by dividing the plants, which are all creepers.

XXXIII. FA'LKIA (so named by Thunberg, in honour of John Peter Falck, a Swede, professor of botany at Petersburgh, and who accompanied Pallas in part of his travels in Siberia.) Thunb. nov. gen. 17. Lin. suppl. 30. Juss. gen. 132. Schreb. gen. no. 611. Convólvulus species, Thunb.

Lin. syst. *Pentándria, Tetragy'nia.* Calyx 5-parted. Corolla campanulate, crenated. Styles 4; stigmas globose. Ovaria 4, 1-seeded.—A small, suffruticose, glabrous plant.

1 F. re'pens (Lin. suppl. 211. Thunb. diss. nov. gen. 1. p. 17.) ♄. F. Native of the Cape of Good Hope, on hills near Cape town. Convólvulus Fálkia, Thunb. prod. 1. p. 35. fl. cap. 2. p. 15. Andr. rep. t. 257. Stems brownish grey, decumbent, rooting; branches filiform. Leaves scattered, petiolate, cordate-ovate, obtuse, entire. Peduncles hardly longer than the leaves. Corollas red, with a paler throat.

Creeping Falkia. Fl. May, Aug. Clt. 1774. Pl. creeping.

Cult. Fálkia is a pretty little plant, which grows freely in a mixture of loam and peat, or any light soil; and the plant is readily increased by division.

Tribe IV. CUSCUTE'Æ (this tribe only contains the *Cuscùta.)* Choisy, in mem. soc. phys. gen. 6. p. 497. bryo without cotyledons. Plants parasitical.

XXXIV. CUSCU'TA (According to Golius, 2036, derived from the Arabic name Kechout.) Tourn. 422. Lin no. 170. ed. Schreb. no. 227. Gaertn. fruct. 1. p. 297. Juss. gen. 137. R. Br. prod. p. 491. H. B. et Kunth gen. amer. 3. p. 121. Choisy, in mem. soc. phys. p. 497.

Lin. syst. *Pentándria, Digýnia.* Calyx 5, rarely 4- Corolla urceolate or campanulate; limb 5, rarely 4- cescent. Stamens usually furnished with a scale each, rarely naked. Styles 2, sometimes free, combined; stigmas acute or capitate. Ovarium 2-seeded. Capsule 1-2-celled.—Leafless, twi herbs. Flowers aggregate, subcapitate, spicate, corymbose, unibracteate. The seed does not but opens and puts forth a little spiral body, bryo. The stalks twine contrary to the sun's Holla sending out a number of little vesicles, which to the bark of the supporting plant.

§ 1. *Species natives of Europe.*

1 C. Europæ'a (Lin. spec. ed. 1. p. 180.) flowers nearly sessile; corolla with a naked throat, 4-5-c talous scales none: stigmas acute, filiform. ⊙. of Europe and Caucasus, in hedges, usually on loftier plants, as *Brambles, Bitter-sweet, Ferns, Hops;* also on *Flax, Nettles,* and *Grass.* In En Cambridgeshire; at Shipston upon Stone, Worcestersh Scotland, near Aberdeen, and at Musselburgh. Smith, e t. 378. Bieb. fl. cauc. 1. p. 115. Oed. fl. dan. Plenck. off. t. 70.—Hook fl. lond. 67. C. màjor, B p. 209. D. C. fl. fr. no. 2754. C. tetrándra, Mœ scándens, Brotero, fl. lus. p. 208. C. Epíthymum, par. ed. 2. 1. p. 85. C. filifórmis, Lam. fl. fr. 2. p. densiflòra, Willemet, in Linnæa, 1. p. 322. Cassùtha cùta, Fuchs. hist. 347. t. 348. Bauh. hist. 3. p. 266. red; segments bluntish. Corollas urceolately campa white, usually 4-cleft, and tetrandrous; but in the so Europe 5-cleft and pentandrous. Seeds usually 2 in Anthers yellow.

European or *Great Dodder.* Fl. Aug. Sept. Brie parasitical.

2 C. Epi'thymum (Lin. spec. 180.) flowers fascicles. corollas 5-cleft; epipetalous scales crescent-shaped, stigmas acute. ⊙. H. Native throughout Europe; in Britain, in cultivated fields, particularly among pulse; furze, flax, thyme, nettles, heath, lavender, spurge, hops, &c. Smith, engl. bot. 378. Oed. fl. dan. t. 427. P off. t. 71. C. Europæ'a, Smith, engl. bot. t. 55. Lam. 88. C. Europæ'a, β, Lin. spec. p. 180. C. filifórm Lam. fl. fr. 2. p. 307. C. mìnor, D. C. fl. fr. no. 2755. thymum, Cam. epit. 983.—Col. ecphr. 2. p. 23. Stems filif Much smaller in every part than *C. Europæ'a.* Flowers crowded, frequently 4-cleft and tetrandrous. Calyx red rolla white, bell-shaped, with acute segments. The from επι, *epi,* upon, and *Thymus,* thyme; so called from parasitical on thyme.

Epithymum or Lesser Dodder. Fl. July, Oct. Br Pl. parasitical.

3 C. lupulifórmis (Krok. fl. siles. no. 251. t. 36.) fl racemose, not conglomerate or pedunculate; stems lupuli rough, dotted. ⊙. H. Native of Bohemia and Silesia. monógynum, Pohl. tent. fl. boh. p. 156. Schultes, oestr. fl 2d. no. 726.

)p-formed Dodder. Pl. parasitical.

C. MONÓGYNA (Vahl, symb. 2. p. 32.) flowers pedunculate, gynous; throat of corolla naked; styles combined; stigma se. ⊙. H. Native of the Levant, on *Támarix Gállica;* between Smyrna and Bursa; and of Caucasus. Sibth et n, fl. græc. t. 257. Bieb. fl. taur. 1. p. 116.—Tourn. cor. Buxb. cent. 1. p. 15. t. 23. Habit of *C. Americàna*, but he size in all its parts. Stem warted. Flowers clustered, g lateral and terminal interrupted racemes. Calyx shining egments ovate. Corolla urceolate, pale red; segments of obtuse, spreading. Cells of capsule 2-seeded.

rynous Dodder. Pl. parasitical.

§ 2. *Species natives of New Holland.*

STRA'LIS (R. Br. prod. p. 491.) digynous; stigmas epipetalous scales lacerately fringed, ending beneath ts, which are broadly subulate; calyx smooth, deeply gments keeled, rather wrinkled. ⊙. G. Native of nd, within the tropic; and New South Wales.

Dodder. Fl. July, Oct. Clt. 1818. Pl. parasi-

RINA'TA (R. Br. prod. p. 491.) digynous; stigmas , epipetal scales lacerately fringed, exceeding the bases subulately filiform filaments; calyx 5-cleft, with keeled, wrinkled segments. ⊙. G. Native of New Holland, e tropic. Grámmica aphýlla, Lour. coch. 171. Stems Corolla campanulate, 5-cleft. Berry white; cells 2-

d-calyxed Dodder. Pl. parasitical.

§ 3. *Species natives of America.*

CORYMBÒSA (Ruiz. et Pav. fl. per. 1. p. 69. t. 115. f. b.) pedunculate; corollas urceolate, quadrifid, tetrandrous, naked throat; stamens inclosed; stigmas capitate. ⊙. ative of Peru, in cultivated fields; particularly on *Medisatìva*. Scales on the branches acute, concave. Sepals , obtuse, white. Corollas white.

ymbose-flowered Dodder. Pl. parasitical.

. ODORA'TA (Ruiz. et Pav. fl. per. 1. p. 69. t. 105. f. a.) s crowded, sessile; corollas campanulate; scales at the f the filaments ovate, fringed, or ciliated; stigmas capi-. ⊙. G. Native of Peru, in corn-fields near Lima. Stems l with purple lines and spots. Scales of the branches ovate. Flowers sweet-scented, propped by concave Calyx white, dotted with red; segments roundish, ob-Corollas white; segments ovate, acute, reflexed; there-e stamens are exserted. This species is called *Cabellos igel* in Peru.

eet-scented-flowered Dodder. Pl. parasitical.

C. UMBELLA'TA (H. B. et Kunth, nov. gen. amer. 3. p.) umbels pedunculate, generally 8-flowered; calycine segts acute; corolla campanulate, with acute, reflexed segts; scales at the base of the filaments lacerately fringed; mas capitate; genitals exserted. ⊙. G. Native of New in, between Queretaro and Salamanca. Flowers pedicellate, androus, digynous, white.

mbellate-flowered Dodder. Pl. parasitical.

) C. OBTUSIFLÒRA (H. B. et Kunth, l. c. p. 122.) heaps of ers sessile; calycine segments obtuse; corolla campanulate, obtuse segments; scales at the base of the filaments lacey fringed; stigmas capitate; genitals hardly inclosed. ⊙. Native of Peru, on the Andes. Said by Torrey to be abundant about the sources of the Canadian river, para-l on *Port. Oleràcea*. Plant orange-coloured. Flowers on t pedicels, pentandrous, digynous, white. Cells of capsule seeded.

Blunt-flowered Dodder. Pl. parasitical.

11 C. GRAVE'OLENS (H. B. et Kunth, l. c.) heaps of flowers sessile; calycine segments obtuse; corollas globose, with obtuse, spreading segments; epipetalous scales fringed; genitals exserted; stigmas capitate. ⊙. G. Native of the Spanish Main, near Cumana, in meadows, where it is called by the natives *Hilo de Oro*. Flowers on short pedicels, pentandrous, digynous. Plant strong-scented.

Strong-scented Dodder. Pl. parasitical.

12 C. FŒ'TIDA (H. B. et Kunth, l. c.) heaps of flowers sessile; calycine segments acuminated; corolla nearly globose, with acute, reflexed segments; epipetalous scales ciliated; genitals exserted; stigmas capitate. ⊙. G. Native of Quito, near Chillo. Plant parasitical on *Bérberis* and *Barnadèsia*, orange-coloured. Flowers fœtid, pentandrous, digynous, white.

Fetid-flowered Dodder. Pl. parasitical.

13 C. FLORIBU'NDA (H. B. et Kunth, l. c. p. 123.) corymbs pedunculate; calycine segments obtuse; corolla globose, twice higher than the calyx, with acute, reflexed segments; epipetalous scales ciliated; genitals much exserted; stigmas capitate. ⊙. G. Native of New Spain, in hot places near Pont Istla. Plant parasitical on *Bignònia viminàlis*, orange-coloured. Flowers pedicellate, white, pentandrous, digynous. Cells of capsule 1-2-seeded.

Bundle-flowered Dodder. Pl. parasitical.

14 C. POPAYE'NSIS (H. B. et Kunth, l. c.) corymbs pedunculate; calycine segments obtuse; corolla globose, a little higher than the calyx, with acute, erect segments; epipetalous scales ciliated; genitals exserted; stigmas capitate. ⊙. G. Native near Popayan, in temperate places. Plant yellow. Corymbs trichotomous. Flowers white, pentandrous, digynous, pedicellate. Cells of capsule 1-2-seeded. Said to be allied to *corymbòsa*, Ruiz. et Pav.

Popayan Dodder. Pl. parasitical.

FIG. 32.

15 C. GRANDIFLÒRA (H. B. et Kunth, l. c. t. 213.) peduncles usually 3-flowered, a little crowded; calycine segments obtuse; corollas rotately-campanulate, with obtuse segments; epipetalous scales wanting; genitals inclosed; stigmas capitate. ⊙. G. Native near Santa Fe de Bogota. Plant parasitical on *Spermacòce*. Peduncles 2-3-flowered, solitary, or in fascicles. Flowers pedicellate, pentandrous, digynous. Cells of capsule 2-seeded.

Great-flowered Dodder. Pl. parasitical.

16 C. CHILE'NSIS (Ker. bot. reg. t. 603. Hook. et Arn. in Beech. voy. pt. bot. p. 35.) pentandrous, digynous; calycine segments ovate, rounded, 3 times shorter than the corolla; epipetalous scales lacerately fringed; segments of corolla ovate, 3 times shorter than the tube, reflexed; anthers sessile; one of the styles shorter than the other; stigmas piliately capitate. ♃. G. Native of Chili, about Conception, Valparaiso, and Andes of Chili.

Chili Dodder. Fl. Jan. Dec. Clt. 1821. Plant parasitical.

17 C. AMERICA'NA (Lin. spec. 180.) flowers pedunculate, umbellate, pentandrous, quinquefid; corolla tubular; limb small, spreading; stigmas capitate; epipetalous scales fringed. ⊙. H. Native of Jamaica, St. Thomas, Surinam, Virginia; parasitic in hedges, and on other plants, in moist situations. The

whole plant has a reddish-yellow appearance, Lam. dict. 2. p. 229. Pursh, fl. amer. sept. 1. p. 116. Jacq. amer. pict. t. 17.—Sloane, jam. 85. hist. 1. p. 201. t. 128. f. 4. C. Surinaménsis, Schill. lepr. t. 2. Vittm. summ. pl. 1. p. 341. C. Gronòvii, Willd. herb. Flowers small, aggregate, yellowish. Genitals hardly inclosed.

American Dodder. Pl. parasitical.

18 C. Jalape'nsis (Schlecht, in Linnæa, 8. p. 515.) scales ovate, cuneated, or spatulate at the base, much shorter than the style, which is hardly exserted; flowers aggregate; corolla deeply 5-lobed: lobes reflexed at length, therefore the anthers are exserted; capsule bicornute. ♃. S. Native of Mexico, near Jalapa, on *Tràgia Báccharis*, and *Cròton*, &c. Flowers white. Said to come nearest to *C. Americàna;* but differs from it in the corolla being longer, blunter, and more deeply lobed; and in the other characters indicated above.

Jalapa Dodder. Pl. parasitical.

19 C. minia'ta (Mart. reise. ex Linnæa, 5. p. 29.) racemes pedunculate, 6-8-flowered; throat of corolla closed by ciliated scales; genitals inclosed. ⊙. G. Native of Brazil.

Vermilion Dodder. Pl. parasitical.

20 C. racemòsa (Mart. l. c. p. 38.) flowers pedunculate, cymosely racemose; corolla twice longer than the calyx, pentandrous; throat closed by ciliated scales. ⊙. G. Native of Brazil.

Racemose-flowered Dodder. Pl. parasitical.

§ 3 *A species native of Africa.*

21 C. Africa'na (Thunb. phyt. blatt. p. 17. fl. cap. p. 568.) peduncles 1-flowered; flowers 5-cleft, pentandrous, digynous. ⊙. G. Native of the Cape of Good Hope, parasitical on various trees. C. Americàna, Thunb. prod. p. 32. Peduncles capillary, furnished with a bractea at the base. Calyx very short, 5-cleft. Filaments 5, inserted in the incisures between the lobes of the corolla, and equal in length to them. The stems are more slender, and the flowers are smaller than those of *C. Americàna*.

African Dodder. Pl. parasitical.

22 C. Ara'bica (Fres. fl. egypt. et arab. p. 165.) digynous, pentandrous; fascicles few-flowered; flowers nearly sessile, small; genitals inclosed; epipetalous scales fringed at top; branches capillary, densely imbricate. ♃. H. Native of Arabia. Habit of *C. epíthymum*. Tube of corolla and calyx shorter than the limb.

Arabian Dodder. Pl. parasitical.

§ 4. *Species natives of Asia.*

23 C. verrucòsa (Sweet, fl. gard. t. 6.) digynous, pentandrous; stigmas lanceolate, obtuse, dilated at the base, fleshy; epipetalous scales fimbriately jagged; anthers nearly sessile; calyx 5-cleft, with roundish segments. ♃. H. Native of Nipaul. Branches irregularly marked with purple, linear spots. Racemes numerous, often 3-flowered, but sometimes 9-10-flowered. Flowers white, fragrant.

Warted-stemmed Dodder. Fl. Sept. Nov. Clt. 1822. Pl. parasitical.

24 C. Hooke'ri (Sweet, hort. brit. p. 290.) digynous, pentandrous; stigmas nearly sessile, diverging, subulate; corolla campanulate, 5-toothed, with reflexed segments; epipetalous scales fringed; anthers sessile. ⊙. G. Native of Mysore and Coromandel. C. refléxa, var. β, verrucòsa, Hook. exot. fl. t. 150. Stems spotted, and dashed with purple. Peduncles and calyxes warted. Corolla white.

Hooker's Dodder. Fl. Sept. Nov. Clt. 1823. Pl. parasitical.

25 C. refle'xa (Roxb. cor. 2. p. 2. t. 104.) digynous, pentandrous; style hardly any: stigmas large, fleshy, expanded, acuminated; corolla with a cylindrical tube and reflexed segments; calycine segments ovate-oblong, acutish; epipetalous scales bearded; filaments very short. ⊙. G. Native of Coromandel, where it is called *Sitamaponynvoloa* by the Telingas. Stems rough. Racemes long, numerous, many-flowered. Flowers white. Capsule baccate.

Reflexed-flowered Dodder. Pl. parasitical.

26 C. Chine'nsis (Lam. dict. 2. p. 229. Willd. spec. 1. p. 704.) digynous, pentandrous; stigmas subcapitate; corolla urceolate, with corniculate segments; calyx almost the length of the corolla, with keeled segments; genitals inclosed. ⊙. G. Native of China. Plant greenish-yellow. Flowers in loose, few-flowered fascicles, the whole forming an irregular panicle. Corollas white. Styles twisted.

China Dodder. Fl. July, Oct. Clt. 1803. Pl. parasitical.

27 C. sulca'ta (Roxb. ex Wall, cat. no. 1320.) digynous, pentandrous; stigmas capitate; corolla campanulate, small; calycine segments ovate-oblong, membranous, pellucid, equal, obtuse, ("fleshy, furrowed," ex Roxb.); genitals exserted. ⊙. G. Native of Silhet, Martaban, Bengal. Stems filiform. Flowers crowded, in lateral, few-flowered fascicles, scaly at the base; pedicels almost wanting. Styles nearly equal, exserted. Capsule small.

Furrowed-calyxed Dodder. Pl. parasitical.

28 C. macra'ntha; monogynous, pentandrous; style one, short: stigma acute; corolla tubular, 4-5 times longer than the calyx, 5-lobed at apex: lobes short, acutish, reflexed; epipetalous scales membranous, near the base of the corolla; sepals oblong-roundish, obtuse, membranous. ⊙. G. Native of Nipaul. C. grandiflòra, Wall, cat. no. 1318. Stems rough, black in the dried state. Common peduncles elongated, racemose, 1-2 inches long, many-flowered, those on the younger branches short and few-flowered; flowers pedicellate. Corolla showy. Anthers sessile, in the throat of the corolla. This, along with *C. refléxa* and *C. monógyna*, might form perhaps a distinct genus from the simple style.

Large-flowered Dodder. Pl. parasitical.

29 C. hyali'na (Roth. nov. spec. p. 220.) digynous tetrandrous; peduncles 3-flowered; flowers pedicellate; corolla transparent, 4-cleft; genitals inclosed; stigmas capitate; capsule membranous. ⊙. S. Native of the East Indies. Stems capillary. Corolla one-half longer than the calyx. Epipetalous scales seated on the stamens, fixed to the mouth of the corolla, and alternating with its segments, which are lanceolate. Capsule 2-celled; cells 2-seeded.

Hyaline-flowered Dodder. Pl. parasitical.

30 C. capilla'ris (Wall. cat. no. 1321.) ⊙. S. Native of the East Indies, at Segaen, opposite Ava. This only differ from *C. sulcàta* in the flowers being a little more crowded.

Capillary Dodder. Pl. parasitical.

31 C. capita'ta (Roxb. ex Spreng. syst. 1. p. 864.) flowers disposed in crowded heads; calyx and corolla papillose, pellucid. ⊙. G. Native of the East Indies.

Capitate-flowered Dodder. Pl. parasitical.

† *Doubtful species.*

32 C. fusifórmis (Willd. rel. ex Rœm. et Schultes, syst. 6. p. 205.) peduncles 1-3-flowered; corolla 4-cleft, very minute and remote. ⊙. G. Native of the Cape of Good Hope, on *Stàvia radiàta*.

Fusiform Dodder. Pl. parasitical.

33 C. cymòsa (Willd. l. c.) corollas quinquefid; flowers cymose; cymes bifid. ⊙. S. Native of South America. Humb. et Bonpl. Perhaps the same as *C. umbellàta*.

Cymose-flowered Dodder. Pl. parasitical.

Cult. The species are all parasitical, or rather epiphytical plants; the hardy species grow very well on ivy, or any small shrub. All the species may be grown by sowing the seeds in at the side of any soft wooded plant.

† *It is not known whether the following genus belongs to the present order.*

XXXV. MOUROUCO'A (the name of the genus in Guiana.) Aubl. Guian. 1. p. 142. t. 54. Desr. in Lam. dict. 4. p. 337. Lam. ill. t. 103. Juss. gen. 133. ed. Usteri. p. 148.

Lin. syst. *Pentándria, Monogýnia.* Calyx deeply 5-parted, coloured; segments approximate: outer ones the largest, violaceous. Corolla funnel-shaped; tube short; segments of the limb spreading, roundish. Stamens rising from the base of the lobes, in the upper part of the tube; filaments long, incurved. Stigma thick, roundish, bilamellate. Capsule girded by the calyx, 2-celled, ex Lam., 3-celled, ex Juss., ovate-oblong, coriaceous, fibrous; cells 1-seeded.? Seeds large.—A climbing shrub, with stiff, elliptic, acute, glabrous leaves, and axillary, fleshy, thick peduncles, bearing fascicles of flowers at their tops. Corollas large, flat, blue.

1 M. viola'cea (Aubl. l. c.) ♄. ⌒. S. Native of Guiana, in woods. Convólvulus macrospérmus, Willd. spec. 1. p. 860. Stem branched. Leaves entire, plicate; petioles channelled above.

Violaceous-calyxed Murucoa. Shrub climbing or twining.

Cult. For culture and propagation see *Argyrèia*, p. 257.

Order CLXV. RETZIA'CEÆ (this order contains plants agreeing with *Rétzia* in important characters.) Bartl. ex Choisy, in mem. soc. phys. gen. 6. p. 400.

Calyx bracteate, imbricate, deeply 5-parted. Corolla tubular, cylindrical. Stamens inserted into the tube; anthers subcordate. Stigmas 2, or bifid. Capsule 2-celled; dissepiment placentiferous on both sides; cells many-seeded.—Branched, erect, shrubs. Leaves alternate, or 4 in a whorl. Flowers lateral, sessile towards the extremities of the branches. This order differs from its allies in the cells of the capsule being many-seeded, and in the dissepiment being placentiferous.

Synopsis of the genera.

1 Re'tzia. Corolla villous. Style bifid. Cells of capsule many-seeded.

2 Lonchóstoma. Corolla glabrous.? Styles 2. Cells of psule generally 10-seeded.

I. RE'TZIA (so named by Thunberg, in honour of Anders ohan Retzius, professor of natural history and economy, in the niversity of Lund, in Sweden; author of Observationes Botaicæ, Lips. fol.) Thunb. act. lund. 1. p. 55. nov. gen. 4. Lam. ill. t. 103. Schreb. gen. no. 285. Lin. suppl. 18. Juss. gen. 133. ed. Usteri. p. 149.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, unequal; segments lanceolate. Corolla tubular, contracted under the limb, villous inside and outside, 5-parted at apex; limb short; segments or lobes obtuse, concave, very villous at apex. Anthers subcordate. Stigma bifid, simple. Capsule oblong, acute; cells many-seeded.—An erect, branched shrub. Leaves 4 in a whorl. Flowers bracteate, terminal, crowded.

1 R. spica'ta (Thunb. act. lund. 1. p. 55. t. 1. f. 2. Lam. ill. t. 103. Lin. suppl. 138.) ♄. G. Native of the Cape of Good Hope, on the highest mountains. R. Capénsis, Thunb. prod. p. 34. Branches hairy. Leaves crowded, lanceolate-linear, sessile, blunt, 1-grooved above, with impressed dots, 2-grooved beneath. Flowers lateral towards the extremities of the branches, sessile, crowded, upright, almost concealed among the leaves. Bracteas acute, keeled, hairy, longer than the calyx. Corollas rufescent. This plant bears a very great affinity with *Convólvulus*, and especially with *Convólvulus œnotheroìdes*, which is probably also a species of *Rétzia*.

Spicate-flowered Retzia. Fl. May, June. Clt.? Shrub 4 feet.

2 R.? campanuloìdes (Spreng. syst. 1. p. 589.) glabrous, erect; stem herbaceous, branched; leaves alternate, linear-lanceolate, entire, erect; flowers solitary, terminal, naked. ♃. G. Native of the Cape of Good Hope. Polemònium campanuloìdes, Thunb. prod. p. 35. Lin. suppl. p. 139. Willd. spec. 1. p. 887. Stigma bifid. Said to resemble *Campánula persicifòlia*.

Campanula-like Retzia. Pl. 2 to 3 feet.

3 R. roelloìdes (Spreng. syst. 1. p. 589.) stems herbaceous, villous; leaves alternate, sessile, lanceolate, marginate, scabrous; flowers axillary and terminal, sessile. ♃. G. Native of the Cape of Good Hope. Polemònium roelloìdes, Thunb. prod. 1. p. 35. Lin. suppl. 139. Willd. spec. 1. p. 887.

Roella-like Retzia. Pl. 1 to 3 feet.

Cult. Any light rich soil will answer this shrub, or a mixture of peat, loam, and sand. Cuttings will strike root freely in sand, under a hand-glass.

II. LONCHO'STOMA (from λογχη, *lonche*, a lance; and στομα, *stoma*, a mouth; in reference to the segments of the corolla, which are lanceolate, and attenuated towards the throat of the corolla.) Wikstr. in acad. holm. 1818. t. 10. Spreng. gen. 1. p. 216.

Lin. syst. *Pentándria, Digýnia.* Calyx bracteate, imbricate, 5-parted. Corolla tubular; limb 5-parted; segments lanceolate, attenuated to the throat. Stamens 5, inserted in the tube of the corolla. Styles 2. Capsule 2-celled, 2-valved; dissepiments placentiferous on both sides; cells generally 10-seeded.—Shrubs, natives of the Cape of Good Hope, with alternate leaves. Flowers spicate, terminal.

1 L. obtusiflòrum (Wikstr. l. c.) leaves elliptic, hairy outside; sepals and segments of corolla obtuse: styles subclavate, inclosed. ♄. G. Native of the Cape of Good Hope. Passerìna pentándra, Thunb. prod. 1. p. 76.

Blunt-flowered Lonchostoma. Shrub.

2 L. acutiflòrum (Wikstr. l. c.) leaves ovate, pilose outside; sepals and segments of corolla acute; styles filiform, exserted. ♄. G. Native of the Cape of Good Hope.

Acute-flowered Lonchostoma. Shrub.

Cult. For culture and propagation see *Rétzia* above.

Order CLXVI. BORAGI'NEÆ (this order contains plants agreeing with *Boràgo* in important characters.) Juss. gen. p. 130. ed. Usteri, p. 143. R. Br. prod. p. 492.—Asperifòliæ Nucíferæ, Lehm. asp.

Calyx 5-parted, rarely 4-parted, permanent. Corolla hypogynous, monopetalous, usually regular, 5-cleft, rarely 4-cleft, imbricate in æstivation. Stamens epipetalous, equal in number to the segments of the corolla, and alternating with them, rarely more. Ovarium 4-parted, 4-seeded, or simple, 2-4-celled, with

a definite number of pendulous ovula. Carpels 4, distinct, or joined at bottom; or a berry containing 2-4 pyrenæ. Seeds exalbuminous. Embryo inverted.—Herbs or shrubs. Leaves alternate, exstipulate, usually rough. Flowers generally disposed in secund spikes, but sometimes panicled and corymbose, and sometimes axillary and solitary.

The true *Boragíneæ* are chiefly herbaceous plants, with alternate exstipulate leaves, the surfaces of which are covered with minute asperities, and with flowers arranged in one-sided spikes or racemes; very rarely solitary. The fruit is generally composed of 4 distinct carpels. Some, *Echiums*, and a few more, are shrubs. The genus *Tournefórtia* and *Messerschmídtia* are chiefly composed of shrubs. Some of the plants of this order are mere weeds, quite unworthy of culture; others are eminently beautiful, as many *E'chiums*, *Onósmas*, *Onosmòdiums*, *Sýmphytums Merténsias*, and others. In general they have mucilaginous and emollient qualities, which are especially abundant in the root of *Sýmphytum* and *Cynoglóssum*. Pure nitre has been found in several plants of this order. A red colour is given out by *Anchùsa tinctòria*, *Lithospérmum tinctòrium*, and *Onósma echioìdes*, which is used in dyeing. Several plants of the same order are employed on the same account in America.

Synopsis of the genera.

TRIBE I.

BORAGIE'Æ. Fruit of 4 distinct, 1-celled carpels, which are imperforated at the base. Corolla deeply 5-parted, with pointed segments. Stamens usually exserted. Inflorescence diffuse.

SUBTRIBE I.

BORA'GEÆ. Nuts fixed to the bottom of the calyx, imperforated at the base. Corolla rotate; throat furnished with vaulted processes.

1 BORA'GO. Corolla rotate; throat furnished with emarginate processes or arches. Stamens glabrous; anthers oblong, pointed, fixed by the inner side. Nuts turbinate, fixed to the bottom of the calyx.

2 TRACHYSTE'MON. Corolla rotate; throat furnished with short, blunt, or emarginated processes or arches. Stamens with lengthened, hairy filaments, and incumbent, pointless anthers. Nuts fixed to the bottom of the calyx.

SUBTRIBE II.

RINDE'REÆ. Nuts adnate to the central column. This, with subtribe *Cynoglósseæ* of tribe *Buglósseæ*, might with propriety form a tribe to be called *Cynoglósseæ*, from the carpels being fixed to the central column.

§ 1. *Throat of corolla furnished with vaulted processes.*

3 MA'TTIA. Corolla angular, tubularly funnel-shaped; throat furnished with processes. Stamens exserted, but usually inclosed; anthers sagittate, connivent. Nuts furnished with a membranous, emarginate, orbicular wing, fixed to the centre column longitudinally.

4 SOLENA'NTHUS. Corolla tubular, 5-toothed; throat furnished with 5 arched processes. Stamens exserted. Nuts 4, depressed, echinated, adnate to the central column.

§ 2. *Throat of corolla naked.*

5 RINDE'RA. Corolla funnel-shaped; throat naked. Anthers sessile, between the segments of the corolla. Nuts margined by a broad, striated, stiffish wing, adhering lengthwise to the thick central column.

6 TRICHODE'SMA. Corolla subrotate; throat naked; segments subulate at apex. Anthers fixed together by hairs. Nuts 4, half immersed in as many hollows or pits of a 4-winged, central column, adnate near the apex.

TRIBE II.

SYMPHY'TEÆ. Corolla tubular, truncate; with very short lobes. Stamens inclosed. Carpels or nuts fixed to the bottom of the calyx. Inflorescence usually revolute.

7 SY'MPHYTUM. Corolla tubularly campanulate; throat furnished with subulate or lanceolate processes, which connive into a cone. Nuts 4, 1-celled, ovate, imperforated at the base.

8 COLSMA'NNIA. Corolla cylindrically campanulate; throat naked. Anthers sagittate, distinct. Nuts 4, 1-celled, ovate-triangular, perforated at the base.

9 STOMOTE'CHIUM. Corolla tubularly subcylindrical; throat closed by roundish, fleshy, muricated processes. Anthers oblong. Nuts 4, 1-celled, roundish, perforated at the base.

10 ONÓSMA. Corolla tubularly-campanulate; throat naked. Anthers sagittate, connected by the lobes at the base. Nuts 4, 1-celled, ovate, imperforated at the base.

11 ONOSMÒDIUM. Corolla tubular; throat naked; limb ventricose; segments conniving. Anthers sagittate, distinct. Nuts 4, 1-celled, turgid, shining, imperforated at the base.

12 PULMONA'RIA. Corolla funnel-shaped; throat pilose. Nuts 4, 1-celled, turbinate, imperforated at the base.

13 MERTE'NSIA. Corolla tubularly funnel-shaped; throat naked. Nuts 4, 1-celled, ovate, smooth or wrinkled, imperforated at the base.

14 CERÍNTHE. Corolla tubular; throat naked. Anthers hastate, connected, having the lobes spirally twisted at the base. Nuts 2, 2-celled, or 4, combined by twos, imperforated at the base.

TRIBE III.

LITHOSPE'RMEÆ. Corolla open, tubular; with broad, mostly rounded lobes. Stamens inclosed or exserted. Nuts 4, distinct, fixed to the bottom of the calyx, imperforated at the base, except in *Stríbila*.

15 LITHOSPE'RMUM. Corolla funnel-shaped; throat naked. Anthers oblong, inclosed. Nuts ovate, hard.

16 BA'TSCHIA. Corolla salver-shaped, with a straight tube, longer than the calyx, bearded by a ring of hairs inside at the base; mouth naked. Nuts 4, hard, shining. Stamens exserted or inclosed.

17 MACROME'RIA. Corolla funnel-shaped; lobes acute;

throat naked. Anthers linear-oblong, incumbent. Style a small pruinose dot. Ovaria 4, connate.

18 Móltkia. Corolla cylindrically funnel-shaped; throat naked. Stamens exserted; anthers oblong, incumbent. Nuts hemispheric, concave at the base.

19 Craniospe'rmum. Corolla cylindrical, 5-toothed at apex; throat naked. Stamens exserted. Anthers oblong. Nuts large, difformed.

20 Stríbila. Corolla funnel-shaped, with a slender tube and spreading limb, villous. Stamens length of the limb of the corolla. Style bifid; stigmas 2, capitate. Fruit pyramidal, perforated at the base.

21 E'chium. Corolla funnel-shaped; throat wide, naked; segments of the limb in many species unequal. Nuts turbinate, gigartoid, scabrous.

22 Echiochìlon. Corolla with a slender arched tube, a bilabiate limb, and a naked throat; upper lip 2-lobed; lower lip somewhat 3-lobed. Nuts glabrous, tubercled.

23 Nònea. Calyx at length inflated. Corolla funnel-shaped; tube straight; throat bearded. Stamens inclosed Stigma simple. Nuts with parallel stripes.

24 Loboste'mon. Corolla funnel-shaped; throat furnished with erect processes, which bear the stamens on the back. Nuts turbinate.

25 Lycópsis. Corolla funnel-shaped, 5-lobed; tube incurved; throat furnished with ovate prominent conniving scales. Stamens inclosed. Stigma emarginate. Nuts turbinate, concave at the base.

Tribe IV.

Buglósseæ. Corolla salver-shaped, or funnel-shaped, having the mouth closed with vaulted processes. Nuts 4, 1-celled, fixed to the bottom of the calyx, perforated at the base, except in *Echinospérmum*.

Subtribe I.

Anchu'seæ. Nuts fixed to the bottom of the calyx, perforated at the base.

26 Anchu'sa. Corolla salver-shaped; throat closed by erect obtuse processes. Stamens inclosed. Nuts turbinate, concave, and perforated at the base.

27 Myosòtis. Corolla salver-shaped; throat furnished with short processes. Stamens inclosed. Nuts perforated at the base.

28 Exarrhe'na. Corolla salver-shaped; throat furnished with vaulted processes. Stamens exserted; anthers peltate. Nuts umbilicate at the base.

29 Bothriospe'rmum. Corolla salver-shaped; throat furnished with bifid processes. Anthers nearly sessile, inclosed. Stigma capitate. Nuts reniform, perforated at the base, and umbilicate on the inner side.

Subtribe II.

Cynoglósseæ. Nuts fixed to the central column, imperforated at the base.

30 Echinospe'rmum. Corolla salver-snaped; throat furnished with short scales. Nuts echinated.

31 Roche'lia. Corolla funnel-shaped, 5-lobed; throat furnished with arched scales or processes. Nuts 2, oblique, combined, adnate to the indurated style.

32 Omphalòdes. Corolla rotate; throat closed by short processes. Nuts depressed, having the margin cup-shaped from an inflexed membrane.

33 Cynoglóssum. Corolla salver-shaped; throat furnished with erect processes. Nuts depressed, echinated.

34 Asperu'go. Calyx compressed in the fruit-bearing state, sinuately denticulated. Corolla funnel-shaped; throat closed by processes. Nuts depressed.

Tribe V.

Heliotrópeæ. Corolla salver-shaped or funnel-shaped, having the throat pervious or bearded; limb plicate. Nuts 4, 1-2-celled, combined into a single fruit, closed at the base, without any manifest torus or receptacle.

35 Heliotròpium. Calyx 5-parted. Corolla salver-shaped; throat pervious, in some bearded; limb plicate. Stigma subconical. Nuts 1-celled.

36 Piptoclaìna. Calyx tubular, 5-toothed. Corolla salver-shaped; throat furnished with teeth between the segments of the limb. Nuts 4, or solitary, 1-celled, wrinkled.

37 Tiarídium. Calyx 5-parted. Corolla salver-shaped; tube angular, arched, 5-rayed; segments of the limb undulated. Stigma capitate. Nuts 2-celled, mitre-formed, acuminated.

38 Colde'nia. Corolla funnel-shaped; throat wide, naked; limb flat, with equal spreading segments. Style bifid at apex. Nuts 1-celled, convex outside.

39 Halga'nia. Corolla funnel-shaped; tube short; limb flat; throat naked. Stamens inclosed; anthers fixed by the base, where they are cordate and connivent. Stigma simple, obtuse. Fruit obliquely and tetragonally ovate, composed of 2 2-celled divisions; cells 1-seeded.

40 Preslæ'a. Corolla funnel-shaped; limb having a plica between each of the segments; throat furnished with 5 fascicles of pili, just above the connivent anthers, which are appendiculate at the base, and inclosed. Stigma rising from a conical disk. Fruit divisible into 4 1-seeded parts or nuts.

41 Eu'ploca. Corolla funnel-shaped; limb flat. Stamens inclosed. Stigma annular, bearded at apex. Nuts 4, approximating by pairs, imperforated and angular at the base, fixed to the bottom of the calyx.

42 Tournefórtia. Corolla salver-shaped or subrotate; throat naked. Stamens inclosed. Stigma peltate, somewhat conical. Berry containing 2 2-seeded bony nuts.

43 Messerschmídtia. Corolla salver-shaped, or subrotate; throat naked. Stamens inclosed. Stigma peltate, somewhat conical. Berry containing 4 1-seeded nuts.

44 Cana'la. Corolla tubular, ventricose, 5-toothed, coarctate at the base into a short tube. Stamens inclosed. Nuts 2, stony, roundish, combined; seeds 4 in each cell.

Tribe I.

BORAGIE'Æ (this tribe contains plants agreeing with *Borago*

in the characters given). D. Don in Edinb. phil. journ. July, 1832. Corolla deeply parted, with pointed segments. Stamens exserted. Inflorescence diffuse. Nuts 4, 1-celled, 1-seeded, distinct.

Subtribe I.

Bora'geæ. Nuts fixed to the bottom of the calyx. Corolla rotate; throat furnished with vaulted processes.

I. BORA'GO (altered from *Cor*, the heart, and *ago*, to effect; in reference to cordial qualities of Borago). Tourn. inst. t. 53. Lin. gen. no. 188. Schreb. 248. Juss. gen. p. 131. ed. Usteri. p. 146. Lehm. asper. p. 2. Lam. ill. t. 94. f. 1. Schkuhr, handb. t. 31. Boraginoïdes, Boerh. p. 88. Cynoglossoïdes, Isnard, act. gall. 1718. t. 10.

Lin. Syst. *Pentándria*, *Monogýnia*. Corolla rotate; throat furnished with emarginate vaulted processes. Anthers distinct, oblong or lanceolate, awned, fixed by the inner side, conniving into a cone. Nuts 4, 1-celled, turbinate, fixed to the bottom of the calyx.—Rough plants, with fusiform roots; oblong or lanceolate leaves, and blue, panicled, drooping flowers.

1 B. officina'lis (Lin. spec. 197.) lower leaves obovate, attenuated at the base; segments of the limb of the corolla ovate, acute, spreading. ♂. H. This plant came originally from Aleppo, but is now naturalized in most parts of Europe. It is now to be found in England, on dunghills and heaps of rubbish frequently. Smith, engl. bot. t. 36. St. Hil. pl. fr. 1. t. 58. Sturm, fl. germ. fasc. icon.—Plenck. icon. t. 77.—Blackw. t. 36.—Sabb. hort. 2. t. 20, 21.—Mor. hist. 437. sect. 11. t. 26. f. 1. Plant hispid from pili, glaucous. Upper cauline leaves oblong, sessile, sub-cordate at the base. Corolla blue or purple, and sometimes white. Nuts ovate oblong, obtuse, ribbed on the inner side; ribs denticulated. Borage was formerly in great request, being reckoned one of the four cordial flowers. "Very light, surely," says an ingenious author, "were those sorrows which could be driven away by borage." Yet Borage flowers are at least innocent, which is more than can be said of many other general remedies for care. The whole herb is succulent, and very mucilaginous, having a peculiar faint smell when bruised. The juice affords a true nitre. The plant is now seldom taken inwardly. The young tender leaves may be used as salads, or as a pot herb.

Officinal Borage. Fl. June, Sept. Britain. Pl. 1 to 1½ foot.

2 B. crassifòlia (Vent. hort. cels. p. 100. t. 100.) leaves lanceolate, acute, fleshy; segments of the limb of the corolla unequal, linear-lanceolate, spreading. ♃. H. Native of Persia. Willd. enum. 1. p. 185. Lehm. asp. p. 203. Stems ascending, glabrous, and as if they were articulated or nodose. Leaves glaucous, muricated from hooked prickles on the edges above, but glabrous beneath, except on the nerves. Flowers solitary or racemose, purplish, erect at first.

Thick-leaved Borage. Fl. Ju. July. Clt. 1822. Pl. 1 to 2 feet.

3 B. longifòlia (Desf. fl. atl. 1. p. 162. t. 44.) leaves linear-lanceolate; segments of the limb ovate, acute, spreading. ♃. H. Native of Numidia, in humid places. Willd. spec. 1. p. 777. Lehm. asp. p. 204. Root branched, woody. Stem hispid from yellow retrograde pili. Leaves scabrous above, and downy beneath: cauline ones half stem-clasping. Flowers disposed in a terminal bracteate panicle. Pedicels and calyxes hairy. Segments of the calyx linear, much longer than the corolla. Corolla blue. Nuts oblong, smooth, obtuse.

Long-leaved Borage. Fl. July, Aug. Clt. 1825. Pl. 1 foot.

4 B. laxiflòra (D. C. fl. fr. 6. p. 422.) leaves oblong; segments of the limb of the corolla ovate, bluntish, erectly spreading. ♃ H. Native of Corsica. Horn. hort. hafn. 1. p. 181. Lehm. asp. p. 203. Anchùsa laxiflòra, Poir. suppl. 1. p. 736. D. C. syn. no. 2728. Sims, bot. mag. t. 1798. Stems decumbent, many from the same root, hispid from retrograde bristles. Leaves rough from strigæ; radical ones rosulate; cauline ones half stem-clasping. Flowers on long pedicels, racemose, nutant. Pedicels and calyx pilose. Corolla fine blue. Nuts turbinate, wrinkled.

Loose-flowered Borage. Fl. May, Aug. Clt. 1813. Pl. dec.

Doubtful species.

5 B. macranthe'ra (Russel, beschr. aleppo 2. p. 151.) leaves lanceolate, ciliated; calyxes ciliated, shorter than the tube of the corolla; anthers unequal. ♃. H. Native about Aleppo.

Long-anthered Borage.

6 B.? verrucòsa (Forsk. fl. ægypt. p. 41.) warts of leaves furnished with stiff pungent bristles: calyx prismatic. ♃.? H. Native of Arabia. Anthers terminated by a long bristle. Seeds flat, emarginate, serrated.

Warted-leaved Borage. Pl.

Cult. Plants of the easiest culture, requiring hardly any care. Most of them are very pretty border flowers. They are always increased by seed, which should be sown in the open ground.

II. TRACHYSTE'MON (from τραχυς, *trachys*, rough, and στημων, *stemon*, a stamen.) D. Don, in edinb. phil. journ. July, Oct. 1832. Boràgo species, Lin. and Smith.

Lin. syst. *Pentándria*, *Monogýnia*. Corolla rotate; throat furnished with short, emarginate processes. Anthers distinct, oblong, pointless, incumbent; filaments long, hairy. Nuts 4, 1-celled, fixed to the bottom of the calyx, imperforated at the base.—Rough plants, with tuberous or fusiform roots, and copious drooping blue flowers.

1 T. orienta'lis (D. Don, l. c.) lower leaves cordate; segments of the limb of the corolla revolute, pilose outside at the apex. ♃. H. Native about Constantinople, and in woods about Belgrade. Boràgo orientàlis, Lin. spec. 197. Sabb. hort. 2. t. 22. Smith, fl. græc. t. 175. Ker. bot. reg. 288. Mill. icon 1. t. 68. Boràgo cordifòlia, Mœnch. meth. suppl. p. 275. Kern. abbild. t. 118.—Tourn. itin. 2. t. 13.—Buxb. cent. 5. p. 16. t. 30. Root tuberous, and black outside. Stem hispid from retrograde pili, paniculately branched at top. Leaves hispid, broad; radical ones on long petioles; the uppermost cauline ones ovate-lanceolate, narrowed at the base, and nearly sessile. Flowers copious, on long pedicels, purplish-blue, disposed in conjugate racemes at the ends of the branches, bracteate. Processes in the throat of the corolla, white, short, blunt, emarginate.

Oriental Trachystemon. Fl. March, May. Clt. 1752. Pl. 1 to 2 feet.

2 T. Cre'ticum; lower leaves ovate; segments of the limb of the corolla linear, revolute, glabrous. ♃. H. Native of the islands of Candia and Zante, and on Mount Athos. Boràgo Crética, Willd. spec. 1. p. 778. Desf. cor. Tourn. in ann. mus. 10. p. 428. t. 34. Sibth et Smith, fl. græc. t. 176. Tourn. cor. inst. p. 6. Lehm. asp. p. 200. Root fusiform. Stems beset with stiff hairs. Leaves pilose, with crenately undulated, subciliated edges, 3-4 inches long; superior leaves nearly sessile. Flowers white, or very pale blue, with rose-coloured stamens, and yellow anthers, pedicellate, disposed in loose, terminal, conjugate racemes; processes of the throat subulate. Filaments naked.

Cretan Trachystemon. Fl. Ap. Ju. Clt. 1823. Pl. 1½ foot.

Cult. These are plants of easy culture, but do best in a shady rather dry situation. They are easily increased by dividing at the root, or by seed.

Subtribe II.

Rinde'reæ. Nuts or carpels fixed to the central column. This, with subtribe II. *Cynoglósseæ*, of tribe *Buglósseæ*, might with propriety form a distinct tribe, to be called *Cynoglósseæ*, from the attachment of the carpels.

§ 1. *Throat of corolla furnished with vaulted processes.*

III. MA'TTIA (meaning unknown to us.) Schultes, obs. p. 30. syst. 4. p. X.—Cynoglóssum species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calycine segments linear-lanceolate. Corolla tubularly funnel-shaped; tube pentagonal; segments of the limb linear, lanceolate, or roundish; throat furnished with compressed emarginate conniving processes, which are the length of the tube. Anthers sagittate, inclosed or exserted, connivent. Stigma simple. Nuts 4, 1-seeded, winged by a flat, emarginate, orbicular, diaphanous membrane, concave outside, glabrous, shining, fixed to the central column at the base (top?).—Erect plants, with sessile leaves, and terminal racemes of drooping flowers.

§ 1. *Nuts compressed, smooth. Stamens exserted.*

1 M. umbella'ta (Schultes obs. p. 32.) leaves narrow-lanceolate, downy, canescent; racemes terminal, umbellate; corolla a little longer than the calyx, with oblong obtuse segments; nuts smooth. ♃. H. Native of Siberia and Hungary. Cynoglóssum umbellàtum, Waldst. et Kit. pl. hung. 2. p. 158. t. 148. Horn. hort. hafn. 1. p. 178. Willd. enum. 1. p. 181. Sýmphytum règium, Gmel. syst. 2. p. 320.—Gmel. itin. 3. t. 36. f. 1. Root nearly simple, perpendicular. Stems simple, bluntly angular, hairy. Radical leaves ovate-lanceolate, tapering into the petioles; upper cauline ones sessile. Pedicels and calyxes woolly. Corolla yellow, tinged with red; processes of the throat red or wanting?

FIG. 33.

Umbellate-flowered Mattia. Fl. May, June. Clt. 1822. Pl. 1½ foot.

§ 2. *Nuts compressed. Stamens inclosed.*

2 M. lana'ta (Schultes, obs. p. 31. syst. 4. p. 82.) leaves ovate-lanceolate; villous, canescent, rather scabrous; flowers racemose; corolla twice longer than the calyx, with linear, connivent segments; nuts smooth. ♃. H. Native of Armenia. Cynoglóssum lanàtum, Lam. dict. 2. p. 238. Desf. ann. mus. 10. p. 432. t. 37. Tourn. cor. p. 7. Stems angular, simple, clothed with hoary tomentum, divided into simple floriferous branches at top. Racemes loose, simple, terminal, and in the axils of the superior leaves; pedicels recurved, and are, as well as the calyxes, woolly. Calycine segments linear, acute. Nuts ovate, cordate, clypeate. Corollas reddish, drooping.

Woolly Mattia. Fl. June. Clt. 1800. Pl. 1½ foot.

3 M. glastifòlia; leaves lanceolate, glabrous, beset by a few scattered papillæ beneath, and denticulately scabrous on the edges; flowers racemose; corolla nearly twice as long as the calyx, with roundish segments; nuts muricate in the centre, with membranous edges. ♃. H. Native of Armenia. Cynoglóssum glastifòlium, Willd. spec. i. p. 764. Desf. cor. Tourn. in ann. mus. 10, p. 430. t. 35. Rindèra glastifòlia, Rœm. et Schultes, syst. 4. p. 83. Stem branched at top. Peduncles axillary and terminal, few-flowered, glabrous; pedicels racemose, loose; and are, as well as the edges of the calyxes, papillose. Segments of the calyx lanceolate, obtuse. Corollas blue.

Glastum-leaved Mattia. Pl. 1½ to 2 feet.

4 M. angustifòlia; leaves linear, hispid from pili; flowers racemose; corollas twice as long as the calyx, with rounded segments; nuts smooth, having the marginal membranes denticulated. ♃. H. Native of Armenia. Cynoglóssum angustifòlium, Willd. spec. 1. p. 763. Lehm. asp. p. 171. Cynogl. emarginàtum, Lam. ill. no. 1799. Cynogl. racemòsum, Schreb. in act. bonn. 3. p. 476. Rindèra? emarginàta, Rœm. et Schultes, syst. 4. p. 83. Stems numerous, simple, canescent, pilose, angular. Flowers erect, secund, disposed into 2 terminal bractless racemes. Calyx hoary, with lanceolate bluntish segments. Scales in the throat lanceolate-acute, small. Corollas blue.

Narrow-leaved Mattia. Pl. ½ to 1 foot.

5 M. crista'ta; leaves linear-lanceolate, attenuated at the base, hispid from pili; flowers racemose; corollas a little longer than the calyx, with rounded segments; nuts muricated in the centre, and crestedly rayed along the edges of the wings. ♃. H. Native of Armenia. Cynoglóssum cristàtum, Lam. dict. 2. p. 237. Lehm. asp. 189. Schreb. nov. act. cur. 3. p. 478. exclusive of the synonymes. Omphalòdes cristàta, Schrank, denks. acad. wiss. munch. 1811 and 1812, p. 221. Root perpendicular. Stems hispid, simple, furnished with some racemiferous peduncles at apex. Racemes 2-3 terminal, and some lateral, many-flowered, loose, drooping before florescence. Pedicels secund, and are, as well as the calyxes, hispid, grey. Calycine segments lanceolate, bluntish. Corollas blue. Stamens inclosed, as in the 2 preceding species.

Crested-fruited Mattia. Pl. 1½ foot.

6 M. Colu'mnæ; leaves ovate-lanceolate, stem-clasping, villous; flowers racemose; corollas about equal in height to the calyx, with rounded lobes; nuts muricated in the centre, and denticulately rayed on the edges of the wings. ♃. H. Native near the town of Aversa, in stony dry places. Cynoglóssum Colúmnæ, Biv. stirp. rar. sic. man. 2. Tenore, prod. fl. neap. p. 33. Cynogl. cristàtum, β. Lam. dict. 2. p. 298. Willd. spec. 1. p. 764.—Column. ecphr. 1. p. 177. t. 178.—Morr. hist. 3. p. 449. sect. 11. t. 30. f. 7. Stem angular. Racemes panicled, terminal. Calycine segments ovate-lanceolate, bluntish. Corolla dirty purple, with deeper veins. Scales of the throat ciliated. Stamens inclosed.

Columna's Mattia. Fl. June, July. Clt. 1825. Pl. 1 to 2 feet.

7 M. Magelle'nse; leaves linear-lanceolate: superior ones broader at the base; flowers disposed in compact racemes; corollas about equal in length to the calyx, with rounded lobes; nuts membranous, muricated in the centre and on the margins. ♃. H. Native of Magella. Cynoglóssum Magellénse, Tenore prod. neap. p. 33. Lehm. asp. p. 168. Plant white from villi. Calyx woolly, with linear segments. Said to be nearly allied to *M. lanàta*. Corolla purplish.

Magella Mattia. Pl. 1 foot.

§ 3. *Nuts depressed, with denticulately ray edges. Stamens inclosed. Flowers solitary. This section will probably constitute a new genus.*

8 M. pilòsa; leaves linear, pilose, hoary; flowers solitary, pedicellate, alternating with the leaves; nuts denticulately rayed on the edges. ⊙. H. Native of Peru, in the provinces of Cercada and Chancay, in arid places. Cynoglóssum pilòsum, Ruiz. et Pav. fl. per. 2. p. 6. t. 111. f. *b*. Lehm. asp. p. 167. Plant hoary pilose. Stem slender, divided into loose, nearly simple branches. Leaves 1 to 1½ inch long. Pedicels much shorter than the leaves. Calyx pilose. Corolla tubular, with a flat limb. Nuts ovate, depressed, glabrous, surrounded by a serrated membrane.

Pilose Mattia. Pl. ½ foot.

9 M. lateriflòrum; leaves linear, pilose; flowers solitary, nearly sessile, opposite the leaves; calyxes unequal, a little shorter than the corolla; nuts with deeply-rayed edges. ⊙. H. Native of Chili about Santiago, and of Peru about Lima, in arid fields. Cynoglóssum lateriflòrum, Lam. dict. 2. p. 237. ill.

t. 92. f. 2. Lehm. asp. p. 166. Cynogl. lineàre, Ruiz. et Pav. fl. per. 2. p. 6. Pers. ench. 1. p. 160. Stems filiform, subtrichotomously branched, pilose and hoary as the rest of the plant. Pedicels short, erect when bearing the flower, but reflexed while bearing the fruit. Calycine segments lanceolate, one longer than the rest. Corollas small, white. Nuts 4, depressed, 2 of them smaller, and probably abortive.

Lateral-flowered Mattia. Pl. $\frac{1}{2}$ to 1 foot.

Cult. For culture and propagation see *Boràgo*, p. 309. Plants of the most easy culture.

§ 2. *Throat of corolla naked.*

IV. SOLENA'NTHUS (from *σωλην*, a tube; and *ανθος*, *anthos*, a flower; in reference to the corolla being tubular.) Led. fl. alt. 1. p. 193. fl. ross. alt. ill. t. 26.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-parted. Corolla tubular, 5-toothed, furnished with 5 arched processes in the throat. Stamens exserted. Stigma simple. Nuts 4, depressed, echinated, adnate to the central column, towards the apex, inside. A robust, erect plant, clothed with soft hairs. Radical leaves petiolate, upper cauline ones sessile. Racemes solitary, or twin, many flowered, bractless, at first revolute, at last erect, the whole forming a terminal naked panicle. Corollas purple or blue.

1 S. circina'tus (Led. l. c. p. 194) ♃. H. Native of Altaia, in the eastern regions of the river Irtysch, also in meadows about mounts Arkaul and Dolenkara. Root thick, perpendicular, furnished with fibres. Stem erect, villous, thickness of a small finger. Radical leaves having the petioles 4-5 inches long, semi-cylindrical, channelled above, striately furrowed beneath, with membranous edges beset with adpressed, deflexed, white hairs; the leaves oblong, sub-cordate at the base, unequal, acute or obtuse, entire, beset with adpressed hairs. Scales in the throat of the corolla oblong, obtuse, erect, with villous edges.

Circinate-racemed Solenanthus. Fl. April, May. Pl. $1\frac{1}{2}$ to 2 feet.

Cult. For culture and propagation see *Boràgo*, p. 309.

V. RINDE'RA (named by Pallas after Dr. Rinder, formerly Dean of Medicine in Moscow.) Pall. itin. 1. append. p. 486. t. F. f. 1-2. Lam. ill. t. 92. f. 3. Cynoglóssum species, Pall.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-parted. Corolla with the tube a little longer than the calyx, a deeply 5-cleft limb, a naked throat, and lanceolate-acute, erect segments. Anthers nearly sessile, in the recesses between the segments of the corolla, inclosed, erect, linear, dehiscing at the sides, and subbifid at the base. Style setaceous; stigma glandular, hardly conspicuous, simple. Nuts 4, glabrous, ovate, compressed, clypeate, each surrounded by a broad membrane, (one of which, from its small size, is abortive,) fixed to the central column at the base.—A glabrous plant, with a branched root, ovate-lanceolate leaves, and terminal racemosely corymbose reddish flowers.

This genus differs from *Máttia* in the throat of the corolla being naked, that is, without vaulted processes.

1. R. tetra'spis (Pall. l. c. Led. fl. alt. 1. p. 193.) leaves oblong, or oblong-lanceolate, smoothish; flowers racemosely corymbose; corollas twice as long as the calyx, with linear segments; stamens shorter than the segments of the corolla. ♃. H. Native of Siberia. R. lævigàta, Rœm. et Schultes, syst. 4. p. 83. Cynoglóssum lævigàtum, Lin. syst. p. 157. suppl. 131. Willd. spec. 1. p. 763. Lam. ill. t. 92. f. 3. Gærtn. fruct. 1. p. 324. t. 67. f. 4. Cynogl. Rindèra, Pall. fl. ross. 2. p. 96. t. 88.—Falck, itin. 2. t. 2.—Mor. hist. 3. sect. 11. t. 30. f. 11. Stems simple. Leaves glaucous, green, soft, glabrous, dotted from minute glands, which are only seen through a lens. Pedicels and calyxes hoary. Calycine segments linear-lanceolate, reflexed when in fruit.

Four-pointed fruited Rindera. Fl. June, July. Clt. 1818. Pl. 1 foot.

Cult. See *Boràgo*, p. 309. for culture and propagation. A plant of easy culture, but of no beauty.

VI. TRICHODE'SMA (from *θριξ τριχος*, *thrix trichos*, a hair; and *δεσμος*, *desmos*, a bond; anthers bound by hairs to each other.) R. Br. prod. p. 496. Lehm. asper. 192.—Boràgo species, Lin. Juss. Lam. &c.—Boraginòides, Mœnch. meth. p. 515.—Pollìchia, Medicus, phil. bot. 1. p. 32.—Cynoglossoìdes Isnard. hist. de l'acad. par. 1718. p. 257. f. 10, 11.

Lin. syst. *Pentándria*, *Monogýnia*. Corolla subrotate, with a naked throat; limb 5-parted, having the segments subulate at the apex. Anthers exserted, furnished with 2 rows of hairs on the back, by which they adhere to each other; awns subulate, twisted. Nuts 4, 1-seeded, half immersed in the pits of a 4-winged central column, closed at the base.—Erect, hispid, annual plants, with terminal racemose or solitary pedicellate axillary flowers.

1 T. I'ndicum (R. Br. prod. 496. Lehm. asp. p. 193.) leaves narrow-lanceolate, bluntish, half stem-clasping; pedicels axillary; calycine segments auricled at the base. ⊙. H. Native of the East Indies. Boràgo I'ndica, Lin. spec. ed. 2d. p. 197. Willd. spec. 1. p. 776. Borraginoìdes sagittàta, Mœnch. menth. p. 516. Pollìchia I'ndica, Med. l. c. 1718. p. 257.—Isnard. l. c. t. 10. ed. germ. t. 9.—Pluk. alm. t. 76. f. 3. Stem hairy, gibbous at the parts where the branches rise. Leaves scabrous above, and softish beneath. Pedicels drooping. Calyx hairy. Corollas pale blue or white; with ovate, cordate-acuminated segments, which are twisted at top; throat green, marked by 5 rusty spots.

Indian Trichodesma. Fl. June, Oct. Clt. 1759. Pl. 1 foot.

2 T. Zeyla'nicum (R. Br. l. c. Lehm. asper. p. 194.) leaves lanceolate, acute, on short petioles, attenuated at the base; pedicels axillary; calyxes not auricled. ⊙. H. Native of the East Indies, and the shores of New Holland, within the tropic. Boràgo Zeylánica, Lin. mant. p. 202. Willd. spec. 1. p. 777. Jacq. coll. 3. p. 169. icon. rar. 2. t. 314. Burm. ind. p. 41. t. 14. f. 2.—Pluck. mant. 13. t. 335. f. 4. Stem purplish, canescent, scabrous at bottom, and hispid at top. Leaves scabrous above, from numerous, callous, white dots; soft beneath, without dots, scabrous on the nerves and veins. Pedicels pilose, hoary, longer than the leaves. Calyx hoary, pilose. Limb of corolla white, with a blue star.

Ceylon Trichodesma. Fl. July, Aug. Clt. 1799. Shrub $1\frac{1}{2}$ foot.

3 T. Africa'num (R. Br. l. c. Lehm. asper. p. 195.) leaves ovate-oblong, acute, petiolate, hispid from bristles; flowers racemose; calyxes not auricled. ⊙. H. Native of the Cape of Good Hope. Boràgo Africàna, Lin. spec. ed. 2. p. 197. Willd. spec. 1. p. 777. Horn. hort. hafn. 1. p. 181. Murr. fl. goett. p. 142. Burm. prod. fl. cap. p. 4. Boràgo verrucòsa, Forsk. fl. ægypt. p. 41. Borraginoìdes aculeàta, Mœnch. meth. p. 516. Pollìchia Africàna, Med. bot. beob. 1783. p. 248.—Isnard. hist. de l'acad. par. 1718. p. 257. t. 11.—Sabb. hort. 2. t. 22. Stem trichotomously branched, strigose. Flowers drooping, disposed in axillary and terminal, pedunculate racemes. Calycine segments lanceolate. Corolla fine blue, with a yellow throat; segments ovate, acuminated, spirally twisted at top. Nuts scabrous.

African Trichodesma. Fl. July, Aug. Clt. 1759. Pl. 1 ft.

4 T. lithospermoìdes (Rœm. et Schultes, syst. 4. p. 69.) leaves oblong-lanceolate, nearly sessile, attenuated at the base, with subrevolute edges; flowers axillary, pedicellate; calyxes

not auricled. ⊙. H. Native of the East Indies. Stem downy, dichotomously branched, and strigose like the leaves. Pedicels hispid: upper ones longer than the leaves. Calycine segments unequal, pilose. Corolla dark in the dried state, with subulate segments.

Lithospermum-like Trichodesma. Pl. 1½ foot.

Cult. Plants of the most easy culture. The seeds require to be reared on a hot-bed early in spring; and the plants should be afterwards planted out in the open ground about the end of May, in a warm sheltered situation.

Tribe II.

SYMPHY'TEÆ. (This tribe agrees with *Sýmphytum* in the characters given.) D. Don, in edinb. phil. journ. July, Oct. 1832. Corolla tubular, truncate, with very short lobes. Inflorescence revolute. Stamens inclosed. Nuts fixed to the bottom of the calyx.

VII. SY'MPHYTUM (from *συμφυω, symphyo*, to make unite; and *φυτον, phyton*, a plant; in reference to the healing qualities of the plant.) Tourn. inst. t 56. Lin. gen. 185. Schreb. no. 245. Juss. gen. 131. ed. Usteri. p. 142. Gærtn. fruct. 1. p. 325. t. 67. f. 4. Lehm. asper. p. 3. and 343. Schkuhr, handb. t. 30.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla cylindrically campanulate; throat furnished with 5 subulate, vaulted processes, which connive into a cone. Nuts 4, 1-celled, ovate, fixed to the bottom of the calyx, imperforated at the base.—Rough, herbaceous plants, with broad leaves and terminal, twin racemes of flowers.

§ 1. *Roots tuberous or fleshy.*

1 S. officina'lis (Lin. spec. p. 195.) stem branched, winged at top; leaves ovate-lanceolate, attenuated at the base, decurrent, very scabrous above, and hairy beneath; racemes twin, nutant, with a flower in the fork; style length of corolla; calyx acute, hairy. 4. H. Native throughout Europe and Siberia, frequent in watery places. Smith, engl. bot. t. 817. Oed. fl. dan. t. 664. Curt. fl. lond. fasc. 4. t. 18. Drev. et Hayne, t. 36. Plenck, icon. t. 76. Woodv. med. bot. suppl. 10. t. 215. Gærtn. fruct. 1. p. 325. t. 67. Sabb. hort. 2. t. 30. Blackw. t. 252. St. Hil. pl. fr. 2. t. 104. Lehm. asper. p. 351.—Petiv. brit. t. 29. f. 5.—Mor. hist. 3. sect. 11. t. 29. f. 1. Root fleshy, black outside. Stems angularly winged. Corolla yellowish-white; segments denticulated. The root of *Comfrey* abounds in a pure, tasteless mucilage, like that of *Marsh Mallow*, but according to Lewis more tenacious. Being easily obtained, it therefore may be conveniently substituted for *Marsh Mallow*, in all cases where emollients or demulcents are in use; as in irritations of the throat, intestines, and, above all, the bladder.

Var. β, pàtens (Sibth. oxon. 220.) plant stronger; flowers bluish-purple, red before expansion. 4. H. Not so common in England as the species, but more so on the Continent, and in Scotland. Sýmphytum màjus flòre purpùreo, Tabern. 559. Plenck. icon. 76. We suspect this to be a distinct species, as the habit is very different from that of the species.

Officinal Comfrey. Fl. May, Aug. Britain. Pl. 2 to 3 feet.

2 S. Bohe'micum (Schmidt, boh. no. 211.) leaves ovate-lanceolate, alternate, running into the petioles; racemes twin, erect, revolute at the apex; style exceeding the corolla. 4. H. Native of Bohemia. S. officinàle, *β*. Bohèmicum, D. Don, in Sweet, fl. gard. w. s. t. 304. Stem winged. Flowers red, or reddish purple.

Bohemian Comfrey. Fl. May, July. Clt. 1810. Pl. 1 to 1½ foot.

3 S. tuberòsum (Lin. spec. 195. Jacq. austr. 3. p. 12. t. 63.) stem simple; leaves ovate-oblong, narrowed at the base: lower ones petiolate: floral ones opposite, sessile, hardly decurrent; segments of the limb of corolla very short, obtuse. 4. H. Native of Germany, Austria, France, Spain, and Italy. It has been observed in several parts of Scotland, about the Water of Leith, and at North Marchiston, near Edinburgh. Jacq. fl. austr. t. 225. Smith, engl. bot. t. 1502. Sabb. hort. 2. t. 31. Lehm. asper. 2. p. 345.—Morr. hist. 3. sect. 11. t. 29. f. 2. S. màjus, radice tuberosa. Root whitish, composed of many thick knobs or tubers. Plant not so stiff and hairy as *C. officinàle*. The following description is given by Schimper of *S. tuberòsum* to distinguish it from *S. Zeychèri* and *S. bulbòsum*: Rhizoma oblique, thickened by scales, furnished with short, protuberant, branchlets; stem simple; leaves oblong-ovate, attenuated at the base: lower ones petiolate: upper ones approximating by pairs or opposite: floral ones somewhat decurrent; teeth of calyx linear-lanceolate, shorter than the tube of the corolla; segments of the limb of the corolla very short, reflexed. Style about equal in length to the corolla; processes of the throat inclosed.

Tuberous-rooted Comfrey. Fl. May, Oct. Scotland. Pl. 1 to 2 feet.

4 S. Zeyche'ri (Schimper, in mag. pharm. geiger. Oct. 1829, and Jan. 1830, ex Bull. phil. vol. 21. p. 443.) rhizoma and stolons tuberous; stem almost simple; leaves ovate, acute, running into the marginate petioles: floral ones approximate, or opposite, sessile; calycine segments linear-lanceolate, shorter than the tube of the corolla; corolla funnel-shaped; anthers shorter than the filaments; segments of the limb of the corolla very broad, erect, 3 times as short as the tube; processes of the throat much exserted, exceeding the style. 4. H. Native of Sicily.

Zeycher's Comfrey. Pl. 1 to 2 feet.

5 S. bulbòsum (Schimper, l. c.) rhizoma and stolons tuberous; stem simple; leaves broadly ovate-lanceolate, acute, running into the petioles: floral ones approximating by pairs, or opposite, ovate, rounded at the base, half stem-clasping; calycine teeth lanceolate: tube equalling the corolla; limb of corolla parted to the middle, with ovate, erect segments; anthers as long as the filaments; processes of the throat exserted, exceeding the style. 4. H. Native of Heidelberg, Vallais, Schliecher; Apennines, Meyer. Rchb. icon. t. 209. f. 367. Mert. et Koch. fl. allem. 2. p. 78. Bluff. and Fingash, fl. germ. suppl. 2. p. 598. Schimper, bot. zeit. 1825. no. 2. S. filipéndula, Bischoff, in bot. zeit. 1826. no. 36. S. Clùsii, Gmel. fl. bad. suppl. S. macrolèpis, Gay. in Dierbach, in Greger's journ. S. punctàtum, Gaud. fl. helv.

Bulbous-rooted Comfrey. Pl. 1 to 2 feet.

6 S. corda'tum (Waldst. et Kit. pl. hung. 1. p. 6. t. 7.) stem simple; leaves cordate, acuminated, on long petioles: floral ones ovate-lanceolate, roundish, sessile, nearly opposite; corolla ventricose, with recurved, obtuse segments. 4. H. Native of Hungary, Transylvania, and Western Iberia, in woods. Bieb. fl. cauc. 1. p. 130. Lehm. asp. 2. p. 344. S. Pannónicum, Pers. ench. 1. p. 161. Bess. fl. gal. 1. p. 152. Root tuberous, creeping, brown outside. Stem simple, hairy. Leaves large, hairy. Flowers cream-coloured, disposed in short, terminal, twin racemes.

Cordate-leaved Comfrey. Fl. May, July. Clt. 1813. Pl. 1 to 1½ foot.

§ 1. *Roots fibrous.*

7 S. orienta'le (Lin. spec. 195.) stem branched, hairy; leaves ovate-oblong, acuminated, petiolate, hairy above, and villous beneath: upper ones narrowed at the base: floral ones opposite, sessile; calyx 5-cleft, tubular at the base; segments of corolla ovate, acute. 4. H. Native of the north of Tauria; and

near Constantinople, on the banks of rivulets. Willd. enum. 1. p. 183. Sims, bot. mag. 1912. Lehm. asper. 2. p. 345. Pall. cat. fl. taur. in act. petrop. 1792. p. 306. Bieb. fl. taur. 1. p. 129.—Tourn. itin. 2. p. 243. t. 14. cor. p. 7.—Buxb. cent. 5. t. 68. Plant hairy. Corollas white, size of those of *S. officinàle*. Calycine segments linear, acute.

Oriental Comfrey. Fl. May, July. Clt. 1752. Pl. 2 feet.

8 S. Cauca'sicum (Bieb. fl. cauc. 1. p. 128.) stem branched, hairy; leaves ovate-lanceolate, attenuated at the base, half decurrent, clothed with soft hairs, canescent beneath: upper ones opposite; calyxes obtuse; limb of corolla campanulate. ♃. H. Native of Caucasus, among bushes at the river Terek, between Mosdok and Kisljar. Root branched, black. Plant hairy. Very like *S. officinàle*, but more soft. Stem angular, paniculately branched at apex. Calyx hispid. Corolla constantly blue.

Caucasian Comfrey. Fl. May, July. Clt. 1820. Pl. 2 feet.

9 S. Tau'ricum (Willd. act. scrut. berol. 3. p. 120. t. 6. f. 1. enum. 1. p. 184.) stem branched, hairy; leaves cordate-ovate, bluntish, petiolate, hairy, bullately wrinkled above: floral ones opposite, sessile; calyx 5-parted; lobes of corolla obtuse. ♃. H. Native of the south of Tauria, and Caucasus. Curt. bot. mag. 1787. S. orientàle, Bieb. fl. cauc. 1. p. 129. ?—Tourn. itin. ed. germ. 2. p. 337. t. 35. Jacq. eclog. p. 119. t. 81. Stem branched. Plant hairy. Corolla milk-white.

Var. β, bullàtum (Jacq. eclog. 119. no. 81. Horn. suppl. hort. hafn. p. 13. Ledeb. in Schrad. journ. 4. p. 60.) leaves bullate, unequal at the base; corollas rather swollen. ♃. H. Native of Caucasus. Stems dotted with red. Corolla pale yellow, or cream-coloured.

Taurian Comfrey. Fl. May, July. Clt. 1806. Pl. 1½ to 2 feet.

10 S. aspe'rrimum (Bieb. fl. cauc. 1. p. 129.) stems branched, muricated; leaves ovate, cordate, acuminated, running into the petioles, hairy above, and strigose beneath: upper ones opposite, nearly sessile; calyx muricated, acute; limb of corolla campanulate. ♃. H. Native of Caucasus and Tauria, on the margins of rivulets. Willd. enum. 1. p. 183. Curt. bot. mag. t. 929. S. ásperum, Lepechin, nov. act. petrop. vol. 14. p. 444. S. orientàle folio subrotundo aspero, flore cæruleo, Tourn. cor. p. 7. Root black. Plant tall, and very rough, but beautiful when in blossom. Stem beset with retrograde strigæ. Corollas downy outside, red before expansion, afterwards blue. Leaves broad.

Var. β, hýbridum (Loud. hort. brit. p. 54.) This is a smaller variety, and appears to be a hybrid between *S. orientàle* and *S. aspérrimum*.

Very rough Comfrey. Fl. May, Sept. Clt. 1799. Plant 5 to 7 feet.

† *Species hardly known.*

11 S. echina'tum (Ledeb. cat. hort. dorp. suppl. 1811.) leaves muricated: lower ones cordate: floral ones sessile, nearly opposite; calyx spreading, twice shorter than the tube of the corolla; stem much branched. ♃. H. Native country unknown.

Echinated Comfrey. Pl. 2 feet?

12 S. racemòsum (Stephan, in Willd. herb. ex Rœm, et Schultes, syst. 4. p. 752.) leaves ovate, sessile; racemes very long, erect. ♃. H. Native of Persia.

Racemose-flowered Comfrey. Pl.

What are Symph. læ've, Bess. cat. hort. crem. suppl. 1812? Symph. intermèdium, Fisch. cat. hort. goreinki? and *S. peregrìnum*, Ledeb. ?

Cult. All the species of *Comfrey* are extremely hardy, and will grow in any soil and situation. Some are very handsome border flowers; and are well fitted for woods or shrubberies, as they will grow under the shade of trees or shrubs. They are easily increased by dividing at the root in Spring; or by seeds, but the former mode is preferable.

VIII. COLSMA'NNIA (named after John Colsmann, a professor at Copenhagen; author of Prodromus descriptionis Gratiolæ Hafn. 1793. 8vo.) Lehm. mag. berol. ges. nat. freund. 8. p. 92. t. 4. asper. p. 3. and 356.

Lin. syst. *Pentándria, Monogýnia.* Calyx petaloid, pentagonal, 5-parted. Corolla cylindrically-campanulate, with a naked throat. Anthers sagittate, distinct. Nuts 4, 1-celled, ovate-triangular, fixed to the bottom of the calyx, perforated at the base.—A hairy plant, with yellow, pedicellate flowers, which are disposed in terminal racemes.

1 C. fla'va (Lehm. l. c.) ♃. H. Native of the Levant. Root brown outside. Stems numerous, erect, simple, beset with adpressed, yellowish, soft hairs, like all other parts of the plant. Leaves obovate-lanceolate, bluntish, attenuated at the base, silky: lower ones petiolate. Flowers pedicellate, disposed in terminal racemes, drooping before florescence, secund: lower ones furnished with lanceolate bracteas. Calyx unequal. Corollas yellow, downy outside. Style purplish.

Yellow-flowered Colsmannia. Pl. ½ foot.

Cult. This plant will answer very well as a low border flower: it will grow well in common garden soil; and will be easily propagated by dividing at the root, or by seed. As the plant is rare, some of it should be grown in pots, so that it may be protected in winter.

IX. STOMOTE'CHIUM (from στομοω, *stomoo*, to close the mouth; and εχιον, *Echion* Bugloss. This genus differs from *E'chium* in the mouth of the corolla being closed by vaulted processes.) Lehm. asper. 4. and 395.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-angled, 5-cleft. Corolla tubularly-cylindrical; throat closed by roundish, fleshy, muricated processes. Anthers oblong, inclosed. Nuts 4, 1-celled, roundish, fixed to the bottom of the calyx, perforated at the base.—A shrubby, scabrous plant.

1 S. papillòsum (Lehm. asp. p. 396.) ♄. G. Native of the Cape of Good Hope. Stem and branches angular, smooth below, and roughish above. Leaves alternate, sessile, almost half stem-clasping, linear-lanceolate, obtuse, stiff, with revolute edges, scabrous from papillæ, especially above; papillæ white, hispid in the young state. Flowers contiguous, nearly sessile, secund, small, with an ovate, hispid bractea to each, disposed in spicate racemes, terminating the branches, erect, constituting terminal panicles.

Papillose Stomotechium. Shrub.

Cult. A mixture of loam, sand, and peat, is a good soil for this shrub; and cuttings may be rooted in the same kind of soil under a hand-glass; but the surest way of increasing it, is by layering down the young shoots, having a little nick cut in each shoot so layed. Seeds are sometimes produced, by which the plant may be reared.

X. ONO'SMA (from ονος, *onos*, an ass; and οσμη, *osme*, smell; grateful to the ass.) Lin. gen. no. 187. ed. Schreb. no. 247. Gærtn. fruct. 1. p. 326. t. 67. Juss. gen. 130. ed. Usteri, p. 146. Lehm. asper. p. 4. and 366.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla tubularly-campanulate; throat naked. Anthers sagittate, connected together by the bases of the lobes. Nuts 4, 1-celled,

ovate, stony, fixed to the bottom of the calyx, imperforated at the base.—Small, suffruticose, scabrous, canescent plants, with crowded, lanceolate, or linear leaves; and terminal racemes of large, yellow, secund, usually drooping flowers.

* *Hairs or bristles stellate, rising from tubercles.*

1 O. fruticòsum (Labill. pl. syr. dec. 3. p. 10. t. 6.) stem shrubby, much branched, hoary; leaves obovate-oblong, hispid from bristles; flowers generally solitary, terminal, nutant. ♄. F. Native of Persia, in the province of Djilan; and of the Island of Cyprus, on Mount Santa Cruz. Smith, fl. græc. t. 174. Lehm. in nov. act. hafn. 1808. t. 1. asper. p. 361. Corolla twice as long as the calyx, tubular, sulphur-coloured, an inch long; teeth short, acute, reflexed. Calycine segments hispid, linear-lanceolate. Style purple. Genitals exserted.

Shrubby Onosma. Shrub 1 to 1½ foot.

2 O. angustifòlium (Lehm. asper. p. 361.) strigose; stems simple; leaves linear, canescent: lower ones sheathing: upper ones dilated at the base; flowers nutant. ♃. F. Native of Apulia, among rocks. O. cinèreum, Sieb. fl. exsic.—Sabb. hort. rom. 2. t. 32.—Column. ecphr. t. 183. f. 2. Stems solitary or numerous. Leaves bluntish. Racemes solitary or twin, terminal. Flowers nearly sessile, propped by lanceolate, acuminated bracteas, which are subcordate at the base. Calyx pilose, silky, canescent; with linear, ciliated segments. Corolla yellow, ventricose above; teeth short, reflexed.

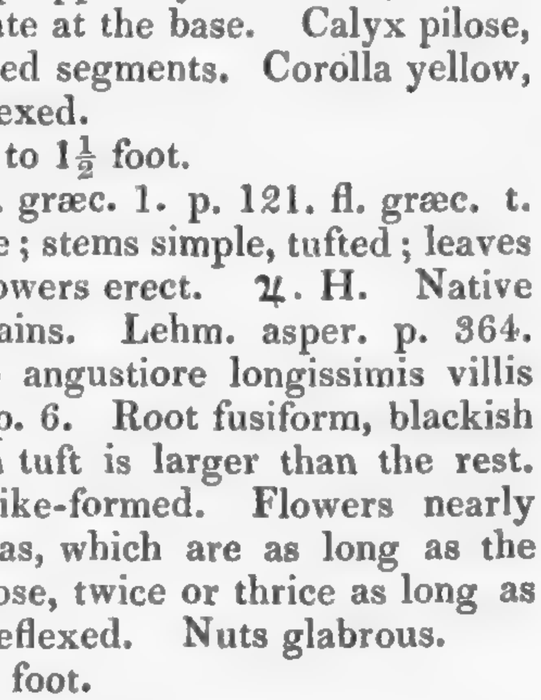
Narrow-leaved Onosma. Pl. ½ to 1½ foot.

3 O. erè'ctum (Smith, prod. fl. græc. 1. p. 121. fl. græc. t. 173.) tubercularly hispid or strigose; stems simple, tufted; leaves linear, a little broader at top; flowers erect. ♃. H. Native of Candia, on the higher mountains. Lehm. asper. p. 364. Sýmphytum Créticum, echii folio angustiore longissimis villis horrido, flore croceo, Tourn. cor. p. 6. Root fusiform, blackish brown. One of the hairs in each tuft is larger than the rest. Racemes terminal, conjugate, spike-formed. Flowers nearly sessile, propped by linear bracteas, which are as long as the calyxes. Corollas yellow, ventricose, twice or thrice as long as the calyxes; teeth obtuse, short, reflexed. Nuts glabrous.

Erect-flowered Onosma. Pl. ½ foot.

4 O. stellula'tum (Bieb. fl. cauc. 1. p. 132.) tubercularly hispid or strigose; stems aggregate; leaves lanceolate, obtuse: lower ones narrowed at the base: superior ones dilated at the base; flowers drooping. ♃. H. Lehm. asper. p. 364. Horn. hort. hafn. 1. p. 180. Stems solitary or many, from the same root. Racemes terminal, conjugate. Flowers pedicellate, propped by ovate-lanceolate bracteas. Calycine segments lanceolate-linear. Corolla citron-coloured, ventricose above; teeth bluntish, reflexed. Stigma capitate, emarginate. Nuts glabrous.

FIG. 34.



Var. α, stellulàtum (Waldst. et Kit. pl. hung. 2. p. 189. t. 173.) leaves broader, flat; the hairs less crowded than in β. Bieb. l. c. ♃. H. Native of Croatia, in the fissures of calcareous rocks; and of Caucasus, in subalpine, grassy, dry places (fig. 34.)

Var. β, Taúricum (Pall. ind. taur. in nov. act. petrop. 1792. p. 306. Bieb. fl. casp. p. 138. no. 11.) leaves narrower, with revolute edges, canescent from hairs. ♃. H. Native of Tauria, among calcareous rocks; Island of Candia and the Peloponnesus. Willd. nov. act. cur. berol. 2. p. 122. Sims, bot. mag. 889. O. montànum, Smith, prod. fl. græc. 1. p. 121. O. cinèreum, Schreber, in nov. act. nat. cur. 3. p. 474. O. orientàlis, Habl. taur. p. 116. Sýmphytum orientàle oleæ folio cinereo, Tourn. cor. p. 7.—Column. ecphr. 1. p. 182. t. 183. O. echioìdes, var. α, Lin. spec. 196. O. echioìdes, var. γ, Bieb. fl. cauc. 1. p. 131.

Starry-haired Onosma. Fl. April, June. Clt. α. 1819. β. 1801. Pl. ½ foot.

5 O. gigante'um (Lam. ill. no. 1840. Pers. ench. 1. p. 162.) tubercularly hispid or strigose; stem branched at top; leaves oblong-lanceolate: floral ones subcordate; calyxes clothed with white hairs; flowers drooping. ♃. F. Native of the Levant. Lehm. asper. p. 365. O. echioìdes, Pall. itin. 2. p. 463?. O. echioìdes, β, altíssima, Bieb. fl. cauc. 1. p. 130. fl. casp. p. 135. Rœm. et Schultes, syst. 4. p. 57. Stem erect, tetragonal. Lower leaves a foot long, attenuated at the base. Racemes terminal, solitary, or conjugate. Flowers distant, pedicellate. Calycine segments linear-lanceolate. Corolla pale yellow. Stamens inclosed. Style purple. Stigma somewhat 2-lobed. Nuts glabrous.

Giant Onosma. Fl. March, June. Clt.? Pl. 3 to 4 feet.

6 O. rígidum (Ledeb. fl. alt. 1. p. 180. fl. ross. alt. ill. t. 238.) tubercularly-hispid, or strigose; stem much branched at the base; leaves lanceolate, acute; flowers erect. ♃. F. Native of the south of Tauria, in dry, stony places, between Jursuph and Nikita. Root woody, brown. Stems many from the same root, tufted, prostrate at the base. One of the hairs in each fascicle is much longer and stiffer than the rest. Racemes terminal, solitary, or twin. Flowers pedicellate, propped by linear-lanceolate bracteas, which are as long as the calyxes. Calycine segments linear-lanceolate, acute. Corolla pale yellow, swollen towards the top; teeth short, bluntish, reflexed. Stamens a little exserted. Stigma 2-lobed. Nuts glabrous. Nearly allied to *O. gigantèum*; but differs in the smaller stature, in the want of subcordate leaves, and in the flowers being erect.

Rigid-haired Onosma. Fl. Aug. Pl. ½ to 1 foot.

* * *Hairs or bristles solitary, not stellate, as in the preceding division.*

7 O. echioìdes (Lin. spec. 196.) tubercularly hispid or strigose; hairs or strigæ erect; stem much branched; leaves spatulate-lanceolate: floral ones, or bracteas, ovate-cordate; nuts glabrous, shining. ♃. H. Native of the south of Europe and Iberia, in gravelly, arid, stony places. All. pedem. 1. p. 51. Vill. dauph. 2. p. 453. Gærtn. fruct. 1. p. 326. t. 67. Desf. fl. atl. 1. p. 161. Sibth. et Smith, fl. græc. t. 172. Jacq. austr. 3. t. 295. Bieb. fl. cauc. 1. p. 131. Sut. fl. helv. 1. p. 107. Laper. abr. p. 89. D. C. syn. fl. fr. no. 2721. Baumg. fl. trans. 1. p. 127. O. echioìdes, β, Lin. spec. 197. Cerínthe echioìdes, Scop. fl. carn. ed. 2d. vol. 1. p. 129. Lin. spec. ed. 1. vol. 1. p. 137. Hort. cliff. p. 48. no. 1.—Plenck, icon. t. 81.—Gmel. sib. 4. p. 76. no. 18. t. 40.—Sabb. hort. rom. 2. t. 32.—Mor. hist. 3. sect. 11. t. 27. f. 1.—Anchùsa lùtea, Dalech. hist. 1102. Sým-

FIG. 35.

phytum echii folio ampliore, radice rubrâ, flore luteo, Tourn. inst. p. 138. Root brownish-red, woody. Stems numerous, diffuse. Radical leaves crowded, tapering into the petioles; cauline ones sessile, broader. Racemes terminal, conjugate. Flowers drooping, pedicellate. Calyx very hispid, with linear-lanceolate, equal segments. Corolla pale yellow, swollen above; teeth recurved, acute. Anthers a little exserted. Stigma obtuse, emarginate. (fig. 35.)

Var. β, *arenàrium* (Lehm. asper. p. 367.) flowers oblique; corolla cylindrically clavate: lower leaves lanceolate, obtuse; fruit erect; stamens very smooth. 4. H. Native of Hungary, in sandy places. O. arenàrium, Waldst. et Kit. hung. 3. p. 308. t. 279. Schultes, fl. austr. no. 764.

Var. γ; branches shorter; leaves narrower. Bieb. l. c. 4. H. Native of Caucasus, in the Caspian desert; and at the lower Volga.

Var. δ; plant dwarf, branched; hairs of the stem and leaves whitish; corollas pale. Bieb. l. c. 4. H. Native of the south of Tauria, on stony hills.

Bugloss-like Onosma. Fl. May, June. Clt. 1683. β. 1804. Pl. 1 to 1½ foot.

8 O. echina'tum (Desf. fl. atl. 1. p. 161. t. 43.) tubercularly hispid or strigose; hairs or strigæ spreading; stem branched at top; leaves narrow-lanceolate: floral ones linear-lanceolate; nuts tubercularly wrinkled. ♂. H. Native of Barbary, in sandy deserts near Cafza. Lehm. asper. p. 368. Plant hispid from numerous white, pungent hairs. Radical leaves running into the petioles at the base: cauline ones sessile. Racemes terminal. Flowers pedicellate. Calycine segments linear-lanceolate, bluntish. Corolla yellow, a little longer than the calyx, tubularly campanulate; teeth reflexed.

Echinated Onosma. Pl. ½ to 1 foot.

9 O. setòsum (Led. fl. alt. 1. p. 181. fl. ross. alt. ill. t. 196.) tubercularly hispid; bristles or strigæ spreading; stem branched at top; leaves glabrous beneath, except the midrib: lower ones dilated at top: floral ones, or bracteas, ovate; nuts reticulately wrinkled. 4. H. Native in the plains about the Caspian Sea; and near Astrachan. Root simple, perpendicular, covered with violaceous bark. Superior cauline leaves lanceolate. Racemes terminal, solitary, or conjugate. Flowers pedicellate, drooping, at first approximate. Calycine segments lanceolate, acute. Corolla yellow, widened a little at apex; teeth short, reflexed. Anthers nearly inclosed.

Bristly Onosma. Pl. 1 foot.

10 O. tinctòrium (Bieb. fl. casp. append. p. 136. fl. cauc. 1. p. 132.) tubercularly-hispid, or strigose; hairs or strigæ spreading; stem much branched; leaves lanceolate: superior ones dilated at the base; filaments very short. 4. H. Native of Tauria, in pastures in the vicinity of the Bosphorus. Lehm. asper. 370. Root simple, blackish, covered with copious red pigment, which stains paper a violet-colour. Leaves with revolute edges; radical ones very long, narrow-lanceolate, obtuse, narrowed towards the base: cauline ones sessile. Racemes terminal, and from the axils of the upper leaves, pedunculate. Flowers on short pedicels, propped by ovate bracteas. Calyx very pilose, hoary at length, hispid: with linear-lanceolate segments. Corolla yellow; teeth bluntish, erectly spreading. Stigma capitate. Nuts glabrous, shining, marbled.

Var. α; corollas at first white, then citron-coloured. Bieb. l. c. 4. H.

Var. β; corollas at first white, then violaceous. 4. H. Native of Caucasus, in plains at the river Terek; and in fields at the river Don.

Dyer's Onosma. Fl. April, July. Clt. 1826. Pl. ½ to 1 foot.

11 O. rupe'stre (Bieb. fl. cauc. 1. p. 132.) tubercularly hispid, or strigose; hairs or strigæ spreading; stems very simple, livid; leaves linear-lanceolate, bluntish, glabrous beneath, except the midrib. 4. H. Native of Iberia, on rocks about Tiflis. Lehm. asper. p. 370. O. tenuifòlium, Willd. spec. 1. p. 775. Stems aggregate, ascending. Leaves rather revolute on the edges. Radical leaves 3-6 inches long, attenuated at the base: cauline ones sessile: upper ones linear, dilated at the base. Racemes terminal, conjugate, or ternate. Flowers pedicellate, bracteate. Calycine segments linear. Corolla somewhat ventricose; teeth ovate, acutish, erectly spreading, at length reflexed. Stamens inclosed; anthers longer than the filaments. Nuts glabrous, shining, marbled.

Rock Onosma. Fl. April, June. Clt. 1819. Pl. ½ to 1½ foot.

12 O. saxa'tile (Pall. itin. 3. append. no. 72. t. F. f. 1. Lehm. asper. p. 371.) tubercularly-hispid, or strigose; bristles or strigæ spreading; leaves narrow-lanceolate, obtuse; racemes very long; tube of corolla filiform, very long; limb wide. 4. H. Native of Siberia, in rocky, arid places. Anchùsa saxátilis, Lam. ill. no. 1822. Root perpendicular, simple. Flowers on short pedicels, propped by bracteas. Calycine segments linear, connivent. Corolla salver-shaped, downy outside; limb small, funnel-shaped, 5-cleft: lobes roundish. Nuts ovate, gyrose.

Rock Onosma. Pl. 1 foot?.

13 O. divarica'tum (Lehm. asper. p. 372.) hispid or strigose; hairs or strigæ spreading, pellucid; stem branched; branches divaricate; leaves lanceolate, attenuated at both ends; racemes leafy. ⊙. H. Native in sandy places, towards the Caspian Sea. O. orientàlis, Pall. itin. 2. append. no. 100. in a note. Root perpendicular. Leaves sessile, strigosely ciliated; radical ones opposite. Flowers pedicellate, distant, bracteate. Calycine segments linear-subulate. Corolla having the tube cylindrical, almost as long as the calyxes, thickened under the limb, clothed with fine villi; limb short, 5-cleft: lobes obtuse. Stamens inclosed. Nuts ovate, subtrigonal, wrinkled.

Divaricate Onosma. Fl. April, June. Clt. 1818. Pl. ½ to 1 foot.

14 O. micra'nthos (Pall. itin. 2. append. no. 100. t. L.) stem branched, divaricate; leaves all on long petioles, hoary and hispid beneath, naked above; racemes terminal, compound, bractless. ⊙. H. Native of Siberia, at the Irtysch; also between the Jaik and Volga, in sandy places. Lam. ill. no. 1840. Willd. spec. 1. p. 775. Lehm. asper. p. 373. Ledeb. fl. alt. 1. p. 182. Root simple, perpendicular, yellow. Stems nearly glabrous. Leaves ovate-oblong. Panicles subdichotomous. Corolla small, purplish, contracted and 5-toothed at the mouth. Anthers inclosed. Nuts naked, oblong-linear, triquetrous, hispid. This species differs from all others in the leaves being on long petioles; in the racemes being terminal, compound, and bractless.

Small-flowered Onosma. Pl. ½ to 1 foot.

15 O. rostella'tum (Lehm. asper. p. 374.) hispid or strigose; leaves lanceolate, attenuated at both ends, hispid from pili or strigæ; flowers erect; corollas cylindrical, deeply 5-cleft: with subulate, conniving segments; stamens exserted. 4. H. Native of the Levant, where it was gathered by Tournefort. Stem erect, branched at top. Leaves sessile, strigosely ciliated on the margins. Racemes terminal, 2-3-flowered, somewhat capitate. Flowers on short pedicels, bracteate. Calycine segments linear-subulate. Corolla tubular, cylindrical, 5-cleft, length of calyxes.

Beaked Onosma. Pl. ½ foot?.

16 O. Syrìacum (Labill. pl. rar. syr. dec. 3. p. 8. t. 5. β. f. 5.) pilose; leaves ovate-lanceolate, denticulated, pilose, or strigose; racemes many-flowered; corollas cylindrical, 5-toothed: teeth reflexed; anthers exserted. ♃. H. Native of Syria, near Tripoli. Lehm. asper. p. 375. Leaves sessile, glandularly denticulated, ciliated. Flowers longer than the pedicels. Calycine segments linear, acute. Corolla blue, 5-cleft; segments acute. Nuts small, muricated, ex Labill.

Var. β; leaves narrow-lanceolate.

Syrian Onosma. Pl. 1 to 1½ foot.

17 O. orienta'le (Lin. spec. 196.) leaves lanceolate: superior ones ovate, hispid from pili or strigæ; racemes few-flowered; corolla cylindrical, drooping, 5-toothed: teeth erect; anthers inclosed. ♃. H. Native of the Levant. Lehm. asper. p. 376. nov. act. soc. reg. hafn. l. c. t. 2. Willd. spec. 1. p. 773. O. frutéscens, Lam. ill. no. 1837. Cerínthe orientàlis, Lin. amœn. 4. p. 267. no. 16. Sýmphytum orientàle quartum, echii folio minore, flore nunc albo, nunc flavescente, Tourn. cor. p. 6. Stems many, rising from a short, woody stipe. Lower leaves sessile: upper ones half stem-clasping. Racemes terminal, twin, 2-3-flowered. Flowers on short pedicels, propped by lanceolate bracteas. Calyx hispid; segments lanceolate, acute, spreading. Corolla yellow, twice as long as the calyx; teeth lanceolate, acute, spreading. Style purplish; stigma subcapitate.

Eastern Onosma. Fl. May, June. Clt. 1752. Pl. ½ foot.

18 O. simplici'ssimum (Lin. spec. 196. mant. 333.) stems much branched at the base; sterile branches prostrate: floriferous ones erect; leaves linear, acutish, strigose, silky, and canescent beneath; corolla clavate or ventricose: teeth reflexed. ♃. H. Native of Siberia, Iberia, and the plains of the river Don. Bieb. fl. cauc. 1. p. 133. fl. casp. append. p. 137. Lehm. asper. 377. Curt. bot. mag. 2248. Ledeb. fl. alt. 1. p. 183. Pall. ind. fl. taur. in nov. act. petrop. 1792. p. 306. O. Sibíricum, Lam. ill. no. 1836. O. símplex, Gærtn. fruct. 1. p. 325. Branches simple. Leaves crowded, sessile, half stem-clasping. Racemes twin, terminal. Flowers on short pedicels, propped each by an erect, cordate bractea. Corolla ventricose, inflated above, pale yellow, contracted at the mouth. Stamens inclosed. Stigma capitate, somewhat 2-lobed.

Very simple-stemmed Onosma. Fl. April, June. Clt. 1768. Pl. ½ to 1 foot.

19 O. Gmelìni (Ledeb. fl. alt. 1. p. 184. fl. ross. alt. ill. t. 280.) tubercularly hispid or strigose; hairs or strigæ spreading; stems simple, ascending; cauline leaves spatulate-lanceolate, rounded at apex: floral ones, or bracteas, ovate-lanceolate, acute; corolla twice as long as the calyx; anthers exserted. ♃. H. Native of Siberia, frequent among rocks between Butakowa and Tscheremschamka; and from Buchtarminsk, even to the lake called Noor Saisan.—Gmel. sib. 4. p. 76. no. 18. t. 40. Stems many, from the same root. Racemes terminal, twin, rarely 3. Calycine segments linear-lanceolate, acute, very hispid. Corolla pale sulphur-coloured, a little contracted at top; teeth ovate, acute, reflexed. Nuts wrinkled.

Gmelin's Onosma. Pl. ½ to 1½ foot.

20 O. polyphy'llum (Ledeb. fl. alt. 1. p. 182. fl. ross. alt. ill. t. 24. Spreng. syst. 1. p. 550.) silky; hairs prostrate or adpressed; stems tufted; floriferous branches simple, erect; leaves crowded, oblong-linear, nerveless, with revolute margins; flowers drooping; corolla clavate, with a 5-toothed mouth. ♃. H. Native of the South of Tauria, among calcareous rocks. Leaves erect, 2-3 inches long, linear, or lanceolate-linear, acute, attenuated towards the base, silky on both surfaces: lower ones crowded: superior ones more remote, broadest at the base. Racemes terminal, conjugate, many-flowered. Flowers pedicellate, bracteate. Calyx about the length of the bracteas, with linear segments. Corolla sulphur-coloured; teeth ovate, acutish, reflexed. Tips of anthers exserted. Stigma 2-lobed. Nuts ovate, beaked, glabrous, shining.

Many-leaved Onosma. Pl. ½ to 1 foot.

21 O. trine'rvium (Lehm. asper. 378.) stem quite simple, leafy; leaves linear-lanceolate, very long, acute, 3-nerved, hispid above, and clothed with incumbent hairs beneath. ♃. S. Native of tropical America. Stem hispid from pili, divided into racemes at top. Leaves sessile. Racemes terminal, bracteate; bracteas linear-lanceolate, longer than the calyxes. Calycine segments linear-lanceolate. Corolla pilose outside, pale yellow, with a 5-toothed mouth. Anthers pilose, inclosed. Style purplish; stigma capitate. Nuts ovate, obtuse, glabrous, shining.

Three-nerved-leaved Onosma. Clt. 1824. Pl. 1 foot.

22 O. seríceum (Bieb. fl. cauc. 1. p. 133.) stems branched; leaves petiolate, oblong-lanceolate, acute, canescent, clothed with silky hairs: hairs prostrate or adpressed; corollas twice as long as the calyx. ♃. H. Native of Iberia, on rocky mountains in the vicinity of Tiflis. Willd. spec. 1. p. 774. Lehm. asper. p. 379. Stem woody at the base, clothed with white down. Leaves silky: radical and lower cauline ones petiolate: superior ones sessile, spatulately-lanceolate. Racemes terminal, and from the axils of the superior leaves, clothed with silky villi, bracteate. Flowers pedicellate. Calycine segments lanceolate, acute, of which 2 are often combined, almost to the apex. Corolla twice as long as the calyx, wide at top, villous outside; teeth reflexed. Anthers inclosed, connected at the base. Style purplish; stigma subcapitate. Nuts not seen.

Silky Onosma. Fl. June, July. Clt. 1752. Pl. ½ to 1 foot.

23 O. tricerospe'rmum (Lag. nov. gen. et spec. p. 10.) strigose; flowers drooping, longer than the calyx; nuts 3-horned. ♃. H. Native of Spain, very common about Madrid, Pedro, Munnoz, Tobosa, Albacele, and elsewhere; in New Castile; also in Murcio, by way sides, and in waste places, where it is called *Ojo de Lobo*. This species differs from all others in the 3-horned nuts.

Three-horned-fruited Onosma. Fl. April, June. Clt. 1824. Pl. ½ foot.

24 O. macroce'phala (D. Don, prod. fl. nep. p. 99.) very hispid from strigæ; leaves lanceolate, acute, soft beneath, 3-nerved: stem ascending, simple; racemes aggregate, terminal; calycine segments linear-plumose, longer than the corolla; genitals inclosed. ♃. F. Native of Sirinagur, where it is called *Lalgiri* by the natives. O. bracteàtum, Wall. fl. ind. 2. p. 13. Leaves soft and silky beneath, but hispid above. Racemes short, glomerate. Bracteas ovate, cuspidate, equal in length to the calyxes. Corolla tubular, yellow, silky outside.

Large-headed Onosma. Pl. 2 to 3 feet.

25 O. Emòdi (Wall. fl. ind. 2. p. 11.) procumbent, strigose; bristles or strigæ spreading; leaves lanceolate, triple-nerved, less hairy beneath; racemes terminal, solitary; bracteas linear, not half so long as the flowers; calyx 5-cornered, with ovate segments; corolla ventricose, 5-keeled, contracted towards the mouth; anthers longer than the filaments, inclosed; style exserted: stigma annular. ♃. F. Native of Nipaul, in Gosaingsthan, where it is called by the natives *Maharanga*. Root branched, covered with deep purple bark. Stem slender, divided into simple branches at top. Leaves sessile, varying in size, mostly lanceolate, 3-5 inches long. Racemes 2 inches long. Corolla pale bluish, the base inverted over the ovarium; segments ovate, acute. Filaments inserted in as many villous protuberances. Nuts dotted and tubercled, keeled on the inner

side, ending in a compressed, short beak. The root is used as a material for dyeing blue, and is imported from Gosainsthan; probably also from Thibet as a drug, under the native name *Maharanga*, meaning in Sanscrit a strong, intense colour.

Emodi Onosma. Fl. Aug. Dec. Pl. 1 to 2 feet.

26 O. vestìtum (Wall. cat. no. 937.) stems simple, erect, densely clothed with spreading, yellowish hair; leaves lanceolate, acute, clothed with soft, silky pili: radical ones crowded; racemes terminal, and from the axils of the upper leaves, subcorymbose; pedicels as long as the flowers, and are, as well as the calyxes, densely clothed with pili; corolla swollen, with a contracted, 5-toothed mouth, twice as long as the calyx; anthers inclosed. ♃. H. Native of Nipaul, in Gosaìnsthan. Stems many, from the same root. Calycine segments linear-lanceolate. Corolla apparently purple, with reflexed teeth.

Clothed Onosma. Pl. 1½ foot.

27 O. hi'spidum (Wall. cat. no. 938.) hispid from long strigose pili; leaves long-lanceolate, bluntish, sessile: upper ones elliptic or ovate-lanceolate; racemes terminal, and from the axils of the upper leaves; corolla twice as long as the calyx, tubular, widened towards the top. ♃. H. Native of Kamaon. Stems simple, many from the same root. Calyx, pedicels, and bracteas very hispid. Calycine segments linear-lanceolate. Corolla yellow or purplish ?. Style exserted.

Hispid Onosma. Pl. 1½ to 2 feet.

28 O. bi'color (Wall. cat. no. 939.) hispid from white, strigose pili; stem branched at top; leaves elliptic-lanceolate, tapering to both ends: radical ones subspatulate, 3-nerved; racemes terminal, solitary, or twin; bracteas and calycine segments ovate-acuminated; flowers nearly sessile; corolla swollen, contracted at the mouth, half as long as the calyx? two-coloured. ☉. H. Native of the East Indies. Radical leaves rosulate.

Two-coloured-flowered Onosma. Pl. 1 foot.

Cult. All the species of this genus are extremely handsome when in blossom. Most of them being natives of rocks or sandy deserts, they answer well to be grown on rockwork, or on wall tops, in which situations the seeds should be sown, where the species will afterwards maintain themselves if allowed to scatter their seeds. In common they are short-lived and apt to rot. They do, however, very well in pots, among other alpine plants; and cuttings of them may be rooted under a hand-glass.

XI. ONOSMO'DIUM (so called from its similarity to *Onósma*.) Michx. fl. bor. amer. 1. p. 132. Pursh. fl. amer. sept. 1. p. 132. Púrshia, Lehm. asp. p. 4. and p. 382. Lithospérmum species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla tubularly campanulate, with a naked throat; limb ventricose; segments conniving. Stamens inclosed; anthers sagittate, distinct. Style exserted. Nuts 4, 1-celled, turgid, shining, fixed to the bottom of the calyx, imperforated at the base. —Hispid, herbaceous plants, with terminal, drooping racemes, of white or cream-coloured flowers.

1 O. hi'spidum (Michx. fl. amer. bor. 1. p. 133.) hispid; leaves obovate-lanceolate, acute; segments of corolla subulate, acute. ♃. H. Native from New York to Carolina, on dry limestone rocks. Pursh, fl. 1. p. 132. Lithospérmum Virgínicum, Lin. spec. p. 190. Willd. spec. 1. p. 752. Lam. ill. p. 397. no. 1783. Mill. dict. no. 2. Púrshia híspida, Lehm. asper. p. 382.—Mor. hist. 3. p. 447. sect. 11. t. 28. f. 3. Leaves dotted from papillæ. Racemes short, revolute. Flowers yellowish-white, similar to those of *Sýmphytum.*

Hispid Onosmodium. Fl. June, Aug. Clt. 1759. Pl. 1 foot.

2 O. mólle (Michx. l. c. t. 15. Pursh, l. c.) plant clothed with white villi; leaves oblong-ovate, somewhat triple-nerved; segments of corolla suboval, obtuse. ♃. H. Native of the western counties, from Pennsylvania to Tennessee. Lithospérmum Caroliniànum, Lam. ill. 1. p. 397. Púrshia móllis, Lehm. asp. 383. Lithospérmum mólle, Muhl. cat. pl. amer. p. 19. Leaves approximate, acutish. Racemes short, terminal, nodding. Calycine segments acute. Corollas white.

Soft Onosmodium. Fl. June, Aug. Clt. 1812. Pl. 1 foot.

3 O. sca'brum (Rœm. et Schultes, syst. 4. p. 57.) leaves elliptic, somewhat triple-nerved, scabrous, obtuse; hairs adpressed, somewhat tubercular at the base; segments of corolla acuminately subulate, acute. ♃. H. Native of Virginia?: and on hills in the prairies of the Red River, and on the uplands of the Arkansas, frequent. Flowers axillary at the tops of the stems, on short pedicels. Calycine segments linear-lanceolate, acute, one-half shorter than the corolla. Corollas testaceous in the dried state, smaller than those of *O. híspidum.*

Scabrous Onosmodium. Pl. 1 foot.

4 O. strigòsum; stem nearly simple, erect; leaves lanceolate, 3-nerved, hispid from strigæ; corolla tubularly clavate, clothed with strigose down: lobes acute. ♃. F. Native of Mexico, in meadows near Pascuaro. Onósma strigòsum, H. B. et Kunth, nov. gen. 3. p. 93. Stem very hispid. Leaves acute, 2 inches long, and ½ an inch broad. Racemes terminal, twin, leafy, nearly 2 inches long. Calyx hispid, with lanceolate, linear, acuminated segments. Corolla white, a little longer than the calyx. Very nearly allied to *Onosmòdium mólle.*

Strigose Onosmodium. Pl. 1 foot.

Cult. See *Onósma* p. 316, for culture and propagation.

XII. PULMONA'RIA (so named from its being supposed to be a good remedy in disorders of the lungs (pulmones); or, according to some, from the spots on the leaves resembling those on some diseased lungs.) Tourn. inst. t. 55. Lin. gen. no. 184. Juss. gen. p. 130. Schreb. gen. no. 244. Lehm. asper. p. 3. 275.—Cerinthoìdes, Bœrh.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft, prismatically pentagonal, but campanulate while in fruit. Corolla funnel-shaped, with a pervious pilose throat. Nuts 4, 1-celled, turbinate, fixed to the bottom of the calyx, imperforated at the base.—Herbaceous plants with spotted leaves, and terminal corymbose racemes of flowers. Radical leaves petiolate; cauline ones sessile.

1 P. officina'lis (Lin. spec. 194.) calyx length of the tube of the corolla; leaves scabrous; radical ones ovate-cordate, cauline ones ovate-oblong, sessile. ♃. H. Native throughout Europe and Caucasus, in shady woods. Found by Mr. Goodyer in a wood by Holbury-House, in the New Forest, Hampshire; and in Flintshire, on the ruins of the monastery of Maes Glas. Smith eng. bot. t. 118. Oed. fl. dan. t. 482. Drev. et Hayne, t. 14. Plenck. off. t. 73. Woodv. med. bot. 2. t. 212. Svensk, bot. 3. t. 135. Blackw. t. 376. Sabb. hort. 2. t. 26. Ludw. eat. t. 45. P. altera, Matth. 1040. Cam. epit. t. 784. P. maculòsa, Lob. obs. 317 icon. 586. P. latifòlia maculàta, Park. par. 251.—Mor. hist. 3. sect. 11. t. 29. f. 8. P. Italorum ad Buglossum accedens, Tourn. inst. p. 136. Root thick, black. Leaves spotted with white, scabrous from strigæ. Flowers terminal. Calyx hairy, brownish-green, with lanceolate acute segments. Corollas red before expansion, then violaceous. The leaves, which are the part recommended in medicine, have no peculiar smell; but in their recent state manifest a slightly astringent and mucilaginous taste; hence they are supposed to be demulcent and pectoral, and have been used in hemoptoes, tickling coughs, and catarrhal defluxions upon the lungs. The name of *Pulmonària* seems, however, to have arisen rather from

the speckled leaves of some species, than from any intrinsic quality which experience has discovered to be useful in pulmonary complaints. Most plants of the order are more mucilaginous than this, which, according to Linnæus, when burnt, affords frequently one-seventh of its weight in ashes.

Var. β, albiflòra; flowers white. ♃. H. Native of Europe. P. vulgaris latifòlia flore albo, Bauh. pin. 259. Tourn. inst. p. 136.

Var. γ, immaculàta; leaves without spots, green. ♃. H. P. non maculosofolio, Clus. hist. 2. 169. 2. Bauh. pin. 260. Knor del. rom. 2. t. p. 2. Knip. cent. 1. no. 72.

Officinal Lungwort. Fl. May. Britain. Pl. 1 foot.

2 P. angustifòlia (Lin. spec. 194. fl. suec. no. 164.) calyxes length of the tube of the corolla; leaves oblong-lanceolate, or lanceolate, clothed with soft down-like hairs, cauline ones half stem-clasping. ♃. H. Native of Portugal, Hungary, Switzerland, Denmark, Sweden, and Siberia, but more rare than *P. officinàlis;* in England, in the same places as mentioned for *P. officinàlis.* Oed. fl. dan. t. 483. Smith eng. bot. t. 1628. St. Hil. livr. 40. t. 7. Lehm. asper. p. 275.—Bocc. mus. 110. t. 86.—Park. par. 248. 3. t. 251. f. 2.—Gmel. sib. 4. p. 73. no. 6.—Mor. hist. 3. sect. 11. t. 29. f. 15.—Clus. hist. 2. p. 169. icon. Stem hairy. Racemes twin, capitate. Calyx inflated, while bearing the fruit with lanceolate-acute segments. This is very nearly allied to *P. officinàlis*, and is only distinguished by the narrower spotless leaves. Corolla violaceous before expansion, and blueish-purple afterwards. There is also a variety with white flowers.

Var. γ, oblongàta (Lehm. asper. 275.) leaves a little shorter, broader, and blunter. ♃. H. Native of Europe. P. oblongàta. Schreb. in litt. P. angustifòlia, Baumg. fl. trans. 1. p. 124, Schultes, fl. austr. ed. 2nd. no 757. Lap. fl. pyr. p. 88. Gmel. fl. bad. 1. p. 424. Willd. enum. p. 105. Vill. dauph. 2. p. 451. All. ped. no. 175. D. C. syn. fl. gall. no. 2720. Sut. fl. helv. 1. p. 105. Roth. tent. fl. germ. 2. p. 212. Poll. pal. 1. p. 186.—Hall, helv. no. 596.

Narrow-leaved Lungwort. Fl. Apr. May. Britain. Pl. 1 foot.

3 P. mollis (Wulf. ex Horn. hafn. 1. p. 719. D. C. fl. fr. suppl. p. 420.) calyxes rather longer than the tube of the corolla; leaves ovate-oblong, half stem-clasping, clothed with downy tomentum: radical ones oblong-lanceolate. ♃. H. Native of Germany, Transylvania, Siberia, and the Pyrenees, in shady places. Poir. suppl. 4. p. 621. exclusive of P. angustifòlia, Pall. Baumg. fl. trans. 1. p. 125. Sims. bot. mag. 2422. Lehm. asper. p. 176. D. C. fl. fr. 6. p. 420. Rchb. icon. cent. 6. p. 4. t. 503. f. 696. P. angustifòlia, Besser, galic. 1. p. 150. exclusive of the synonymes. P. officinàlis, Patrin mss. P. officinàlis, γ, Lin. P. II. non maculoso folio Clus. hist. 2. p. 169. Knor. del. 2. t. p. 2. An intermediate plant between *P. officinàlis* and *P. angustifòlia*, covered all over with soft hairs. Peduncles shorter than the floral leaves. The recesses between the lobes of the corolla are wider than in *P. officinàlis.* Colour of flower the same as in the two preceding.

Soft Lungwort. Fl. April, May. Clt. 1805. Pl. ¾ foot.

4 P. grandiflòra (D. C. cat. hort. monsp. 1813, p. 135. icon. ined. t. 64.) calyxes length of the tube of the corolla; stamens inclosed within the tube; leaves spotted with white, downy, lower ones oblong-spatulate, superior ones ovate-cordate. ♃. H. Native country unknown; but probably of some part of Europe. P. maculàta, Diet. gart. lex. 7. p. 657. P. angustifòlia, hort. belg. P. angustifòlia, Poir. dict. 5. p. 735. ?—Mor. hist. 3. sect. 11. t. 29. f. 9. ? Flowers reddish before expansion, afterwards bluish-purple.

Great-flowered Lung-wort. Fl. April, June. Clt. 1819. Pl. 1 foot.

5 P. pube'scens (Willd. herb. ex Rœm. et Schultes, syst. 4. p. 744.) calyxes length of the tube of the corolla; leaves mucronate, veiny-nerved, glabrous above, clothed with downy tomentum beneath; radical ones ovate-petiolate: cauline ones ovate-sessile, or cordate, half stem-clasping. ♃. H. Native of Curil Islands, where it was collected by Steller and Pallas. Peduncles naked, terminal, bearing a fascicle of flowers at the apex. Calyx hairy, with lanceolate segments.

Downy Lung-wort. Fl. Apr. June. Clt. 1821. Pl. ½ to 1 foot.

6 P. azu`rea (Besser, fl. galic, 1. p. 250. Lehm. asp. 274.) calyx hardly so long as the tube of the corolla; leaves hispid from pili: radical ones oblong-lanceolate, acuminated, tapering into the petioles: cauline ones narrow-lanceolate, sessile; limb of corolla campanulate. ♃. H. Native of Galicia, Austria, and Hungary. P. angustàta, Schrad. Bessèra azùrea, Schultes, obs. bot. p. 27. oestr. fl. 2. ed. 1st, p. 735.—Mor. hist. 3. sect. 11. t. 29. f. 5. ? Pulm. III. Austrìaca, Clus. clxix. P. Clùsii, Baumg. fl. trans. 1. p. 123. Calyx campanulate; segments unequal, acute, keeled at the base; hence it is prismatically pentagonal. Corolla tubularly campanulate; tube red, cylindrical, somewhat tetragonal at the base, attenuated in the middle; segments of the limb roundish, spreading, blue. Flowers disposed in a corymbose terminal raceme; floriferous peduncles pendulous. Bracteas similar to the cauline leaves.

Azure-blue Lung-wort. Fl. Apr. Ju. Clt. 1823. Pl. 1 foot.

7 P. tuberòsa (Schrank, cat. hort. mon. 1814.) perhaps only a slight variety of P. officinàlis. ♃. H. Native country unknown.

Tuberous-rooted Lung-wort. Fl. April, May. Clt. 1824. Pl. ¾ foot.

Cult. All the species of *Pulmonària* are very pretty plants when in blossom; and being early flowerers they are rather desirable for borders. They are of the most easy culture, and will grow in any common garden soil, and are readily increased by division. Most of the species grow well under the drip of trees, and all do best in shady situations.

XIII. MERTE'NSIA (named after Prof. Mertens, of Bremen, author of a work on marine Algæ.) Roth. cat. 1. p. 34. Pers. ench. 1. p. 161.—Pulmonària species of Lin. and others.—Lithospérmum species of Lehm.

Lin. syst. *Pentándria, Monogýnia.* Calyx short, 5-parted. Corolla funnel-shaped; throat pervious, naked, or furnished with small, fleshy processes. Anthers oblong, inclosed. Nuts 4, 1-celled, ovate, smooth or wrinkled, imperforated at the base, fixed to the bottom of the calyx.—Elegant, trailing or erect, smooth glaucous plants. Racemes panicled or subcorymbose. Flowers blue, drooping. Radical leaves increasing after florescence, petiolate; cauline ones sessile.

1 M. panicula`ta; stem erect; leaves nerved, scabrous, acuminated: lower ones ovate-cordate: superior ones ovate-oblong; flowers panicled; calyx hispid from pili. ♃. H. Native of Hudson's Bay. Pulmonària paniculàta, Ait. hort. kew, 4. p. 181. Pursh. fl. amer. sept. 1. p. 131. Lithospérmum paniculàtum, Lehm. asp. p. 289. Peduncles glabrous, terminal, and axillary; at first sub-umbellate, then racemose. Lower leaves large. Corollas blue. Nuts ovate, trigonal, wrinkled, white, longer than the calyx. There is also a variety of this with white flowers.

Panicled-flowered Mertensia. Fl. May, June. Clt. 1778. Pl. 1½ foot.

2 M. Dahu`rica; stem erect; leaves obsoletely nerved, rather scabrous; radical ones ovate, obtuse: cauline ones lanceolate, acuminated; calyxes blunt, rather villous. ♃. H. Native of Dahuria. Pulmonària Dahùrica, Fisch. hort. gorenski. Sims. bot. mag. 1743. P. amœ`na, Stev. in litt. Lithospérmum Dahùricum, Lehm. asper. p. 296. P. grácilis, Willd. herb. ex

Rœm. and Shultes syst. 4. p. 747. Radical leaves sub-cordate, cauline ones half stem-clasping. Flowers in terminal, solitary, or conjugate racemes, blue or lilac. Peduncles from the axils of the upper leaves downy, pilose.

Dahurian Mertensia. Fl. May. Clt. 1812. Pl. 1 to 1½ feet.

3 M. pulmonarioìdes (Roth. catal. 1. p. 34.) stems erect; leaves nerved, quite glabrous: radical ones obovate-elliptic: cauline ones ovate-lanceolate, bluntish; racemes subcorymbose, many-flowered; calyxes glabrous. ♃. H. Native from Pennsylvania to Carolina, on the gravelly shores of rivers. Pulmonària Virgínica, Lin. spec. p. 194. Michx. fl. bor. amer. 1. p. 131. Pursh, fl. 1. p. 130. Horn. hort. hafn. 1. p. 179. Curt. bot. mag. 160. Mill. icon. 2. t. 212. Trew. pl. sel. t. 42. Lithospérmum púlchrum, Lehm. asper. p. 290.—Plukn. alm. t. 227. f. 6. Stem glabrous. Leaves glaucous-green, bluntish. Peduncles terminal, and from the axils of the upper leaves. Calyx small, of a greenish purple colour, as well as the peduncles and pedicels: with lanceolate, blunt, spreading segments. Corollas beautiful blue; tube villous inside at the base. There is also a white-flowered variety of this.

Lungwort-like Mertensia. Fl. March, May. Clt. 1699. Pl. 1 to 1½ foot.

4 M. margina'ta; small, glabrous, erect; leaves hispid on the margins: those on the lower part of the stem oblong-spatulate, or oblong-ovate: upper ones ovate, acute, half stem-clasping, all glabrous, glaucous, and rather fleshy; fascicles or racemes pedicellate, a little longer than the leaves, 4-5-8 or more flowered; calyx 5-parted, smooth, acute, having the segments rather hispid on the margins, about half the length of the tube of the corolla. ♃. H. Native of Louisiana; and on arid hills near the confluence of the Teeton river, Missouri. Pulmonària lanceolàta, Pursh, fl. amer. sept. 2. p. 729. Pulm. marginàta, Nutt. gen. amer. 1. p. 115. Lithospérmum marginàtum, Spreng. syst. 1. p. 541. Stem a little branched. Radical leaves petiolate; lower stem leaves sessile. Flowers subpanicled; fascicles axillary and terminal. Corolla funnel-shaped, blue, much like those of *M. Virgínica*. Leaves perfectly glabrous, except on the margins.

Marginate-leaved Mertensia. Fl. June, July. Clt. 1813. Pl. 1 foot.

5 M. Drummóndii; stems glabrous, ascending; radical leaves ovate-lanceolate: cauline ones sessile, oblong-lanceolate, callous, subdenticulated, glaucous; panicles terminal, crowded; calyx glabrous, with lanceolate, acutish, somewhat denticulated segments. ♃. H. Native of North-west America. Lithospérmum Drummóndii, Lehm. pug. 1. p. 26. Stems numerous, from the same root, ½ a foot high. Peduncles much shorter than the leaves. Corolla 3 times longer than the calyx, almost half an inch long, blue; segments rounded.

Drummond's Mertensia. Pl. ½ foot.

6 M. corymbòsa; stem erect, pilose; leaves ovate, acute, smoothish, pilose beneath and on the margins; flowers racemosely corymbose; calycine segments lanceolate-linear, elongated, acute. ♃. H. Native of North-west America. Lithospérmum corymbòsum, Lehm. pug. 2. p. 27. Stems many from the same root, fistular. Calyx hairy. Corolla funnel-shaped, blue, ½ an inch long; tube pilose inside; segments roundish.

Corymbose-flowered Mertensia. Pl. ½ to 1 foot.

7 M. Sibírica; plant glaucescent; stems erect; leaves rather fleshy, glabrous: radical ones cordate, roundish-obtuse, or broad-elliptic: cauline ones ovate, acute; calyxes glabrous; pedicels longer than the flowers. ♃. H. Native of Siberia, in woods at the river Lena; and of Kamtschatka. Pulmonària Sibírica, Lin. spec. p. 194. Willd. spec. 1. p. 770. Lithospérmum Sibíricum, Lehm. asper. p. 293. Led. fl. alt. 1. p. 177. fl. ross. alt. ill. t. 207.—Gmel. sib. 4. p. 75. no. 15. t. 39. bad. Root blackish. Stems simple, glabrous. Leaves glaucous green, like the rest of the plant: superior cauline ones sessile; all nerved: uppermost ones almost opposite. Flowers terminal, pedicellate, disposed in elongated, conjugate racemes, with a flower in the fork. Calyx small, with linear, lanceolate, acute, rather unequal segments. Corolla purplish blue; tube 3-4 times longer than the calyx, and a little longer than the limb. Style a little exserted.

Siberian Mertensia. Fl. May, July. Clt. 1801. Pl. ½ to 1½ foot.

8 M. Palla'sii; quite glabrous, pale green; stem erect, weak; leaves membranous: radical ones subcordate-ovate, bluntish: superior cauline ones ovate, acute; pedicels shorter than the flowers; tube of corolla one and a half longer than the limb, and 3 times longer than the calyx; style shorter than the corolla. ♃. H. Native of the Altaian mountains. Pulmonària bracteàta, Willd. herb. ex Schultes, syst. 4. p. 747. Lithospérmum Pallásii, Ledeb. fl. alt. 1. p. 176. fl. ross. alt. ill. t. 23. Stems simple, striately angular. Racemes usually twin, with a flower in the fork. Corolla funnel-shaped, fine blue, showy. Habit more slender than in *M. Sibírica*. Leaves pale green, not glaucous, membranous, not rather fleshy, broader and more numerous. Flowers larger. Calycine segments narrower. Corollas azure blue, not purplish blue; filaments longer and less dilated at apex; and the style longer than the corolla, not shorter.

Pallas's Mertensia. Fl. June. Pl. 1 to 1½ foot.

9 M. denticula'ta; stems erect; leaves nerved, almost glabrous, acute, with denticulately scabrous edges; radical leaves ovate: cauline ones oblong; calycine segments oblong, with denticulated margins. ♃. H. Native of North America; also of Siberia. Pulmonària Sibírica, Pursh, fl. amer. sept. 2. p. 729. exclusive of the synonymes. Lithospérmum denticulàtum, Lehm. asper. p. 294. Stems many from the same root, glabrous. Leaves pale green, beset with callous dots above. Petioles stem-clasping at the base; cauline leaves half stem-clasping. Peduncles terminal, corymbose, many-flowered, elongating after florescence. Calyx short. Corolla blue, like those of *M. Sibírica*.

Denticulated Mertensia. Fl. May, June. Clt. 1800. Pl. ½ to 1 foot.

10 M. simplicíssima; stem erect, quite simple; leaves ovate-oblong, acuminated, rather undulated, glabrous; calycine segments rough, rugose, undulated. ♃. H. Native of Eastern Siberia. Pulmonària simplicíssima, Ledeb. obs. bot. in act. nov. acad. sc. petro. 5. p. 518. no. 5. Lithospérmum simplicíssimum, Lehm. asper. p. 295. Stem glabrous. Leaves approximating by pairs, or tern. Peduncles terminal, and from the axils of the upper leaves, solitary, at length elongated; the lower ones sometimes 2-flowered, with one of the flowers sessile, and the other pedicellate. Calycine segments lanceolate-linear, acuminated. Corolla blue? twice as long as the calyx, smaller than any other species of the genus; tube a little narrower than the limb, ex Ledeb. l. c.

Very simple-stemmed Mertensia. Pl. ¾ to 1½ foot.

11 M. villósula; stem erect; leaves cordate-ovate, acuminated, nerved, almost glabrous above, but silky beneath from incumbent pili, and villous on the margins; calyxes villous. ♃. H. Native of the Carpathian mountains. Lithospérmum villósulum, Lehm. asper. p. 288. Stems smoothish. Lower leaves on long petioles, 7-nerved; upper ones sessile, ovate, and more acuminated, 5-nerved. Racemes terminal, bifid. Pedicels nutant, and are, as well as the peduncles, villous. Calycine segments lanceolate, acuminated, ciliated with longer villi on the margins. Tube of corolla a little longer than the calyx, constricted under the limb.

Villous Mertensia. Pl. ½ to 1 foot.

12 M. pilòsa ; stems erect, more or less rough from strigæ, like the upper surfaces of the leaves, but the under surfaces of the leaves, and margins, and bases of the stems are beset with longer, softer, strigose pili ; radical leaves on long petioles, subcordate-ovate, acute, membranous : cauline leaves sessile, narrower ; racemes cymose, panicled, terminal, twin. ♃. H. Native of America, in Eschscholz Bay, beyond Beering's Straits. Stems simple or branched, many from the same root. Radical leaves 3½ inches long, and 2 broad. Pedicels drooping. Calycine segments narrow-lanceolate, acuminated. Corolla 1 to 1½ inch long, pale blue, glabrous outside, but pilose inside ; tube slender ; limb campanulate ; throat furnished with minute, arched, glandular, fleshy processes. Nuts granular, wrinkled. Small fleshy processes of the throat have been observed in this, *M. denticulàta*, *M. marítima*, and *M. Dahùrica*.

Pilose Mertensia. Pl. 1½ to 2 feet.

13 M. parviflòra ; plant quite glabrous, glaucous ; stems procumbent, much branched ; leaves oval-spatulate, abruptly acuminated, fleshy ; peduncles lateral, 1-flowered ; corolla hardly twice as long as the calyx. ♃. H. Native of New England and Canada, on the sea shore. Pulmonària parviflòra, Michx. fl. amer. bor. 1. p. 133. Pursh, fl. 1. p. 131. Pulmonària marítima of all American authors. Flowers small, blue.

Small-flowered Mertensia. Fl. July. Clt. 1827. Pl. procumbent.

14 M. maritíma (Link. handb. erk. der. gew. 1. p. 58.) plant glabrous, glaucous ; stems procumbent, branched ; leaves ovate, bluntish, fleshy ; calyx glabrous. ♃. H. Native of the north of Europe, on the sea shore ; as of Britain, Norway Iceland, Greenland, Lapland, &c. Pulmonària marítima, Lin. spec. 195. Willd. spec. 1. p. 770. Smith, engl. bot. 368. Curt. fl. lond. fasc. 6. t. 18. Oed. fl. dan. t. 25. Light. fl. scot. 134. t. 7. Wahl. fl. lapp. p. 57.—Dill. hort. elth. 75. t. 65. f. 75.—Mor. hist. 3. sect. 11. t. 28. f. 12.—Plukn. phyt. t. 172. f. 3. —Pet. brit. t. 29. f. 3. Root fusiform, woody, with capillary fibres. Leaves ovate or oblong, acutish ; upper ones half stem-clasping. Flowers erect, disposed in terminal, corymbose racemes. Calycine segments oval, acutish. Corolla blue, twice or thrice as long as the calyx ; limb subcampanulate. This plant is a great ornament to the sandy sea coasts in Scotland and the north of England. The plant is by some called the Oyster plant, from the similarity of its taste to that of oysters.

Sea Mertensia. Fl. July. Britain. Pl. procumbent.

Cult. All the species of *Merténsia* are elegant, hardy border plants, much admired by gardeners for their brilliant blue flowers, which are of a reddish hue before expansion. The first twelve species do best in a peat border, but they will also grow in common garden soil ; these are best fitted for the front of flower borders. The last two species, being natives of the sea coast, require, when cultivated, to be grown in pots, in a mixture of sand and peat, or sand altogether, and placed among other alpine plants ; but to keep them in vigour, even in this situation, they require to be refreshed occasionally with salted water.

XIV. CERI'NTHE (from *κηρος*, *keros*, wax ; and *ανθος*, *anthos*, a flower ; bees are supposed to obtain wax largely from this flower.) Tourn. inst. t. 50. Lin. gen. no. 189. Schreb. gen. no. 246. Juss. gen. p. 130. ed Usteri. p. 145. Lam. ill. no. 262. t. 93. Gærtn. fruct. 1. no. 413. t. 67. f. 1. Schkuhr, handb. t. 30. Lehm. asper. p. 386.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx of 5 unequal sepals. Corolla tubular, with a naked throat. Anthers hastate, spirally twisted at the base of the lobes, where they are connected. Nuts 2, 2-celled, imperforated at the base, fixed to the bottom of the calyx.—Glabrous glaucous plants, with terminal, leafy racemes of tubularly campanulate, drooping, variegated flowers.

§ 1. *Corolla 5-toothed : teeth reflexed, or spreading.*

1 C. ma'jor (Lin. spec. 195.) stem branched ; leaves cordate-ovate, denticulately ciliated ; corollas ventricose at top, 5-toothed : teeth very short, acuminated, reflexed. ⊙. H. Native of the south of Europe, Barbary, and Siberia. Scop. fl. carn. ed. 2d. 1. p. 128. All. ped. 1. no. 176. Desf. fl. atl. 1. p. 160. Suter, fl. helv. 1. p. 106. Horn. hafn. 1. p. 180. Curt. bot. mag. t. 333. Sturm, fl. germ. 1. fasc. 12. icon. C. glàbra, Mill. fig. t. 91. D. C. syn. fl. fr. no. 2702. C. glaúca, Mœnch. meth. p. 520.—Hall. helv. no. 602.—Lob. icon 397. f. 2.—Mor. hist. 3. sect. 11. t. 29. f. 1.—Ger. emac. 538. f. 1—2.—Park. par. 521. f. 1. Stem glabrous. Lower leaves tongue-shaped, emarginate, attenuated at the base ; superior ones blunt ; the floral ones sometimes purplish-green, all fleshy, glaucous, and stem-clasping, glabrous above, densely beset with white dots, rough beneath. Pedicels shorter than the floral leaves. Corolla yellow at bottom and purple at top. This is one of the most common herbs all over Italy : hence Virgil's expression of "*Cerinthæ ignobile gramen.*" There is abundance of honey juice in the tube of the corolla, for which reason it is much resorted to by bees ; the plant is therefore peculiarly proper to be planted near Apiaries.

Greater Honeywort. Fl. July, Aug. Clt. 1596. Pl. 1 foot.

2 C. a'spera (Roth. catal. 1. p. 33.) stem branched ; leaves oblong, denticulately ciliated, rough beneath ; corolla cylindrical, 5-toothed : teeth short, acuminated, reflexed. ⊙. H. Native of Portugal, Spain, France, Italy, Transylvania, and the Islands of the Archipelago. Smith, fl. græc. t. 170. Lapey. abr. p. 88. Baumg. fl. trans. 1. p. 127. St. Hil. pl. fr. 3. t. 235. Hoffm. et Link. fl. port. 1. p. 196. D. C. syn. fl. fr. no. 2701. Lehm. asper. p. 388. C. màjor, *β*, Lin. spec. p. 196. Tratt. arch. p. 85. t. 63. C. màjor, Mill. dict. no. 1. —Mor. hist. 3. sect. 11. t. 29. f. 2.—Bauh. hist. 3. p. 602. icone. C. màjor, var. *α*, Lam. dict. no. 1. Stem glabrous, sometimes spotted. Lower leaves tongue-shaped, all obtuse and glaucous beneath, and stem-clasping and rough from white warts above ; floral ones cordate-ovate. Pedicels much shorter than the bracteas, which are sometimes coloured beneath. Corolla twice as long as the calyx, yellow, with a brownish purple tube.

Rough Honeywort. Fl. July, Aug. Clt. 1633. Pl. 1 to 2 feet.

3 C. retórta (Smith, prod. fl. græc. 1. p. 121. fl. græc. t. 171.) stem erect, branched at top ; corollas retorted, clavately cylindrical, with a constricted 5-toothed mouth : teeth spreading, acute. ⊙. H. Native of the Peloponnesus ; and of Caria, in cultivated parts of mountains. Leaves stem-clasping, somewhat spatulate, emarginate at top, with a short mucrone, beset with white warts on both surfaces, all quite entire and glaucous ; floral ones more oblong, purple beneath while young. Margins of the sepals denticulately ciliated, as in the two preceding. Corolla not above half the size of those of the preceding, with a yellow tube and a violaceous limb.

Retorted-flowered Honeywort. Fl. July, Aug. Clt. 1825. Pl. 1½ foot.

4 C. purpu'rea (Vis. in bot. zeit. 1829. p. 8.) stem erect, branched at top ; leaves stem-clasping, obtuse, glaucous, thickish, smooth, entire, spotted with white : lower leaves spatulate, attenuated at the base : superior ones cordate ; corollas conically clavate, ventricose under the throat ; limb constricted : teeth bluntly triangular, reflexed, very short. ⊙. H. Native of Dalmatia, in the woods of Boraca. Nearly allied to *C re-*

torta, Smith. The floral part of the plant is purple, fading to purplish or blue.

Purple-topped Honeywort. Pl. 1 foot.

5 C. alpi'na (Kit. in Schultes, fl. austr. ed. 2. vol. 1. p. 353. no. 751.) stem erect, hairy?; leaves ovate-lanceolate, quite entire; corollas 5-toothed: teeth bluntish, erectly spreading. ⊙. H. Native of Hungary, on the higher alps; and of the Carpathian mountains.—Mor. hist. 3. sect. 11. t. 129. f. 7.? This species differs from *C. mìnor*, in the leaves being much narrower and longer; in the calycine segments being linear-lanceolate; and in the bracteas and floral leaves being much longer and closely imbricated. Corolla yellow at bottom and violaceous at top.

Alpine Honeywort. Pl. 1 foot.

§ 2. *Corolla 5-cleft, with conniving segments.*

6 C. mi'nor (Lin. spec. 196.) stem solitary, branched; leaves cordate-ovate, quite entire, glabrous; corollas 5-cleft, with conniving segments. ♂. H. Native of Middle and South Europe, and Barbary, in fields. Scop. fl. carn. ed. 2d. 1. p. 128. All. pedem. no. 177. Vill. dauph. 2. p. 448. Roth. fl. germ. 2. p. 210. Desf. fl. atl. 1. p. 160. Jacq. fl. austr. 2. t. 124. Smith, prod. fl. græc. 1. p. 120. Lapeyr. abr. p. 88. Baumg. fl. trans. 1. p. 428. C. acùta, Mœnch. meth. p. 520.—Mor. hist. 3. sect. 11. t. 29. f. 5.—Clus. hist. 2. p. 162. icone. Root branched. Stem glabrous. Radical leaves obovate, tapering into the petioles: cauline ones all stem-clasping: lower ones of these spatulate, all glabrous and pale green, but densely beset with minute white warts above. Bracteas distinct, acutish, much longer than the pedicels, denticulately ciliated on the margins, like the sepals. Corolla ventricose, 5-cleft almost to the middle, yellow; segments lanceolate-linear.

Smaller Honeywort. Fl. June, Oct. Clt. 1570. Pl. 1 to 1½ foot.

7 C. macula'ta (Lin. spec. ed. 1. p. 137. All. ped. 1. p. 178. Bieb. fl. cauc. 1. p. 134.) stems many from the same root; leaves cordate-ovate, quite entire, glabrous; corollas 5-cleft, 5-spotted, with connivent segments. ♃. H. Native of Piedmont, Hungary, Tauria, and Caucasus. Lehm. asper. p. 393. C. mìnor, β, maculàta, Lin. spec. ed. 2d. p. 196. Willd. spec. 1. p. 772. Horn. hort. hafn. 1. p. 180. C. quinquemaculàta, Wahl. fl. carp. p. 50. no. 171. Root branched. Stems many, branched, purplish at bottom. Radical leaves oblong: cauline ones stem-clasping, emarginate, all obtuse, and glaucous. Bracteas or floral leaves acutish, finely and denticulately ciliated, like the sepals. Pedicels one-half shorter than the bracteas, pilosely hispid. Calyx and corolla like that of *C. mìnor*; but differs in the corolla being marked by 5 dark purple spots on the tube, and sometimes these spots are so close as to form a purple circle.

Spotted-flowered Honeywort. Fl. June, Oct. Clt. 1804. Pl. 1 to 1½ foot.

Cult. The seeds of all the species only require to be sown in the open ground. The *C. maculàta* is perennial, and requires to be planted in a sheltered dry situation, or the roots, which are fleshy, will be apt to rot.

Tribe III.

LITHOSPE'RMEÆ (this tribe contains plants agreeing with the genus *Lithospérmum*, in the characters indicated below.) D. Don, in edinb. phil. journ. july, oct. 1832. Corolla open, tubular, with broad, mostly rounded segments. Stamens inclosed or exserted. Nuts 4, distinct, fixed to the bottom of the calyx, imperforated at the base, except in *Stríbila*.

XV. LITHOSPE'RMUM (from λιθος, *lithos*, a stone; and σπερμα, *sperma*, a seed; in reference to the hard seeds or nuts.) Tourn. inst. t. 55. Lin. gen. no. 181. Schreb. gen. no. 241. Lam. ill. no. 255. t. 91. Gærtn. fruct. 1. no. 420. t. 67. f. 8. Schkuhr, handb. t. 29. Trev. entw. des embryo, t. 4. f. 61—67. Lehm. asper. p. 282. sect. 2. and 3. Buglossoìdes, Mœnch. meth. p. 418.—Arnèbia, Forsk. fl. ægypt. p. 62.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped, with a naked pervious throat. Anthers oblong, inclosed. Nuts 4, 1-celled, fixed to the bottom of the calyx, imperforated at the base.—Rough plants, with usually narrow leaves, and terminal white or blue flowers. Radical leaves not increasing after the plants have done flowering.

Sect. I. Leioca'ryon (from λειος, *leios*, smooth; and καρυον, *karyon*, a nut; the nuts or carpels are smooth and even.) Nuts hard, stony, glabrous, shining, in most of the species hispid, and beset with impressed dots.

§ 1. *Corolla blue, or purplish blue.*

1 L. graminifòlium (Viv. fragm. fl. ital. fasc. 1. p. 3. t. 5. ann. bot. 1. p. 163.) stems herbaceous, erect; leaves long-linear, scabrous above, but hoary and silky beneath, with revolute edges; flowers terminal, somewhat corymbose. ♃. H. Native of Italy, on the alps at Etruria, and Carrara, at the foot of the mountains. Lehm. asper. p. 297. Pulmonària suffruticòsa, Lin. spec. 1. p. 1667. Willd. spec. 1. p. 769. Lois. not. p. 37. journ. bot. 2. p. 261. Lithospérmum angustifòlium umbellàtum, C. Bauh. pin. p. 238. 517. Plukn. phyt. t. 42. f. 7.—Bocc. sic. p. 77. t. 41. f. 2. B. C.—Mor. hist. 3. sect. 11. t. 31. f. 6. bad. Plant forming a dense tuft. Stems numerous, simple, pubescently tomentose. Leaves sessile, approximate, green above: lower ones drooping: superior ones erectly spreading, all acuminated, 3-6 inches long. Flowers sessile, secund, forming 3-4 short spikes, which constitute a terminal corymb. Calyx hispid; segments rather unequal, acute. Corolla blue, tubular. Stigma subcapitate. Nuts ovate, shining. Bracteas linear, longer than the calyx.

Grassy-leaved Gromwell. Fl. May, June. Clt. 1825. Pl. ½ to ¾ foot.

2 L. purpu'reo-cœru'leum (Lin. spec. p. 190.) stems herbaceous: sterile ones creeping: floriferous ones erect; leaves lanceolate, acute, attenuated at the base, scabrous; flowers axillary and at the sides of the leaves, disposed in terminal, short, twin racemes, which are elongated at length. ♃. H. Native of Middle and South Europe; and of Caucasus, in woody mountain places; in England, as in Somersetshire, near Taunton; near Denbigh, in Wales; in chalky soil in several parts of Kent, in hedges. Scop. fl. carn. ed. 2. 1. p. 122. All. pedem. 1. no. 186. Vill. dauph. 2. p. 451. Jacq. fl. austr. 1. p. 11. t. 14. Roth. tent. fl. germ. 2. p. 214. Sut. fl. helv. 1. p. 103. Smith, engl. bot. t. 117. Gmel. fl. bad. 1. p. 415. Smith, prod. fl. græc. 1. p. 114. L. violàceum, Lam. fl. fr. 2. p. 271.—Hall. helv. no. 596.—Mor. hist. 3. sect. 11. t. 31. f. 2.—Sabb. hort. rom. 2. t. 28.—Lob. icon. 458. f. 1.—Bocc. sic. 75. t. 40. and 41.—Plukn. phyt. t. 76. f. 2. Root blackish. Stems pilose, scabrous. Leaves on short petioles, or sessile, dark green, with revolute margins, 1½ inch long. Calyx hairy, scabrous, with linear segments. Corolla showy, at first red, afterwards purple. Nuts hispid, smooth, shiny, whitish. There is a variety of this with white flowers.

Purple-blue-flowered Gromwell. Fl. May. England. Pl. 1 foot.

3 L. prostra'tum (Lois. fl. gall. 1. p. 105. t. 4.) stems suffruticose, prostrate; leaves lanceolate-linear, hispid; tube of corolla 3 times longer than the calyx, densely villous inside above. ♄. H. Native of France, in dry places, and by way

sides about Bayonne. Lapeyr. abr. p. 86. Lehm. asper. p. 300. Stems pilose, branched; branches canescent from dense pili. Leaves sessile. Flowers axillary, distant, sessile, disposed in terminal leafy spikes on the older branches. Calyx densely pilose, canescent, with subulate segments. Corolla bluish purple, size of those of *L. purpùreo-cærùleum*, downy outside. Stigma emarginate.

Prostrate Gromwell. Fl. May, June. Clt. 1825. Shrub prostrate.

4 L. FRUTICÒSUM (Lin. spec. 190.) stem shrubby, erect, much branched; leaves linear, bluntish, with revolute edges, strigosely hispid, hoary beneath; tube of corolla twice as long as the calyx. ♄. H. Native of the south of Europe; and at Algiers. Desf. fl. atl. 1. p. 155. Smith, prod. fl. græc. 1. p. 114. Lapeyr. abr. p. 86. D. C. syn. fl. fr. no. 2717. Lehm. asper. p. 301. Lois. fl. gall. 1. p. 105. Hoffm. et Link, fl. port. 1. p. 170. t. 21. L. fruticòsum, β, rosmarinifòlium, Pers. syn. 1. p. 158.—Barrel. icon. 1168. obs. 143.—Garid. aix. p. 68. t. 15.—Alp. exot. p. 69. t. 68. Branches hairy, scabrous. Leaves sessile, deep green above. Flowers distant, axillary, disposed in 5-6-flowered, terminal, leafy racemes. Calyx pilose, with linear segments. Corolla of a violet blue colour. Anthers beyond the throat. Stigma obtuse. Nuts ovate, hispid, shining, brown when ripe.

Var. β, *màjor* (Lehm. asper. p. 302.) corolla 3 times as long as the calyx; stamens about equal in length to the corolla. ♄. H. Native of Naples, in Goat's Island; and the Islands in the Grecian Archipelago, on the mountains. L. rosmarinifòlium, Tenore. syn. fl. neap. p. 33. no. 20. Lindl. bot. reg. 1736. L. fruticòsum, Smith, fl. græc. t. 161. This variety differs from the species in the larger form, longer and broader, more crowded leaves, and in the corollas being much larger.

Shrubby Gromwell. Fl. May, June. Clt. 1683. Shrub 1 to 1½ foot.

5 L. CILIA'TUM (Forsk. desc. p. 39. Vahl. symb. 1. p. 14.) stem suffruticose, erect, branched, muricately hispid above; leaves cordate-ovate, hoary, with callous, setosely ciliated edges. ♄. F. Native on the banks of canals near Cairo. Willd. spec. 1. p. 755. Lehm. asper. p. 314. Branches dichotomous, white. Leaves thick, half stem-clasping. Calycine segments lanceolate. Corolla violaceous, longer than the calyx. Nuts small, black. Spikes lateral, half an inch long.

Ciliated-leaved Gromwell. Shrub ½ to 1 foot.

6 L. CALLÒSUM (Vahl. symb. 1. p. 14.) stem suffruticose, branched, hispid; leaves lanceolate-linear, obtuse, callosely warted, strigose, very hispid; bracteas setosely ciliated. ♄. F. Native about Cairo, in deserts. Willd. spec. 1. p. 754. Lehm. asper. p. 315. L. angustifòlium, Forsk. descr. p. 39. icon. vol. 2. t. 16. f. 2. Stem covered with white bark, villous below, and hispid above. Leaves sessile, canescent while young. Flowers disposed in terminal racemes. Calyx hispid, with linear, ciliated segments. Corolla twice as long as the calyx; tube villous, red; limb violaceous, white in the middle, fading to blue; segments ovate, acutish. Nuts ovate, acute.

Var. β, *niveum* (Poir. suppl. 2. p. 836.) stems very white, with deciduous bark; leaves small, ovate-lanceolate. ♄. F.

Callous-tubercled Gromwell. Shrub ½ to 1 foot.

7 L. ARNE'BIA (Lehm. asper. p. 316. Rœm. et Schultes, syst. 4. p. 45.) stems herbaceous; leaves linear-lanceolate, obtuse, pilosely hispid; spikes solitary, terminal, secund; bracteas lanceolate. ⊙. H. Native of Egypt. Arnèbia tinctòria, Forsk. descr. p. 62—63. L. tinctòrium, Vahl, symb. 2. p. 33. t. 28. Willd. spec. 1. p. 752. but not of Lin. L. tetrastígma, Lam. ill. no. 1790. Pers. ench. 1. p. 158. Root fusiform, red. Stems simple, pilosely hispid, as well as the whole plant: lateral ones decumbent: middle ones erect. Leaves sessile: radical ones 2 inches long: cauline ones 1 inch. Calycine segments linear, bluntish. Corolla longer than the calyx, blue, with a filiform tube. Nuts obcordately triangular, smooth, shining. *Segaret el arneb* is the Arabic name of the plant.

Arnebia Gromwell. Pl. ½ foot.

8 L. MI'NIMUM (Moris, elench. sard. ex Linnæa, 5. p. 93.) hispid; stem erect, a little branched; leaves oblong-linear: lower ones spatulate; tube of corolla hairy, almost twice as long as the calyx. ⊙. H. Native of Sardinia, in arid pastures by the sea side. Corolla blue, with a yellow throat.

Least Gromwell. Fl. March, April. Pl. ½ foot.

§ 2. *Flowers white or pale yellow.*

9 L. AGGREGA'TUM (Ruiz. et Pav. fl. per. 2. p. 4.) stem herbaceous, prostrate, branched; leaves opposite, ovate, obtuse, wrinkled. ⊙. H. Native of Peru, on the hills of Tarma and Huanuco. Lehm. asper. p. 313. Plant downy. Root fusiform. Leaves on short petioles. Flowers aggregate, nearly sessile, secund, small, white. Nuts 2, ovate, smooth.

Aggregate-flowered Gromwell. Pl. prostrate.

10 L. LINEA'TUM (Lehm. asper. p. 312.) stem herbaceous, erect, branched; lower leaves obovate, obtuse: superior ones broad-lanceolate, hairy, subciliated, lined; tube of corolla twice as long as the calyx. ♃. H. Native country unknown. Stem woody at the base, branched, scabrous, hairy. Lower leaves 3-4 inches long, all lined above, with a rudiment of a branch in nearly the axils of all. Racemes terminal, leafy, at first nutant. Calyx hairy, with unequal linear segments. Corolla pale yellow; tube downy; throat furnished with 5 obtuse, glandular protuberances. Stigma capitate. Nuts hispid, shining, beset with impressed dots and lines.

Lined-fruited Gromwell. Fl. July, Aug. Clt. 1826. Pl. 1 to 1½ foot.

11 L. OFFICINA'LE (Lin. spec. p. 189. fl. suec. ed. 2d. p. 159.) stems herbaceous, terete, erect, much branched; leaves broad-lanceolate, acute, veiny, very scabrous; tube of corolla length of calyx. ♃. H. Native of Europe, Asia, and North America, on way sides, among bushes; also in waste places, in dry, gravelly, or chalky soil. In Britain it is found but sparingly in some woods. Smith, engl. bot. t. 134. Oed. fl. dan. t. 1084. Bieb. fl. cauc. 1. p. 121. Sturm, fl. germ. fasc. 5. icone. Lehm. asper. p. 310. Svensk, bot. t. 177. Hayne, term. bot. t. 21. f. 3. Woodv. med. bot. p. 134. t. 213.—Plenck. icon. t. 75.—Sabb. hort. rom. 2. t. 29.—Ludw. ect. 147.—Lob. stirp. t. 542. f. 2.—Hall. helv. no. 595. Root fibrous. Stem setosely scabrous. Leaves sessile, deep green above, and paler beneath. Flowers on short pedicels, solitary, axillary, disposed in leafy elongated racemes during florescence. Calyx hairy, with linear-lanceolate segments. Corolla pale yellow; throat furnished with 5 erect gibbæ. Nuts hispid, shining, white, hard; whence they have been celebrated in ancient times as a cure for the stone, without the least shadow of reason.

Var. β, *latifòlium* (Lehm. asper. p. 311.) seeds turgid, ovate, shining, beset with pitted dots all over; fructiferous calyx spreading, exceeding the corolla; leaves ovate-oblong, nerved. ♃. H. Native from Virginia to Kentucky, in shady woods. L. latifòlium, Michx. fl. bor. amer. 1. p. 130. Pursh, fl. amer. sept. 1. p. 131. L. officinàle, β, màjus, Willd. spec. 1. p. 751.—Sabb. hort. rom. 2. t. 29. Flowers pale yellow.

Officinal Gromwell, or Grey Mill or Millet. Fl. May, Aug. Britain. Pl. 1½ to 2 feet.

12 L. SCA'BRUM (Thunb. in Schrad. journ. 1806. p. 44. prod. fl. cap. p. 34.) stem herbaceous, angular, strict, branched; leaves narrow-lanceolate, with revolute margins, scabrous from papillæ above, rather hairy beneath; tube of corolla hardly longer than

the calyx. 4. G. Native of the Cape of Good Hope. Willd. spec. 1. p. 753. Lehm. asper. p. 309. Stem and branches hairy. Leaves sessile, bluntish, 1½ to 2 inches long. Racemes usually bifid, terminating the stem and branches; bracteas lanceolate. Corolla salver-shaped, white; throat marked by 5 obtuse gibbosities. Stigma obtuse. Nuts half ovate, acuminated, shining, white. Habit of *L. officinàlis*.

Scabrous Gromwell. Pl. 1 to 1½ foot.

13 L. ANGUSTIFÒLIUM (Michx. fl. bor. amer. 1. p. 130.) Pursh, fl. amer. sept. 1. p. 137.) stems herbaceous, procumbent; leaves linear, clothed with adpressed pubescence; flowers as if they were lateral; nuts beset with impressed dots. ⊙. H. Native of shady woods, on the banks of the river Ohio. Lehm. asper. p. 309. Flowers white. Nuts turgidly ovate, shining.

Narrow-leaved Gromwell. Fl. July, Aug. Pl. 1 foot.

14 L. STRÍCTUM (Lehm. asper. p. 303.) stem herbaceous, very simple, thick; leaves linear, acute, adpressed to the stem, strigose above, and almost glabrous beneath; spikes terminal, solitary; tube of corolla twice as long as the calyx. ⊙. H. Native of tropical America. Stem terete, canescent at top. Lower leaves ½ inch long, very blunt: upper ones 1½ inch long. Flowers on short pedicels from the axils of linear bracteas. Calyx pilose, with linear-lanceolate segments. Corolla villous outside, pale yellow. Anthers sagittate. Nuts ovate, turgid.

Straight Gromwell. Pl. 1 to 1½ foot.

15 L. CUNEIFÒLIUM (Ruiz. et Pav. fl. per. 2. p. 5. no. 4.) stems herbaceous, prostrate, hoary; leaves cuneiform, hoary; flowers sessile, axillary, solitary. ⊙. H. Native of Peru, on arid hills. Pers. ench. 1. p. 158. Lehm. asper. p. 307. Root fusiform, fibry. Stems numerous. Leaves sessile. Corolla white. Nuts ovate, acuminated, shining.

Wedge-leaved Gromwell. Pl. prostrate.

16 L. MICRA'NTHUM (Viv. fl. libyc. p. 10. t. 1. f. 4.) hispid from strigæ; leaves linear-lanceolate; flowers disposed in short, terminal, secund spikes, the whole forming a kind of cyme; hairs on the calyx spinescent when bearing the fruit; tube of corolla filiform. ⊙. H. Native of Libya, in the great Syrtus. Root simple. Stem a finger in height. Calycine segments linear, acute. Corolla yellowish green, longer than the calyx, with a naked throat. Nuts ovate, acute, convex on the back.

Small-flowered Gromwell. Pl. ½ foot.

SECT. II. DEINOSPE'RMUM (from δεινος, *deinos*, rough; and σπερμα, *sperma*, a seed; the nuts are rough.) Nuts very hard, wrinkled, callosely dotted, rough, or muricated.

§ 1. *Flowers white or yellow.*

17 L. A'PULUM (Vahl. symb. 2. p. 33.) stems herbaceous; leaves linear-lanceolate, acute, pilose; spikes terminal, secund; bracteas lanceolate; nuts muricated. ⊙. H. Native of Portugal, south of France, Italy, Samos, and other islands of the Archipelago; in the kingdom of Tunis, near Caffan; as well as of North America, in Virginia, Ohio, and Mississippi, in dry woods. Willd. spec. 1. p. 752. Sibth. et Smith, fl. græc. t. 158. Hoffm. et Link. fl. port. 1. p. 169. Pursh, fl. amer. sept. 1. p. 131. Lehm. asper. p. 317. Myosòtis A'pula, Lin. spec. 189. All. pedem. no. 192. Desf. fl. atl. 1. p. 158. Lapeyr. abr. p. 83. Myosòtis lùtea, Lam. fl. gal. 2. p. 282.—Mor. hist. 3. sect. 11. t. 28. f. 8.—Column. ecph. 1. p. 185. f. 1.—Plukn. phyt. t. 16. f. 5.—Lob. icon. t. 587. f. 1.—Buglóssum lùteum ánnuum mínimum, Tourn. inst. p. 134. Root branched. Stems rarely more than one from the same root, pilose. Leaves sessile, deep green, an inch long. Spikes 3-5 together, terminal, many-flowered. Calyx very hairy. Corolla yellow, longer than the calyx. Nuts gibbous on both sides, beaked, marked with 4 elevated submuricated lines.

Apulian Gromwell. Fl. June, July. Clt. 1768. Pl. ½ foot.

18 L. PU'MILUM (Lehm. asper. p. 319.) stems herbaceous, ascending, branched; leaves imbricate, linear, obtuse, strigosely pilose; flowers solitary, sessile, interfoliaceous; segments of the limb of corolla acute; nuts rugose. 4. H. Native of North America. Habit of *Anchùsa cæspitòsa*, but smaller. Root thick, with filiform fibres. Stems many, 2-3 inches long. Leaves crowded, an inch long, and more. Calyx pilose, with ciliated segments. Corolla yellow?; tube a little longer than the calyx.

Dwarf Gromwell. Pl. ¼ foot.

19 L. MYOSOTOÌDES (Lehm. asper. p. 319.) stems herbaceous, procumbent, filiform; leaves linear-lanceolate, pilose; flowers solitary, lateral; tube of corolla longer than the calyx; limb obtuse; nuts rugose. ⊙. H. Native of Chili, in sandy places about Conception; and at Santiago. L. tinctòrium, Ruiz. et Pav. fl. per. 2. p. 4. t. 114. L. tíngens, Rœm. et Schultes, syst. 4. p. 44. Plant pilose. Root slender, fusiform. Stems numerous; middle ones erect. Flowers on short pedicels. Calyx closed in the fructiferous state. Corolla white, exceeding the calyx.—This plant tinges paper in which it has been pressed of a violet colour.

Mouse-ear-like Gromwell. Pl. procumbent.

20 L. ARVE'NSE (Lin. spec. 190. fl. suec. no. 160. ed. 2d.) stems herbaceous, erect, branched; leaves lanceolate, narrowed at the base, acutish, hairy, subciliated; calyxes a little shorter than the corolla, spreading in the fructiferous state; nuts wrinkled, scabrous. ⊙. H. Native of Europe, Asia, Africa, and North America, in cultivated fields, and sterile or waste places; plentiful in some parts of Britain. Oed. fl. dan. t. 456. Smith, engl. bot. t. 123. Bieb. fl. cauc. 1. p. 121.—Hall. helv. no. 594.—Mor. hist. 3. sect. 11. t. 31. f. 7.—Riv. mon. tab. 9. f. 1. Root perpendicular, branched, red outside. Stem scabrous from adpressed hairs. Leaves sessile, scabrous, 1½ inch long. Flowers nearly sessile, solitary, disposed in leafy racemose spikes. Calyx hispid or pilose. Corolla white, pilose outside, with a violaceous ring inside. Nuts scabrous, black.

Var. β; flowers blue. ⊙. H. Native of Iberia. Bieb. fl. cauc. 1. p. 121.

Var. γ; flowers purplish. ⊙. H. Native of France. L. arvénse, β, D. C. fl. fr. no. 2713.

Corn-field Gromwell, or Bastard Alkanet. Fl. May, June. Britain. Pl. ½ to 1½ foot.

21 L. PLEBE'IUM (Cham. in Linnæa, 4. p. 446.) stem erect or prostrate, trichotomous at the nodi, clothed with spreading pili; leaves opposite; spikes elongated, leafy; leaves linear, or linear-lanceolate, obtuse, nearly naked above and strigose beneath, irregularly ciliated with twin pili; calyx densely pilose; nuts rugose, glabrous. ⊙. H. Native of Unalaschka and the Aleutian Islands, on the sea shore. Stems rarely solitary and erect; but generally many from the same root, and trailing. Flowers nearly sessile. The largest leaves are 3 inches long and 4 lines broad. Calyx 5-cleft or 5-parted, with lanceolate acutish segments. Corolla salver-shaped, hardly exceeding the calyx, glabrous, white or pale yellow.

Plebeian Gromwell. Pl. ½ to ¾ foot.

22 L. RUDERA'LE (Dougl. mss. ex Lehm. pug. 2. p. 28.) stem herbaceous, erect, hairy; leaves linear, acuminated, strigose; spikes leafy; corolla villous: tube length of calyx. ⊙. H. Native of North-west America. Stem angular, furrowed, branched at top. Leaves scattered, crowded, sessile. Calyx

hairy, with unequal linear segments. Corolla yellow. Flowers almost sessile. Stigma simple.

Rubbish Gromwell. Pl. 1 foot.

23 L. SCHREBERIA'NUM (Spreng. syst. 1. p. 546.) stems nearly simple; leaves all ovate, hispid: radical ones petiolate: cauline ones sessile; calyx hairy, equal in length to the tube of the corolla. ♃. H. Native of Kamtschatka. Pulmonària pùmila, Schrank.

Schreber's Gromwell. Pl. dwarf.

24 L. CRASSIFÒLIUM (Lehm. asper. p. 324.) stems herbaceous, ascending, hoary; leaves lanceolate-spatulate, obtuse, canescent from incumbent hairs; floral leaves cordate, acute, nearly glabrous; corolla a little longer than the calyx; nuts rugose. ♃. F. Native of the Levant. Stems numerous. Radical leaves petiolate: cauline ones sessile. Flowers disposed in terminal, leafy, conjugate spikes. Corolla glabrous, the colour not known.

Thick-leaved Gromwell. Pl. ½ ascending.

25 L. ORIENTA'LE (Lin. syst. ed. 12. vol. 2. p. 145.) stems ascending, herbaceous, branched from the base; leaves oblong-lanceolate, bluntish, repand, pilose: floral ones ovate-lanceolate; corollas longer than the calyxes, which droop in the fructiferous state; nuts tubercular. ♃. H. Native of the Grecian Islands; and in sandy places of Cafsa. Vahl, symb. 1. p. 14. Willd. spec. 1. p. 753. exclusive of the syn. of Forsk. Desf. fl. atl. 1. p. 153. Curt. bot. mag. t. 515. Sibth. et Smith, fl. græc. t. 160. Anchùsa orientàlis, Lin. spec. ed. 1st. p. 133. ed. 2d. p. 191.—Dill. hort. elth. 1. p. 60. t. 52. f. 60.—Buxb. cent. 3. t. 29. Root fusiform, black outside. Plant pilosely hispid. Leaves soft, pale green. Flowers golden yellow, on short pedicels, disposed in long, leafy, terminal racemes. Corolla with a cylindrical tube, which is contracted in the middle, longer than the calyx; limb short, recurvedly convex, with roundish segments, and rather elevated recesses. Nuts incurvedly gibbous, rather reniform, brown, shining. Habit of *Lycópsis lùtea*.

Eastern Gromwell. Fl. June, July. Clt. 1713. Pl. ascending.

26 L. DECU'MBENS (Vent. cels. t. 37.) stem herbaceous, decumbent; leaves lanceolate, acute, strigose; calyx pentagonal at the base, with subulate, erect segments; tube of corolla much longer than the calyx; nuts tubercular. ⊙. H. Native of the Levant, near Bagdad. Lehm. asper. p. 326. Root fusiform, fibry. Stems hispid, dichotomously branched; branches ending in very long spike-formed racemes. Flowers nearly sessile, shorter than the bracteas. Calyx hispid. Corolla yellow, downy outside; segments rounded, erectly spreading. Nuts pyramidal, angular, acute, truncate at the base.

Decumbent Gromwell. Pl. decumbent.

27 L. CORNU'TUM (Ledeb. fl. alt. 1. p. 175. fl. ross. alt. ill. t. 25.) hairy; stem herbaceous, erect; leaves oblong, callous, ciliated; calyxes, when bearing the fruit, furnished with 5 horns at the base: segments lanceolate-linear, erect; tube of corolla one half longer than the calyx; nuts tubercled. ⊙. H. Native of Siberia, in dry places; at the river Irtysch; between the river Kurtschum and the lake called Noor-Saisan; as well as on the Arkaul and Dolenkara mountains. Stems simple. Plant strigose. Racemes erect, bracteate. Calyx hairy. Corolla yellow, pilose outside. Stigmas 4, capitate. Calyx structure of that of *L. decúmbens*.

Horned-calyxed Gromwell. Fl. May. Plant ¼ to ¾ foot.

28 L. MURICA'TUM (Ruiz. et Pav. fl. per. 2. p. 4. no. 2. Lehm. asper. p. 327.) stems herbaceous, prostrate; leaves lanceolate-linear, obtuse, downy: lower ones opposite; calyx equal in length to the corolla, expanded while in fruit; nuts muricated. ⊙. H. Native of Chili, in waste places, and on walls. Plant downy. Stems many. Flowers lateral and terminal, sessile. Corolla white.

Muricated-seeded Gromwell. Pl. prostrate.

29 L. HÍSPIDUM (Ruiz. et Pav. fl. per. 2. p. 5. no. 5.) stems herbaceous, ascending, strigosely hispid; leaves linear-lanceolate, acute, revolute at apex, strigosely hispid; calyx setosely hispid, length of the tube of the corolla; nuts granular. ⊙. H. Native of Peru, in stony places. Lehm. asper. p. 328. Plant hispid, whitish. Root fusiform, fibry. Stems numerous, rather angular, branched. Leaves sessile, an inch long. Spikes long; flowers nearly sessile, secund: superior ones more crowded and bractless. Corolla yellow. Nuts ovate, acute.

Hispid Gromwell. Pl. 1 foot, ascending.

30 L. CALYCÌNUM (Moris, in acad. del Torino, vol. 37. p. 98. t. 22.) hispid from bristles; stem herbaceous, erect, branched; leaves lanceolate: superior ones dilated at the base, sessile, undulated: spikes dense, secund, bractless, revolute at apex; calyx equal in length to the corolla, expanded in the fruit-bearing state; nuts wrinkled from tubercles. ♃. F. Native of Chili. Root fusiform, fibrous at bottom. Calyx hispid, like the rest of the plant. Corolla yellow, funnel-shaped. Nuts ovate, gibbous outside, conniving at top. Perhaps the same as *L. hispidum*.

Large-calyxed Gromwell. Pl. 1 foot.

31 L. RAMÒSUM (Willd. herb. ex Lehm. asper. 328.) stem herbaceous, erect, much branched; leaves linear-lanceolate, bluntish, strigose, with ciliated, hispid margins; calyx hispid, length of the tube of the corolla; nuts granular. ⊙. H. Native of Mexico. Stem hairy, canescent. Leaves ½ an inch or more long. Spikes lateral, and at the tops of the branches, all lateral, conjugate, sometimes solitary, leafy. Flowers sessile, distant, opposite the bracteas, or from the axils of the bracteas. Corolla white, downy under the limb. Nuts ovate, subtrigonal, acuminated, granular outside.

Branched Gromwell. Pl. 1 foot.

32 L. PAPILLÒSUM (Thunb. in Schrad. journ. 1806. p. 44—45. prod. fl. cap. p. 34.) stem herbaceous, assurgent, nearly simple; leaves oblong-lanceolate, papillose, hairy, with revolute margins; calyxes hairy, length of the tube of the corolla, spreading in the fructiferous state; nuts wrinkled. ⊙. ? H. Native of the Cape of Good Hope. Lehm. asper. p. 329. Stem bearing 2 flowering branches at top, hispid. Leaves sessile, strigose, canescent. Racemes bracteate: bracteas longer than the flowers. Calycine segments obtuse, concave, lanceolate. Flowers distant. Corolla white; tube a little longer than the calyx. Nuts ovate.

Papillose Gromwell. Pl. ½ foot.

33 L. LYCOPSOÌDES (Lehm. pug. 2. p. 28.) stems herbaceous, procumbent, branched, hairy; leaves ovate-lanceolate, denticulated, setosely ciliated, hairy on both surfaces; flowers scattered, lateral and axillary; nuts ovate-trigonal, emarginate, convex and wrinkled on the back. ⊙. ? H. Native of North-west America. Stems terete, di-trichotomous. Flowers on short pedicels. Calyx very hispid, drooping when in fruit, somewhat inflated; segments lanceolate. Corolla yellow, glabrous; limb small, erect.

Lycopsis-like Gromwell. Pl. 1 foot ?

34 L. TENUIFLÒRUM (Lin. fil. suppl. p. 130.) stem herbaceous, erect, branched; leaves lanceolate, obtuse, hairy, scabrous: lower ones opposite; calyxes shorter than the filiform tube of the corolla, conniving when bearing the fruit. ⊙. H. Native of Egypt, and the island of Cyprus. Lehm. asper. p. 320. Jacq. icon. rar. 2. p. 10. t. 313. Sibth. et Smith, fl. græc. t. 159. Horn. hort. hafn. 1. p. 175. Buglossoìdes ramosíssima,

Mœnch. meth. p. 418. Habit of *L. arvénse*, but much smaller. Stem downy, scabrous. Leaves 1 to 1½ inch long: floral ones length of calyxes. Flowers on short pedicels, secund, disposed in terminal, leafy racemes. Calycine segments ciliated. Corolla downy outside, inflated at the base, and constricted in the middle, white, suffused with red? Nuts brown, incurved, tubercled.

Thin-flowered Gromwell. Fl. May, June. Clt. 1796. Pl. ½ to 1 foot.

35 L. TENE'LLUM (Nutt. in amer. phil. trans. n. s. 5. p. 188.) leaves linear, acute, strigose; flowers remote, pedicellate; calyx foliaceous, with unequal segments; nuts glabrous, convex. ⊙. H. Native of North America, in arid places in the prairies of the Red River. Stem about a span high, clothed with adpressed whitish strigæ. Flowers scattered, small, white. Corolla funnel-shaped. Nuts 4, convex outside, connivent, and rather pilose and angular. Perhaps this plant is not precisely a *Lithospérmum;* bearing, indeed, some affinity to *Cynoglóssum*, and by no means according with the usual character of the fruit of this genus.

Slender Gromwell. Pl. ½ to 1 foot.

§ 2. *Flowers blue or purple.*

36 L. TINCTÒRIUM (Lin. spec. ed. 1st. p. 132. mat. med. p. 58.) stems herbaceous, procumbent; leaves lanceolate, obtuse, pilosely hispid: floral ones subcordate; calyxes hairy, a little shorter than the tube of the corolla; nuts tubercled. ♃. H. Native of Spain; south of France; Italy, and Hungary, in sandy, sterile places; and in deserts about Alexandria. D. C. syn. fl. fr. no. 2716. Andr. bot. rep. t. 576. Regnau, bot. 1. t. 34. Lehm. asper. p. 330. Anchùsa tinctòria, Horn. hort. hafn. 1. p. 176. Willd. enum. 1. p. 178. exclusive of the synonymes. Lapeyr. abr. p. 86. L. tuberculàta, Forsk. descr. p. 41. L. procumbens, seminibus rugosis, Sauv. monsp. p. 63. Anchùsa puniceis floribus, Bauh. pin. p. 255. Anchùsa monspelìaca, Bauh. hist. 3. p. 584. Root rather woody, twisted, of many branches, tinges paper of a violet colour. Stems many, dividing into 2 branches at top, hispid, as well as the leaves. Upper leaves half stem-clasping; lower ones petiolate, subspatulate-lanceolate. Flowers sessile, disposed in simple or conjugate, terminal, leafy spikes. Corolla fine blue, with a white throat. Anthers sessile, in the middle of the tube.

Dyer's Gromwell, or Bugloss. Fl. June, Aug. Clt. 1596. Pl. procumbent.

37 L. DISPE'RMUM (Lin. spec. 191. dec. 1. t. 7.) stem herbaceous, erect, branched; leaves linear-lanceolate, obtuse, pilose; calyx beset with spreading hairs: segments linear, spreading, but incurved in the fructiferous state; nuts covered with callous dots. ⊙. H. Native of Siberia, at the Volga; in Tauria, and of Caucasus; also of Thessaly, on Mount Ossa. Willd. spec. 1. p. 755. Smith, prod. fl. græc. 1. p. 115. Bieb. fl. taur. 1. p. 122. Pers. ench. 1. p. 158. L. incúrvum, Pers. l. c. L. retórtum, Pall. itin. 3. append. no. 722. t. L. l. f. 2. Lam. dict. 3. p. 30. Willd. spec. 1. p. 755. Messerschmídtia cancellàta, Asso, synop. fl. arrag. no. 162. t. 1. f. 7. Willd. spec. 1. p. 790.—Quer. hisp. 4. p. 145. t. 25. Root simple, perpendicular. Plant pilose. Stem canescent. Lower leaves petiolate, spatulate: upper ones sessile, lanceolate. Flowers secund, on short pedicels, disposed in leafy terminal racemes. Corolla pale purple. Tube of corolla a little longer than the calyx, pale; limb blue. Nuts usually 2, rarely solitary, or 3, ovate-trigonal.

Two-seeded Gromwell. Fl. June, July. Clt. 1799. Pl. 1 foot.

38 L. INCA'NUM (Forst. prod. p. 12. no. 63.) stem shrubby, decumbent; leaves linear-lanceolate, clothed with silky pili, canescent; calyxes unequal, shorter than the tube of the corolla; nuts rough. ♄. G. Native of the island of Teautea, and Savage Island. Plant silky and canescent. Stem and branches pilose. Leaves an inch long. Spikes terminal, pedunculate, compound, ½ to 1 inch long, coarctate, bracteate, secund, pilose; flowers on very short pedicels. Corolla pilose outside, colour unknown. Nuts ovate.

Hoary Gromwell. Shrub ½ to 1 foot.

39 L. HISPÍDULUM (Smith, prod. fl. græc. 1. p. 114. fl. græc. t. 162.) stem shrubby, depressed, diffuse; leaves obovate, obtuse, hispid; tube of corolla inflated above, twice as long as the calyx; nuts tubercled, scabrous. ♄. F. Native of Rhode Island. Stems tufted; branches hoary and silky. Leaves generally ¼ an inch, scabrous. Flowers axillary at the tops of the branches, twice as long as the leaves, blue. Corolla glabrous. Stigma obtuse. Nuts ovate.

Hispid Gromwell. Shrub diffuse, tufted.

40 L. VILLÒSUM (Wall. cat. no. 941.) plant clothed with long white hairs all over, which rise from white warts, most conspicuous on the bracteas and calyxes; leaves narrow-lanceolate: the radical ones crowded; racemes terminal, and from the axils of the upper leaves, bracteate, very hairy. ♃. F. Native of the Carnatic, near Hurdwar and Dorhora. Anchùsa polýgama, Ham. herb. Plant tufted; stems many from the same root. Corolla salver-shaped, with a long tube. Nuts rugose?

Villous Gromwell. Pl. 1 foot?

41 L. FLEXUÒSUM (Lehm. asper. p. 333.) stem shrubby, decumbent, flexuous; leaves ovate, scabrous above, hispid beneath; calyxes length of the tube of the corolla, spreading and incurved in the fructiferous state; nuts callously muricated. ♄. G. Native of the Cape of Good Hope. Cynoglóssum muricàtum, Thunb. in Schrad. journ. 1806. p. 49. prod. p. 34. Willd. spec. 1. p. 762. Stem branched, hispid. Flowers on short pedicels, disposed in terminal, leafy racemes; bracteas lanceolate. Calyx hispid. Corolla blue. Anthers in the middle of the tube, beneath the throat. Nuts 2, ovate, triangular.

Muricated Gromwell. Shrub decumbent.

42 L. OLEIFÒLIUM (Lapeyr. abr. suppl. p. 28.) shrubby, diffuse; leaves elliptic-oblong, green above, shining, and beset with short adpressed hairs, but silky and silvery beneath; branches hoary. ♄. F. Native of the Eastern Pyrenees, among rocks on the banks of the river Caumella, below St. Aniol. Lower leaves opposite, 1½ inch long, and ½ inch broad. Flowers axillary. Calycine segments clothed with silky down, obtuse. Corolla thrice as long as the calyx, blue; tube downy. Nuts 2, downy, cinereous, trichotomous, somewhat rostrate, glabrous.

Olive-leaved Gromwell. Shrub ½ to 1 foot.

† *Species not sufficiently known.*

43 L. DIFFU'SUM (Lag. gen. et spec. nov. diagn. p. 10.) stem suffruticose, diffuse; leaves substrigose, linear, broadest at the base, with revolute edges; corolla 3 times longer than the calyx. ♄. F. Native of Spain, among bushes near Arvas, Pajares, and elsewhere.

Diffuse Gromwell. Shrub diffuse.

44 L. ÆGYPTÌACUM (Mikan ex Schrank, obs. bot. in act. acad. reg. sc. mon. 1813. § 14. p. 73.

Egyptian Gromwell. Pl.?

Cult. For the culture and propagation of the perennial, herbaceous species, see *Boràgo*, p. 309; for those of the annual species, see *Anchùsa*, p. 343; and for those of the shrubby kinds, see *Onósma*, p. 317.

XVI. BA'TSCHIA (named by Michaux after G. J. G.

Batsch, a German professor of botany.) Gmel. in Lin. syst. 2. p. 315. Michx. fl. bor. amer. 1. p. 133. t. 14. Pursh. fl. amer. sept. 1. p. 122. R. Br. in append. Frankl. journ. p. 732. Anónymos, Walt. fl. car. p. 91. Lithospérmum species, Lehm.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft. Corolla salver-shaped; tube longer than the calyx, bearded by a ring of hairs inside at the base; mouth naked. Anthers inclosed. Nuts 4, 1-celled, ovate, smooth, shining, fixed to the bottom of the calyx, imperforated at the base.—Plants with the habit of *Lithospérmum.* Flowers yellow or fulvous, almost fastigiate in short bracteate spikes. Leaves narrow, without collateral nerves.

1 B. longiflòra (Pursh. fl. amer. sept. 1. p. 132.) plant clothed with silky villi; erect; leaves approximate, long, and linear: with revolute margins; corolla with an elongated and somewhat pentagonal tube, and crenately cut segments; calycine segments long, linear. ♃. H. Native on the banks of the Missouri and Mississippi. Lithospérmum incìsum, Lehm. asper. p. 303. Lith. angustifòlium, Muhl. Lith. longiflòrum, Spreng. syst. 1. p. 544. Flowers sulphur-yellow, disposed in fastigiate fascicles.

Long-flowered Puccoon. Fl. July. Clt. 1812. Pl. ½ foot.

2 B. decu'mbens (Nutt. gen. amer. 1. p. 114.) hirsutely villous; stems decumbent; segments of the calyx and leaves linear; flowers scattered; lobes of corolla fimbriately crenate, shorter than the tube. ♃. H. Native of North America, around the Mandan village. Lithospérmum Mandanénse, Spreng. syst. 1. p. 544. Nearly allied to *B. longiflòra.* In both these species the orifice of the corolla is nearly closed by 5 arched protuberances. All the species afford a crimson lac from the root.

Decumbent Puccoon. Pl. decumbent.

3 B. Gmelìni (Michx. fl. amer. bor. 1. p. 130. Pursh. fl. 1. p. 132.) plant hairy; stems erect, simple; leaves linear-lanceolate, obtuse: floral ones ovate-lanceolate, obtuse; tube of corolla shorter than the calyx; calycine segments long-lanceolate, acute, unequal. ♃. H. Native of Lower Carolina, in dry sunny woods: and in woods of the Arkansas and Red River. Anónymos Caroliniénsis, Walt. fl. carol. p. 91. B. Caroliniénsis, Pers. ench. 1. p. 159. Anchùsa hírta, Muhl. cat. p. 19. Lithospérmum hírtum, Lehm. asper. p. 304. Leaves 2-3 inches long. Flowers yellow, pilose outside. Nuts ovate, turgid, glabrous, shining.

Gmelin's Puccoon. Fl. May, July. Clt. 1812. Pl. ½ foot.

4 B. cane'scens (Michx. fl. amer. bor. 1. p. 130. t. 14 Pursh, fl. 1. p. 132.) plant clothed with white villi; stem erect, nearly simple; leaves oblong, obtuse, emarginate at apex, at length rather scabrous; tube of corolla twice as long as the calyx; calyxes very short, linear, acute. ♃. H. Native of Virginia, Carolina, Tenessee, on dry sunny hills, in a sandy soil. Anchùsa canéscens, Muhl. cat. p. 19. Anchùsa Virginiàna, Lin. syst. p. 191. Lithospérmum canéscens, Lehm. asper. p. 305. Anchusa floribus sparsis, caule glabro, Gronov. virg. p. 24. Anchusa lùtea minor quam alii Puccoon vocant, Gronov. virg. p. 19.—Mor. hist. 3. p. 447. sect. 11. t. 28. f. 4. Stems divided into two leafy racemes at top. Flowers nearly sessile. Corolla fulvous. Nuts similar to those of *Lithosp. officinàle.* The root is covered with a red substance, which is the true Puccoon of the Indians, and paints a beautiful red.

Canescent Puccoon. Fl. Ju. July. Clt. 1826. Pl. 1 to 2 feet.

5 B. conspícua (R. Br. in Richards. append. to Frankl. journ. p. 732.) stem beset with loose hairs; leaves oblong, obtuse, clothed with adpressed pili: floral ones secund, becoming gradually smaller to the top of the spikes; lobes of corolla entire. ♃. H. Native of North-west America, on the banks of the Saskatchawan. Lithospérmum conspícuum, Spreng. syst. 1. p. 548. Stems many from the same root, di-trichotomous at top. Spikes divaricate. Calyx hairy; segments subulate, three times shorter than the corolla. Corolla of an orange-yellow colour, pilose outside.

Conspicuous Puccoon. Pl. 1½ foot.

6 B. seríсea (Rœm. et Schultes, syst. 4. p. 743.) stem suffruticose, erect, trichotomously branched, villous at top; leaves oblong-lanceolate, obtuse, silky above, but somewhat villous beneath, canescent; tube of corolla twice as long as the calyx. ♃. H. Native of Virginia. Lithospérmum seríceum, Lehm. asper. 206. Anchùsa Virgínica, Lin. spec. 191. Gron. virg. p. 24. Willd. spec. 1. p. 7580.—Mor. hist. 3. p. 447. sect. 11. t. 28. f. 4. Stem divided at top into 3-6 floriferous branches. Leaves 2 inches long. Flowers pedicellate from the axils of the floral leaves. Calyx villous, with unequal linear segments. Corolla yellow, downy outside. Nuts ovate, glabrous.

Silky Puccoon. Fl. May, July. Clt. 1825. Pl. 1 foot.

7 B. dísticha; stem herbaceous, erect, branched at top; leaves clothed with adpressed pili: lower ones spatulate, obtuse: superior ones oblong-lanceolate, acute: floral ones ovate, in 2 rows; tube of corolla length of calyx. ♃. S. Native of Cuba. Lithospérmum dístichum, Orteg. dec. p. 8. Jacq. fragm. t. 48. f. 3. Willd. enum. 1. p. 177. Lehm. asper. p. 308. Stems numerous, strigose or pilose, divided into 3-6 leafy spikes at top. Flowers axillary, distich, on short pedicels, shorter than the floral leaves. Calyx pilose, with lanceolate-acute segments. Corolla white; throat yellow, marked by 5 obtuse gibbosities. Nuts small, ovate, turgid, hard, shining, white.

Distich-leaved Puccoon. Fl. May, June. Clt. 1806. Pl. ½ to 1 foot.

Cult. The species grow well in common garden soil, but best in a peat border. They are increased by dividing at the root, or by seed.

XVII. MACROME'RIA (from μακρος, *macros*, long, and μερις, *meris*, a part; the flowers are by far the largest of the whole family, of which it may justly be reckoned the most showy genus). D. Don, in edinb. phil. journ. July, Oct., 1832.

Lin. syst. *Pentándria, Monogýnia.* Calyx deeply 5-parted, rather unequal. Corolla funnel-shaped, much longer than the calyx; limb 5-lobed: lobes erect, acutish. Stamens nearly equal, with capillary glabrous filaments, and linear-oblong, incumbent, versatile anthers; cells of anthers parallel, dehiscing lengthwise. Style capillary, glabrous; stigma a pruinose dot. Ovaria 4, connate.—Perennial Mexican herbs. Stems erect, very simple. Leaves alternate, sessile, lanceolate, nerved. Racemes few-flowered bracteate. Calycine segments linear. Corolla white? 2-3 inches long; tube attenuated at the base; throat dilated; lobes of limb oblong; imbricate in æstivation. The long filaments distinguish this genus from *Lithospérmum* and *Bátschia*, to which it otherwise comes nearest in affinity.

1 M. longiflòra (D. Don, l. c.) leaves lanceolate, acuminated, smoothish; genitals inclosed. ♃. F. Native of Mexico. Lithospérmum longiflòrum, Sesse et Mocino, mss. in herb. Lamb.

Long-flowered Macromeria. Pl.

2 M. exse'rta (D. Don, l. c.) leaves lanceolate, mucronate, scabrous; genitals exserted; stem hispid. ♃. H. Native of Mexico. E'chium species, Sesse et Mocino, mss. in herb. Lamb.

Exserted-stamened Macromeria. Pl.

Cult. For culture and propagation see *Bátschia* above.

XVIII. MO'LTKIA (named by Dr. Lehmann in honour of Count Gadske Moltke, a Danish prince, founder of a Museum of Natural History at Copenhagen). Lehm. in act. soc. nat. scrut. hal. 3. p. 3. asper. p. 339.

Lyn. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla cylindrical, somewhat funnel-shaped; with a naked throat. Stamens exserted; anthers oblong, incumbent. Nuts 4, 1-celled, large, difformed, imperforated at the base, fixed to the bottom of the calyx.—Strigose, canescent, herbaceous plants, with lateral and terminal secund bracteate spikes of flowers; terminal spikes conjugate, lateral, solitary.

1 M. puncta'ta (Lehm. l. c. p. 5. asper. 339.) leaves obovate-lanceolate, obtuse, clothed with strigose pili; corolla a little longer than the calyx; nuts beset with adpressed dots. ♃. H. Native of Galatia. Stems simple, many from the same root. The whole plant canescent from strigose pili. Spikes 3-4 inches long. Bracteas lanceolate. Calyx strigose, with linear segments.

Dotted-seeded Moltkia. Pl. ½ to 1 foot.

2 M. cœru'lea (Lehm. l. c. p. 6. asper. p. 340.) leaves oblong-lanceolate, acute, rather silky; corolla much longer than the calyx; nuts wrinkled. ♃. H. Native of Armenia. Onósma cœrùlea, Willd. spec. 1. p. 775. Pers. ench. 1. p. 162. Sýmphytum orientàle angustifòlium flore cœruleo, Tourn. cor. p. 7. Plant canescent, and rather silky from incumbent pili. Stem shrubby at the base, ascending. Leaves an inch long. Spikes 4-6 inches long; bracteas lanceolate. Corollas bluish-purple. Calyx pilose, with linear-lanceolate segments.

Blue-flowered Moltkia. Pl. ½ to 1 foot.

Cult. For culture and propagation see *Onósma*, p. 317. Elegant plants, well worth the gardener's care.

XIX. CRANIOSPE'RMUM (from κρανιον, *kranion*, the cranium; and σπερμα, *sperma*, a seed; in reference to the form of the nuts). Lehm. asper. p. 336.

Lin. syst. *Pentándria, Monogýnia.* Calyx oblong, 5-parted. Corolla cylindrical with a 5-toothed mouth, and a naked throat. Stamens much longer than the corolla; anthers oblong. Nuts 4, 1-celled, hemispherical, concave at the base, fixed to the bottom of the calyx.—Plant densely villous, or strigose. Roots fusiform. Stems many from the same root, simple, erect, rather tufted. Radical leaves oblong-lanceolate, obtuse, petiolate as well as the lower cauline ones: the upper cauline ones sessile and acutish, all canescent while young. Flowers on short pedicels, disposed in short, terminal, sub-capitate, leafy racemes. Calyx villously hispid, nutant in the fructiferous state. Corolla glabrous, rose-coloured.

1 C. subvillòsum (Lehm. l. c. p. 337.) ♃. H. Native of Siberia, in gravelly places, by Lake Baikal.

Subvillous Craniospermum. Pl. 1 to 1½ foot.

Cult. For culture and propagation see *Onósma*, p. 317.

XX. STRO'BILA (from στροβιλος, *strobilos*, a top; in reference to the form of the fruit.) Dióclea, Spreng, syst. 1. p. 502-556, but not of D. C. Anchùsa species, Sieber.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped, villous, with a slender tube and spreading limb. Stamens equal in length to the limb. Style bifid; stigmas 2, capitate. Fruit pyramidal, perforated at the base.—Plant much branched, strigose, very hispid. Leaves lanceolate. Spikes leafy. Corolla cream-coloured, thrice as long as the calyx.

1 D. hispidíssima (Spreng, syst. 1. p. 556.) ♃. ? H. Native of Egypt, near Abugyr. Anchùsa aspérrima, Delile, fl. ægypt. vol. 2. Anchùsa hispidíssima, Sieb.

Very hispid Stríbila. Pl. 1 to 2 feet.

Cult. See *Anchùsa*, p. 343, for culture and propagation.

XXI. E'CHIUM (εχιον of Dioscorides. εχιειον of Nicander; from εχις, *echis*, a viper; being supposed to cure the bite of the viper, or to have seeds resembling a viper's head; the genus is, therefore, called *Viper's Bugloss* in English, and *Viperine* in French.) Pliny. Tourn. inst. t. 54. Lin. gen. no. 191. Schreb. gen. 251. Juss. gen. p. 130. ed. Usteri. p. 145. Lam. ill. no. 255. t. 94. Gærtn. fruct. 1. no. 419. t. 67. f. 7. Schkuhr, handb. t. 32.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped or campanulate; throat wide, naked; segments of the limb unequal in many of the species. Stamens exserted. Style bifid at top, hairy at the base. Nuts 4, 1-celled, turbinate, gigartoid, scabrous, imperforated at the base, fixed to the bottom of the calyx.—Rough, shrubby, or herbaceous plants. Leaves lanceolate, or oblong-lanceolate. Spikes of flowers compound, unilateral, recurved at top, usually forming pyramidal panicles; spikelets, bracteate. Corolla blue, violaceous, or white.

§ 1. *Shrubs. Stamens in all exserted. Natives of the Canary Islands.*

1 E. aculea'tum (D. C. cat. hort. monsp. 1813. p. 106. Lehm. asper. p. 405.) stem branched, whitish; leaves sessile, linear, very narrow, silky, but the ribs and margins are spinulose; panicles short, subglomerate; spikelets simple. ♄. G. Native of the Canary Islands. Poir. dict. 8. p. 664. Young branches beset with prickles, which rise from tubercles. Leaves 2-3 inches long and 2 lines broad, canescent. Calyx spinulose; segments linear, unequal. Corolla white; limb rather unequal, obtuse.

Prickly Viper's Bugloss. Fl. May, July. Clt. 1815. Shrub 4 to 6 feet.

2 E. gigante'um (Lin. fil. suppl. 131.) stem branched, hoary at top: leaves petiolate, lanceolate, attenuated at the base; clothed with silky pubescence: having the ribs and margins hispidly scabrous; panicles thyrsoid, strigose; spikelets bifid. ♄. G. Native of Teneriffe, among rocks. Jacq. fil. eclog. p. 93. t. 63. Cav. pl. ciud. Brouss. in ann. cienc. nat. 1801. no. 7. D. C. pl. hort. monsp. 1813. p. 106. Vent. malm. t. 71. Willd. spec. 1. p. 782. Lehm. asper. p. 406. Leaves bluntish, 3-5 inches long, and about ½ an inch broad, tapering at the base into half stem-clasping petioles. Calycine segments linear, lanceolate, mucronate, unequal. Corolla white, fading to purplish; segments obtuse, nearly equal.

Giant Viper's Bugloss. Fl. July, Nov. Clt. 1779. Shrub 6 to 10 feet.

3 E. mo'lle (Poir. dict. 8. p. 668.) stem branched, white; leaves subpetiolate, narrow-lanceolate, clothed with silvery pubescence; panicles ovate; spikelets pedunculate, simple. ♄. G. Native of the Canary Islands. Lag. gen. et spec. nov. diagn. p. 10. D. C. cat. hort. monsp. 1813. p. 106. Lehm. asper. p. 408. Leaves acute, 3-6 inches long, and 6-8 lines broad, attenuated into somewhat clasping petioles at the base. Calyx cinereous, from silky down and hairs; segments nearly equal, lanceolate. Corolla nearly regular, white?; segments blunt.

Soft Viper's Bugloss. Fl. June, July. Clt. 1820. Shrub 4 to 6 feet.

4 E. densiflòrum (D. C. cat. monsp. 1813. p. 108. icon. hort. monsp. ined. t. 22. exclusive of the synonymes) stem branched; branches hoary; leaves lanceolate, nerved, clothed with silky hoary down; panicles spike-formed, dense; spikelets sessile, simple. ♄. G. Native of Teneriffe, or Madeira. Lehm. asper. p. 408. E. stríctum, Lam. ex Desf. tabl. de l'ecole bot. 1815. Poir. suppl. 5. p. 486. Flowers from lilac to pale blue, with white lines, approximating into a dense, cylindrical or oblong-ovate panicle.

Dense-flowered Viper's Bugloss. Fl. June, July. Clt. 1820. Shrub 2 to 4 feet.

5 E. candi'cans (Lin. fil. suppl. p. 131.) stem branched, subtomentose above; leaves lanceolate, feather-veined, clothed with silky silvery canescent down; panicles terminal, conical; spikelets pedunculate, simple. ♄. G. Native of Madeira, on high rocks. Jacq. coll. 1. p. 44. icon. rar. 1. t. 30. Ait. hort. kew. ed. 1. vol. 1. p. 186. Willd. spec. 1. p. 782. Lehm. asper. p. 409. Ker. bot. reg. t. 44. Leaves tapering to both ends. Calyx hairy; segments nearly equal, oblong, acute. Corolla campanulate, blue, pilose at top outside.

Whitish Viper's Bugloss. Fl. May, June. Clt. 1777. Shrub 2 to 4 feet.

6 E. cynoglossoìdes (Hort. par. ex Poir. suppl. 5. p. 487. Rœm et Schultes, syst. 4. p. 17.) stem branched, downy; leaves lanceolate, clothed with silk-grey down; panicle very large, composed of elongated racemes or spikes. ♄. G. Native of the Canary Islands. This species is very nearly related to *E. candìcans*, but differs in the size of the panicle, and in the down being cinereous. Leaves 5-6 inches long, and 2 broad, attenuated into the petioles at the base. Panicles pilose. Calycine segments acute. Corolla blue; limb obtuse.

Hound's-tongue-like Viper's Bugloss. Fl. May, June. Clt. 1818. Shrub 2 to 4 feet.

7 E. fastuòsum (Jacq. fil. eclog. no. 41. p. 61. t. 41. Lehm. asper. p. 410.) stem branched, rather villous above; leaves oblong-lanceolate, acuminated, veiny, beset with soft hairs, ciliated; panicle thyrsoid, ovate, large, dense; spikelets pedunculate, simple. ♄. G. Native of the Canary Islands. *E. candìcans.* D. C. cat. hort. monsp. 1813. p. 107. Leaves pale green, clothed with soft white hairs. Calyx hairy; segments narrow-lanceolate, acute. Corolla campanulate, deep blue.

Proud Viper's Bugloss. Fl. April, Aug. Clt. 1779. Shrub 2 to 4 feet.

8 E. macrophy'llum (Lehm. asper. p. 412.) stem erect; leaves oblong-lanceolate, obliquely acuminated, veiny, very soft, nearly glabrous, rather silky, silvery on both surfaces. ♄. S. Native of the Canary Islands?. Leaves crowded at the tops of the stem and branches, from a span to a foot long, and $1\frac{1}{2}$ to 2 inches broad; almost as silvery as those of *Protèa argéntea*, glaucous, green. Flowers unknown.

Long-leaved Viper's Bugloss. Fl. June, July. Clt. 1823. Shrub 2 to 4 feet.

9 E. foliòsum (Lehm. asper. p. 412.) stem branched, hoary and pilose above; leaves oblong-lanceolate, clothed with soft hairs; panicles leafy; peduncles one-half shorter than the leaves; spikelets nearly simple. ♄. G. Native of the Canary Islands?. Leaves pale green, 5-6 inches long, and 1 or $1\frac{1}{2}$ broad: floral ones 2-3 inches long. Lower spikelets bifid: upper ones simple. Peduncles and calyxes hairy. Segments of calyx unequal, lanceolate, acuminated. Corolla campanulate, white; segments unequal, obtuse.

Leafy Viper's Bugloss. Fl. May, June. Clt. 1815. Shrub 2 to 4 feet.

10 E. linea'tum (Jacq. fil. eclog. p. 62. t. 42.) stem branched, clothed with white pubescence above; leaves ovate-lanceolate, hairy, glaucous-green; spikelets of panicles pedunculate, bifid. ♄. G. Native of the Canary Islands?. Lehm. asper. p. 413. Lower leaves 3 inches long; tapering into the stem-clasping petioles: upper ones gradually shorter. Flowers disposed in a leafy raceme, formed from axillary spikelets. Calyx hairy; segments ovate-lanceolate, acute, marked each with a paler nerve outside. Corolla campanulate, bluish white, fading to purple, nearly equal, elegantly marked inside with 5 blue nerves. Stamens with white filaments and blue anthers.

Lined-flowered Viper's Bugloss. Fl. May, June. Clt. 1815. Shrub $1\frac{1}{2}$ to 2 feet.

11 E. símplex (D. C. cat. hort. monsp. 1813. p. 108. icon. hort. monsp. ined. t. 21.) stem simple; leaves large, ovate-lanceolate, silky on both surfaces; panicle long, spike-formed; spikelets bifid; stigma simple. ♂?. ♄. G. Native of Teneriffe. Lehm. asper. p. 415. Stem woody, but nevertheless biennial; hardly a foot high, and leafy at top the first year, but in the second year it lengthens out into a very long, cylindrical, regular panicle, which is leafy at the base. Flowers white.

Simple-stemmed Viper's Bugloss. Fl. June, July. Clt. 1820. Shrub 1 to 3 feet.

12 E. stríctum (Lin. fil. suppl. p. 131.) stem branched, hispid from retrograde pili, or bristles; leaves oblong-lanceolate, very scabrous, hairy; spikelets of panicle bifid: when young capitate. ♄. G. Native of Teneriffe among rocks. Lam. ill. p. 414. no. 1868. Jacq. schœnbr. 1. p. 15. t. 35. Willd. spec. 1. p. 783. Ait. hort. kew, ed. 1st. vol. 1. p. 186. D. C. cat. hort. monsp. 1813. p. 108. Horn. hort. hafn. 1. p. 182. Leaves 2-4 inches long, and $\frac{1}{2}$ inch broad, callosely dotted above, paler and less dotted beneath. Peduncles axillary and terminal, very hispid; lower ones 3-4 inches long, becoming gradually shorter to the top. Calycine segments lanceolate. Corolla blue, rarely white, sub-campanulate, nearly regular; segments acutish: the 2 superior ones broadest. Anthers blue.

Strict Viper's Bugloss. Fl. May. Dec. Clt. 1779. Shrub 2 to 3 feet.

13 E. brachya'nthum (Horn. hort. hafn. 1. p. 182. Lehm. asper. p. 417.) stem branched; branches hairy; leaves lanceolate, veiny, hairy; spikelets of panicles bifid; corollas nearly equal, one half shorter than the calyx. ♄. G. Native of Madeira among rocks. Panicle terminal, ovate, hispid. Calycine segments narrow-lanceolate, acuminated, unequal. Corolla subcampanulate, white, becoming reddish-violet as they fade, pilose at top outside; segments roundish.

Short-flowered Viper's Bugloss. Fl. June, July. Clt. 1819. Shrub 3-5 feet.

14 E. bífrons (D. C. cat. hort. monsp. 1813. p. 107. icon. pl. monsp. ined. t. 19.) stem shrubby, branched; branches pubescent at top; leaves oblong-lanceolate, downy, attenuated at both ends; panicles ovate; spikelets usually simple. ♄. G. Native of the Canary Islands. Lehm. asper. p. 418. This very distinct species is difficult to characterize: the calyxes in the terminal panicles are equal in length to the corollas, but those in all the lateral panicles are not one half the length of the corolla, hence the specific name. Corolla white, fading to red.

Two-faced Viper's Bugloss. Fl. May, June. Clt. 1820. Shrub 2 to 3 feet.

15 E. vire'scens (D. C. cat. hort. monsp. 1813. p. 107. exclusive of the syn. of Jacq Lehm. asper. p. 471.) stem shrubby, branched; branches clothed with soft hairs; leaves lanceolate, green, hairy; panicle spike-formed; spikelets pedunculate, lower ones bifid, superior ones simple. ♄. G Native of Teneriffe among rocks. Flowers pale blue, with white lines.

Greenish Viper's Bugloss. Fl. June, July. Clt. 1820. Shrub 2 to 3 feet.

16 E. ambíguum (D. C. cat. hort. monsp. 1813. p. 107. icon pl. monsp. ined. t. 20.) stem shrubby, branched; branches hispid from bristles; leaves oblong-lanceolate, attenuated at both ends, hispid; panicle oblong-ovate; spikelets bifid; calycine lobes equal in length to the corolla. ♄. G. Native of the Canary Islands. E. candìcans, Lam. ill. no. 1866. t. 94. f. 2, exclusive of the synonymes. A humble shrub, one-half smaller than *E. bífrons*, and all the species belonging to the present section. Flowers small, from white to flesh-colour.

Ambiguous Viper's Bugloss. Fl. May, June. Clt. 1820. Shrub 1 to 2 feet.

17 E. nervòsum (Ait. hort. kew, ed. 2d. 1810, vol. 1. p. 300.)

stem shrubby; leaves lanceolate, nerved, and are, as well as the branches, silky; calycine segments linear, bluntish; racemes or panicles ovate; style hairy. ♄. G. Native of Madeira. Flowers blue or purple?

Nerved-leaved Viper's Bugloss. Fl. June, August. Clt. 1777. Shrub.

§. 2. CAPE'NSES. *Shrubby plants, natives of the Cape of Good Hope. Flowers solitary, axillary or spicate. Stamens exserted or inclosed.*

18 E. FORMÒSUM (Pers. ench. 1. p. 163. Lehm. asper. p. 418.) stem branched above, glabrous; leaves narrow-lanceolate, very scabrous above; racemes subcymose; corollas tubular, very long. ♄. G. Native of the Cape of Good Hope. E. tubíferum, Poir. dict. 8. p. 663. E. grandiflòrum, Desf. arb. 1. p. 177. Vent. malm. p. 97. t. 97. Andr. bot. rep. t. 20. Ker. bot. reg. 124. Kerner, semp. 5. t. 205. Leaves clasping the stem at the base, grass-green, 3-4 inches long, with spinulosely denticulated margins. Bracteas subcordate at the base. Calyx hairy, sub-bilabiate; segments unequal. Corolla equal, red, 1½ inch long. Stamens equal in length to the corolla. Stigma emarginate.

Beautiful Viper's Bugloss. Fl. June, July. Clt. 1787. Shrub 2 to 3 feet.

19 E. SCA'BRUM (Lehm. asper. p. 419.) stem hairy above; leaves elliptic-lanceolate, scabrous, hispid; spikelets terminal, bipartite; bracteas falcate, hispid. ♄. G. Native of the Cape of Good Hope. Stem much branched at top; branches scabrous; branchlets hairy. Leaves beset with adpressed strigæ, 1 to 1½ inches long. Calycine segments acute, lanceolate, rather unequal, hairy. Corolla irregular, large, blue. Stamens length of corolla.

Scabrous Viper's Bugloss. Fl. May, July. Clt. 1820. Shrub 2 to 3 feet.

20 E. FRUTICÒSUM (Lin. spec. p. 199.) stem tomentose; leaves lanceolate-spatulate, acutish, clothed with silky villi; spikelets crowded, corymbose. ♄. G. Native of the Cape of Good Hope. Berg. pl. cap. p. 39. Willd. spec. 1. p. 781. Ait. hort. kew, ed. 1st, vol. 1. p. 186. Ker, bot. reg. 86. E. Africànum, Pers. ench. 1. p. 163.—Comm. hort. 2. p. 107. t. 54. Stem branched. Spikelets usually bipartite, hairy. Calycine segments acute, nearly equal. Corolla purple, with rather unequal segments. Stamens a little longer than the corolla.

Var. β, màjus (Thunb. fl. cap. prod. p. 33.) stem, as well as the leaves, which are oblong, silky; spikelets alternate, pedunculate. ♄. G. Native of the Cape of Good Hope. Leaves more spatulate, bluntish, and twice the size of those of the species.

Shrubby Viper's Bugloss. Fl. May, June. Clt. 1759. Shrub 2 to 3 feet.

21 E. ARGE'NTEUM (Lin. mant. p. 202. Lehm. asper. p. 421.) stem branched; leaves lanceolate, acute, reflexed at the apex, clothed with silky pili: margins of the floral ones setosely prickly; spikes terminal, simple, leafy. ♄. G. Native of the Cape of Good Hope. Berg. cap. p. 40. Lam. ill. p. 413. no. 1862. Andr. bot. rep. 154. Thunb. prod. fl. cap. p. 33. Willd. spec. 1. p. 783. E. fruticòsum, Jacq. schœnbr. 1. t. 34. Branches hoary, from copious adpressed pili, hispid above from stiff bristles. Lower leaves 1½ inch long. Calyx hispid, with unequal segments; the two lateral ones larger, and keeled. Corolla blue, campanulately tubular; segments unequal, obtuse. Stamens unequal; the 2 lower ones longer than the corolla, the rest inclosed. Plant canescent.

Var. β, fèrox (Lehm. asper. p. 422.) stem shrubby; branches and leaves prickly; flowers spicate; corollas nearly equal. ♄. G. Native of the Cape of Good Hope. E. fèrox, Pers. ench. 1. p. 163. E. ferocíssimum, Andr. bot. rep. t. 39. E. argénteum, Roth. bot. abh. p. 25.

Silvery Viper's Bugloss. Fl. June, July. Clt. 1789, β. 1794. Shrub 3 to 6 feet.

22 E. GLAUCOPHY'LLUM (Jacq. coll. 2. p. 325. icon. rar. 2. p. 10. t. 312.) stem branched; leaves lanceolate, glabrous, with callosely scabrous edges, glaucous; spikelets bipartite, bracteate. ♄. G. Native of the Cape of Good Hope. Lehm. asper. p. 423. Andr. bot. rep. t. 165. E. lævigàtum, Lam. ill. p. 413. no. 1863. but not of Thunb. E. glàbrum, Thunb. in Schrad. journ. bot. 1803. p. 38. prod. fl. cap. p. 33. Stem quite glabrous. Leaves sessile, acute, 1½ inch long, scabrous from white callous dots on the edges. Spikelets panicled, terminal, and from the axils of the leaves. Calyx glabrous, with lanceolate segments, which are edged with callous dots. Corolla violaceous; limb almost regular. Stamens unequal, longer than the corolla.

Glaucous-leaved Viper's Bugloss. Fl. July. Clt. 1792. Shrub 2 to 3 feet.

23 E. LÆVIGA'TUM (Lin. spec. p. 199. Thunb. prod. p. 33.) stem simple, glabrous; leaves ovate-lanceolate, glabrous, spinulosely ciliated on the margins; spikes terminal, compound; spikelets simple, very short. ♄. G. Native of the Cape of Good Hope. Lehm. asper. p. 424. Willd. spec. 1. p. 785. exclusive of the syn. of Jacq. Leaves ciliated with distant white bristly strigæ, and with callous dots along the midrib beneath. Calycine segments strigose along the margins and middle nerves. Corolla funnel-shaped; limb nearly equal, obtuse. Stamens much exserted, declinate, unequal. Stigma simple. Corollas blue.

Smooth Viper's Bugloss. Fl. June, July. Clt. 1774. Shrub 1 to 2 feet.

24 E. PANICULA'TUM (Thunb. in Schrad. journ. 1806. p. 41. prod. p. 33.) stem branched; branches elongated, angular, and downy above; leaves lanceolate, hispid, spinulosely ciliated; spikelets panicled. ♄. G. Native of the Cape of Good Hope. Willd. spec. 1. p. 784. Lehm. asper. p. 425. Branchlets subfastigiate, hispid, and compressedly angular. Leaves about an inch long, with diaphanous ciliæ, which rise from papillæ. Panicle terminal. Calyx 5-angled; segments acute, having the angles and edges hispidly ciliated. Corolla white, regular; limb bluntish. Stamens unequal, twice as long as the corolla.

Panicled-flowered Viper's Bugloss. Fl. May, July. Clt. 1815. Shrub 2-3 feet.

25 E. SWA'RTZII (Lehm. asper. p. 426.) stem branched at top, glabrous; leaves linear-lanceolate, glabrous, furnished with callous dots on the margins, but when young hispidly ciliated; spikelets terminal, bifid or trifid. ♄. G. Native of the Cape of Good Hope. E. angustifòlium, Swartz in litt. Branchlets scabrous. Leaves sessile. Bracteoles hispid. Calyx hispid, with unequal lanceolate segments. Corolla irregular, blue, rather large. Stamens exserted.

Swartz's Viper's Bugloss. Shrub 2 to 3 feet.

26 E. GLA'BRUM (Vahl. symb. 3. p. 22.) stem branched; leaves narrow-lanceolate, somewhat falcate, glabrous above, but beset with callous dots beneath: uppermost leaves, as well as the calyxes pilose, or strigose; spikelets alternate. ♄. G. Native of the Cape of Good Hope. Lehm. asper. p. 427. Andr. bot. rep. t. 165. E. falcàtum, Lam. ill. p. 413. no. 1864. E. Vàhlii, Rœm. et Schultes, syst. 4. p. 14. Branches purplish, beset with adpressed villi. Leaves an inch long. Spikelets erect, 2 inches long, leafy, from the axils of the upper leaves. Calyx pilose, with lanceolate unequal segments. Corolla irre-

gular, white. Stamens unequal, the 2 lower ones longer than the corolla, the rest shorter. Stigma sub-capitate, somewhat 2-lobed.

Glabrous Viper's Bugloss. Fl. May, June. Clt. 1791. Shrub 1 to 2 feet.

27 E. trigònum (Thunb. in Schrad. journ. bot. 1806. p. 42. prod. p. 33.) stem branched, villously hispid above; leaves oblong-lanceolate, obtuse, canaliculate, very numerous, strigosely pilose; stamens inclosed. ♄. G. Native of the Cape of Good Hope. Lehm. asper. p. 428. Willd. spec. 1. p. 784. Leaves somewhat imbricated, keeled below, very soft and canescent while young. Spikelets terminal, few-flowered. Calyx hoary, villous, with lanceolate obtuse segments. Corolla large, pilose outside, with an obtuse limb. Stamens unequal, about the length of the corolla. Stigma simple.

Trigonal Viper's Bugloss. Shrub.

28 E. verrucòsum (Swartz, in litt. ex Lehm. asper. p. 429.) stem branched; leaves linear-lanceolate, incumbent, much crowded, hispid, but papillosely setose beneath; spikelets panicled. ♄. G. Native of the Cape of Good Hope. Branches hoary and hairy. Leaves numerous, an inch long. Spikelets forming a terminal crowded panicle. Calyx hairy and hoary, with linear acute segments. Corolla white, rather irregular. Genitals exserted.

Warted Viper's Bugloss. Fl. June, July. Clt. 1822. Shrub.

29 E. capita'tum (Lin. mant. p. 42.) stem branched, pilose; leaves lanceolate, hispid; flowers equal, disposed in capitate corymbs; calyxes hoary. ♄. G. Native of the Cape of Good Hope. Thunb. prod. p. 33. Lam. ill. p. 414. no. 1869. Willd. spec. 1. p. 785. Lehm. asper. p. 430. E. híspidum, Burm. cap. p. 4. Leaves numerous, 1 to 1½ inch long. Peduncles terminal and axillary, pilose; lower ones the longest. Bracteas hispid. Calyx pilose, with linear equal segments. Corolla red, equal, funnel-shaped, small, with ovate segments. Stamens twice as long as the corolla. Style bifid at apex.

Capitate-flowered Viper's Bugloss. Fl. June, July. Clt. 1819. Shrub 2 to 3 feet.

30 E. sphæroce'phalum (Vahl. symb. 3. p. 22. Lehm. asper. p. 431.) stem branched, glabrous; leaves lanceolate, sub-imbricated, convex and strigose beneath; heads of flowers terminal, solitary. ♄. G. Native of the Cape of Good Hope. E. capitàtum, var. sphærocéphalum, Lam. ill. 1. p. 414. no. 1865. Rœm. et Schultes, syst. 4. p. 13. Branches angular, and hispid at top. Leaves sessile, half stem-clasping, obtuse, hardly a nail in length, pilose above and on the margins, but strigose beneath. Bracteas ciliated. Calyx pilose, with linear segments. Corolla equal, a little longer than the calyx. Stamens fleshy, much longer than the corolla.

Round-headed Viper's Bugloss. Shrub.

31 E. rosmarinifòlium (Vahl. symb. 3. p. 22.) stem pilose; leaves petiolate, linear, with revolute edges, pilose, and canescent beneath; spikelets terminal, simple. ♄. G. Native of the Cape of Good Hope. Lehm. asper. p. 432. Branches tomentose below, and clothed with white villi above. Peduncles and calyxes pilose. Calycine segments linear, unequal. Corolla nearly regular; tube pilose from the middle to the limb. Genitals inclosed.

Rosemary-leaved Viper's Bugloss. Shrub.

32 E. strigòsum (Swartz, in litt. ex Lehm. asper. p. 432.) stem hoary, villous: leaves lanceolate, obtuse, keeled, strigose on both surfaces; spikelets terminal, bipartite. ♄. G. Native of the Cape of Good Hope. Leaves an inch long; when young, hoary. Bracteas and calyxes hispid. Calycine segments lanceolate, nearly equal. Corolla large, violaceous; limb rather unequal. Stamens exserted.

Strigose Viper's Bugloss. Fl. June, July. Clt. 1821. Shrub 1 to 2 feet.

33 E. trichótomum (Thunb. in Schrad journ. bot. 1806. p. 39. prod. p. 33.) stem glabrous at bottom, somewhat trichotomously branched; leaves linear, very numerous, hoary, villous; spikelets terminal, bipartite, divaricate. ♄. G. Native of the Cape of Good Hope. Lehm. asper. p. 433. Willd. spec. 1. p. 784. Stem purplish. Branches glabrous: when young simple, or tripartite, bifid at apex, villous and hoary. Leaves alternate, opposite, and 3 in a whorl, ½ an inch long, keeled. Flowers on short pedicels; bracteas ovate, acute. Calyx hoary, very villous, with linear acute segments. Corolla white: limb irregular. Stamens much exserted.

Trichotomous-branched Viper's Bugloss. Shrub 2 to 3 feet.

34 E. híspidum (Thunb. l. c. p. 40. prod. p. 33.) stem glabrous, branched; branches and leaves hispid; leaves lanceolate; spikelets terminal, rather compound. ♄. G. Native of the Cape of Good Hope. Willd. spec. 1. p. 784. Lehm. asper. p. 433. Leaves sessile, an inch long, bluntish. Spikelets terminal, many-flowered. Bracteas linear-lanceolate, hispid. Calyx hispid, with erect, acute segments. Corolla white, regular. Stamens about as long as the corolla, or a little longer.

Hispid Viper's Bugloss. Fl. May, June. Clt. 1818. Shrub 1 to 2 feet.

35 E. lu'cidum (Lehm. sem. hort. hamb. 1827.) stem shrubby, branched; leaves narrow-lanceolate, quite glabrous, shining, ciliated at the base; spikes terminal, aggregate, thyrsoid, very villous. ♄. G. Native of the Cape of Good Hope. Stem suffruticose, branched from the base. Leaves sessile, bluntish. Corolla funnel-shaped, hardly longer than the calyx, pilose outside, unequal; segments obtuse, longer than the calyx. Stamens unequal, inclosed. Stigma simple. Nuts papillose.

Shining Viper's Bugloss. Shrub.

36 E. lasiophy'llum (Link. enum. 1. p. 170.) stem beset with adpressed hairs; leaves lanceolate, apiculated, silky; spikelets short; corollas nearly equal; stamens about equal in length to the corolla, but the style is longer. ♄. G. Native of the Cape of Good Hope? E. longifòlium, Hort. but not of Delile. Leaves hoary and soft from incumbent hairs. Spikes few-flowered, not curved. Calycine segments linear-lanceolate, about equal in length to the corolla. Corolla pilose outside, white, with a rounded limb. Filaments glabrous.

Woolly-leaved Viper's Bugloss. Fl. June, July. Clt. 1819. Shrub 2 to 3 feet.

§. 3. *Stems herbaceous; but in a few of the species they are woody at the base.*

37 E. cauda'tum (Thunb. in Schrad. journ. 1806. p. 43. prod. p. 33. Lin. fil. suppl. p. 132.) stem simple, villous, woody at the base; lower leaves oblong-lanceolate, superior ones lanceolate, all hispid or strigose; spike terminal, ovate-oblong, compound; stamens unequal, exserted. ♃. G. Native of the Cape of Good Hope, in sandy places. Willd. spec. 1. p. 786. Lehm. asper. p. 436. Stem purplish. Radical leaves an inch broad, petiolate; lower cauline ones sessile, 2-3 inches long. Spike 2-3 inches long. Calycine segments linear, beset with silky pili on the margins and back. Corolla small, red, irregular.

Tailed Viper's Bugloss. Fl. May, June. Clt. 1818. Plant 1 to 2 feet.

38 E. spica'tum (Thunb. l. c. p. 41, 42. prod. p. 33.) stems herbaceous, simple, pilose; leaves lanceolate-linear, hairy: hairs

spreading; spikes terminal, compound, linear-oblong; stamens exserted. ♃. G. Native of the Cape of Good Hope, in sandy places. Willd. spec. 1. p. 786. Lam. ill. 1. p. 413. no. 1861. Burm. cap. p. 5. Root fleshy, fusiform, purplish. Stems 2 or more from the same root, purplish. Radical leaves 2-3 hands long, rosulate, nearly as long as the flowering stem, petiolate; cauline leaves sessile, 2-3 inches long, acuminated. Spikes a finger to 2 hands long. Bracteas subulate. Calyx clothed with silvery villi; segments oblong-linear, obtuse. Corollas small, white.

Spicate-flowered Viper's Bugloss. Fl. March, May. Clt. 1799. Pl. 1 to 2 feet.

39 E. INCA'NUM (Thunb. l. c. p. 39. prod. p. 33.) stem herbaceous, simple, canescent; leaves linear-ensiform, rather scabrous, clothed with adpressed hairs, canescent; raceme spicate, linear. ♃. G. Native of the Cape of Good Hope, in Swartland, in sandy places. Willd. spec. 1. p. 786. Lehm. asper. p. 436. Leaves a span long, attenuated, and a little sheathing at the base: cauline ones lanceolate: uppermost ones an inch long. Racemes from a finger to a span long, composed of spikelets. Peduncles and pedicels very short. Calycine segments linear, obtuse, hoary and hairy. Corolla irregular, blue.

Hoary Viper's Bugloss. Pl. 1 to 1½ foot.

40 E. ACUTIFÒLIUM (Willd. herb. ex Lehm. asper. p. 437.) stem herbaceous, simple; leaves lanceolate, acuminated, clothed with white villi; racemes terminal, composed of nearly sessile spikelets; corolla nearly equal; stamens exserted. ♃. H. Native of Persia, in exposed places of woods. Root nearly simple, dark purple. Stem strigose. Radical leaves petiolate: cauline ones sessile. Bracteas pilose, linear-lanceolate. Calyx clothed with white villi; segments linear, rather unequal. Corolla villous outside; segments obtuse. Stigma sub-capitate.

Acute-leaved Viper's Bugloss. Pl. 1 to 2 feet.

41 E. THYRSOÍDEUM (Vent. malm. p. 98, in a note.) stem herbaceous, simple, hairy; leaves oblong-lanceolate, very rough; flowers thyrsoid; corolla unequal; stamens exserted. ♃. H. Native country unknown. Poir. dict. 8. p. 670. Lehm. asper. p. 431. Stem hispid. Leaves strigose above, and pilose below: lower ones 3-5 inches long: superior ones narrower, and gradually shorter. Spikelets approximate at top, forming a terminal thyrse; lower ones 3 inches long. Calyx hispid, with linear segments. Corolla bluish, villous outside; with ovate, nearly equal segments.

Thyrsoid-flowered Viper's Bugloss. Fl. July, Aug. Clt. 1820. Pl. 1½ to 2½ feet.

42 E. RU'BRUM (Jacq. fl. austr. 5. append. p. 27. t. 3.) stems herbaceous, simple, hispid; leaves linear-lanceolate, hispid; spike terminal, compound, very long; corollas nearly regular; stamens exserted. ♂. H. Native of Austria, Hungary, Transylvania, Tauria, Siberia, and Caucasus, in exposed fields. Lehm. asper. p. 439. Bieb. fl. cauc. 1. p. 135. Sims, bot. mag. t. 1826. Baumg. fl. trans. 1. p. 130 E. Róssicum, Gmel. syst. 2. p. 323. E. Créticum, Pall. ind. taur. E. Itálicum, Gmel. itin. 1. p. 119. t. 19.—Mor. hist. 3. sect. 11. t. 27. f. 2.—Clus. hist. 2. p. 164. f. 2. Root woody. Stem usually solitary. Flowers in nearly sessile axillary fascicles, the whole forming a compound terminal spike, from ½ to 1½ foot long. Calyx hispid, with unequal linear segments. Corolla red, 3 times longer than the calyx, with downy lines outside; segments of the limb unequal, obtuse. Stigma simple.

Red-flowered Viper's Bugloss. Fl. July, Aug. Clt. 1791. Pl. 2 to 3 feet.

43 E. CLAVA'TUM (Willd. herb. ex Lehm. asper. p. 440.) stem herbaceous, nearly simple; leaves linear-lanceolate, strigose; spike terminal, compound, very short; corolla tubularly clavate, unequal; stamens exserted. ♃. H. Native at the river Uruch. Root woody. Stem hispid. Radical and lower cauline leaves petiolate, 3-4 inches long; upper cauline leaves sessile. Spikelets of flowers sessile, forming a terminal spike. Calyx strigose, with subulate unequal segments. Corolla downy outside. Stigma emarginate, sub-bilobed.

Clavate-flowered Viper's Bugloss. Pl. 1 to 2 feet.

44 E. PAPILLÒSUM (Lehm. asper. p. 441.) stem herbaceous, simple; leaves oblong-lanceolate, attenuated at the base, obtuse, papillosely strigose; spikelets axillary, sessile, short, reflexed; corolla rather unequal; stamens exserted. ♃. H. Native of Siberia. Sy'mphytum secúndum, Gmel. syst. 2. p. 320. itin. 3. t. 36. f. 2. Stem rather angular, beset with soft strigæ. Lower cauline leaves 2-3 inches long, obovate-oblong, becoming gradually smaller and narrower as they ascend. Calyx pilose, hoary, with lanceolate segments. Corolla downy outside. Stigma simple.

Papillose Viper's Bugloss. Pl. 1½ to 2 feet.

45 E. GLOMERA'TUM (Poir. dict. 8. p. 670.) stem woody at the base, simple, strict, hispid; leaves oblong-lanceolate, rough; raceme spike-formed, very long, composed of glomerate spikelets; corolla nearly equal; stamens exserted. ♃. H. Native of Syria. Lehm. asper. p. 442. Stem angular, canescent. Leaves canescent, beset with adpressed strigæ: lower ones a span long: upper ones 2-4 inches long, and 2-3 lines broad, becoming gradually shorter as they ascend. Raceme constituting the greater part of the stem. Bracteas with setose margins. Calycine segments lanceolate-linear, with hispid edges. Corolla white, regular. Style bifid at top.

Glomerate-racemed Viper's Bugloss. Pl. 2 to 4 feet.

46 E. ITA'LICUM (Lin spec. 200.) stem. herbaceous, simple, strict; leaves linear-lanceolate, hispid from strigæ; raceme very long, spike-formed, composed of bifid dense-flowered spikelets; corolla nearly equal; stamens exserted. ♂. H. Native of Spain, south of France, Italy, Switzerland, Hungary, Transylvania, Greece, Tauria, Eastern Caucasus, Iberia, and Jersey, in waste fields. All. fl. ped. no. 180. Suter, fl. helv. 1. p. 108. Smith, engl. bot. t. 2081. Lapeyr. abr. p. 89. Smith, prod. fl. græc. 1. p. 124. Baumg. fl. trans. 1. p. 231. E. aspérrimum, Bieb. fl. cauc. 1. p. 135. exclusive of the synonymes of Lam. and Sabat. E. altíssimum, Jacq. fl. austr. 5. p. 35. app. t. 16. E. linearifòlium, Mœnch. meth. suppl. p. 149.—Hall. helv. no. 604. Stems many from the same root, beset with dark purple dots, and spreading stiff hairs. Calyx hispid, with linear rather unequal segments. Corollas white, or pale violet, pilose outside; segments ovate obtuse. Style bifid at apex.

Var. β. *lùteum* (Lehm. asper. p. 444.) stem simple; leaves lanceolate, very hairy; corolla nearly regular; stamens exserted. ♂. H. Native of the Pyrenees. E. lùteum, Lapeyr. abr. p. 91. Flowers yellow.

Var. γ; leaves softer and more villous; flowers nearly sessile. ♂. H. Native of the Pyrenees. E. Itálicum, β. Lepeyr, abr. p. 89. "Echium, corollis vix calycem excedentibus margine villosis." Lin. hort. ups. p. 35.

Italian Viper's Bugloss. Fl. July. Britain. Pl. 2 to 4 feet.

47 E. PYRENA'ICUM (Lin. mant. p. 334.) stem herbaceous, branched, hispid from strigæ; branches ascending pyramidal, panicled; leaves linear-lanceolate; spikelets elongated; flowers rather distant; corolla nearly equal; stamens exserted. ♂. H. Native of the South of France; Upper Italy; Lower Pyrenees; and about Tangiers and Algiers. Desf. fl. atl. 1. p. 164. D. C. syn. no. 2708. fl. gall. 6. p. 418. Willd. enum. 1. p. 187. Lehm. asper. 445. E. pyramidàle, Lapeyr. abr. p. 90. fl. pyr. t. 66. E. aspérrimum, Lam. ill. no. 1854. Pers. ench. 1. p. 164. E. Itálicum, var. γ. Willd. spec. 1. p. 787. E. Itálicum, var. β. Lin. spec. p. 201. E. Itálicum, Lam. fl. fr. 2. p. 451. E. lævigàtum, β. Vittm. summ. 1. p. 398. Murray, syst.

15. p. 196. Stem and branches beset with dark purple dots and spreading stiff hairs. Leaves hispid, from strigæ, deep green. Spikelets conjugate on the top of the stem and branches, axillary. Calyx hispid, with linear almost unequal segments, Corolla white or pale violet, villous outside, with lanceolate, obtuse segments. Style bifid at apex. Nuts beaked.

Pyrenean Viper's Bugloss. Fl. July, Aug. Clt. 1815. Pl. $1\frac{1}{2}$ to 2 feet.

48 E. margarita'ceum (Lehm. asper. p. 446.) stem herbaceous, branched, very hispid from bristles; leaves lanceolate, bristly: bristles rising from large tubercles; spikelets almost simple, elongated; stamens about equal in length to the corolla, which is tubular. ⊙. H. Native of Egypt. E. Rauwólfii Delile, fl. egypt. t. 19. f. 3. Spikelets usually solitary, rarely conjugate, very long and very hispid. Calyx hispid, with lanceolate, unequal segments. Corolla rather unequal, white; pilose outside.

Pearl Viper's Bugloss. Pl. $1\frac{1}{2}$ to 2 feet.

49 E. Menzie'sii (Lehm. pug. 2. p. 29.) stem herbaceous, erect, beset with retrograde strigæ; leaves sessile, acute, very hispid: lower ones narrow-lanceolate: superior ones ovate-lanceolate; racemes many-flowered, imbricate, hispid; stamens much shorter than the corolla, which is small and somewhat tubular. ♂. H. Native of the North-west coast of America. Stems herbaceous, erect, angular, $1\frac{1}{2}$ foot, branched. Leaves obscurely 3-nerved. Racemes secund, simple, terminal, bractless. Calyx very hispid, with equal linear segments. Corolla glabrous, yellowish; having 3 of its lobes twice the breadth of the rest. Nuts ovate, trigonal, wrinkled.

Menzies's Bugloss. Pl. $1\frac{1}{2}$ foot.

50 E. fla'vum (Desf. fl. atl. 1. p. 164. t. 45.) stem herbaceous, simple; leaves lanceolate, very hairy; raceme terminal, spike-formed; spikelets simple, dense; corolla almost regular; stamens exserted. ♂. H. Native of Atlas, near Tlemsen. Lehm. asper. p. 447. The whole plant is covered with numerous yellowish hairs. Racemes very numerous, axillary, twisted into a spire, but erect while in fruit. Calycine segments subulate. Corolla yellow; tube slender, arched; limb obtuse. Stigmas bifid.

Yellow-flowered Viper's Bugloss. Pl. 1 to 2 feet?

51 E. pustula'tum (Sibth. et Smith, prod. fl. græc. 1. p. 125. fl. græc. t. 180.) stem herbaceous, nearly simple, tubercularly hispid, as well as the leaves; leaves linear-oblong, repand; spikelets simple, spreading; stamens about equal in length to the corolla, which is irregular. ♂. H. Native of Sicily. Lehm. asper. p. 448. Hairs or strigæ very long, shining, rising from large white tubercles, giving the plant a canescent appearance. Tubercles on the stem blackish. Root fusiform. Calyx hispid, with nearly equal linear segments. Corolla large, sub-bilabiate, blue, or violaceous, before expansion red, marked with pilose lines outside. Style bifid at apex.

Pustulate Viper's Bugloss. Pl. 1 to $1\frac{1}{2}$ foot.

52 E. vulga're (Lin. spec. p. 200. fl. suec. ed. 2d. no. 168.) stem herbaceous, usually simple, strigose; leaves linear-lanceolate, hispid; raceme terminal, spike-formed, very long, composed of spreading simple spikelets; corolla irregular; stamens exserted. ♂. H. Native throughout Europe to Caucasus; also of North America, by way sides, and in waste fields and places; plentiful in some parts of Britain. Scop. fl. carn. ed. 2d. 1. p. 129. All. ped. no. 181. Mœnch, meth. p. 422. Vill. dauph. 2. p. 448. Sut. fl. helv. 1. p. 108. Bieb. fl. cauc. 1. p. 135. Bess. fl. gall. 1. p. 154. Smith, prod. fl. græc. 1. p. 125. engl. bot. t. 181. Oed. fl. dan. t. 445. Sturm. fl. germ. fasc. 18. with a figure. Pursh, fl. amer. sept. 1. p. 130. Blackw. t. 299.—Mor. hist. 3. sect. 11. t. 27. f. 1.—Riv. tab. t. 7. f. 2.—Sabb. rom. 2. t. 96. and a monstrous variety, t. 97. Root branched. Stems many from the same root, covered with black tubercles, furnished with axillary spikelets from the middle to the top, the whole forming a very long raceme. Radical leaves rosulate, obtuse. Calyx hispid, with unequal segments. Corolla downy outside, fine purple before expansion, afterwards of a violet blue colour. Style bifid at apex. Nuts wrinkled, tubercled.

Var. β. stem branched from the base, spreading, and often decumbent; stamens longer. ♂. H. Native of Britain. E. vulgàre, β, Smith, fl. brit. 1. c. E. violàceum, Schmidt, fl. bohem. no. 203. p. 3.

Var. γ. *albiflòrum* (Roth, l. c. and others.) flowers white.

Common Viper's Bugloss. Fl. July, Aug. Britain. Pl. 2 to 4 feet.

53 E. tubercula'tum (Hoffm. et Link, fl. port. 1. p. 183.) stem herbaceous, simple, upright, tubercularly hispid, as well as the leaves; leaves lanceolate-linear, with revolute margins; spikelets simple, erect, strict; stamens about equal in length to the corolla, which is irregular. ♃ ?. ♂. H. Native of Portugal; by way sides, particularly about Lisbon and Coimbra. Root branched. Superior leaves sessile, 1-3 inches long, and 3-4 lines broad. Spikelets axillary and terminal, dense, pedunculate. Calyx very hispid, with linear segments. Corolla blue, pilose outside. Style bifid at top.

Tubercular Viper's Bugloss. Fl. July, Aug. Clt. 1820. Pl. $1\frac{1}{2}$ to 2 feet.

54 E. Lusita'nicum (Royen, lugdb. p. 407. Lin. spec. p. 200.) stems herbaceous, simple, hairy; leaves lanceolate, attenuated at the base, acute, rather villous; spikelets simple, alternate, erectly spreading; corolla nearly equal; stamens exserted, 2 of which are very long. ♃. H. Native of Portugal, in sandy places. Lehm. asper. 450. Willd. spec. 1. p. 789. Pers. ench. 1. p. 164. Mill. dict. no. 4. E. Itálicum, Brot. fl. lus. 1. p. 290. Hoffm. et Link, fl. port. 1. p. 185. Root branched. Stems many from the same root. Radical leaves rosulate, canescent, 1 foot long, and 2 inches broad, on short petioles: cauline ones sessile, gradually narrower and shorter. Spikelets simple, numerous, pedunculate, axillary, covering the stem almost from the base to the top. Peduncles and calyxes strigosely hispid, the hairs rising from blackish tubercles. Calycine segments equal, lanceolate, acuminated. Corolla funnel-shaped, pilose outside; limb blue, painted with violet lines, bluntish. Style bifid at apex.

Portugal Viper's Bugloss. Fl. July, Aug. Clt. 1731. Pl. 2 to 3 feet.

55 E. viola'ceum (Lin. mant. p. 42.) stem herbaceous, branched; lower leaves oblong: upper ones lanceolate, cordate at the base, stem-clasping, hispid from strigæ; spikelets simple, elongated; stamens about equal in length to the corolla, which is irregular. ⊙. H. Native of the South of Germany, Spain, France, Italy, Transylvania, and in the South of Tauria, &c. Retz. obs. fasc. 2. p. 9. Willd. spec. 1. p. 788. Bieb. fl. cauc. 1. p. 422. D. C. syn. fl. fr. p. no. 2709. Bess. fl. gal. 1. p. 154. Baumg. fl. trans. 1. p. 131. Lapeyr. abr. p. 91. E. Créticum, Lam. ill. no. 1857. Lapeyr. abr. p. 91. Root fusiform. Stem hispid, from strigæ. Lower leaves obtuse, tapering into the petioles at the base: cauline ones acuminated. Calyx pilose, with unequal, narrow-lanceolate, ciliated, spreading segments. Corollas large, violet or pale blue, striated, beset with scattered hairs. Style bifid at apex.

Violaceous-flowered Viper's Bugloss. Fl. July, Aug. Clt. 1658. Pl. 1 to 2 feet.

56 E. orienta'le (Lin. hort. cliff. p. 43. spec. 200.) stem herbaceous, branched; branches ascending, pyramidal: leaves oblong-lanceolate: uppermost ones cordate, ovate, soft on both surfaces from dense pili; stamens shorter than the corolla, which is large. ♂. H. Native of the Levant. Willd. spec. 1. p. 789. Lam. ill. p. 413. no. 1859. E'chium orientàle, Vesbas-

ci folio, flore maximo campanulato, Tour. itin. 2. p. 107. t. 107.—Trew. pl. rar. 1. t. 1?. Root fusiform, fibrous. Stem pilose. Leaves pale green; radical and lower cauline ones a foot and more long: the rest gradually shorter as they ascend. Spikelets axillary and terminal, simple. Calyx hairy; with lanceolate, acute, segments. Corolla large, purplish blue, with a rather curved tube, and obtuse limb. Style bifid at apex.

Eastern Viper's Bugloss. Fl. July, Aug. Clt. 1780. Pl. 2 to 3 feet.

57 E. grandiflòrum (Desf. fl. atl. 1. p. 166. t. 46.) stem herbaceous, nearly simple, pilosely strigose; leaves ovate-oblong, clothed with downy tomentum: floral ones ovate-lanceolate; spikelets simple, erect; corolla 4 times longer than the calyx; stamens inclosed. ⊙. H. Native of Barbary and Cyrenaica. Horn. hort. hafn. 1. p. 183. Lehm. asper. p. 456. E. macránthum. Rœm. et Schultes, syst. 4. p. 20. Leaves bluntish: lower ones drawn out into petioles: middle and upper ones sessile, 2-3 inches long, becoming gradually shorter as they ascend. Spikelets terminal, and from the axils of the superior leaves. Bracteas clasping, hispid. Calyx pilose or hispid, with linear-subulate segments. Corolla large, nearly an inch long, violaceous, striated, pubescently pilose outside, particularly at the striæ. Style bifid at apex.

Great-flowered Viper's Bugloss. Fl. July, Aug. Clt. 1818. Pl. 1½ foot.

58 E. plantagíneum (Lin. mant. p. 202.) stem herbaceous, erect, paniculately-branched; radical leaves petiolate, ovate-oblong, lined; cauline leaves sessile, lanceolate, beset with long incumbent hairs; stamens hardly equal in length to the corolla, which is irregular. ⊙. H. Native of Greece, Portugal, South of France, Italy, Montevideo, &c. All. ped. no. 138. Smith, prod. fl. græc. 1. p. 124. fl. græc. t. 179. Jacq. hort. vind. 1. t. 45. D. C. syn. fl. fr. no. 2711. St. Hil. pl. usuell. bras. t. 25. Hoffm. et Link, fl. port. 1. p. 186. Poir. dict. 8. p. 671. Horn. hort. hafn. 1. p 182. Lehm. asper. p. 457. E. plantaginoìdes, Rœm. et Schultes, syst. 4. p. 19.—Barrel. icon. 1026. obs. 145. E. amplissimo folio Lusitanicum, Tourn. inst. p. 135. —E. orientàle, folio oblongo molli et cinericio, Tourn. cor. p. 6. Root fusiform, reddish brown. Stems many from the same root, soft to the touch at the base, but scabrous above. Radical leaves obtuse, 2-3 inches long, and 1 to 1½ broad: cauline ones stem-clasping: uppermost ones acute. Flowers large, showy, disposed in solitary, many-flowered, pedunculate spikelets. Calyx hispid; with linear lanceolate, nearly equal segments. Corolla large, purplish-violet, rarely white, red before expansion; limb sub-bilabiate, obtuse. Filaments glabrous. Style bifid at apex.

Plantain-like Viper's Bugloss. Fl. July, Oct. Clt. 1779. Pl. 1 to 2 feet.

59 E. Bentha'mii (Wall. cat. no. 931.) plant thickly clothed with strigose pili; radical leaves long, lanceolate, tapering at both ends, acuminated, 5-nerved; stems simple, naked from the base to the spike of flowers: lower bracteas ovate-lanceolate, acuminated, gradually diminishing in size to the top of the spike: calycine segments very long, linear, very villous. ♃. H. Native of the East Indies, at Buddrinath. Leaves 1 to 1½ foot long. Spike solitary, a foot long. Corolla not seen.

Bentham's Viper's Bugloss. Pl. 2 to 4 feet.

60 E. e'legans (Lehm. asper. p. 459.) stem herbaceous, erect, branched at the base, pilosely hispid; leaves linear-lanceolate, hispid, somewhat repand; stamens a little longer than the corolla, which is irregular. ♂. H. Native in the fields of Naples. E. híspidum, Smith, fl. græc. 1. p. 125. fl. græc. t. 181. E. Sibthórpi, Rœm. et Schultes, syst. 4. p. 26. The whole plant is canescent. Branches beset with red spots. Spikelets simple, alternate, many-flowered. Bracteas linear, ovate at the base. Calycine segments unequal, lanceolate, acute. Corolla of a fine scarlet colour, pilose at bottom. Filaments glabrous. Style bifid at apex.

Elegant Viper's Bugloss. Fl. June, July. Clt. 1824. Pl. 1 to 2 feet.

61 E. Cre'ticum (Lin. spec. 200.) stem herbaceous, diffuse, very hispid, branched at the base; leaves oblong-lanceolate, hispid; calyxes while bearing the fruit distant and widened; stamens inclosed. ⊙. H. Native of Candia, and throughout the Grecian Islands, in the sand by the sea-side. Smith, prod. fl. græc. 1. p. 126. fl. græc. t. 183. Sims, bot. mag. 1934. Schultes obs. p. 33. Nocca, in Usteri. ann. bot. 5. stuck. p. 14. Willd. enum. 1. p. 187. Horn. hort. hafn. 1. p. 183. Lehm. asper. p. 460. Sabb. hort. rom. 2. t. 95. E. rùbrum Mœnch. meth. p. 421. E. angustifòlium, Mill. dict. no. 6. E. Créticum angustifòlium rùbrum, Tourn. inst. p. 136. Root slender, brown. Stems decumbent in the spontaneous plant, but erect when cultivated. Leaves bluntish: radical ones petiolate: cauline ones sessile: floral ones acute, stem-clasping at the base. Spikelets simple, axillary, and terminal, many-flowered. Calyx hispid, with unequal foliaceous segments. Corolla irregular, reddish-violet, marked by 5 villous lines outside. Style bifid at apex.

Cretan Viper's Bugloss. Fl. July, Sept. Clt. 1683. Pl. ½ to 1½ foot.

62 E. floribu'ndum (Lehm. pug. 2. p. 24.) leaves nearly sessile, linear-lanceolate, acute, a little ciliated, downy on both surfaces: radical ones lanceolate, petiolate: racemes bifid, bracteolate; nuts smoothish: prickles glochidate, disposed in a simple series along the margins. ⊙. H. Native of the north-west coast of America. Stem beset with adpressed hairs. Racemes axillary, pedunculate, panicled at the top of the stem, many-flowered. Pedicels pilose: floriferous ones length of calyx, erect; but twice that length, and refracted in the fruit-bearing state. Calycine segments lanceolate, obtuse. Corolla blue, size of that of *Myosòtis palústris*, with roundish segments. Nuts ovate, acute.

Bundle-flowered Bugloss. Pl. 1 to 2 feet.

63 E. Bonarie'nse (Poir. dict. 8. p. 674.) stem herbaceous, simple, pilose; lower leaves linear, very narrow: superior ones dilated at the base, hairy; stamens hardly exceeding the corolla, which is large. ♂?. ⊙?. H. Native of Buenos Ayres. Lehm. asper. p. 462. Stem somewhat fistular. Leaves stem-clasping, 1 to 2 inches long, obtuse: floral ones subsagittate. Spikes terminal on long peduncles. Calyx very hispid, with lanceolate, acuminated segments. Corolla bluish-violet, irregular. Style glabrous; stigma bifid.

Buenos Ayrean Viper's Bugloss. Pl. 1 foot?

64 E. angustifòlium (Lam. ill. p. 412. no. 1856.) stem herbaceous, simple, erect, hispid; leaves linear, very narrow, attenuated at the base, hispid; corolla twice as long as the calyx; stamens exserted. ⊙. H. Native of Spain. Pers. ench. 1. p. 184. Lehm. asper. p. 462.—Barrel. icon. 1011. —Bocc. mus. t. 78. f. 3. Hairs rising from white conical tubercles. Leaves bluntish, 3-4 inches long, and about a line in breadth: lower ones petiolate: upper ones sessile. Spikelets solitary, pedunculate, terminal, and from the axils of the upper leaves. Calycine segments subulate. Corolla funnel-shaped, blue, beset with long, white, stiff hairs above; segments unequal. Style bifid at apex.

Narrow-leaved Viper's Bugloss. Pl. 1 to 2 feet?

65 E. Merte'nsii (Lehm. asper. p. 463.) stems woody at the base, simple, erect, leafy; leaves linear-lanceolate, hispid, hoary; corolla twice as long as the calyx; stamens equal in length to the corolla. ♃. H. Native of Spain. Root fusiform, simple. Stems one or more from the same root, hispid, hoary. Lower leaves 3-4 inches long, and 1-2 lines broad,

acutish; superior ones smaller, all imbricate at the base, and clasping the stem, with revolute edges. Flowers on short pedicels, disposed in short pedunculate spikelets, the whole constituting a terminal, compact, oblong raceme. Calyx hoary and pilose; with linear, nearly equal segments. Corolla funnel-shaped, blue, beset with long white hairs; segments unequal. Style bifid at apex.

Mertens's Viper's Bugloss. Fl. June, July. Clt. 1824. Pl. ½ to 1 foot.

66 E. spatula'tum (Viv. fl. libyc. p. 8. t. 9. f. 1.) plant shrubby, strigose; leaves long-spatulate; corolla twice as long as the calyx; stamens inclosed. ♄. F. Native of Libya, on the shores of the Great Syrtus. Stem branched from the base. Leaves tapering into the petioles; upper ones oblong, sessile. Flowers disposed in short terminal spikes. Calyx very hispid; with linear, acute segments. Corolla violaceous, hairy outside, ciliated. Stigma emarginate.

Spatulate-leaved Viper's Bugloss. Shrub.

67 E. setòsum (Vahl. symb. 2. p. 35.) stems woody at the base, procumbent, branched; leaves linear-lanceolate, very hispid, hoary; stamens a little longer than the corolla. ♃. H. Native of Egypt. Willd. spec. 1. p. 784. Lehm. asper. p. 464. E. rùbrum, Forsk. descr. p. 41. icon. 2. t. 17. f. 2.—The whole plant is hoary, and strigosely hispid. Leaves bluntish, sessile: lower ones more than an inch long. Spikelets terminal, solitary; bracteas ovate-lanceolate. Calycine segments linear-lanceolate, rather unequal. Corolla irregular, red inside, and canescent from villi outside. Style bifid at apex.

Bristly Viper's Bugloss. Pl. procumbent.

68 E. seríceum (Vahl, symb. 2. p. 35.) stems woody at the base, ascending, branched, diffuse; leaves linear, cuneated, hoary on both surfaces from incumbent hairs; stamens much longer than the corolla. ♃. H. Native of Egypt. Willd. spec. 1. p. 783. Lehm. asper. p. 465.—The whole plant is hoary and pilose. Leaves obtuse: lower ones crowded, petiolate, 2-3 inches long; petioles ciliated, stem-clasping; upper leaves gradually shorter, stem-clasping at the base. Flowers sessile, disposed in terminal, simple, compact spikelets. Calycine segments equal, lanceolate. Corolla irregular, villous outside. Style bifid at apex.

Silky Viper's Bugloss. Pl. ascending.

69 E. dista'chyum (Viv. fl. libyc. p. 8. t. 5. f. 1.) stem shrubby, decumbent, hispid from adpressed bristles; leaves linear, and are, as well as the calyxes and bracteas, strigose; corolla twice as long as the calyx; stamens exserted. ♄. F. Native of Libya, in the Great Syrtus, on the shores of Pentapoli. Leaves sessile, with subrevolute edges. Calycine segments linear. Spikes conjugate. Floral leaves length of calyxes. Corolla blue, hairy outside, with roundish lobes. Stigma deeply bifid. Allied to *E. seríceum*, and *E. setòsum*.

Two-spiked Bugloss. Pl. decumbent.

70 E. marítimum (Willd. spec. 1. p. 788. Lehm. asper. p. 466.) stems herbaceous, ascending, simple; leaves spatulate-lanceolate, obtuse, villously strigose, cinereous; stamens about equal in length to the corolla, which is large. ⊙. H. Native of Italy and Sicily, near the sea side; and in corn-fields of Tunis. E. marítimum stoechadum, flore maximo cœruleo, Tourn. inst. p. 136.—Barrel. icon. t. 1012.—Bocc. mus. 2. t. 78. f. 1. Root quite simple. Lower leaves tapering into petioles, 3 inches long; superior ones sessile, lanceolate, obtuse. Spikelets terminal, and from the axils of the upper leaves, dense, pedunculate. Calyx hoary from numerous hairs, with unequal, lanceolate segments. Corolla blue, irregular, downy outside; segments unequal. Style bifid at apex.

Sea-side Viper's Bugloss. Fl. July, Aug. Clt. 1815. Pl. ascending, ½ to 1 foot long.

71 E. te'nue (Roth. cat. bot. fasc. 2. p. 16.) stems herbaceous, erect, branched, slender; leaves linear-lanceolate, setosely pilose; stamens unequal, shorter than the corolla, which is small. ⊙. H. Native of Barbary, in sandy places. Pers. ench. 1. p. 164. exclusive of the syn. of Schousb. Lehm. asper. p. 467. The whole plant, with the exception of the corollas, is beset with tubercles, and stiff, dense hairs. Leaves acute, 2-3 inches long, and 3-4 lines broad. Racemes terminal, usually 3, alternate, dense. Calycine segments lanceolate-linear, nearly equal, acuminated, connivent. Corolla small, fine blue, reticulately veined, downy outside; limb oblique, unequal, obtuse.

Var. β, *hùmile* (Lehm. asper. p. 467.) leaves narrow-lanceolate, pilose, scabrous, running into the petioles at the base; calyxes very hairy. ⊙. H. Native of Barbary, in sandy places. E. hùmile, Desf. fl. atl. 1. p. 165. Pers. ench. 1. p. 164. Plant tufted, 3-4 inches high. Calycine segments linear-subulate.

Slender Viper's Bugloss. Fl. June, July. Clt. 1824. Pl. 1 foot.

72 E. pu'milum (Lehm. pug. 1. p. 18.) stem herbaceous, simple; leaves linear-lanceolate, hispid, hoary; spikes terminal, simple, very short; stamens a little longer than the corolla, which is large. ♃. H. Native of Egypt. Root rather woody. Stems 2 inches high, simple, hispid. Leaves obtuse. Spikes simple, dense, 8-12-flowered, at first revolute. Calyx hispid; segments equal, linear, bluntish. Flowers large for the size of the plant, irregular, violaceous, pilose outside, 3 times as long as the calyx. Stigma bifid.

Dwarf Bugloss. Pl. 2 inches.

73 E. parviflòrum (Mœnch. meth. p. 423. Roth. catal. fasc. 2. p. 14.) stems herbaceous, ascending, branched; leaves obovate-oblong, bluntish, strigosely pilose; stamens one half shorter than the corolla, which is small. ⊙. H. Native along the shores of the Mediterranean sea, &c. Pers. ench. 1. p. 164. Horn. hort. hafn. 1. p. 183. Willd. enum. 1. p. 187. E. calycìnum, Viv. fragm. fl. ital. fasc. 1. p. 2. t. 4. D. C. fl. fr. 4. p. 419. Lois. journ. bot. 2. p. 262. E. prostràtum, Tenore. fl. neap. prod. p. 14. fl. neap. 1. p. 60. t. 12. E. ovàtum, Poir. dict. 8. p. 666. E. micránthum, Schousb. beob. maroc. p. 75. E. Lusitánicum, All. ped. no. 182. E. marítimum, Tenore.—Till. hort. pis. p. 56. t. 23. f. 3.—Bocc. mus. p. 163. t. 132. Root fibrous. Stems many from the same root, strigosely hispid. Tubercles white, from which hairs rise. Radical leaves more than 2 inches long, petiolate, as well as the lower cauline ones: upper cauline ones sessile. Flowers nearly sessile, disposed in simple, terminal spikes. Calyx hispid, inflated, and larger in the fruit-bearing state; with unequal, lanceolate segments. Corolla rather irregular, pale blue, tubular, pilose outside; segments roundish-cordate. Style bifid at apex.

Small-flowered Viper's Bugloss. Fl. July, Aug. Clt. 1798. Pl. procumbent.

74 E. diffu'sum (Smith, prod. fl. græc. 1. p. 125. fl. græc. t. 182.) stems herbaceous, prostrate, diffuse, nearly simple; leaves linear-subspatulate, setosely strigose; stamens a little shorter than the corolla, which is large. ⊙. H. Native of Candia. Root thick, rather woody. Stems numerous, hispid. Leaves 1-2 inches long. Flowers sessile, disposed in terminal, simple, many-flowered elongated spikes; bracteas obovate-spatulate, recurved. Calyx bristly, with nearly equal, linear, acute segments. Corolla irregular, scarlet, beset with white pili outside. Style bifid at apex.

Diffuse Viper's Bugloss. Fl. June, July. Clt. 1817. Pl. prostrate.

75 E. longifòlium (Delile. descrip. egypt. 2. t. 16. f. 3.) erect, simple; leaves linear-lanceolate, elongated, strigose; corolla large; stamens exserted. ♃. H. Native of Egypt.

Long-leaved Viper's Bugloss. Pl.

76 E. arena'rium (Guss. sem. hort. Bocc. 1825. ex Linnæa, 4. p. 37.) stem diffuse; leaves obtuse; corolla small, tubular; calyx hispid from strigæ, by which it differs from *E. diffùsum*, and *E. tènue*. ♃. H. Native of the South of Europe.

Sand Bugloss. Pl. diffuse.

† *Species doubtful or hardly known, many of which are probably synonymous with some of those described above.*

77 E. Salma'nticum (Lag. gen. et spec. nov. diagn. 1806. p. 10.) radical leaves lanceolate; stamens very long, glabrous; throat of corolla impervious. ♃. H. Native of Spain, about Salamanca. Plant hispid.

Salamanca Viper's Bugloss. Fl. June, July. Clt. 1811. Pl. 1 to 2 feet.

78 E. Valentìnum (Lag. l. c.) plant strigose; leaves lanceolate; corollas campanulately funnel-shaped, nearly equal, longer than the calyx; stamens about equal in length to the corolla. ♃. H. Native of Spain, in the province of Valentia, where it was gathered by Cavanilles.

Valentia Viper's Bugloss. Pl.

79 E. Schiffe'ri (Lang, in syll. soc. reg. ratisb. vol. 2. with a figure, ex Bull. phil. 18. p. 240.) We know nothing of this species.

Schiffer's Viper's Bugloss. Pl.

80 E. Laga'scæ (Rœm. et Schultes, syst. 4. p. 27.) strigose; stem panicled at top; branchlets alternate, terminated by a bifid spike; corolla shorter than the calyx; upper leaves lanceolate, subpetiolate. ♃. H. Native of Spain, near Hispalim. E. paniculàtum, Lag. l. c. but not of Thunb.

Lagasca's Viper's Bugloss. Pl.

81 E. elonga'tum (Lam. ill. no. 1855. Poir. dict. 8. p. 669.) stem herbaceous, erect, pilose, forming a long spike at top; corolla hardly exceeding the calyx; stamens exserted. ♂.? H. Native country unknown. This species is said to differ from *E. aspérrimum*, and *E. Pyrenàicum*, in the long spike; in the sessile flowers, small, obliquely truncate corollas, with short, obtuse, white lobes.

Elongated-spiked Viper's Bugloss. Pl.

82 E. spine'scens (Med. bot. beob. des jahres. 1783. no. 36. Lehm. asper. p. 474.) Nothing is known of this plant but the name.

Spinescent Viper's Bugloss. Pl.

83 E. megala'nthum (Lapeyr. abr. suppl. p. 39.) stem herbaceous, simple, elongated, pilose; leaves lanceolate, strigose; corolla unequal, rather villous outside, much longer than the calyx; pistil longer than the stamens, which are exserted. ♂. H. Native of the Pyrenees; as well as of Galicia and Jacca, on the mountains. E. grandiflòrum, Lapeyr. abr. p. 90. fl. pyr. ined. t. 65. E. longistamíneum, Pourr. chlor. hisp. no. 611. Habit of *E. altíssimum*, Jacq.; but the stem is only floriferous at the apex. Corolla irregular, 4 times longer than the calyx, white, ciliated on the edges. Perhaps only a var. *E. violàceum*. See D. C. fl. fr. 6. p. 418.

Large-flowered Viper's Bugloss. Pl. 2 to 3 feet.

84 E. Austra'le (Lam. ill. no. 1860. Poir. dict. 8. p. 692.) stem herbaceous, pilose; leaves ovate, attenuated at both ends; corollas equalling the stamens, which are villous at the apex. ⊙. H. Native about the Nile, in fields. Poir. dict. 8. p. 692. D. C. syn. fl. fr. no. 2710. Pers. ench. 1. p. 164. This species is joined by Loiseleur, in fl. gall. 1. p. 111. with *E. Lusitánicum*; others have joined it with *E. violàceum*, *E. Créticum*, and *E. grandiflòrum*. It is often to be found in gardens and Herbaria under the names of *E. violàceum*, and *E. Créticum*; and is probably the *E. Créticum* of Schultes, obs. bot. p. 33. of which he gives the following diagnosis: "Stem 1-2 feet high, clothed with canescent hairs. Superior leaves acuminated. Spikes elongated, leafy, very hispid. Calycine segments straight, acute. Corolla twice as long as the calyx, rather pilose, violaceous or purple, irregular. Stamens and style rather pilose; stigma bifid. ⊙. H. Native of the south of Europe."

Southern Viper's Bugloss. Fl. July, Aug. Clt. 1824. Pl. 1½ foot.

85 E. longiflòrum (Du Mont de Courset, bot. cult. 7. suppl. p. 147. to vol. 3. p. 198.) Nothing is known of this plant but the name. ♄. G. Native of the Cape of Good Hope.

Long-flowered Viper's Bugloss. Fl. June, July. Clt. 1806. Shrub 2 to 3 feet.

86 E. pyramida'tum (Du Mont de Courset, l. c.) ♄. G. Native of the Cape of Good Hope. Nothing is known of this plant but the name.

Pyramidal Viper's Bugloss. Fl. May, July. Clt. 1820. Shrub 2 to 3 feet.

87 E. brachysta'chyum (Pall. ex herb. Willd. see Rœm. et Schultes, syst. 4. p. 726.) corollas nearly equal, twice longer than the calyx; stamens longer than the corolla; spikes axillary, usually 5-flowered, sessile; leaves lanceolate, obtuse, rough from dots or tubercles. ♃. H. Native of Siberia. Pallas.

Short-spiked Viper's Bugloss. Pl.

88 E. a'lbicans (Schott. fil. ex Rœm. et Schultes, syst. 4. p. 726.) stem erect, simple, hairy, mixed with long strigæ; radical leaves broad-lanceolate: cauline leaves linear-lanceolate, densely strigose; bracteas and leaves of calyx hispid from long, ciliated strigæ; corolla pale red, hairy. ♂.? H. Native near Tarifa, Schott. Plant white from strigæ. Spikes lateral, much shorter than in *E. Itálicum*.

Whitish Viper's Bugloss. Pl. erect.

Cult. All the species of *Echium* are very elegant when in flower; and are, therefore, worth cultivating in every collection, particularly the hardy species. The shrubby kinds, being all greenhouse plants, grow very well in a mixture of loam, sand, and peat; and cuttings of them will strike root in the same kind of soil, under a hand-glass; but they are more readily increased by layering down the young shoots, making a small incision with a knife on the back of each shoot so laid before pegging it down; they may be also raised from seeds, which are sometimes produced in this country. The hardy species grow very well in common garden soil, in a dry situation; and they are only to be increased by seeds, which should be sown in the open ground in spring; their treatment is that of other hardy, perennial, biennial, and annual plants. All the hardy kinds are well fitted for decorating flower borders, from the different shades of their elegant blossoms.

XXII. ECHIOCHI'LON (from εχιον, *echion*, Bugloss; and χειλος, *cheilos*, a lip; in reference to the bilabiate limb of corolla, and its affinity with Bugloss.) Desf. fl. atl. 1. p. 166. t. 47. Lehm. asper. p. 477.

Lin. syst. *Pentándria, Monogýnia.* Calyx 4-parted. Corolla with a slender arched tube, a naked throat, and a bilabiate limb; upper lip 2-lobed: lower one somewhat 3-lobed. Stamens 5, inclosed. Nuts 4, 1-celled, glabrous, tubercled, imper-

forated at the base, fixed to the bottom of the calyx.—A shrubby plant, with hairy branches, evergreen, subulate, hispid leaves, and axillary, sessile, solitary, small blue flowers. This genus appears to be the connecting link between *Boragíneæ* and *Labiàtæ*.

1. E. fruticòsum (Desf. l. c. Delile, fl. ægypt. 238. Viv. p. 9.) ♄. F. Native of the kingdom of Tunis, near Kerwan; and on the shores of the Great Syrtus. Stems and leaves tubercular, rather strigose. Branches clothed with white pili. Lower leaves reflexed: upper ones adpressed to the stem. Corolla hairy outside; lobes rounded. Anthers versatile. Style slender; stigma 2-lobed.

Shrubby Echiochilon. Shrub 1 foot.

Cult. For culture and propagation see *Onósma*, p. 317.

XXIII. NO'NEA (named by Mœnch, after J. P. None, a German botanist.) Mœnch. meth. 420. Med. phil. bot. 1. p. 31. D. C. syn. fl. fr. no. 2718, &c.—Oscámpia, Mœnch. meth. p. 420. Lycópsis, Lehm. asper. 252.—Echioìdes, Dill. —Lycópsis species of Lin. and other authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft, drooping, inflated and campanulate in the fruit-bearing state. Corolla funnel-shaped, with a pervious bearded throat, and a straight tube. Stamens inclosed. Stigma simple. Nuts 4, 1-celled, turbinate, concave, and perforated at the base, fixed to the bottom of the calyx.—Hispid, annual plants; with terminal, leafy racemes of flowers. Habit of species of *Lycópsis*. Radical leaves petiolate: cauline ones sessile.

1 N. pícta; hispid; stems procumbent, much branched; leaves linear-lanceolate, undulated, obsoletely toothed: floral ones broadest at the base; limb of corolla equal, shorter than the tube. ⊙. H. Native of Siberia, in sandy deserts at the Volga, Terek, and Kuma; in vineyards about Astrachan; and in Eastern Iberia; as well as in the Soongarian desert. Anchùsa pícta, Bieb. fl. cauc. 1. p. 127. Trev. in schrift. gesell. nat. freund. berol. 1817. p. 147. Lehm. asper. 255. Ledeb. fl. alt. 1. p. 185. Root simple. Floral leaves much longer than the flowers. Calycine segments unequal, subulate. Corolla having the tube a little longer than the calyx, pale at bottom, with a pilose throat, and a blue limb, painted with deeper veins.

Painted-flowered Nonea. Fl. June, July. Clt. 1800. Pl. procumbent.

2 N. Cá'spica; hispid; stem erect, almost simple; leaves lanceolate, or narrow-oblong, attenuated at both ends, entire; limb of corolla equal, shorter than the tube. ⊙. H. Native in sandy places towards the Caspian Sea; and in the Soongarian desert. Ledeb. fl. alt. 1. p. 185. Onósma Cáspica, Willd. spec. 1. p. 775. exclusive of the synon. of Pall. Lycópsis Cáspica, Lehm. asper. p. 256. Root fusiform, violaceous. Pedicels shorter than the floral leaves. Calycine segments hairy, lanceolate-linear, long-acuminated. Corolla one-half longer than the calyx, purple; tube slender, dilated at top, equal in length to the limb.

Caspian Nonea. Pl. ½ to ¾ foot.

3 N. cilia'ta (Rœm. et Schultes, syst. 4. p. 71.) hispid; stem simple, erect; leaves oblong-lanceolate, obtuse, denticulated: floral ones acuminated; limb of corolla unequal, nearly the length of the tube. ⊙. H. Native of the Levant. Lycópsis ciliàta, Willd. spec. 1. p. 780. Lehm. asper. p. 257. Root quite simple. Racemes twin, terminal. Floral leaves longer than the calyx. Calycine segments narrow-lanceolate, acuminated. Corolla large, yellow; tube cylindrical, a little longer than the calyx. Leaves beset with long white pili, especially on the margins and midrib.

Ciliated-leaved Nonea. Fl. June, July. Clt. 1804. Pl. ½ to ¾ foot.

4 N. obtusifòlia; hispid from pili; stems ascending, simple; leaves oblong-lanceolate, obtuse, nearly entire: floral ones lanceolate, acute; limb of corolla unequal, one-half shorter than the tube. ⊙. H. Native of Chio. Lycópsis obtusifòlia, Willd. spec. 1. p. 780. Pulmonària Chia echii folio verrucoso, calyce vesicario, flore cœruleo, Tourn. cor. p. 6. Root fibrous. Stems many from the same root. Radical leaves rosulate, roundish-obtuse: cauline leaves half stem-clasping. Calycine segments ovate, acute. Corolla blue, one-third longer than the calyx.

Var. β. Pulmónaria Lesbia, echii folio verrucoso, calyce vesicario, flore cœruleo, Tourn. cor. p. 6. ⊙. H. Native of Lesbo. This is larger; the leaves more hispid, and obsoletely and remotely toothed, but otherwise very like var. α.

Obtuse-leaved Nonea. Fl. June, July. Clt. 1818. Pl. ½ to ¾ foot.

5 N. Sibthorpia'na; hispid from pili; stems procumbent, almost simple; radical leaves oblong-elliptic: cauline ones lanceolate, obtuse, quite entire: floral ones acute, ovate-lanceolate at the base; limb of corolla equal, flat, one-half shorter than the tube. ♃. H. Native of Candia, on the Spaciotic mountains. Anchùsa ventricòsa, Smith, prod. fl. græc. 1. p. 117. fl. græc. t. 169. Viv. fl. libyc. p. 10. t. 4. f. 1. Root fusiform, fibrous. Stems simple or bifid at top: lateral ones prostrate: middle ones ascending. Leaves sessile. Flowers sessile, in the axils of the floral leaves. Calycine segments short, unequal, acute. Corolla white, ex Smith, violaceous or blue, ex Viv., small, having the tube a little longer than the calyx, and the throat bearded; processes in the throat ciliately fringed. Style exceeding the corolla. This and *N. alpéstris* are probably species of *Anchùsa*, from the throat of the corolla being furnished with fringed processes.

Sibthorp's Nonea. Pl. procumbent.

6 N. alpe'stris; hispid; stems ascending, simple; leaves oblong-lanceolate, bluntish, erosely toothed; limb of corolla equal, length of tube; calyx 5-toothed; teeth bluntish, ex Stev. acute, ex Lehm. ♃.? H. Native of Eastern Caucasus, on alp Schahdagh, at the fountains of the river Jucharibasch. Anchùsa alpéstris, Stev. in Lin. trans. 11. p. 409. t. 32. Lycópsis alpéstris, Lehm. asper. p. 260. Root branched, blackish. Racemes terminal, conjugate, revolute at top. Bracteas lanceolate, acuminated. Corollas size of those of *Anchùsa lùtea*, twice as large as the calyx; tube cream-coloured; limb yellow, with a fulvous base; throat closed by 5 very short bearded scales. Calyx with 5 bluish lines.

Alp Nonea. Pl. 1 foot.

7 N. ròsea (Link, enum. 1. p. 167.) hispid; stems procumbent, simple; leaves oblong, bluntish, obsoletely toothed, clammy; limb of corolla equal, length of tube. ⊙. H. Native of Siberia, at the river Terek, in gardens and vineyards. Anchùsa ròsea, Bieb. fl. cauc. 1. p. 225. cent. pl. ross. t. 43. Lehm. asper. p. 261. Root fusiform, simple. The whole plant is hispid and clammy. Floral leaves cordate-oblong, obliquely acuminated, much longer than the flowers. Racemes usually solitary. Calycine segments lanceolate-subulate, conniving in the fruit-bearing state. Corolla having the tube a little curved, a little longer than the calyx; limb fine purple, marked with 10 yellow lines towards the throat, disposed by pairs; throat bearded with long hairs. Anthers bluish.

Rose-coloured-flowered Nonea. Fl. June, July. Clt. 1823. Pl. procumbent.

8 N. decu'mbens (Mœnch, meth. p. 422.) hispid; stems

procumbent, branched; leaves lanceolate, quite entire: floral ones much longer than the calyx; corolla equal, hardly exceeding the calyx; limb very short. ⊙. H. Native of Europe, and in sandy places near Tozzer. N. violàcea, D. C. syn. fl. fr. no. 2718. exclusive of the syn. of Desf. Echioìdes nígricans, Desf. fl. atl. 1. p. 163. Anchùsa nígricans, Brot. fl. lus. 1. p. 298. Lycópsis nígricans, Pers. ench. 1. p. 163. Horn. hort. hafn. 1. p. 181. Hoffm. et Link, fl. port. 1. p. 130. t. 22. Lycópsis vesicària, Lin. spec. 198. Roth. tent. fl. germ. 2. p. 216. Willd. spec. 1. p. 779. enum. 1. p. 188. Lapeyr. abr. p. 89. Lehm. asper. p. 262.—Mor. hist. 3. sect. 11. t. 26. f. 11. —Zan. hist. t. 30. Leaves acute, pale green; floral ones obliquely acuminated. Calycine segments lanceolate, acute. Corolla with a yellowish tube, and a dark purple, almost black limb; throat pilose. Anthers brown.

Decumbent Nonea. Fl. June, July. Clt. 1686. Pl. procumbent.

9 N. ELONGA'TA; hispid from pili; stem erect, simple; leaves lanceolate, quite entire: floral ones ovate, cordate, shorter than the calyxes; limb of corolla equal, one-half shorter than the exserted tube. ♃. ? H. Native of the deserts of Alexandria. Lycópsis elongàta, Lehm. asper. p. 264. Calycine segments lanceolate, unequal. Corolla with a pale yellow tube, and purplish blue limb; tube of corolla length of calyx.

Elongated-racemed Nonea. Pl. 1½ to 2 feet.

10 N. COLSMANNIA'NA; hispid; stems erect, branched; branches divaricate; leaves linear-lanceolate, quite entire: floral ones ovate, acuminated; limb of corolla unequal, a little shorter than the tube. ♃. H. Native country unknown. Lycópsis Colsmanniàna, Lehm. asper. p. 265. Root woody, twisted. Stems many from the same root, tufted. Floral leaves a little longer than the flowers. Racemes usually conjugate. Calycine segments lanceolate, acute. Corolla purple; tube length of calyx. Nuts as in *N. decúmbens*.

Colsmann's Nonea. Pl. ½ to ¾ foot.

11 N. PU'LLA (D. C. syn. fl. fr. no. 2719.) pilose; stems erect, nearly simple; leaves lanceolate, quite entire, soft, clothed with adpressed pili: floral ones ovate-lanceolate; limb of corolla equal, length of tube. ♃. H. Native of South and Middle Europe, in corn-fields, and by way sides; and of Caucasus, in grassy places. Lycópsis púlla, Lin. spec. p. 196. Jacq. fl. austr. 2. p. 53. t. 188. Gærtn. fruct. 1. p. 327. Lapeyr. abr. p. 89. Bess. fl. gal. 1. p. 153. Anchùsa púlla, Bieb. fl. cauc. 1. p. 125. Lycópsis vesicària, Horn. hort. hafn. 1. p. 181. but not of Lin. Echioìdes violàcea, Desf. fl. atl. 1. p. 164. Anchùsa tinctòria, Pall. ind. taur.—Clus. hist. 2. p. 164. f. 1.—Riv. intr. herb. 1. t. 8. Root fusiform, simple. Leaves somewhat canescent: radical ones more or less crowded: cauline ones half stem-clasping, acuminated, ciliated with long rigid hairs, longer than the flowers. Racemes axillary and terminal, at the tops of the stems, short, dense, many-flowered, nutant. Calycine segments unequal, acuminated. Corolla with a pale yellow tube, which is shorter than the calyx, and a dark purple, almost black limb.

Dark-flowered Nonea. Fl. June, July. Clt. 1648. Pl. ½ to 1½ foot.

12 N. LU'TEA (D. C. fl. gall. 6. p. 420.) pilose; stems ascending, branched above; leaves oblong, obtuse, almost quite entire: floral ones subcordate, obliquely acuminated, at last distich; limb of corolla equal, length of tube. ⊙. H. Native of France and Italy; and of Caucasus, in sterile places, especially among sand at the river Terek. Lycópsis lùtea, Lam. ill. no. 1828. Schultes, obs. p. 33. Lehm. asper. p. 267. Anchùsa lùtea, Bieb. fl. cauc. 1. p. 126. exclusive of the syn. of Lin. and Curt. Horn. hort. hafn. 1. p. 176. Willd. enum. 1. p. 179. exclusive of the syn. of Lin. and Forsk. Anchùsa lycópsidis, Retz, fil. pug. p. 8—9. Anchùsa dùbia, Nocca, hort. ticin. t. 3. Asperùgo divaricàta, Murray, in nov. comm. gœtt. 1776. vol. 7. p. 25. t. 2. Oscámpia dichótoma, Mœnch. meth. p. 421. Root fibrous. Radical leaves obovate-oblong, obtuse; floral ones longer than the calyxes, all rather clammy. Racemes terminal, erect. Calycine segments lanceolate, acuminated. Corolla pale sulphur-coloured, longer than the calyx; tube much shorter than the calyx, marked by 5 hollows under the throat, which is green and pilose.

Var. β; flowers about half the size. ⊙. H. Bieb. fl. cauc. 1. p. 126.—Bieb. cent. 2. t. 13. f. 2.

Yellow-flowered Nonea. Fl. June, July. Clt. 1805. Pl. 1 to 2 feet.

13 N. FLAVE'SCENS; annual, downy, also beset with stiff bristles or strigæ; stems diffuse or erect, branched; leaves oblong-lanceolate, acute, quite entire: cauline ones sessile: floral ones subcordate; corollas about equal in length to the calyx: tube 3 times longer than the limb, which is equal; calyxes, when bearing the fruit, inflated and pendulous: teeth connivent; nuts obovate, nearly glabrous. ⊙. H. Native of Caucasus, in fields near Sallian and Lenkoran; as well as in the island of Sara. Lycópsis flavéscens, Meyer, verz. pflanz. p. 98. Corollas pale yellow.

Yellowish-flowered Nonea. Pl. diffuse.

14 N. SETÒSA; strigose; stem erect, simple; leaves oblong-lanceolate, denticulated: floral ones ovate; limb of corolla equal, twice as long as the calyx, and the length of the tube. ⊙. ? H. Native of Iberia. Lycópsis setòsa, Lehm. asper. p. 269. Leaves obtuse. Strigæ or bristles very long. Racemes at first conglobate. Calycine segments lanceolate, acuminated. Corolla large, yellow, with a pilose throat. Habit of *N. echioìdes*.

Bristly Nonea. Pl. ½ to 1 foot.

15 N. ECHIOÌDES; pilose; stems erect, much branched; leaves lanceolate, quite entire, pilose, rather silky: floral ones ovate, somewhat cordate; limb of corolla unequal, thrice as long as the calyx, but one-half shorter than the tube. ♃. H. Native of Caucasus and Armenia, in alpine pastures. Lycópsis echioìdes, Lin. spec. p. 199. Willd. spec. 1. p. 781. Lehm. asper. p. 270. Lycópsis púlchra, Willd. herb. no. 3396. Anchùsa echioìdes, Bieb. fl. cauc. 1. p. 270.—Buxb. cent. t. 1. Stems numerous. Radical leaves large; lower cauline ones 3-4 inches long. Flowers nearly sessile, disposed in terminal, conjugate, leafy, spike-formed racemes. Calyx silky from pili, with lanceolate segments. Corolla large, an inch long, pale yellow, with very black spots in the throat, which is pilose.

Bugloss-like Nonea. Fl. June, July. Clt. 1820. Pl. ½ to 1½ foot.

16 N. DECU'RRENS; perennial; the whole plant clothed with short, minute, velvety down; stem erect, a little branched, winged; cauline leaves lanceolate, acute, quite entire, a little decurrent; corollas hardly longer than the calyx; tube exceeding the limb, which is equal; calyx, when bearing the fruit, inflated, pendulous; teeth of calyx connivent; nuts large, downy. ♃. H. Native of Caucasus, on the Talusch Mountains, in grassy places, at the altitude of 900 to 1000 hexapods. Lycópsis decúrrens, Meyer, verz. pflanz. p. 98. Corollas purple.

Decurrent-leaved Nonea. Pl. erect.

17 N. VERSÍCOLOR (Sweet, hort. brit.) pilose or strigose; stems prostrate; leaves obtuse; corollas equal. ⊙. H. Native of Caucasus, on alps about Chinalug; and on the edges of fields towards Kasbek. Anchùsa versícolor, Stev. in act. mosc. p. 11. Nearly allied to *N. ròsea*, and *N. lùtea*, but differs in the floral leaves being obtuse, not cordate; in the co-

rollas being larger, and the limb subcampanulate, striped with blue, dusky-white, and violet; in the nuts being larger and veiny, not smooth.

Party-coloured-flowered Nonea. Fl. June, Aug. Clt. 1820. Pl. prostrate.

18 N. PHANERANTHE'RA (Viv. fl. libyc. p. 9. t. 1. f. 3.) radical leaves elliptic: cauline and floral ones half stem-clasping; spikes erectish, secund; stamens exserted, alternating with the segments of the corolla. ⊙. H. Native of Cyrenaica. Mólkia Cyrenàica, Spreng. syst. 1. p. 548. Stem erect, hispid, simple, but sometimes branched at the base. Leaves hispid; cauline ones linear-elliptic; floral ones ovate-acuminated. Flowers disposed in a secund, racemose spike, which is hardly recurved. Calyx cleft beyond the middle; segments linear, acuminated, connivent, but reflexed in the fructiferous state. Corolla glabrous, hardly longer than the calyx; throat naked. Nuts convex on the back, reticulately veined, beaked at the apex, and tubercled at the sides. Filaments inserted a little below the segments of the corolla.

Appearing-anthered Nonea. Pl. ½ foot?

19 N. SCHULTE'SII; plant very hispid; leaves and bracteas very long, lanceolate; stem erect; calyx at length inflated. ⊙. H. Native of Teneriffe. Lycópsis calycìna, Rœm. et Schultes, syst. 4. p. 74. Root purple, a span long. Stems many, branched from the base. Leaves thin. Bristles or strigæ on the leaves white, on the calyxes and bracteas yellowish. Bracteas twice as long as the flowers, or more. Calycine segments linear-subulate, unequal. Corolla twice as long as the calyx, fucescent in the dried state.

Schultes's Nonea. Pl. ½ to 1 foot.

20 N. CONFERTIFLÒRA; branches decumbent, diffuse, very rough; leaves long-lanceolate, quite entire, strigose; spikes imbricate, bracteate; corolla longer than the calyx. ⊙.? H. Native of Palestine. Lycópsis confertiflòra, Clark, ex Spreng. syst. 1. p. 556.

Crowded-flowered Nonea. Pl. decumbent.

† *Species hardly known.*

21 N. A'LBA (D. C. fl. gall. 6. p. 420.) ⊙. H. Native in corn-fields near Avignon. Corollas white.

White-flowered Nonea. Pl.

22 N. CAPE'NSIS; leaves lanceolate, strict, dotted; peduncles recurved; flowers terminal, spicate, secund.—Native of the Cape of Good Hope. Lycópsis Capénsis, Burm. prod. fl. cap. p. 4.

Cape Nonea. Pl.?

What are *Echioìdes rùbra*, Desf. fl. atl., and *Echioìdes grandiflòra*, Desf. tabl. d l'ecole, bot. 1815?

Cult. For culture and propagation see *Anchùsa*, p. 343.

XXIV. LOBOSTE'MON (from λοβος, *lobos*, a lobe, and στημων, *stemon*, a stamen; in allusion to the processes of the throat bearing the stamens on their back). Lehm. sem. hort. hamb. 1827.

LIN. SYST. *Pentàndria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped; throat furnished with erect processes, which bear the stamens on their back. Nuts 4, 1-celled, turbinate, fixed to the bottom of the calyx, imperforated at the base.—A small shrub, with the habit of *E'chium sphærocéphalum*.

1 L. ECHIOÌDES (Lehm. l. c. t. 5. f. 1.) stem terete, glabrous; branches hairy; leaves scattered, sessile, elliptic-lanceolate, obtuse, glabrous above, but strigose beneath; spikes 2-3 together, terminal bracteate; bracteas length of calyx. ♄. G. Native of the Cape of Good Hope, at Brede river. Corolla blue.

Bugloss-like Lobostemon. Shrub.

Cult. For culture and propagation see the shrubby species of *E'chium*, p. 335.

XXV. LYCO'PSIS (from λυκος, *lycos*, a wolf; and οψις, *opsis*, the face; some resemblance in flowers.) Lin. gen. no. 190. Schreb. gen. no. 250. Juss. gen. p. 131. ed. Usteri, p. 146. Schkuhr, handb. 1. t. 29. Lam. ill. t. 92.—Anchùsa species of Lehm. and Bieb. Buglóssum, Gærtn. fruct. 1. no. 414. t. 67. f. 2. Echioìdes, Dill. gen. 3.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-cleft, erect, not inflated. Corolla funnel-shaped, 5-lobed, erectly spreading; lobes entire; tube incurved; throat furnished with ovate, prominent, connivent processes. Stigma emarginate. Nuts concave at the base, 1-celled, turbinate, fixed to the bottom of the calyx.—Rough, erect plants. This genus differs principally from *Anchùsa* in the curved tube of the corolla.

1 L. ORIENTA'LIS (Lin. spec. p. 199.) stem erect, dichotomously branched; leaves ovate, half stem-clasping, unequal at the base, quite entire, hispid from strigæ; racemes very long, leafy; tube of corolla unequal, incurved: the processes in the throat pencilled. ⊙. H. Native of Caria. Smith, prod. fl. græc. 1. p. 124. Anchùsa ovàta, Lehm. asper. p. 222.—Buxb. cent. 5. t. 30. Plant strigose. Stem bluntly angular. Pedicels one half shorter than the bracteas. Calycine segments linear-lanceolate, unequal, erect in the flowering state, but spreading in the fruit-bearing state. Tube of corolla length of calyx, white at bottom and violaceous at top; limb sky-blue. Nuts wrinkled, black.

Eastern Wild Bugloss. Fl. June, July. Clt. 1796. Pl. 1 foot.

2 L. VARIEGA'TA (Lin. spec. 198.) stems ascending, nearly simple; leaves ovate-oblong, half stem-clasping, hispid from strigæ, spiny, toothed; racemes solitary, bracteate at bottom; tube of corolla unequal, incurved; processes in the throat downy. ⊙. H. Native of Italy, and the adjacent islands; Candia, and other islands of the Archipelago and of the Peloponnesus. Allion, pedem. no. 168. Smith, fl. græc. t. 178. L. bullàta, Cyrill. pl. rar. fasc. 1. p. 34. Anchùsa perlàta, Lam. ill. no. 1820. Anchùsa variegàta, Lehm. asper. p. 223.—Mor. hist. 3. sect. 11. t. 26. f. 10.—Stiss. bot. t. 57.—Barrel. icon. t. 403.—Munt. oeff. pl. t. 309. Buglossoìdes, Riv. mon. p. 9. Anchùsa Crética, Mill. dict. no. 7. Plant very hispid from strigæ. Radical leaves obtuse, 3-4 inches long; the upper cauline ones hardly an inch. Racemes short at first, capitate. Calycine segments linear, unequal. Tube of corolla a little shorter than the calyx; limb blue, variegated with white lines; processes in the throat white.

Variegated-flowered Wild Bugloss. Fl. June, July. Clt. 1683. Pl. ascending, 1 foot.

3 L. ARVE'NSIS (Lin. spec. 199. fl. suec. no. 167.) stem erect, branched; leaves lanceolate, half stem-clasping, toothed, very hispid from strigæ; racemes leafy; tube of corolla incurved, length of the calycine segments, which are unequal and lanceolate; processes of the throat hairy. ⊙. H. Native throughout Europe and North America, in corn-fields and waste grounds; plentiful in Britain. Curt. fl. lond. t. 336. Oed. fl. dan. t. 435. Smith, engl. bot. t. 938. Anchùsa arvénsis, Hoffm. et Link, fl. port. 1. p. 179. Bieb. fl. cauc. 1. p. 123. Lehm. asper. p. 225. —Blackw. t. 234.—Mor. hist. 3. sect. 11. t. 26. f. 8. Echioìdes, Riv. mon. t. 7. f. 2. Plant hispid from strigæ. Leaves undulated. Racemes short at first, but at length elongated. Corolla

blue, striped with 5 fine white veins. Nuts reticulately wrinkled, girded by a tumid circle below. This plant was formerly recommended as a remedy against the anthrax, or corrosive ulcer, commonly called a carbuncle, by laying the bruised leaves on the tumour; but it is difficult to persuade oneself that such a plant can have any efficacy in such a disease.

Corn or Common Wild Bugloss. Fl. June, Sept. Britain. Pl. $\frac{1}{2}$ to 1 foot.

4 L. Virgínica (Gron. virg. 140. Pursh, fl. 1. p. 133.) leaves linear-lanceolate, entire, crowded, soft, tomentose; stem erect. ⊙. H. Native from Pennsylvania to Virginia, in dry woods. Plant small, very hispid. Lower leaves spatulate, entire. Racemes solitary. Corollas small, white.

Virginian Wild Bugloss. Pl. small.

Cult. The seeds of all the species only require to be sown in the open border in spring.

Tribe IV.

BUGLO'SSEÆ (βουγλωσσος is the Greek name for Bugloss, from βους, *bous*, an ox; and γλωσσα, *glossa*, a tongue; in reference to the roughness and shape of the leaves of most species.) D. Don. in edinb. phil. journ. July, Oct. 1832. Corolla salver-shaped, having the mouth closed with vaulted processes. Nuts 4, distinct, 1-celled.

Sub-Tribe I.

ANCHUSEÆ. Nuts perforated at the base, fixed to the bottom of the calyx.

XXVI. ANCHU'SA (from αγχουσα, *anchousa*, paint for the skin; use of some species.) Lin. gen. no. 182. ed. Schreb. no. 242. Juss. gen. p. 131. Lam. ill. no. 257. t. 92. Schkuhr, handb. 1. t. 29. Lehm. asper. p. 211.—Buglóssum Gærtn. fruct. 1. no. 414. t. 67. f. 2. Tourn inst. t. 53.—Lycópsis species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft or 5-parted. Corolla funnel-shaped; throat closed by erect obtuse processes. Nuts 4, 1-celled, turbinate, fixed to the bottom of the calyx, perforated and concave at the base.—Rough plants, usually with terminal flowers.

§ 1. *Calyx 5-parted, erect in the fruit-bearing state. Corollas unequal in most of the species.*

1 A. linifòlia (Willd. herb. ex Lehm. asper. p. 215.) stems decumbent, stoloniferous; leaves opposite, sessile, linear-lanceolate, acute, entire, nearly glabrous, ciliated at top; flowers axillary, solitary, equal. ♃. F. Native of South America. A. leucántha, Willd. herb. l. c. A. lanceolàta, Willd. herb. no. 3316. Root creeping. Calyx pilose. Corolla glabrous, pale yellow: tube length of calyx: throat closed by 5 very hairy tubercles; segments roundish, obovate.

Flax-leaved Bugloss. Pl. $\frac{1}{2}$ foot.

2 A. oppositifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 91. t. 200.) stems procumbent, creeping, branched; leaves opposite, linear, quite entire, ciliated with strigæ on the back and margins; flowers axillary, solitary, on short pedicels. ♃. F. Native of the Andes, of Quindiu near Teindala; and Jaquanquer, between the town of Pasto and Tulcan. Herb tufted, strigose. Leaves subconnate at the base, acute, 9-10 lines long, and one broad. Calyx hispid, with lanceolate, equal segments. Corolls white, about the size of those of *M. palústris.* Nuts strigose, glabrous.

Opposite-leaved Bugloss. Pl. procumbent.

3 A. pygmæ'a (H. B. et Kunth, nov. gen. 3. p. 92.) plant tufted, creeping, leafy; leaves scattered, sessile, linear, quite entire, hispid from strigæ; flowers axillary, solitary, sessile. ♄. F. Native of Quito, on the top of Mount Antisana, at the altitude of 2104 hexapods. Leaves imbricate at the base, acutish, 4 lines long. Calyx beset with adpressed pili; with linear-lanceolate, acute, nearly equal segments. Corolla funnel-shaped, white, glabrous, size of those of *Myosòtis arvénsis.* Nuts wrinkled, glabrous.

Pygmy Bugloss. Pl. tufted, creeping.

4 A. crucia'ta (Cham. in Linnæa. 4. p. 438.) shrubby, strigosely pilose, canescent at top, much branched; branches ascending; leaves linear-lanceolate, connate at the base, and are, as well as the axillary branchlets, strictly opposite; cymes scorpioid, panicled at top, furnished with bracteas which are hardly longer than the calyxes. ♄. F. Native of the South of Brasil. Calyx very hairy, with lanceolate, unequal segments. Corolla hairy outside, with a short tube; processes of the throat fringed. Stigma emarginate.

Cross-leaved Bugloss. Shrub 1 to $1\frac{1}{2}$ foot.

5 A. stœchadifòlia (Cham. in Linnæa, 4. p. 439.) nearly allied to *A. cruciàta*, and in like manner has opposite leaves, but differs from it in the cymes being solitary and terminal, in the flowers being larger, in the leaves being linear, with revolute margins, hoary, and in habit. ♄. F. Native of the South of Brasil. Habit of *Gnaphàlium Stœ'chas*, or *Lavándula;* of a hoary aspect. Bracteas longer than the pedicels. Corolla having the tube shorter than the calyx, and the limb blue, villous outside; processes of the throat fleshy, papillose. Stigma subcapitate.

Stœchas-leaved Bugloss. Shrub 1 to $1\frac{1}{2}$ foot.

6 A. tetra'quetra (Cham. in Linnæa, 8. p. 113.) glabrous: tops and inflorescence hairy; stems simple, erect, tetraquetrous; leaves lanceolate, or oblong-lanceolate, mucronate: radical ones on long petioles: cauline ones opposite, partly connate at the base, all strigose; cymes on long peduncles, composed of short spikes: terminal ones twice bifid: axillary ones bifid; flowers sessile, bracteate; nuts smooth, solitary by abortion; calyx 5-toothed. ♃. F. Native of Brasil, Sello. Stems height of the radical leaves. Teeth of calyx acute. Corolla pilose outside; processes of the throat small, fringed. Nuts smooth, a little smaller than the calyx.

Four-sided-stemmed Bugloss. Pl. $1\frac{1}{2}$ to 2 feet.

7 A. Sellowia'na (Cham. in Linnæa, 8. p. 115.) plant scabrous, from strigæ; stems erect and decumbent, glabrous, acute-angled at the base; leaves scattered, mucronate: superior ones ovate, half stem-clasping: lower ones obovate-lanceolate, narrowed into marginate half stem-clasping petioles; spikes twin, terminal and axillary, on peduncles which are equal in length to the leaves; bracteas broad, cordate, ovate, acute, exceeding the flowers a little; nuts granular, glabrous, solitary by abortion; covered by the 5-cleft calyx. ♃. F. Native of Brasil, Sello. Corolla clothed with silky pili outside; processes of the throat small, villous. Stigma deeply emarginate.

Sello's Bugloss. Pl. $1\frac{1}{2}$ foot.

8 A. cæspitòsa (Lam. dict. 1. p. 504. ill. no. 1818.) stems decumbent; leaves linear, obtuse, hispid from pili, undulated, longer than the stems; racemes terminal, few-flowered; flowers equal. ♃. H. Native of Candia, on the Spaciotic mountains. Willd. spec. 1. p. 759. Sibth et Smith, fl. græc. t. 169.—Buglóssum Créticum humifusum acaulon perenne, echii folio angustissimo Tourn. cor. p. 6. Roots woody, dark brown. Stems simple, short, tufted. Flowers 2-4 terminal, large for the size of the plant. Corolla with a white tube, which is nearly twice as long as the calyx, and a deep blue limb: the processes in the throat pencil-formed and white.

Tufted Bugloss. Pl. decumbent and tufted.

9 A. hispida (Forsk. descr. p. 40. Vahl. symb. fasc. 2. p.

33.) stems diffuse; leaves ovate-lanceolate, attenuated at the base, bluntly-toothed, hispid from strigæ; pedicels axillary, conjugate; flowers equal.—Native in Egypt. Lehm. asper. p. 216. Stem hispid, from retrograde pili. Calyx hispid. Corolla small, nearly the length of calyx; segments ovate, short.

Hispid Bugloss. Fl. May, June. Clt. 1817. Pl. diffuse.

10 A. cilia'ta (Cham. in Linnæa, 4. p. 440.) leaves tufted, large, obovate, elliptic-lanceolate, but usually linear-lanceolate, exceeding the stems, which are erect or ascending, and furnished with small leaves; cymes scorpioid, bracteate, forming terminal panicles; flowers sessile. ♃. F. Native of Brazil, both within and without the tropic. Habit of *Myosòtis*. Plant beset with short strigose hairs. Radical leaves a foot long; cauline ones 3 inches long, half stem-clasping, ciliated with longer strigæ, all acuminated. Calycine segments equal, lanceolate, acute, pilose on the back. Corolla tubular, hairy outside; segments of the limb lanceolate, acute; processes of the throat fringed, bearded. Stigma capitate, hardly emarginate. Nuts usually solitary by abortion, chartaceous, shining.

Ciliated Bugloss. Pl. 1 foot.

11 A. tene'lla (Lehm. asper. 217.) stems depressed, dichotomous, weak; leaves on short petioles, ovate, hispid; pedicels solitary, interfoliaceous, nodding, while bearing the fruit; flowers equal. ⊙. H. Native of China. Horn. hafn. 1. p. 176. A. Zeylánica, Jacq. eclog. p. 47. t. 29. Horn. enum. 1807. Plant hairy. Corolla small, glabrous, white; tube shorter than the calyx; segments of the limb roundish-obovate, purplish at the base; processes of the throat emarginate, yellowish. Nuts somewhat kidney-shaped, verrucose.

Weak Bugloss. Fl. May, June. Clt. 1820. Pl. ½ foot.

12 A. tinctòria (Lin. spec. ed. 2d. vol. 1. p. 192. exclusive of the syn. edit. 1st.) stems diffuse; leaves oblong, hispid from pili; bracteas exceeding the calyx; processes of corolla shorter than the stamens. ♃. H. Native of the Peloponnesus, Island of Cyprus, and in deserts about Alexandria. Sibth. et Smith, fl. græc. t. 166. Desf. atl. 1. p. 156, exclusive of many synonymes. Willd. spec. 1. p. 758. Lehm. asper. p. 218. Plant pilose. Root woody, descending, of a dark blood colour. Spikes or racemes usually twin, rarely 3 or 4 terminal, many-flowered. Corolla with a deep blood-coloured tube, which is inflated at the base and the length of the calyx; processes inserted near the middle of the tube; limb deep blue; segments roundish, obovate. This plant is cultivated in the South of France for the deep purplish red colour of its roots. It imparts a fine deep red colour to oils, wax, and all unctuous substances, as well as to spirits of wine. The spirituous tincture on being inspissated changes to a dark brown. Its chief use is for colouring plasters, lip-salves, &c.

Dyer's Bugloss. Fl. June, Oct. Clt. 1596. Pl. ½ foot, diffuse.

13 A. aggrega'ta (Lehm. asper. p. 219.) stems diffuse, strigose; leaves linear-oblong, obtuse, very hispid; flowers sessile, aggregate, 4 times shorter than the bracteas; nuts hemispherical. ⊙. H. Native near Athens. A. parviflòra Smith, prod. fl. græc. 1. p. 117. fl. græc. t. 167, but not of Willd. Plant very hispid. Flowers sessile, crowded in dense, solitary, terminal, leafy spikes. Corolla with a pale tube, which is twice as long as the calyx; limb deep blue, with ovate flattened segments; processes of the throat pencil-formed. Calyx subglobose, with conniving segments. Perhaps a species of Nònea.

Aggregate-flowered Bugloss. Pl. ½ foot.

14 A. parviflòra (Willd. spec. 1. p. 759.) stem much branched, hispid; leaves linear, bluntish, hispid; racemes few-flowered, crowded. ⊙.? H. Native of the Levant. Lehm. asper. 220.

Small-flowered Bugloss. Pl. ½ to 1 foot.

15 A. echina'ta (Lam. dict. 1. p. 505. ill. no 1821.) stems ascending, nearly simple, bristly; leaves sessile, lanceolate, attenuated at the base, acute, very hispid from bristles; spikes leafy; flowers equal.—Native of Syria, near Tripoli. Lehm. asper. p. 221. Root woody, twisted. Bristles on the plant stiff and white. Spikes of flowers lateral and terminal, simple, or bifid. Calyx white, from bristles. Corolla having the tube longer than the calyx; segments of the limb obtuse.

Echinated Bugloss. Pl. 1 foot.

16 A stylòsa (Bieb. fl. cauc. 1. p. 123.) stem erect, branched at top; leaves lanceolate, attenuated at the base, undulately denticulated, hispid; bracteas subulate; calyxes nearly equal, shorter than the tube of the corolla, with subulate segments. ⊙. H. Native of Tauria, on stony hills, on the banks of the Karasu, and among corn. Bieb. cat. pl. t. 23. A. ánnua Pall. ind. taur. Buglóssum Orientàle erectum, foliis undulatis, flore amœne cœruleo Tourn. cor. p. 6.—Barrel. icon. 578.—Bocc. mus. t. 77. Root perpendicular, branched, white. Plant hispid. Racemes axillary, and terminal, usually twin. Flowers regular, a little smaller than those of *A. officinàlis*. Corolla fine blue; segments of the limb roundish: processes of the throat naked. Style equal, filiform, about equal in height to the corolla.

Long-styled Bugloss. Fl. May, June. Clt. 1820. Pl. 1 foot.

17 A. Barrelie'ri (D. C. syn. fl. fr. 2731.) stems erect, nearly simple; leaves oblong-lanceolate, denticulated, hispid; racemes conjugate, panicled, bracteate; calyxes very blunt, longer than the tube of the corolla; corolla regular. ♃. H. Native of the South of Europe, by road sides, among rubbish, and in shady places; as of Piedmont, Naples, &c. Baumg. trans. 1. p. 122. Bess. fl. gal. 1. p. 147. Lehm. asper. 227. Lois. fl. gall. 1. p. 106. Vittm. summ. 1. p. 288. Bell. append. fl. pedem. p. 15. Tenor. fl. neap. p. 46. Buglóssum Barrelièri, All. pedem. no. 164. Pentagn. inst. 2. p. 314. Myosòtis obtùsa, Waldst. et Kit. pl. rar. hung. 1. p. 103. t. 100. Schultes, fl. austr. no. 792. Horn. hafn. 1. p. 173. Willd. enum. 1. p. 176.—Barrel. icon. 333. Root woody, branched. Cauline leaves half stem-clasping. Calyx pilose; segments obtuse. Corolla with a white tube; limb blue, with roundish obtuse segments; throat yellow; processes of the throat erect, white. The flowers are very like those of a species of *Myosòtis*, both in colour and form.

Barrelier's Bugloss. Fl. May, June. Clt. 1820. Pl. 1 to 2 feet.

18 A. strigòsa (Labill. icon. pl. syr. dec. 3. p. 7. t. 4.) stem erect, branched at top; leaves ovate-lanceolate, denticulated, prickly; racemes conjugate, furnished with bracteoles at the base, which are shorter than the pedicels; calyxes obtuse, shorter than the tube of the corolla; flowers regular; processes of the throat papillose. ♃. H. Native of Syria, about Tripoli. Lehm. asper. p. 229. Plant covered all over with white bristles, which rise from white papillæ or glands. Racemes twin, secund. Corolla blue; processes of the throat nearly orbicular.

Strigose Bugloss. Pl. 1½ foot.

19 A. panicula'ta (Ait. hort. kew. 1. p. 177.) stem erect, branched; leaves lanceolate, undulated, strigose, lucid; racemes conjugate, divaricate, panicled, bracteate; flowers equal; calyxes longer than the tube of the corolla, with subulate segments; processes of the throat pencil-formed. ♃. H. Native of the South of Europe, North of Africa, Island of Madeira, and Siberia. Willd. spec. 1. p. 756. Sibth et Smith, fl. græc. t. 163. Lehm. asper. p. 230. A. Itálica, Retz, obs. 1. p. 12. elàtum Mœnch. meth. p. 418. Bugl. angustifòlium, All. ped. no. 163 ?—Mor. hist. 3. sect. 11. t. 28. f. 2. and t. 26. f. 1. —Tourn. inst. p. 134. Buglóssum amœ'num, Gærtn. fruct. 1. p. 323. t. 67. f. 2. Roots creeping. Plant hispid, large. Racemes twin, with a flower in the fork, constituting panicles at the tops of the stems. Bracteas linear, length of pedicels. Calycine segments subulate, unequal. Corolla blue, or violaceous, with a white throat; processes of the throat erect, pencil-formed; segments of the limb unequal, obovate-roundish, obtuse. This is a very showy plant when in blossom.

Panicled-flowered Bugloss. Fl. May, June. Clt. 1777. Pl. 3 to 5 feet.

20 A. microca'lyx (Vis. in bot. zeit. 1829. p. 8.) hispid; stems weak, nearly simple; leaves flat: radical ones obversely-lanceolate, attenuated at the base, obtuse, repand: cauline ones lanceolate, sessile, acute, entire; racemes pedunculate, conjugate, alternate, leafy at the base, loose; calyx very hispid, 5-cleft, shorter than the tube of the corolla, but twice as long as the bracteas; processes of the throat thickened at tops, truncate, smoothish. ♃. H. Native of Dalmatia, about Verlika, on the edges of fields. Calyx smaller than in *A. sempervírens*. Tube of corolla straight. Nuts wrinkled, acutely bicostate at the apex, and umbilicate. Peduncles erect in the fructiferous state.

Small-calyxed Bugloss. Pl. 1 foot?

21 A. dasya'ntha (Cham. in Linnæa, 4. p. 437.) leaves of the floriferous branches oblong-cuneated, sometimes acute, and sometimes bluntish at apex, and short-acuminated: upper ones dilated at the base, and more acute; bracteas subcordate-ovate, acute, length of flowers; cymes or spikes glomerate; flowers sessile; calyx hardly 5-cleft to the middle; corolla funnel-shaped; tube exceeding the calyx; throat villous; stigma 2-lobed. ♃. F. Native of Tropical Brasil. Said to have the habit of *Anchùsa sempervírens;* but the flowers are smaller, the calyx hardly 5-cleft to the middle, the corollas hairy outside, the processes of the throat small and bearded. The upper portion of a branch is the only part of this plant which has been examined.

Thick-flowered Bugloss. Pl.?

22 A. Mille'ri (Willd. enum. 1. p. 179.) stems ascending, diffuse; leaves oblong, bluntish, obsoletely denticulated, hispid; racemes solitary, leafy; calyx length of the tube of the corolla, with linear-obtuse segments; corolla equal. ⊙. H. Native country unknown, Levant.? Lycópsis Millèri, Horn. hort. hafn. 1. p. 182. Plant strigose, hispid. Corolla flesh-coloured; throat oblique, incurved; segments of the limb obovate, roundish; processes of the throat erect, yellow, pilose at the base. Perhaps a species of *Lycópsis* from the oblique, incurved throat of the corolla.

Miller's Bugloss. Fl. May, June. Clt. 1713. Pl. 1½ foot.

23 A. macrophy'lla (Lam. ill. no. 1816. Lehm. asper. p. 233.) stem weak, branched at top; radical leaves oval: cauline ones lanceolate, acute, quite entire, strigose; racemes somewhat panicled, loose, bracteate; calyxes length of the tube of the corolla, with acutish segments; flowers regular. ♃?. H. Native of the kingdom of Morocco. Desf. atl. 1. p. 157. Lycópsis macrophýlla, Lam. dict. 3. p. 657. Plant strigose. Radical leaves large, disposed in an orb: cauline ones half stem-clasping. Corolla tubular, pale yellow, small, a little longer than the calyx, glabrous; segments of the limb obtuse; processes of the throat erect, obtuse, tomentose.

Long-leaved Bugloss. Pl. 1½ foot.

24 A. latifòlia (Lehm. sem. hort. hamb. 1821. p. 2. pug. 1. p. 6.) leaves ovate-lanceolate, undulated, hairy; bracteas ovate-lanceolate, equal in length to the calyx; calyx 5-cleft, bluntish; processes of the throat bearded. ♂. H. Native country unknown. Anchùsa versícolor Hortul. Stems many from the same root, erectish, hairy, much branched. Flowers imbricate, on short pedicels, disposed in conjugate, bracteate, terminal racemes. Corolla with a violaceous tube, equal in length to the calyx; constricted below the throat; limb deep rose-coloured, having the edges variegated with white.

Broad-leaved Bugloss. Fl. May, June. Clt. 1826. Pl. 1½ to 2½ feet.

25 A. villòsa (Spreng. syst. 1. p. 560.) stem branched; leaves lanceolate, quite entire, villous; racemes axillary; flowers remote; bracteas exceeding the calyxes; calycine segments bluntish, shorter than the tube of the corolla. ♃. H. Native country unknown. Calyx 5-parted, erect.

Villous Bugloss. Pl.

26 A. myosotidiflòra (Lehm. asper. p. 234.) stem erect, simple; radical leaves on long petioles, reniformly cordate: cauline ones sessile, ovate, hairy; racemes terminal, panicled, bractless; flowers equal. ♃. H. Native of Siberia, among rocks. Myosòtis macrophýlla, Bieb. cauc. 1. p. 119. Adams and Web. et Mohr, cat. 1. p. 46. no. 7. Bieb. cent. pl. ross. t. 14. Root oblique, covered by the remains of the leaves at top. Leaves large, canescent while young. Calycine segments linear. Corolla having the tube the length of the calyx; limb fine blue; and the throat closed by yellow processes.

Mouse-ear-flowered Bugloss. Fl. July, Sept. Clt. 1825. Pl. 1 foot.

27 A. tuberòsa (H. B. et Kunth, nov. gen. 3. p. 92.) root tuberous; stem erect, nearly simple; leaves scattered, sessile, linear, quite entire, hispid from strigæ; spikes leafy, terminal. ♂. F. Native of Mexico, in bushy places, between Moran and Regla, at the altitude of 1300 hexapods. Root tuberous, turnip-formed, globose, size of a cherry, furnished with fibres. Plant strigose. Leaves an inch long, and 1 line broad. Calyx hispid, with linear, bluntish segments. Spikes 1-2 inches long. Corolla pale yellow, ex Bonpl. downy outside, sweet-scented. Ovaria glabrous.

Tuberous-rooted Bugloss. Pl. 1 foot.

§ 2. *Calyx 5-cleft, or deeply 5-toothed, campanulate when in fruit, and more or less inflated and nodding. Corollas equal.*

28 A. amplexicau'lis (Sibth et Smith, prod. fl. græc. 1. p. 116. Lehm. asper. p. 237.) cauline leaves cordate-oblong, stem-clasping, repand; spikes dichotomous, 2-leaved; calyx 5-cleft. ♃?. H. Native in fields about Constantinople. According to the diagnosis given this plant would appear to approach the *Anchùsa sempervírens*, now *Omphalòdes sempervírens*.

Stem-clasping-leaved Bugloss. Pl. 1 foot.

29 A. verrucòsa (Lam. ill. p. 403. no. 1819. Horn. hort. hafn. 1. p. 176. Lehm. asper. p. 238.) leaves oblong-lanceolate, repandly-toothed, hispid from strigæ, which rise from white warts: upper ones subcordate at the base; pedicels interfoliaceous. ⊙. H. Native of Egypt. A. flàva, Forsk. descr. p. 40. no. 30. Lycópsis Ægyptìaca, Lin. spec. 1. p. 138. Pers. ench. 1. p. 163. Asperùgo Ægyptìaca, Lin. spec. ed. 2. p. 198. mant. 334. Vahl. symb. 1. p. 14. Jacq. vind. 3. p. 15. t. 21. Willd. spec. 1. p. 778. Plant very hispid from strigæ. Stems branched at top. Upper leaves sometimes subcordate at the base. Calycine segments unequal, lanceolate-linear, acute. Corolla yellow; tube shorter than the calyx; segments of the limb rounded; processes of the throat yellow.

Warted-leaved Bugloss. Fl. July, Aug. Clt. 1821. Pl. ½ to 1 foot.

30 A. defle'xa (Lehm. sem. hort. hamb. 1823. p. 17. pug.

1. p. 5.) leaves linear-lanceolate, hispid; pedicels solitary, axillary, deflexed while bearing the fruit. ⊙. H. Native of Egypt. Stem solitary, or many from the same root, nearly terete, hispid. Calycine segments linear-lanceolate, bluntish, beset with white strigæ, especially along the edges. Corolla shorter than the tube of the calyx; segments roundish obovate, rose-coloured, or blue, with deeper veins; processes of the throat glabrous.

Deflexed-pedicelled Bugloss. Pl. ½ to 1 foot.

31 A. ochroleu'ca (Bieb. fl. cauc. 1. p. 125. Curt. bot. mag. t. 1603. Lehm. asper. 239.) leaves lanceolate, strigose, hispid, ciliated on the edges; bracteas linear-lanceolate; calyx 5-toothed: teeth obtuse; tube of the corolla length of the calyx. ♃. H. Native of Caucasus and Transylvania, in fields. Baumg. fl. trans. 1. p. 120. Horn. hafn. 1. p. 176. Willd. enum. 1. p. 178. Schrank, pl. rar. mon. 1. t. 6.—Gmel. sib. 4. p. 74. no. 13. Root branched. Stems diffuse, angular, scabrous. Flowers on short pedicels in the axils of the bracteas, disposed in conjugate, spike-formed, terminal racemes, which are crowded in fascicles before expansion. Corolla cream-coloured; tube a little longer than the calyx; processes of the throat erect, villously tomentose.

Cream-coloured flowered Bugloss. Fl. July, Aug. Clt. 1810. Pl. 1 to 2 feet.

32 A. Aga'rdhii (Lehm. asper. p. 241.) leaves linear-lanceolate, tubercled, strigose; bracteas ovate-lanceolate, setosely ciliated; calyx 5-cleft: segments obtuse; tube of corolla one-half longer than the calyx. ♃. H. Native of Siberia. Stem erect, strigose. Flowers on short pedicels, distant, disposed in terminal racemes, which are generally conjugate. Corolla purple; processes of the throat erect, pilose.

Agardh's Bugloss. Fl. July, Sept. Clt. 1820. Pl. 1 foot.

33 A. undula'ta (Lin. spec. ed. 2d. 1. p. 191. ed. 1. p. 133.) leaves lanceolate, dentately undulated, hispid from strigæ; racemes spike-formed, compact; bracteas lanceolate; calyxes deeply 5-parted, acute. ♃. H. Native of Italy, France, Spain, Portugal, Barbary, and the Islands of the Archipelago, in meadows and fields. Sibth et Smith, fl. græc. t. 165. Hoffm. et Link, fl. port. 1. p. 177. t. 22. Brot. fl. lus. 1. p. 297. Curt. bot. mag. t. 2119. Horn. hort. hafn. 1. p. 175. Mill. fig. 1. t. 29.—Sabb. hort. 2. t. 24. Stems many from the same root. Plant canescent. Flowers on short pedicels, secund, disposed in conjugate, terminal, compact racemes. Corolla purple, with the tube longer than the calyx, and ovate obtuse segments; processes of the throat saccate above, with pilose edges.

Undulated-leaved Bugloss. Fl. June, Aug. Clt. 1752. Pl. ½ to 1½ foot.

34 A. crispa (Viv. append. fl. cors. 1825. ex Linnæa. 1. p. 500.) strigose; leaves linear-oblong, coarsely and distantly toothed: cauline ones undulately curled; spikes loose; calyx 5-cleft, equal in height to the tube of the corolla, when bearing the fruit ventricose, pendulous, and secund; corolla with obovate segments; processes of the throat ovate, ciliated; nuts smooth, triquetrous. ♃?. H. Native of Corsica.

Curled-leaved Bugloss. Pl. ½ to 1 foot.

35 A. hy'brida (Ten. prod. fl. neap. 1. p. 45. t. 11.) leaves oblong-lanceolate, sinuately toothed, undulated, villously hispid; bracteas ovate-cordate; calyx 5-toothed: teeth bluntish. ♃. H. Native near Naples, along way-sides. Root fusiform. Plant villously hispid. Stems simple. Flowers on short pedicels, disposed in axillary and terminal, conjugate racemes. Corolla purple; tube longer than the calyx; processes of the throat white, obtuse, pilose.

Hybrid Bugloss. Fl. June, Aug. Clt. 1820. Pl. 1 to 1½ foot.

36 A. angustifòlia (Lin. spec. ed. 2d. vol. 1. p. 192.) leaves linear-lanceolate, hispid from pili; bracteas ovate-lanceolate, small when the flowers are open; calyx 5-toothed: teeth very blunt. ♃. H. Native of the South of Europe. Curt. bot. mag. 1897. Sibth et Smith, fl. græc. t. 164. Horn. hort. hafn. 1. p. 175. Lapeyr. abr. p. 86. A. officinàlis, Lin. spec. ed. 1st. p. 133. A. spicàta, Lam. ill. no. 1810. Buglóssum angustifòlium, Mœnch, meth. p. 418.—Zan. hist. 49. t. 50. stirp. rar. t. 39.—Mor. hist. 3. sect. 11. t. 28. f. 9.—Lob. stirp. 576. f. 2. Buglòssum angustifòlium mìnus, Tourn. inst. 134. Root fusiform. Stems very scabrous, canescent from retrograde hairs. Racemes spike-formed, conjugate, terminal; bracteas hispidly ciliated. Corolla with a pale purple tube, which is white at bottom, exceeding the calyx; limb deep blue; segments obovate-oblong, conniving a little.

Narrow-leaved Bugloss. Fl. May, June. Clt. 1640. Pl. 1 to 2 feet.

37 A. lycopsòides (Bess. hort. Krzem. ex Link. enum. 1. p. 166.) very like *A. procèra* and *A. angustifòlia*, but smaller; flowers secund, almost in one row; bracteas ovate, acuminated, ciliated, spreading also in one row. ♃. H. Native of Russia. Corolla smaller than in *A. procèra*, at first violaceous, but at length blue.

Lycopsis-like Bugloss. Fl. July, Aug. Clt. 1824. Pl. 1½ foot.

38 A. proce'ra (Bess. l. c. ex Link. l. c.) larger than *A. angustifòlia*; flowers secund in 2 rows; bracteas ovate, acuminated, ciliated, distinct, spreading; calyx closed. ♃. H. Native of Galicia. Corolla blue. Perhaps a variety of *A. angustifòlia*.

Tall Bugloss. Fl. May, June. Clt. 1824. Pl. 2 to 3 feet.

39 A. leptophy'lla (Rœm. et Schultes, syst. 4. p. 90.) leaves oblong-lanceolate, strigose; spikes secund, imbricate; calyxes 5-cleft, length of the tube of the corolla. ♃. H. Native of the South of Europe. A. angustifòlia, Willd. enum. 1. p. 178, exclusive of his spec. pl. Schultes fl. austr. 2. ed. 1. p. 364. Sims, bot. mag. 1897. Corolla twice smaller than in *A. officinàlis*, pale blue. Stem pilose. Calycine segments obtuse, silky, from adpressed hairs. Leaves thinner than in *A. officinàlis*.

Slender-leaved Bugloss. Fl. July, Oct. Clt. 1640. Pl. 1 to 2 feet.

40 A. officina'lis (Lin. spec. ed. 2. vol. 1. p. 191. fl. suec. ed. 2d. no. 161.) leaves lanceolate, hispid; bracteas ovate-lanceolate, equal to the calyx in length; calyxes 5-cleft, acute. ♃. H. Native of Europe, Asia, and Africa, in waste places, and by way sides, and on the edges of fields. Smith's engl. bot. t. 662. Oed. fl. dan. t. 5. Bieb. fl. cauc. 1. p. 124. Bess. fl. gal. 1. p. 146. Gmel. fl. bad. 1. p. 417. Vill. fl. dauph. 2. p. 455. Scop. fl. carn. ed. 2. vol. 1. p. 123. Willd. 1. p. 756. Lehm. asper. p. 247.—Plenck, off. t. 79.—Blackw. herb. t. 500. Plant hispid. Radical leaves tufted. Flowers sessile, imbricate, disposed in conjugate, terminal spikes. Corolla blue, or purple; tube length of calyx; segments of the limb oblong-roundish; processes of the throat erect, tomentose. This plant when tender in the spring is eaten boiled in Upland. The tube of the corolla is melliferous, and the bees are very fond of it. This is not the *Anchùsa*, but the Bugloss of the officinal writers. It appears to be nearly similar to Borage; the leaves being less juicy, and the roots more mucilaginous; these, with the leaves and flowers, are ranked among the articles of the Materia Medica, bnt they are very seldom made use of. "In China," Loureiro says, "the plant is in great esteem for gently promoting the eruption of the small-pox."

Var. β. cærùlea; flowers blue. ♃. H. Native of Europe. A. angustifòlia, Baumg. fl. trans. 1. p. 121. Schultes fl. austr. no. 783. Gmel. fl. bad. 1. p. 418. Suter, fl. helv. 1. p.

104. Roth tent. fl. germ. 2. p. 220. Vill. dauph. 2. p. 455. Poll. pal. 1. p. 183, and of many other European Floras.

Var. γ. incarnàta; flowers flesh-coloured, or red. ♃. H. Roth. tent. fl. germ. l. c. and some other Floras. A. incarnàta Schrad. in litt.

Var. δ. álba; flowers white. ♃. H. Roth. l. c.

Officinal Bugloss. Fl. June, Oct. Britain. Pl. 1 to 2 feet.

41 A. Cape'llii (Moris, elench. sard. ex Linnæa, 5. p. 93.) plant procumbent, clothed with strigose hairs; leaves lanceolate, denticulated: radical ones undulated; bracteas ovate-lanceolate, half stem-clasping; flowers loosely racemose; calyx 5-cleft, when bearing the fruit inflated and nutant. ♃. H. Native of Sardinia. Allied to *A. officinàlis* and *A. angustifòlia*.

Capelli's Bugloss. Pl. procumbent.

42 A. Cape'nsis (Thunb. in Schrad. journ. 1806. p. 45. prod. fl. cap. p. 34.) leaves linear-lanceolate, attenuated at both ends, somewhat hispid from villi; racemes terminal, panicled; bracteas ovate-lanceolate; calyxes 5-cleft, obtuse. ♂. G. Native of the Cape of Good Hope. Andr. bot. rep. t. 336. Curt. bot. mag. t. 1822. Lehm. asper. p. 249. Stems simple, hairy, canescent. Corolla blue, twice as long as the calyx.

Cape Bugloss. Fl. July, Aug. Clt. 1800. Pl. 1½ foot.

43 A. leucoiifòlia (Lehm. asper. p. 249.) leaves linear-subspatulate, bluntish, silky and hoary; spikes solitary; bracteas lanceolate, attenuated at the base; calyxes 5-cleft, acute. ♃. H. Native of Armenia. Lithóspermum Orientàle leucoji fòlio, flore cœruleo parvo, Tourn. cor. p. 6. Stem downy, hoary, leafy at bottom. Flowers sessile, crowded into terminal spikes. Bracteas longer than the calyx. Corolla a little longer than the calyx; tube very short; limb blue, with obovate-rounded segments.

Snow-drop-leaved Bugloss. Pl. 1 foot.

44 A. bracteola'ta (Viv. fl. libyc. p. 10. t. 4. f. 2—3.) plant clothed with soft white hairs, which rise from obsolete tubercles; lower leaves spatulate: cauline ones linear-oblong, sessile, obtuse: floral ones half stem-clasping, cordate, acute, imbricated in two rows. ♃. H. Native of Cyrenaica, on the mountains. Lycópsis Cyrenàica, Spreng. syst. 1. p. 557. Stem ascending, dividing into spike-bearing branches at top. Floral leaves or bracteas a little longer than the leaves. Flowers disposed in dense, leafy, revolute spikes. Calyx hispid, with linear-acute segments, equal in length to the tube of the corolla. Corolla blue; the throat and tube white.

Bracteolate Bugloss. Pl. ascending.

† *Species hardly known.*

45 A. longifòlia (Lam. ill. no. 1817. dict. 1. p. 502.) leaves long, tongue-shaped, broadest at the base and apex; spikes small, naked, somewhat panicled. ♃. H. Native of Italy. Stem simple; hairs springing from white tubercles. Flowers small, of a beautiful blue.

Long-leaved Bugloss. Fl. June, Aug. Clt. 1819. Pl. 1½ foot.

46 A. Africa'na (Burm. prod. fl. cap. p. 4.) stem shrubby, villous; leaves lanceolate, tomentose beneath. ♄. G. Native of the Cape of Good Hope.

African Bugloss. Shrub.

Cult. The species of *Bugloss* are of the most easy culture; they will grow in any soil, and are readily increased by seed. *A. Capénsis* should be treated as a green-house plant. Some of the species are very pretty when in blossom, as *A. paniculàta*, *A. Barrelièri*, &c.

XXVII. MYOSO'TIS (from *μυς μυος, mys myos*, a mouse; and *ους ωτος, ous otos*, an ear; supposed resemblance in leaves.) Dill. gen. 3. Lin. gen. no. 180. Schreb. gen. no. 240. Juss. gen. p. 131. ed. Usteri, p. 146. Schkuhr, handb. t. 29. Lehm. asper. p. 78.—Echioìdes, Mœnch. meth. p. 416.

Lin. syst. *Pentándria, Monogýnia.* Corolla salver-shaped; throat furnished with short processes; limb 5-parted, obtuse. Stamens inclosed. Nuts 4, 1-celled, fixed to the bottom of the calyx, perforated at the base.—Annual or perennial, rough or smoothish plants, with terminal racemes of blue flowers; the racemes revolute before expansion.

§ 1. *Nuts smooth, glabrous.*

1 M. latifòlia (Poir. suppl. 4. p. 45. Lehm. asper. p. 82.) stem erect, nearly simple, pilose; leaves on long petioles, ovate-lanceolate, pilose; calyxes acute, villous; corollas a little longer than the calyx. ♃. F. Native of the Canary Islands. This species differs from the rest in the leaves being on long petioles, 2-3 inches long, and 1½ inch broad. Corollas blue?

Broad-leaved Scorpion-grass. Pl. ?

2 M. grandiflòra (H. B. et Kunth, nov. gen. amer. 3. p. 90. t. 199.) stems nearly simple; leaves strigose, obtuse: radical ones lanceolate, petiolate: cauline ones lanceolate-oblong, sessile; spikes terminal, solitary, or twin, leafy; flowers pedicellate; calyx closed; fruit glabrous. ♃. F. Native of Quito. Stems terete, strigose. Corolla white, size of those of *Tiarídium I'ndicum;* processes of the throat roundish, downy. Calycine segments linear, acutish.

Great-flowered Scorpion-grass. Pl. ½ to ¾ foot.

3 M. corymbòsa (Ruiz. et Pav. fl. per. 2. p. 5. no. 2.) stems procumbent, divaricate; leaves linear, acute; flowers corymbose; corollas 3 times longer than the calyx. ☉. H. Native of Chili, about Conception, in fields. Pers. ench. 1. p. 157. Lehm. asper. p. 82. Plant hispid. Middle stem erect; side ones procumbent; branches forked at top. Corymb forked, sometimes spicate. Corolla white.

Corymbose-flowered Scorpion-grass. Pl. procumbent.

4 M. robu'sta (D. Don, prod. fl. nep. p. 101.) leaves elliptic-oblong, acute, sessile, pilose on both surfaces; racemes conjugate, short, bractless; calycine segments oval, obtuse, longer than the tube of the corolla. ♃. H. Native of Nipaul, in Gosainsthan, where it is called *Khurkurree* by the natives. Root fusiform. Stems ascending, simple, pilose. Leaves 3 inches long, and ½ inch broad.

Robust Scorpion-grass. Pl. 1½ foot.

5 M. la'xa (Lehm. asper. p. 83.) stem filiform, loose; leaves obovate-lanceolate, obtuse, nearly glabrous; racemes bractless, very long; pedicels diverging while bearing the fruit, very long, much longer than the calyx, which is spreading and obtuse; corollas small. ☉. H. Native of North America. Stem glabrous, divided at top into some racemiferous branches. Calyx rather pilose, ventricose at the base; teeth ovate-lanceolate, acute.

Loose Scorpion Grass. Pl. 1 to 1½ foot.

6 M. sparsiflòra (Mikan, in Hoppe. taschenb. 1807. p. 74. Pohl, fl. boh. 1. p. 175.) stem branched, diffuse; leaves oblong-lanceolate, acutish; racemes loose, few-flowered, leafy at the base; pedicels deflexed while bearing the fruit, longer than the calyx, which is spreading, and beset with hooked bristles at the base; corollas small. ☉. H. Native of Bohemia, Silesia, Transylvania and Caucasus, in shady humid places; and of Altaia, at the river Kurtschum. Baumg. fl. trans. 1. p. 117. Horn. hort. hafn. 1. p. 174. Bess. fl. gal. 1. p. 143. Lehm. asper. p. 84. Led. fl. alt. 1. p. 186. M. sèpium, Hort. crac. Stem angular at top, scabrous from reflexed hairs. Leaves strigose. Racemes axillary and terminal. Calyx globose at the base. Corollas small, blue, sometimes white; throat yellow.

Scattered-flowered Scorpion Grass. Fl. May, June. Clt. 1822. Pl. ½ foot.

7 M. sylva'tica (Ehrh. herb. 31. Lehm. asper. p. 85.) leaves oblong-lanceolate, bluntish, clothed with soft hairs; racemes very long, loose, bractless; pedicels diverging while bearing the fruit, a little longer than the 5-cleft, closed calyx; limb of corolla flat, longer than the tube. ♃. H. Native throughout Europe, in woods in mountainous places. Hoffm. deutschl. fl. 1. p. 85. exclusive of *M. alpìna*. Baumg. fl. trans. 1. p. 117. exclusive of the synonymes. Pers. ench. 1. p. 156. Sut. fl. helv. 1. p. 102. M. intermèdia, Smith, engl. fl. 1. p. 250. M. scorpioìdes, var. sylvática, Horn. hort. hafn. 2. p. 956. M. scorpioìdes, var. Smith, fl. brit. 1. p. 212. M. arvénsis, Wahl. fl. suec. 1. p. 120.—Hall. helv. no. 591.—Knip. cent. 11. t. 81. M. perénnis, β, D. C. fl. fr. no. 2725. M. arvénsis,? β, sylvática, Pers. ench. 1. p. 156. M. intermèdia, α, parviflòra, Led. fl. alt. 1. p. 187. Stems simple, divided at top into long loose racemes, hairy. Racemes solitary and conjugate. Calycine segments unequal, lanceolate, acuminated, obsoletely 3-nerved, furnished with hooked hairs at the base, conniving while bearing the fruit. Corolla blue, with a yellow throat.—There is a variety of this species found at the Cape of Good Hope. See Cham. in Linnæa, 4. p. 445.

Wood Scorpion Grass. Fl. June, July. Britain. Pl. ½ to 1 foot.

8 M. cæspitòsa (Schultes, fl. starg. suppl. p. 11. Ledeb. fl. alt. 1. p. 188.) plant strigose, tufted; leaves lanceolate, obtuse; calyx 5-cleft, about equal in length to the tube of the corolla, strigose; fruit bearing pedicels twice as long as the calyxes; racemes loose, naked. ♃. H. Native of the duchy of Mecklenburgh; and of Altaia, near Riddersk, Smejow, &c., in boggy places; in Britain, common about ponds. Link. enum. 1. p. 165. Bess. pl. volh. p. 52. Hook. suppl. engl. bot. t. 2661. M. lingulàta, Schultes. Lehm. asper. 1. p. 110. M. uliginòsa, Schrad. M. commutàta, Schultes, syst. 4. p. 102. M. strigulòsa, Rchb. M. scorpioìdes parviflòra, Wahl. fl. suec. 1. p. 119. Hairs of the stem and calyx adpressed. Corolla blue, with a yellow throat; limb as long as the tube. Very nearly allied to *M. palústris*.

Tufted Mouse-ear. Fl. June, Aug. Britain. Pl. tufted.

9 M. alpe'stris (Hoppe, in Schmidt, fl. boh. cent. 3. no. 225.) stems tufted, erect; leaves lanceolate, or oblong-linear, acutish, obsoletely 3-nerved, strigose; racemes strict, bractless; pedicels spreading while bearing the fruit, a little longer than the calyx, which is 5-parted and spreading; limb of corolla flat, a little longer than the tube. ♃. H. Native of Europe, and the north of Asia, on the alps, and in dry alpine places; in Scotland, on the elevated range of the Breadalbane mountains. Lehm. asper. p. 86. Schultes, fl. austr. 1. p. 788. Willd. enum. 1. p. 175. Ledeb. fl. alt. 1. p. 189. M. lithospermifòlia, Horn. hort. hafn. 1. p. 173. M. scorpioìdes, β, lithospermifòlia, Willd. enum. 1. p. 175. M. suavèolens, Waldst. et Kit. hung. ined. Willd. l. c. M. odoràta, Poir. suppl. 4. p. 44. M. rupícola, Smith, engl. bot. t. 2559. M. Pyrenàica, Pourr. mem. acad. toul. 3. p. 323. M. montàna, Bess. fl. gal. 1. p. 142. Bieb. 3. p. 116. exclusive of the syn. of Erhr. pl. volh. p. 8. M. alpína, Lapeyr.—Barrel. icon. t. 404. Root brown. Stem beset with adpressed hairs, simple at bottom, but divided at top into short racemes; the raceme terminating the stem, conjugate; those terminating the branches solitary. Calyx beset with hooked hairs; segments linear-lanceolate, acute. Tube of corolla shorter than the calyx; limb blue; throat yellow.—There are varieties of this with white and reddish flowers.

Alp Scorpion Grass. Fl. June, July. Scotland. Pl. ½ foot.

10 M. nemoròsa (Besser. pl. volh. p. 52. Ledeb. fl. alt. 1. p. 188.) stem erect, acute-angled, shining and smooth at the base; racemes loose, naked; fruit bearing pedicels a little longer than the calyxes; calyx 5-toothed, exceeding the tube of the corolla, hispid from strigæ, as well as the leaves. ♃. H. Native of Altaia, in woods and groves near Riddersk, &c. M. laxiflòra, Rchb.

Grove Scorpion-grass. Fl. June, Aug. Pl. ½ foot.

11 M. rotundifòlia (Wall. cat. no. 930.) plant tufted, beset with short strigæ; leaves small, oval-roundish: radical ones on long petioles; upper cauline leaves sessile; racemes terminal, twin. ♃. H. Native of Kamaon. Stems simple, erect. Nuts unknown. Nearly allied to *M. alpéstris*.

Round-leaved Scorpion-grass. Pl. ¼ foot.

12 M.? longiflòra (Wall. cat. no. 929.) root creeping; stems smoothish, prostrate or ascending; leaves ovate, mucronate, on long petioles, beset with short strigæ; racemes short, simple or twin, terminal. ♃. H. Native of Simla and Kamaon. Racemes and calyxes strigose. Calycine segments linear-lanceolate, shorter than the tube of the corolla. Corolla salver-shaped, white or blue. Nuts unknown. Habit of a species of *Omphalòdes*.

Long-flowered Scorpion-grass. Pl. prostrate, creeping.

13 M. palu'stris (With. p. 225.) hairs of the stem adpressed; leaves obovate-lanceolate, obtuse, rather scabrous from strigæ; racemes bractless; pedicels diverging while bearing the fruit, nearly twice the length of the calyx, which is 5-parted, obtuse, and spreading, and equalling the tube of the corolla; limb of corolla flat, longer than the tube. ♃. H. Native throughout Europe, Asia, and North America, in humid meadows, bogs, banks of rivers, rivulets, and ditches; plentiful in Britain, in like situations. Lehm. asper. p. 88. Hoffm. et Link, fl. port. 1. p. 174. Bess. fl. gal. 1. p. 142. M. perénnis, Mœnch. hass. no. 154. Lapeyr. abr. p. 84. D. C. syn. fl. fr. no. 2725. M. scorpioìdes, Horn. hort. hafn. 1. p. 173. Pursh, fl. 1. p. 133. Willd. spec. 1. p. 746. Wahl. fl. lapp. p. 54. Bieb. fl. cauc. 1. p. 118. Michx. fl. 1. p. 129. M. scorpioìdes, var. palústris, Lin. spec. ed. 2d. vol. 1. p. 188. fl. suec. ed. 2d. no. 157. Smith, fl. brit. 1. p. 212. Curt. fl. lond. fasc. 27. t. 65. Smith, engl. bot. 1973. St. Hil. pl. fr. 3. t. 264. Sturm, fl. germ. fasc. 5. with a figure. Svensk, bot. 1. t. 72. Ledeb. fl. alt. 1. p. 189. Echioìdes palústris, Mœnch, meth. p. 416. Plant pale green, roughish. Stems creeping at the base. Racemes simple or conjugate. Corolla blue; throat yellow; tube length of calyx; segments of the limb obovate, emarginate, or obcordate.—There is also a variety of this with white flowers. This, the *Forget-me-not*, is the emblem of affection among the Germans. It is now a general favourite, and deservedly so; its beauty is so striking as to have acquired for it a kind of proverbial name. Few who have observed the flower are likely to forget it.

FIG. 36.

Var. β, *parviflòra* (Led. fl. alt. 1. p. 189.) flowers 3 times smaller, and more crowded than in the species. ♃. H. Native near Barnaoul.

Marsh Scorpion Grass, or Forget me not. Fl. April, May. Britain. Pl. ½ to 1 foot.

14 M. re'pens (G. Don, Hook. fl. scot. p. 83. under M. palústris. Engl. bot. suppl. t. 2703.) hairs of the stem spreading; leaves obovate, obtuse, rather strigose; calyx covered

with adpressed bristles, deeply 5-cleft when in fruit, mostly connivent, shorter than the diverging pedicels; limb of the corolla flat, longer than the tube: lobes somewhat emarginate. 4. H. Native of Scotland; and in Yorkshire, Kent, and Sussex, in open heaths and parts of forests. Root creeping. Leaves lingulate. Nuts smooth. Plant pilose.

Creeping Scorpion Grass, or Mouse-ear. Fl. April, Aug. Britain. Pl. ½ foot.

15 M. collìna (Hook. engl. bot. suppl. 2629. ed. 2d. t. 257.) annual; calyx beset with spreading, uncinate bristles, open and ventricose when bearing the fruit, as long as the diverging pedicels; limb of corolla concave, shorter than the tube. ⊙. H. Native of Britain, common in dry fields, and on sunny sandy banks, flowering early in summer, and soon withering away. M. arvénsis, Smith, engl. bot. 2558. engl. fl. 1. p. 252. Racemes without peduncles, the flowers beginning among the leaves, sometimes from the very base of the stem. Corollas small, blue, with a yellow throat.

Hill Scorpion Grass. Fl. May, June. Britain. Pl. ¼ to ½ foot.

16 M. arve'nsis (Sibth, fl. oxon. p. 68.) leaves oblong-lanceolate, acute, hairy; racemes bractless; pedicels spreading while bearing the fruit, twice as long as the calyx, which is erect, 5-cleft, and open; limb of corolla erectly spreading, nearly the length of the tube. ⊙. H. Native throughout Europe, Asia, Africa, and North America, in corn fields and in sterile dry places; plentiful in Britain in like situations. Bess. fl. gal. 1. p. 142. Wahl. fl. lapp. p. 55. Bieb. fl. cauc. 1. p. 119. Willd. spec. 1. p. 747. Lehm. asper. p. 90. M. ánnua, Mœnch, fl. hass. no. 153. Lapeyr. abr. p. 84. D. C. syn. no. 2724. M. scorpioìdes, Desf. fl. atl. 1. p. 153. M. scorpioìdes, var. α arvénsis, Lin. spec. ed. 2d. p. 188. Smith, fl. brit. 1. p. 212. engl. bot. suppl. 2629. Œd. fl. dan. t. 583. Bull. herb. t. 355. Lin. fl. suec. ed. 2d. no. 157. Echioìdes ánnua Mœnch. meth. p. 416.—Hall. hist. no. 590.—Gerard, hist. p. 338. f. 4.—Lob. icon. 461. f. 2. Stem beset with spreading hairs. Lower hairs of calyx hooked. Calycine segments linear-lanceolate, unequal, conniving when in fruit. Corolla with a white tube, which is a little shorter than the calyx; limb blue; throat yellow; segments hardly emarginate.

Var. β. símplex (Pers. ench. 1. p. 156.) stem very simple; leaves rosulate; petals not emarginate; flowers on short pedicels. ⊙. H.

Var. δ. alpìna; stem dwarf, branched, more pilose; radical leaves tufted; flowering racemes revolute; flowers on short pedicels; corolla small, blue, rarely white or purple, with a yellow throat. ⊙. H.

Corn Scorpion Grass, or Mouse-ear. Fl. April, Aug. Britain. Pl. ½ to 1 foot.

17 M. ve'rna (Nutt. gen. addend.) small and hairy; stem simple; radical leaves spatulate-oblong: cauline ones linear-oblong; spikes simple; flowers nearly sessile; seeds smooth and shining. ⊙. H. Native of New Jersey, in sandy woods and by way sides. Flowers small and white. Lycópsis Virginica, Pursh ?.

Spring Mouse-ear, or Scorpion Grass. Fl. May, July. Pl.

18 M. multicau'lis (Wall. cat. no. 7020.) plant rough from short strigæ; stems numerous, simple, ascending, dividing into racemiferous branches at top; radical leaves oval, on long petioles: lower cauline ones petiolate: upper cauline ones sessile, oval-oblong; racemes numerous, axillary, and terminal, slender; pedicels erect. 4. H. Native of Nipaul, in Gosainsthan. Stems many from the same root. Racemes twin or solitary. Nuts unknown.

Many-stemmed Mouse-ear. Pl. ascending, 1 foot long.

19 M. pa'llens (Wall. cat. 7019.) hispid from strigæ; stems erect, simple; radical leaves rosulate: cauline ones lanceolate, sessile, and half stem-clasping, bluntish, mucronate; terminal racemes twin, with a flower in the fork: axillary ones solitary; nuts unknown. ⊙. H. Native of Kamaon. Lower leaves lanceolate-spatulate. Pedicels at length drooping. Nearly allied to *M. arvénsis.*

Pale Mouse-ear, or Scorpion Grass. Pl. 1 to 1½ foot.

20 M. interme'dia (Link. enum. 1. p. 164.) stem erect, branched, hispid; leaves obversely lanceolate, or ovate-oblong, hispid; pedicels much longer than the flowers; calyx beset with hooked hairs, exceeding the corolla, closed in the fruit-bearing state. ⊙. ? H. Native of Europe, in humid places; and of the Cape of Good Hope. M. arvénsis, Lehm. asper. p. 90. but not of Lin. Drev. et Heyne, bild. 2. t. 51. M. intermèdia, β, parviflòra, Ledeb. fl. alt. 1 p. 187. M. scorpioìdes, Thunb. fl. cap. 183. Racemes strict, naked. Corolla small, blue, with a yellow throat. This species is usually confounded with *M. arvénsis.*

Intermediate Mouse-ear, or Scorpion Grass. Fl. April, May. Britain. Pl. 1 to 2 feet.

21 M. versícolor (Roth. fl. germ. 2. p. 222.) leaves lanceolate, bluntish, hairy; racemes bractless; pedicels erectly spreading while in fruit, shorter than the calyx, which is 5-cleft, acute, and closed; limb of corolla spreading, shorter than the tube. ⊙. H. Native throughout Europe, in dry, arid places. Engl. bot. ed. 2d. t. 258. M. scorpioìdes, Smith, engl. bot. 480. f. 1. M. scorpioìdes, γ, Lin. spec. ed. 2d. p. 189. Smith, fl. brit. 1. p. 212. M. arvénsis, var. γ, versícolor, Pers. ench. 1. p. 156. M. arvénsis, β, Willd. 1. p. 747. M. díscolor, Lin. syst. ed. 15. p. 190. M. collìna, Hoffm. fl. germ. 1791. p. 61. Ehrh. herb. p. 51.? M. arvénsis, var. β, Gmel. fl. bad. 1. p. 411. Smith, fl. brit. 1. p. 213. Roth. 2. p. 223.—Knip. cent. 11. t. 80. Stems angular, hairy, solitary, or tufted. Flowers on short pedicels. Lower hairs of calyx hooked. Calycine segments unequal, narrow-lanceolate, conniving when in fruit. Corolla small, blue, with a yellow throat, or pale yellow; segments of the limb obtuse.

Var. β, arenària (Schrad. in litt. ex Lehm. asper. p. 93. Schulz, starg. suppl. p. 12.) flowers small, all blue; throat yellow; stigma somewhat 2-lobed. ⊙. H. M. ramosíssima, Rochel. Leaves oblong, hispid. Tube of corolla exserted, usually yellow.

Var. γ, lùtea (Pers. ench. 1. p. 156. Hoffm. et Link, fl. port. 1. p. 173.) stem scabrous, hairy; superior leaves lanceolate, quite entire; tube of corolla exceeding the calyx. ⊙. H. M. arvénsis, var. β, Willd. 1. p. 747. Anchùsa lùtea, Cav. icon. 1. p. 60. t. 69. f. 1. exclusive of the synonymes.

Party-coloured-flowered Scorpion Grass, or Mouse-ear. Fl. April, June. Britain. Pl. ½ to 1 foot.

22 M. stri'cta (Link, enum. 1. p. 164. exclusive of var. versícolor, Roth. Ledeb. fl. alt. 1. p. 186.) stem branched at the base, hispid as well as the leaves, which are oblong; racemes strict, naked; pedicels shorter than the calyx; calyx 5-cleft, exceeding the tube of the corolla, hispid from hooked bristles. ⊙. H. Native of Siberia, in dry sterile places on hills near Sogra, between Butokowna and Tscheremschuka. Flowers usually yellow.

Strict Mouse-ear. Fl. June, July. Clt. 1822. Pl. 1 foot.

23 M. Forste'ri (Lehm. asper. p. 95.) leaves obovate-spatulate, hispid from strigæ; racemes bractless; pedicels erectly spreading while in fruit, length of calyx; calycine segments oblong, bluntish, 3-nerved. 4. G. Native of New Holland, where it was collected by Forster. Root creeping; fibres in fascicles. Stems ascending, hispid. Racemes filiform.

Forster's Scorpion Grass. Pl. ½ to 1 foot.

24 M. littora'lis (Stev. cat. hort. gorenki? Lehm. asper. p. 95.) radical leaves obovate, obtuse: cauline ones ovate-cor-

date, pilose above and nearly glabrous beneath; flowers nearly sessile, imbricate, disposed in spike-formed, bractless racemes. ⊙. H. Native on the shores of the Caspian Sea. Plant small at the time of flowering, but afterwards more elongated. Radical leaves rosulate. Racemes solitary, pilose, many-flowered. Calyx hairy; segments unequal, connivent, linear-lanceolate. Tube of corolla length of calyx.

Sea-shore Scorpion Grass. Pl. 1 to 2 inches.

25 M. pusílla (Lois. in Desv. journ. 2. p. 260. t. 8. f. 1. not 36. D. C. fl. fr. 6. p. 421. no. 2724. Lehm. asper. p. 96.) radical leaves somewhat spatulate, obtuse: cauline ones oblong, pilose; racemes short, leafy; pedicels axillary, erect, much shorter than the leaves; tube of corolla a little longer than the calyx; limb very short. ⊙. H. Native of Corsica, in fields. Root simple, slender, with some long fibres. Stems simple, numerous from the same root, pilose. Calycine segments acute.

Least Mouse-ear. Fl. June, July. Clt. 1820. Pl. $\frac{1}{4}$ foot.

26 M. spatula'ta (Forst. prod. p. 12. no. 62.) stem filiform, procumbent; leaves petiolate, ovate, distant, hispid from pili; pedicels lateral, one-half shorter than the leaves; tube of corolla much longer than the calyx. ⊙. H. Native of New Zealand. Pers. ench. 1. p. 175. Willd. spec. 1. p. 748. Lehm. in act. soc. hal. 3. t. 1. f. 2. asper. 97. Anchùsa spatulàta, Rœm. et Schultes, syst. 4. p. 100. Stem pilose. Calyx obovate, with lanceolate segments.

Spatulate-leaved Mouse-ear. Pl. procumbent.

27 M. seri'cea (Lehm. asper. p. 98.) stem erect; leaves sessile, oblong-lanceolate, silky; racemes leafy; pedicels axillary, erect when in fruit, length of the floral leaves; tube of corolla length of calyx. ⊙. H. Native of Siberia. Anchùsa sericea, Rœm. et Schultes, syst. 4. p. 774. M. pectinàta, Hort. Stem silky, divided into many erect leafy racemes at apex. Calycine segments linear, bluntish. Corollas large, blue.

Silky Mouse-ear, or Scorpion Grass. Fl. June, Aug. Clt. 1802. Pl. $\frac{1}{2}$ to 1 foot.

28 M. foliòsa (Lehm. asper. p. 99.) leaves spatulate-lanceolate, roundish, obtuse, nearly glabrous; flowers axillary, on short pedicels, one-half shorter than the leaves; tube of corolla nearly the length of the calyx. ♃. G. Native of South America. Anchùsa foliòsa, Rœm. et Schultes, syst. 4. p. 775. Roots nearly simple. Stem scabrous from adpressed short hairs. Racemes leafy. Calyx pilose; with linear-lanceolate, obtuse segments. Corolla rather pilose outside.

Leafy Mouse-ear, or Scorpion Grass. Pl. $\frac{1}{2}$ to 1 foot.

29 M. villòsa (Ledeb. act. nov. acad. petrop. 5. p. 516. no. 3. fl. alt. 1. p. 191. fl. ross. alt. ill. t. 215.) plant clothed with white villi; stems simple; leaves elliptic, obtuse, 3-nerved, reticulately veined, villous; racemes twin, bracteate; bracteas minute; pedicels hardly the length of the flowers; nuts truncate, marginately toothed: teeth inflexed. ♃. H. Native of Siberia, on the alps, along with *Dryas octopétala;* and of the bay of St. Lawrence, along with *M. alpéstris*. Lehm. asper. p. 100. Anchùsa villòsa, Rœm. et Schultes, syst. 4. p. 775. Plant tufted, white from villi. Root woody. Stems simple, divided at top into simple leafy racemes. Racemes axillary and terminal. Calycine segments linear. Corolla rather large, deep blue, with a pale throat.

Villous Mouse-ear, or Scorpion Grass. Pl. $\frac{1}{4}$ foot.

30 M. aretioìdes (Cham. in Linnæa, 4. p. 443.) stems tufted, clothed with long white hairs, divided at top; leaves densely imbricated, sessile, lanceolate, cuneate at the base, acutish at the apex; racemes cymose, twin, terminal, each furnished with a leaf at the base. ♃. H. Native of the island of St. Laurence. Stems hardly emerging from the tufts of leaves. Surculi creeping. Pedicels longer than the calyxes. Calycine segments lanceolate, acutish. Corolla salver-shaped; limb fine blue; genitals inclosed.

Arctia-like Mouse-ear. Pl. 2 to 4 inches.

31 M. rupe'stris (Pall. itin. 3. append. p. 716. E. f. 3. R. Br. prod. p. 494.) plant silky; leaves linear, villous; racemes twin or tern, alternate, leafy at the top of the stem; pedicels erectly spreading while bearing the fruit, length of the floral leaves, but exceeding the flowers. ♃. H. Native of Dahuria, and Altaia, on the mountains, in dry rocky places. Willd. spec. 1. p. 748. Lam. ill. p. 305. no. 1772. Lehm. asper. p. 100. Anchùsa rupéstris, Rœm. et Schultes, syst. 4. p. 100. Root simple. Stems tufted, numerous from the same root, simple, slender, canescent. Racemes axillary and terminal. Calyx villous; with spreading segments. Corolla large, showy, deep blue, twice as long as the calyx. Nuts truncate, marginate, with the margins toothless.—There is a white-flowered variety of this plant found at the river Tschuja.

Rock Mouse-ear. Fl. July. Clt. 1802. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

32 M. obova'ta (Ledeb. fl. alt. 1. p. 190.) plant rather silky; stems tufted, simple; leaves obovate-oblong; racemes twin, bracteate; pedicels hardly exceeding the flowers; nuts unknown. ♃. H. Native of Kamtschatka; also of Dahuria, near Nertschinsk. Root thick, woody. Radical leaves rosulate, all attenuated into the petioles. Flowers like those of *M. rupéstris*.

Obovate-leaved Mouse-ear, or Scorpion Grass. Fl. June, July. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

33 M. fla'ccida (Dougl. mss. ex Lehm. pug. 2. p. 22.) stem erect, branched; leaves linear, strigose; spikes bractless, bifid; calyx 5-parted, closely adpressed to the fruit, closed, very hispid at the base and apex. ⊙. H. Native of North-west America. Stem beset with adpressed hairs or strigæ. Calycine segments linear, obtuse. Corolla yellow, glabrous; limb short. Nuts ovate, beaked, smooth.

Flaccid Mouse-ear, or Scorpion Grass. Pl. $1\frac{1}{2}$ foot.

34 M. leucophœ'a (Dougl. mss. ex Lehm. pug. 2. p. 22., stem erect; leaves lanceolate-linear, silky above and strigose beneath; spikes crowded at the top of the stem, few-flowered; calyx very hispid; nuts unknown. ⊙. H. Native of North-west America.—A very pretty plant. Stem angular, beset with adpressed hairs below, and spreading pili above. Leaves 3-nerved. Spikes hispid. Calycine segments linear, obtuse, tomentose inside at apex. Corollas large, white; with roundish, obovate segments.

Leucophœous Mouse-ear, or Scorpion Grass. Pl. 1 foot.

35 M. pauciflòra (Ledeb. in act. nov. acad. petrop. 5. p. 517. no. 4. Lehm. asper. 1. p. 101.) leaves linear, villously hispid, hoary; racemes conjugate, usually 3-flowered; pedicels 3 times longer than the calyx when bearing the fruit; bracteas minute. ♃. H. Native of Dahuria. Anchùsa pauciflòra, Rœm. et Schultes, 4. p. 774. Plant clothed with white, shining hairs. Stems simple, numerous from the same root. Racemes terminal. Corolla large for the size of the plant, pale blue, with a yellow throat.

Few-flowered Mouse-ear. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

§ 2. *Nuts wrinkled, rugged, granular, or bristly.*

36 M. peduncula'ris (Trev. in scrift. ges. freund. berol. 1813. p. 147. t. 2. f. 6, 7, 8, 9.) leaves elliptic-roundish, obtuse; racemes many-flowered, bractless, loose; pedicels longer than the calyxes, thickened above while in fruit; nuts pyramidal, downy. ⊙. H. Native near Astrachan, in fields and vineyards. Lehm. asper. p. 102. Roots fibrous. Stems numerous from the same root, beset with adpressed hairs, as well as the leaves. Racemes terminal, simple. Calycine segments linear,

or lanceolate, erectly spreading. Nuts beset with hooked bristles at the sides, nevertheless shining.

Peduncular Mouse-ear, or Scorpion Grass. Fl. May, June. Clt. 1824. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

37 M. TENUIFLÒRA (Viv. fl. libyc. 9. t. 1. f. 2.) plant strigose; stem erect; lower leaves spatulate: superior linear-oblong; calyx 5-parted, equal in length to the corolla, erect when bearing the fruit; bracteas linear-lanceolate, exceeding the flowers. ⊙. H. Native of Cyrenaica, in dry, exposed parts of mountains. Stem sparingly branched. Flowers disposed in short, imbricate, solitary, terminal spikes. Calyx hispid; with linear, acute, connivent segments. Corolla furnished with 5 fascicles of hairs inside. Nuts triquetrous, having the margins and back tubercled.

Thin-flowered Mouse-ear. Pl. $\frac{1}{2}$ foot.

38 M. NA'NA (Vill. dauph. 2. p. 459.) leaves oblong-lanceolate, villous; racemes few-flowered, leafy at bottom; nuts denticulately crenulated on the margins. ♃. H. Native of the alps of Dauphiny, Piedmont, Switzerland, Tyrol, Carinthia, Carniola, and Savoy. Vill. delph. 4. t. 13. prosp. p. 41. t. 23. f. 3. All. ped. no. 189. Wulf. in Jacq. coll. 1. p. 261. Schmidt, fl. boh. cent. 2. p. 27. Lam. ill. 1. p. 396. no. 1780. D. C. syn. fl. fr. no. 2726. Lois. fl. gall. 1. p. 104. Sut. fl. helv. 1. p. 102. Pers. ench. 1. p. 157. M. pauciflòra, Vittm. summ. 1. p. 382. M. Terglovénsis and M. nàna, Vittm. summ. 1. p. 382. M. Terglovénsis Hacq. pl. alp. carn. p. 21. t. 2. f. 6. Arètia Hacq. in act. soc. hist. nat. berol. 1780. p. 128. Lithospérmum alpìnum tomentòsum mínimum Tourn. inst. p. 137. Plant tufted, the smallest species of the genus. Root blackish. Stems numerous, simple, leafy. Radical leaves rosulate. Racemes simple, with hardly ever more than 4 flowers. Calyx villous; segments lanceolate, bluntish. Corollas large, sweet-scented; tube pale, about the length of the calyx; limb blue; throat yellow; segments ovate-roundish.

Dwarf Mouse-ear, or Scorpion Grass. Fl. May, July. Clt. 1800. Pl. 1 to 3 inches.

39 M. PECTINA'TA (Pall. itin. vol. 3. append. no. 71. t. E. f. 4.) leaves ovate-lanceolate, villous; racemes erect, strict, bracteate; nuts truncate at the apex, pectinated by erect marginal bristles. ♃. H. Native among frigid, mossy rocks, at the Jenissee; also about the Baical, and in Kamtschatka. Pers. ench. 1. p. 157. Willd. spec. 1. p. 750. Lam. ill. p. 396. Lehm. asper. p. 105. Root fibrous, adhering to the fissures of rocks. Stems erect, pilose, many from the same root, divided into simple racemes at top. Calyx pilose, with lanceolate, acute segments. Corolla blue, with a pale throat; tube length of calyx.

Pectinate-fruited Mouse-ear. Pl. $\frac{1}{2}$ to 1 foot.

40 M. CILIA'TA (Rudolph, in mem. acad. st. petersb. 1809. vol. 1. p. 352. t. 11. Led. fl. alt. 1. p. 191. fl. ross. alt. ill. t. 215.) leaves oblong-lanceolate, canescent, strigose, as well as the stems; racemes many, bracteate, loose; nuts truncate at the apex, girded by a toothed margin, having the teeth erect and ciliated. ♃. H. Native of Siberia, in exposed places at the Jenissee, especially near Krasnajarsk; also of the Altaian mountains, near Salair. Root perpendicular, fibry. Stems simple, many from the same root, divided into numerous loose racemes at top, strigose and canescent. Pedicels 3 times as long as the flowers. Calyx pilose, with linear segments. Corolla twice as long as the calyx; throat closed by 5 peculiar scales. Habit of *Echinospérmum barbàtum*.

Ciliated-toothed Mouse-ear. Pl. $\frac{1}{2}$ to 1 foot.

41 M. A'LBIDA (H. B. et Kunth, nov. gen. amer. 3. p. 91.) stem erect, much branched, and are, as well as the leaves, hispid, white; leaves sessile, linear, acutish; spikes terminal, leafy; flowers sessile; calyx closed; nuts scabrous. ⊙. H. Native of Mexico, near San Juan del Rio, and Hacienda de Lira, at the altitude of 1000 hexapods. Lithospérmum ramòsum, Lehm. asper. p. 328. ex Lam. Leaves 1 to $1\frac{1}{2}$ inch long, and one line broad. Corollas very minute, yellow, glabrous; and the processes of the throat orange-coloured. Calyx hispid, with linear-lanceolate segments.

Whitened Mouse-ear. Pl. 1 foot.

42 M. GRANULÒSA (Ruiz. et Pav. fl. per. 2. p. 5. no. 1.) stem erect; leaves linear-lanceolate, bluntish, rather hispid; corolla twice longer than the calyx; nuts granular. ⊙. H. Native of Peru, in sandy places in the provinces of Lima and Chancay. Pers. ench. 1. p. 157. Lehm. asper. p. 108. Plant hispid, or strigose. Root fusiform, fibry. Branches disposed in a corymbose manner. Racemes terminal. Flowers distant. Calyx hairy, with obtuse segments. Corolla white. Nuts ovate.

Granular-fruited Mouse-ear. Pl. $\frac{1}{2}$ to 1 foot.

43 M. HU'MILIS (Ruiz. et Pav. fl. per. 2. p. 5. no. 4.) stems procumbent; leaves linear, hispid; flowers lateral, secund; nuts rugose. ♃. G. Native of Peru, in fields. Pers. ench. 1. p. 157. Lehm. asper. p. 108. Plant hispid from pili. Root fusiform, fibry. Middle stems erect. Flowers on short pedicels. Calycine segments lanceolate. Corolla white, longer than the calyx. Nuts ovate.

Humble Mouse-ear. Pl. procumbent.

44 M. FU'LVA (Hook. et Arn. in Beech. voy. pt. bot. p. 38.) hispid; stem erect, nearly simple; leaves remote, broad-linear, bluntish; racemes spike-formed, conjugate, bractless; calyx densely pilose, deeply 5-parted; nuts only 2, and one of which is abortive. ⊙. H. Native of Chili, about Conception. Stem slightly branched upwards. Root fusiform, simple. Pedicels and calyxes clothed with fulvous hairs. Leaves strigose. Corolla white. Nuts wrinkled.

Fulvous-haired Mouse-ear, or Scorpion Grass. Pl. 1 foot.

45 M. MICRA'NTHA (Pall. in litt. ex Lehm. asper. p. 109.) stems diffuse, decumbent; leaves narrow-lanceolate, obtuse, strigose; flowers nearly sessile, interfoliaceous; nuts rugose, with prominent ribs.—Native of Siberia, at the Volga. Stems strigose, branched, many from the same root. Flowers distant, secund, axillary, and interfoliaceous. Calyx hairy; segments lanceolate, elongated and spreading when in fruit. Corolla small, a little longer than the calyx. Nuts ovate.

Small-flowered Mouse-ear. Pl. procumbent.

46 M. CHORISIA'NA (Cham. in Linnæa, 4. p. 444.) plant beset with white strigose pili; radical leaves linear, acute, obscurely 3-nerved; stems filiform, ascending, usually simple, bearing racemes from the base; segments of calyx, bearded at apex; stigma capitate; nuts wrinkled. ⊙. ♂?. H. Native of New California, at port St. Francisco. Calyx beset with adpressed strigæ. Radical leaves 3 inches long, and 2 lines broad. Corolla rotate. Calycine segments lanceolate, acute. Said to agree in hairiness and duration with *M. cæspitòsa*, Schultes, and in the racemes being leafy at bottom with *M. parviflòra*, but the nuts are wrinkled, and the habit peculiar.

Choris's Mouse-ear, or Scorpion Grass. Pl. $\frac{1}{2}$ to 1 foot.

47 M. GLOMERA'TA (Nutt. gen. amer. 1. p. 112.) stem erect, simple; leaves spatulate-linear, those on the stem rather acute, hairy; spikes pedunculate, axillary, conglomerate, bifid, sessile above; calyx extremely hispid; lobes of corolla entire. ♂. H. Native of the Missouri, on arid, argillaceous hills, around the great Bend. Cynoglóssum glomeràtum, Pursh. fl. amer. 2. p. 729. Rochèlia glomeràta, Torrey. Radical leaves villous, obovate-spatulate. Corolla white; tube constricted near the base. Stigma capitate. Stamens included beneath the arched protuberances of the orifice. Nuts rugose, with an elevated, scabrous, or minutely crenulated ridge in the centre.

Glomerate-spiked Mouse-ear, or Scorpion Grass. Fl. May, Aug. Clt. 1812. Pl. ½ to 1 foot.

† *Species not sufficiently known.*

48 M. austra'lis (R. Br. prod. p. 495.) hispid; leaves oblong-lanceolate; calyxes equal to the tube of the corolla, beset with hooked hairs. ⊙ ?. H. Native of New South Wales, about Port Jackson; and of Van Diemen's Land. R. Br. says that the anthers are peltate in *Myosòtis*, and that there is hardly any difference between it and *Anchùsa*, unless in the one the racemes are bractless, and bracteate in the other.

Southern Mouse-ear. Pl.

49 M. alpìna (Lapeyr. abr. p. 85. fl. pyr. t. 64.) nuts smooth; stem simple, sub-bifid; flowers capitate; calyxes hoary from villi; leaves lanceolate, those at the bottom of the stem very villous. ♃. H. Native of the Pyrenees. This is a peculiar species.

Alpine Mouse-ear. Pl. tufted.

50 M. lingula'ta (Lehm. asper. p. 110.) the specimen received by Lehmann under this name is nearly allied to *M. palústris*, and is probably the *M. commutàta*, Schultes. It has also been received under the name of *M. uliginòsa*, Schrad.

Lingulate-leaved Mouse-ear. Pl. 1. foot?

51 M. ramosíssima (Rochel, Lehm. asper. p. 111.) stem much branched, beset with spreading hairs; floriferous branches beset with adpressed bristles; calyx divided beyond the middle, unequal, a little shorter than the corolla: with linear, hispid, obtuse segments. ⊙. H. Native country unknown. Flowers very small, blue.

Much-branched Mouse-ear. Pl. ¼ to ½ foot.

Cult. Some of the species of this genus are very delicate and beautiful when in blossom, as *M. palústris*, the *Forget-me-not*, *M. rupéstris*, *M. rèpens*, *M. nàna*, and all the perennial kinds. They thrive best in moist places, or by the edges of ponds or ditches; they also may be grown in pots and placed among the other alpine plants. The annual species grow best in dry sandy soil, or on old walls where the seed may be sown. Most of the perennial species may be increased by dividing at the root, and all by seed.

XXVIII. EXARRHE'NA (εξ, *ex*, without; and ἀρρὴν, *arrhen*, a male; in reference to the exserted stamens.) R. Br. prod. p. 495. Lehm. asper. 76.

Lin. syst. *Pentándria Monogýnia.* Calyx 5-cleft. Corolla salver-shaped; throat closed by arched processes; limb 5-parted, obtuse. Stamens exserted; anthers peltate. Style length of stamens; stigma nearly simple. Nuts 4, distinct, 1-celled, fixed to the bottom of the calyx, umbilicate at the base.—A pilose herb, with the habit of *Myosòtis*, and differs principally from that genus in the exserted stamens. Leaves decurrent. Racemes conjugate or solitary, bractless. Flowers white, sweet-scented.

1 E. suave'olens (R. Br. l. c.) ⊙ ?. H. Native of Van Diemen's Land. Lehm. asper. l. c. Myosòtis suavèolens, Poir. suppl. 4. p. 44.

Sweet-scented-flowered Exarrhena. Pl.

Cult. For culture and propagation see *Myosòtis* above.

XXIX. BOTHRIOSPE'RMUM (from βοθριον, *bothrion*, a small pit, and σπερμα, *sperma*, a seed; in reference to a deep pit on the inner side of each carpel.) Bunge, in mem. acad. petersb. 2. p. 121.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, permanent at length, a little widened or increased. Corolla salver-shaped; throat furnished with bifid, arched processes; tube short; limb 5-cleft. Anthers nearly sessile, oblong. Stigma capitate. Nuts 4, 1-celled, fixed to the bottom of the calyx, reniform, granular on the outside, perforated at the base, and deeply umbilicate on the inner side; each pit girded by a neck. —This genus is nearly allied to *Myosòtis*, *Exarrhèna* and *Boràgo*. Habit of *Myosòtis*.

1 B. Chine'nse (Bunge, l. c.) ♂. H. Native of China, near Pekin, among rubbish. Herb very hairy. Leaves oblong, entire, attenuated into the petioles. Racemes leafy. Flowers blue, like those of *Myosòtis*. All parts of the plant are more robust than most species of *Myosòtis*.

China Bothriospermum. Pl. 1 foot?

Cult. For culture and propagation see *Myosòtis* above.

Subtribe II. CYNOGLO'SSEÆ. Nuts fixed to the central column, not perforated at the base.

XXX. ECHINOSPE'RMUM (from εχινος, *echinos*, a hedgehog, and σπερμα, *sperma*, a seed; in allusion to the seeds or nuts being echinated.) Swartz, ex Lehm. asper. p. 113. Blum. bijd. 846. Led. fl. alt. 1. p. 197. Myosòtis species, Lin. Juss. Lam. &c. Lam. ill. t. 91. Gærtn. fruct. 1. t. 68. f. 1.—Láppula Rivin.—Mœnch. meth. 1. p. 416.—Rochèlia, Lam. ill. t. 91, under Myosòtis. Rœm. et Schultes, syst. 4. p. xi. and p. 108.—Echioìdes species, Mœnch.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla salver-shaped, or funnel-shaped; throat furnished with short scales; limb 5-parted, obtuse, spreading. Nuts 4, distinct, 1-celled, triangular, compressed, echinated, fixed to the central column, not perforated at the base.—Scabrous, annual, or biennial-branched, erect plants. Leaves decurrent. Racemes bracteate, terminal. Flowers small, blue. "The Linnean species of *Myosòtis*, with echinated fruit, constitute a distinct genus, nearly allied to *Cynoglóssum*, from the nuts being adnate to the central column, but differs from that genus in the nuts being compressed, not depressed, and in the racemes being bracteate." R. Br. prod. p. 494.

§ 1. *Fruit drooping, or deflexed. Racemes almost bractless.*

1 E. Zeyla'nicum (Lehm. asper. p. 116.) leaves somewhat cordately ovate, callously hispid; racemes erect, very long, bractless; nuts densely clothed with sub-imbricate, glochidate prickles. ♃. H. Native of Ceylon, on the sea-shore among the sand. Myosòtis Zeylánica, Swartz in litt. Lehm. in act. soc. schrift, hall. 3. p. 20. Cynoglóssum Zeylánicum Thunb. in litt. Anchùsa Zeylánica, Vahl. herb. Horn. enum. hort. hafn. 1807. Rochèlia Zeylánica, Rœm. et Schultes, syst. 4. p. 108. Plant hispid, erect, branched. Corollas small, blue, a little longer than the calyx. Calycine segments ovate, obtuse.

Ceylon Echinospermum. Pl. 1 to 2 feet.

2 E. Virgínicum (Lehm. asper. p. 117.) leaves ovate-oblong, acuminated, scabrous above, downy beneath; racemes divaricate, bracteolate; nuts beset with dense, scattered, glochidate prickles. ⊙. H. Native of North America, in woods, especially in Virginia, Carolina, and Kentucky. Myosòtis Virgínica, Lin. spec. ed. 2d. vol. 1. p. 189. Pursh. fl. 1. p. 134. Willd. spec. 1. p. 748. Mill. dict. no. 1. Michx. fl. bor. 1. p. 129. Wahl. fl. lapp. p. 56. Rochèlia virgínica, Rœm. et Schultes, syst. 4. p. 108.—Mor. hist. 3. p. 449. sect. 11. t. 30. f. 9. Myosòtis seminibus hispidis, foliis lanceolato-ovatis, Gron. virg. p. 19. Plant erect, scabrous, branched; hairs on the stem retrograde. Corolla white, a little longer than the calyx. Calyx pilose, with ovate lanceolate segments, which are elongated and divaricate in the fruit-bearing state. "Leaves large. Flowers small, pale blue." Pursh. l. c.

Virginian Echinospermum. Fl. June, July. Clt. 1699. Pl. 1 to 1½ foot.

3 E. JAVA'NICUM (Lehm. asper. p. 118. Blum. bijdr. p. 846.) leaves lanceolate, strigose above, hairy beneath; racemes erect, loose, bifid, bractless; nuts depressed, densely clothed with scattered, somewhat imbricate, glochidate prickles. ♃. H. Native of Java, on mounts Gede and Salak, in dry, exposed places. Myosòtis Javánica, Swartz in litt. Lehm. in act. soc. schrift. hall. 3. p. 20. Rochèlia Javánica, Rœm. et Schultes, syst. 4. p. 108. Cynoglóssum Javánicum, Thunb. in litt. Stem erect, downy. Racemes bifid. Corolla blue; tube a little longer than the calyx, hispid, with ovate obtuse segments. This species differs from *E. Virgínicum*, to which it is very nearly allied, in the floriferous branches being erect, not divaricate, in the leaves being elliptic-lanceolate, short-acuminated, strigose above, and hairy beneath, not villous; and in the racemes being longer and bractless.

Java Echinospermum. Pl. 1 foot.

4 E. BORBÓNICUM (Lehm. asper. p. 119.) suffruticose; leaves lanceolate-linear, very long, nearly naked; racemes erect, bractless; nuts beset with densely scattered, very short, glochidate prickles. ♄. S. Native of the island of Bourbon. Myosòtis Borbónica, Lehm. in act. soc. scrift. hall. 3. p. 25. t. 2. Pers. ench. 1. p. 157. Myosòtis Borbóniæ, Lam. ill. 1. p. 396. no. 1777. dict. 4. p. 401. Rochèlia Borbónica, Rœm. et Schultes, syst. 4. p. 108. Stem scabrous, branched at top. Leaves scabrous above from white dots, and almost glabrous beneath. Flowers in 2 rows. Calyx obovate; with oblong lanceolate, bluntish segments. Corolla as in *Myosòtis palústris*.

Bourbon Echinospermum. Shrub 1 to 1½ foot.

5 E. DEFLE'XUM (Lehm. asper. p. 120.) leaves oblong-lanceolate, bluntish, hairy; racemes erectly spreading, bracteolate at the base; nuts having a simple series of prickles along the margins, which are connate at the base, and glochidate at the apex. ♂. H. Native of Lapland, Norway, Hungary, Siberia, and Styria, at the bottom of the Alps, in stony shady places. Myosòtis defléxa, Wahl. fl. carp. p. 47. fl. lapp. p. 55. act. stockh. 1810. p. 113. t. 4. Horn. hort. hafn. 1. p. 174. Oed. fl. dan. t. 1568. Rochèlia defléxa, Rœm. et Schultes, syst. 4. p. 109. Root fusiform, fibry. Stem hispid, branched at top. Calyx hairy, with oblong, obtuse segments, which are elongated, divaricate, and reflexed in the fruit-bearing state. Corolla size and colour of *E. láppula*. There are varieties of this, with blue or white, smaller or larger corollas.

Deflexed-calyxed Echinospermum. Fl. May, June. Clt. 1820. Pl. ½ to 1 foot.

§ 2. *Fruit erect. Racemes leafy.*

6 E. LA'PPULA (Lehm. asper. p. 121.) stem branched at top; leaves lanceolate, beset with incumbent strigæ, ciliated; calyx at length spreading, exceeding the pedicels; corolla small, exceeding the calyx, with an erectly spreading limb; nuts furnished with a double row of glochidate prickles along the margins, having the disk and sides tubercled. ⊙. H. Native of Europe, Asia, and North America, among rubbish, stones, and on walls; and of China, on mountains. Myosòtis Láppula, Lin. spec. ed. 2d. vol. 1. p. 189. fl. suec. ed. 2d. no. 158. All. ped. 1. p. 191. Smith. prod. fl. græc. 1. p. 112. Bess. fl. gall. 1. p. 145. Pursh. fl. 1. p. 134. Baumg. fl. trans. 1. p. 118. Oed. fl. dan. t. 692. Wahl. fl. lapp. p. 56. Bieb. fl. taur. 1. p. 120. Lam. ill. 91. Láppula Myosòtis, Mœnch. meth. p. 417. Cynoglóssum Láppula, Scop. fl. carn. ed. 2d. vol. 1. p. 25. Rochèlia Láppula, Rœm. et Schultes, syst. 4. p. 109.—Hall. hist. helv. no. 589.—Column. ecphr. p. 179. icon.—Clus. hist. 2. p. 163. f. 1. Root fusiform. Stems scabrous from pili, branched at top. Calycine segments linear-lanceolate, spreading in the fruit-bearing state. Corolla with a very short tube; limb exceeding the calyx, blue. There is also a white flowering variety.

Var. β. squarròsum (Lehm. asper. 1. p. 122.) angles of nuts beset with hooked prickles; leaves lanceolate, pilose, callous at apex. ⊙. H. Myosòtis squarròsa, Retz. obs. 2. p. 9. no. 10. Willd. spec. 1. p. 749, exclusive of the syn. of Pall. Pers. ench. 1. p. 157.

Burdock Echinospermum. Fl. April, Aug. Clt. 1656. Pl. 1 to 1½ foot.

7 E. HETERACA'NTHUM (Ledeb. suppl. ind. hort. dorp. 1823. p. 3. fl. alt. 1. p. 198.) stem erect, branched above; leaves strigose; corolla hardly exceeding the calyx; calyxes at length, spreading, exceeding the pedicels; nuts furnished with 2 rows of glochidate prickles along the margins: those in the inner row connate at the base, having the disk tubercled, and the sides tubercled and prickly. ⊙. H. Native near Astrachan.

Various-spined Echinospermum. Pl. 1 foot.

8 E. INTERME'DIUM (Ledeb. fl. alt. 1. p. 199. fl. ross. alt. ill. t. 180.) stem branched above; leaves strigose; corolla length of calyx; flowers pedicellate; pedicels a little longer than the calyx in the fruit-bearing state; nuts furnished with a single row of horizontal, approximate, glochidate prickles along the margins, having the disk granulated, and the sides wrinkled. ⊙. H. Native of Altaia, in sandy places at the river Katunga. Habit exactly of *E. Láppula*. Stem hispid. Leaves oblong-linear. Racemes solitary or twin. Bracteas ciliated. Corollas blue.

Intermediate Echinospermum. Pl. 1 to 1½ foot.

9 E. PA'TULUM (Lehm. asper. p. 124.) branches divaricate, spreading; leaves oblong-lanceolate, beset with spreading strigæ; corolla length of calyx, at length spreading; flowers sessile; nuts furnished with a single row of distant, elongated, glochidate prickles along the margins, having the sides and disk beset with acute prickles. ⊙. H. Native of Caucasus, at the rivers Kuma and Terek; also on the lower Volga, about Sarepta, and about the town of Astrachan, &c. Myosòtis squarròsa, Bieb. cauc. 1. p. 120, exclusive of the synonymes of Retzius, Horn. hort. hafn. 1. p. 174. Willd. enum. 1. p. 176. Rochèlia squarròsa, Rœm. et Schultes, syst. 4. p. 124. M. Láppula, var. Pall. itin. 3. p. 718. no 71, in a note. Root simple, perpendicular. Stem beset with rigid spreading hairs. Calyx pilose; segments linear, erectly spreading inflorescence, but in the fruit-bearing state they are divaricate and elongated. Corolla small, blue, a little longer than the calyx, like those of *Myosòtis arvénsis*.

Spreading-branched Echinospermum. Fl. April, Aug. Clt. 1802. Pl. ½ to 1½ foot.

10 E. STRÍCTUM (Ledeb. fl. alt. 1. p. 200. fl. ross. alt. ill. t. 27.) branches erect; leaves lanceolate, beset with spreading strigæ; tube of corolla length of calyx; flowers pedicellate; pedicels when bearing the fruit length of calyx; nuts furnished with a single row of erect, approximate, glochidate prickles along the margins, keeled and beset with obtuse tubercles on the disk, and wrinkled on the sides. ⊙. H. Native of Altaia, in sandy places at the river Irtysch, between the river Kurtschum and Lake Noor-Saisan. Stems many from the same root. Limb of corolla pale blue. Bracteas much smaller than in *E. pátulum*.

Strict Echinospermum. Pl. 1 foot.

11 E. TE'NUE (Ledeb. fl. alt. 1. p. 201. fl. ross. alt. ill. t. 182.) stem branched above, hispid from strigæ, as well as the leaves; leaves oblong-linear, obtuse; corolla exceeding the calyx a little; calyxes when bearing the fruit divaricate, twice as long as the pedicels; nuts furnished with a single row of short, distant, glochidate prickles along the margins, having the disk a little

keeled, and the sides tubercled. ⊙. H. Native of Altaia, at the river Tscharysch, and near Smejow. The whole plant is hispid from spreading hairs. Racemes terminal, elongated, usually solitary, rarely twin; bracteas narrow, ciliated. Corolla pale blue. Segments of calyx linear.

Slender Echinospermum. Pl. ½ to 1 foot.

12 E. MICROCA'RPUM (Ledeb. fl. alt. 1. p. 202. fl. ross. alt. ill. t. 183.) stems branched above, and are, as well as the leaves, silky from strigæ; leaves oblong, or ovate-oblong, attenuated at the base: radical ones rosulate; tube of corolla exceeding the calyx; segments of calyx erectly spreading while bearing the fruit, about equal in length to the pedicels; nuts furnished with a single row of approximate, glochidate prickles along the margins, having the disk a little keeled, and the keel and sides tubercled. ♂. H. Native of Altaia, in stony places, near the summits of the Arkaul mountains; and on mountains near Bucktorminsk, and near the mine of Nicolajew. Stems many from the same root. Racemes terminal, and sometimes axillary. Bracteas ciliated. Corolla with a pale blue limb; and the scales on the throat yellow.

Small-fruited Echinospermum. Pl. ½ to 1 foot.

13 E. CONDYLÓPHORUM (Lehm. asper. p. 125.) branches divaricately reflexed; leaves lanceolate, villous; pedicels thickened when bearing the fruit; nuts furnished with a single row of glochidate prickles along the margins. ♃. H. Native of Siberia. Root fusiform, simple, woody. Stem branched above, beset with incumbent hairs. Racemes for the most part conjugate, with a solitary flower in the fork; flowers distant. Calyx strigose; with oblong acutish segments, which are elongated and divaricate in the fruit-bearing state. Corolla fine blue: tube nearly the length of the calyx.

Club-bearing Echinospermum. Pl. 1 foot.

14 E. BRAHYCE'NTRUM (Led. fl. alt. 1. p. 203. fl. ross. alt. ill. t. 302.) stems branched above, and are, as well as the leaves, rather silky from adpressed soft strigæ; leaves as in *E. microcárpum;* tube of corolla a little shorter than the calyx; but twice shorter than the limb; calycine segments erect in the fructiferous state, exceeding the pedicels; nuts edged with a single row of very short prickles, having the disk and sides tubercled. ⊙. ♃. H. Native of Altaia, in exposed stony places between Butakowa and Tscheremschuka, and near Buchtarminsk. Very like *E. microcárpum*. Racemes elongated. Calyx hairy. Corollas varying to blue, red, and white.

Short-spurred Echinospermum. Pl. 1 to 2 feet.

15 E. SEMIGLA'BRUM (Ledeb. fl. alt. 1. p. 204. fl. ross. alt. ill. t. 28.) leaves oblong, glabrous above, but hispid beneath, as well as the stems which are branched; tube of corolla length of calyx, and about equal in length to the pedicels; nuts furnished with a single row of very long glochidate prickles along the margins, having the disk keeled and prickly, and the sides tubercled. ⊙. H. Native of Altaia, in saltish sandy places at the river Irtysch, not far from the Lake called Noor-Saisan. Stems many from the same root, rather tufted. Radical leaves rosulate, sub-spatulate, obtuse: cauline leaves ciliated at the base. Racemes solitary or twin, bracteate. Calyx hispid. Corollas small white, rarely pale blue.

Half-glabrous Echinospermum. Pl. ½ to 1 foot.

16 E. MACRA'NTHUM (Ledeb. fl. alt. 1. p. 205. fl. ross. alt. ill. t. 29.) stem branched; leaves strigose, oblong, obtuse, tapering to the base; corollas twice as large as the spreading calyx; fruit-bearing pedicels about equal in length to the calyx; nuts furnished with a single row of glochidate prickles, which are dilated at the base, upper ones the smallest, having the disk keeled; the keel prickly, and the sides somewhat tubercled. ⊙. or ♂. H. Native of Altaia, in sandy, saltish places, at the river Istysch, not far from the Lake called Noor-Saisan. Stem solitary, or many from the same root. Leaves strigose. Racemes terminal, erect, strict. Bracteas similar to the leaves. Calyx hispid. Corolla with a white tube, one-half shorter than the calyx, and a blue limb, which is 3 times longer than the tube.

Large-flowered Echinospermum. Pl. ½ to 1½ foot.

17 E. MÍNIMUM (Lehm. asper. p. 126.) branches divaricate; leaves lanceolate, obtuse, beset with spreading hairs; pedicels thickened in the fruit-bearing state; nuts large, furnished with a single row of somewhat branched, glochidate, very long prickles along the margins. ⊙. H. Native of Siberia, at the Volga, in nitrous places. Myosòtis echinóphora, Pall. itin. 3. append. no. 71. t. j. i. f. 1. Willd. spec. 1. p. 750. Rochèlia echinóphora, Rœm. et Schultes, syst. 4. p. 110. Plant hispid from white hairs. Root simple, perpendicular. Calycine segments lanceolate, elongated, and spreading in the fruit-bearing state. Corolla small, nearly the length of the calyx, with a blue limb and a white throat.

Least Echinospermum. Pl. ½ foot.

18 E. REDÓWSKII (Lehm. asper. p. 127.) stem simple, straight; leaves lanceolate-linear, beset with spreading hairs, reflexed; nuts furnished with a single row of short glochidate prickles along the margins. ♂. H. Native of Russia. Myosòtis Redówskii, Horn. hort. hafn. 1. p. 174. Rochèlia Redówskii, Rœm. et Schultes, syst. 4. p. 110. Root fusiform. Stem strigose. Racemes lateral and terminal, simple or bifid. Calyx pilose, with linear segments, hardly the length of the corolla, elongated and spreading in the fruit-bearing state.

Redowski's Echinospermum. Fl. May, July. Clt. 1819. Pl. 1 to 2 feet.

19 E. BARBA'TUM (Lehm. asper. p. 128.) stem branched above; leaves lanceolate, beset with incumbent hairs; corolla large, with a flat limb; nuts furnished with a double row of very short glochidate prickles along the edges. ⊙. H. Native of Tauria, on calcareous mountains, to Caucasus and Iberia, in gravelly and exposed places. Myosòtis barbàta, Bieb. fl. cauc. 1. p. 121. pl. cent. ross. t. 36. Myosòtis, Pall. cat. pl. taur. in nov. act. petrop. 1792. p. 303. Rochèlia barbàta, Rœm. et Schultes, syst. 4. p. 110. Root fibry, reddish. Stem beset with soft incumbent hairs. Branches leafy, bearing the flowers at the apex, for the most part bifid. Calyx villous, with oblong, acutish segments, which spread in the fruit-bearing state. Corolla fine azure blue, size of those of *Myosòtis palústris*. Processes of the throat orange colour.

Bearded Echinospermum. Fl. June, July. Clt. 1823. Pl. 1 to 1½ foot.

20 E. GRA'CILE (Lehm. asper. p. 129.) stems procumbent, filiform; leaves linear; nuts echinated; echinæ glochidate. ⊙. H. Native of Chili, about Conception in fields, and on hills. Myosòtis grácilis, Ruiz. et Pav. fl. per. 2. p. 5 and 6. no. 3. Pers. ench. 1. p. 157. Rochèlia gràcilis, Rœm. et Schultes, syst. 4. p. 111. Root capillary. Plant rather hispid. Flowers lateral, secund, disposed in a loose, leafy raceme. Corolla white.

Weak Echinospermum. Pl. procumbent.

21 E. MARGINA'TUM (Lehm. asper. p. 130.) stem erect, branched above; leaves oblong, obtuse, beset with spreading hairs; nuts furnished with a single row of glochidate prickles along the margins, which are combined to the middle. ⊙. H. Native on the Lower Volga, about Astrachan, in vineyards and sandy places. Myosòtis marginàta, Bieb. fl. cauc. 1. p. 120. Horn. hort. hafn. 1. p. 174. Willd. enum. 1. p. 176. Rochèlia marginàta, Rœm. et Schultes, syst. 4. p. 110. Root simple, perpendicular. Stem pilose. Racemes erect. Calyx pilose; segments lanceolate, spreading in the fruit-bearing state. Corolla small, a little longer than the calyx, blue.

Marginate-fruited Echinospermum. Fl. April, Aug. Clt. 1822. Pl. ½ to 1 foot.

22 E. DIFFU'SUM (Lehm. pug. 2. p. 33.) stem and leaves hairy; radical leaves petiolate, oblong-lanceolate: upper cauline ones ovate, obtuse, sessile; racemes erect, simple, bracteate; nuts covered with glochidate prickles all over. ⊙. H. Native of the north-west coast of America. Myosòtis diffùsa, Dougl. mss. Stem divided at top into racemiferous branches. Leaves somewhat 3-nerved. Pedicels subsecund, drooping in the fructiferous state. Calycine segments oblong-linear, blunt. Corollas large, white.

Diffuse Echinospermum. Pl. 1 foot.

23 E. CYNOGLOSSOI'DES (Lehm. asper. p. 131.) stems erect, suffruticose; leaves lanceolate, obtuse, hispid; nuts furnished with a single row of long, glochidate prickles along the margins, which are combined to the middle. ♄. G. Native of the Cape of Good Hope. Myosòtis cynoglossoìdes, Lam. ill. no. 1778. p. 396. Pers. ench. 1. p. 157. Cynogl. echinàtum, Thunb. in Schrad. new. journ. bot. 1806. p. 48. prod. 1. p. 34. Pers. ench. 1. p. 60. Willd. spec. 1. p. 763. Rochèlia cynoglossoìdes, Rœm. et Schultes, syst. 4. p. 111. Stems numerous, branched from the base, clothed with adpressed hairs. Racemes erect, secund. Calyx hispid; with lanceolate-acute segments, which spread in the manner of a star in the fruit-bearing state. Corolla blue?

Cynoglossum-like Echinospermum. Shrub 1 to 2 feet.

24 E. VAHLIA'NA (Lehm. asper. p. 132.) stem suffruticose, dichotomously branched at top; leaves linear, densely pilose, greyish; nuts muricately spinose. ♄. G. Native about Alexandria. Myosòtis spinocárpus, Vahl, symb. 2. p. 32. Willd. spec. 1. p. 750. Lehm. in act. nat. scrut. hal. 3. 2. p. 24. t. 1. f. 1. Anchùsa spinocárpus, Forsk. descr. p. 41. Del. egypt. p. 42. t. 17. f. 3. Plant greyish. Leaves bluntish. Peduncles axillary, solitary, in the branches. Leaves 2 under each calyx. Keel of nuts toothed.

Vahl's Echinospermum. Shrub ½ foot.

Cult. Most of the species of this genus have rather a weed-like appearance; and therefore they are only to be found in botanical gardens. They are of the most easy culture; only requiring the treatment given to other common hardy annuals and perennials. The two last species, being natives of Africa, should be kept in pots, and placed among other greenhouse plants. They are all increased by seed.

XXXI. ROCHE'LIA (named after Anthony Rochel, director of the botanic garden at Pest, in Hungary, who has written on the plants of the Carpathian mountains.) Rchb. comm. in icon. pl. rar. 2. p. 13. t. 123. f. 236. 237. Ledeb. fl. alt. 1. p. 172. fl. ross. alt. ill. t. 244. but not of Rœm. et Schultes.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped, 5-lobed; throat furnished with arched scales. Nuts 2, oblique, adnate to the indurated style, or central column, combined, 1-celled, 1-seeded.—Hispid plants, with narrow leaves, and terminal racemes of flowers.

1 R. LEIOCA'RPA (Ledeb. l. c.) plant hispid from spreading pili; cauline leaves oblong-linear; nuts smooth, glabrous. ⊙. H. Native of the Soongarian steppe, in sterile places at the river Kurtschum. Herb green. Stem simple, divided into 2 or 3 racemes at top, or branched from the base to the apex; the branches very straight, and adpressed to the stem.

Smooth-fruited Rochelia. Pl. ½ foot.

2 R. STELLULA'TA (Led. fl. atl. 1. p. 172.) plant hoary, and hispid from erectish strigæ; cauline leaves oblong-linear, somewhat spatulate; nuts strigose. ⊙. H. Native of Siberia.

Starry Rochelia. Pl. ½ foot.

Cult. For culture and propagation, see *Echinospérmum* above.

XXXII. OMPHALO'DES (from *ομφαλος, omphalos*, the navel; and *ειδος, eidos*, like; nuts or fruit resembling the navel; hence some species have been called Venus's Navelwort.) Tourn. inst. t. 58. Mœnch. meth. p. 420. Lehm. asper. p. 180.—Cynoglóssum species, Lin. gen. no. 181, and Schreb. no. 243. Juss. gen. p. 131. ed. Usteri, p. 147. Gærtn. fruct. 1. no. 426. t. 67. f. 4. C.—Picòtia species, Rœm. et Schultes, syst. 4. p. 84—85.

LIN. SYST. *Pentándria, Monogy'nia.* Calyx 5-cleft. Corolla rotate; throat closed by short vaulted processes; limb 5-parted, obtuse. Nuts 4, 1-celled, depressed, cup-shaped, with an inflexed membrane along the margin, fixed to the central column, not perforated at the base.

§ 1. *Perennial plants, with usually rhizomatous roots, broad green leaves, and terminal racemes of blue or white flowers.*

1 O. NI'TIDA (Lehm. in new schrift. gesell. berol. 8. p. 97. asper. p. 181.) leaves oblong-lanceolate, nerved, glabrous above, and shining, downy beneath: lower ones on long petioles: superior ones sessile. ♃. H. Native of Portugal, in humid places, under the shade of trees. Hoffm. et Link, fl. port. 1. p. 104. t. 25. Cynoglóssum nítidum, Willd. enum. 1. p. 181. Sims, bot. mag. t. 2529. Cynoglóssum Lusitánicum, Lam. dict. 2. p. 239. Brot. fl. lus. 1. p. 296. Cynoglóssum lanceolàtum of various Herbaria. Picòtia nítida, Rœm. et Schultes, syst. 4. p. 84. Omphalòdes Lusitánica, Cynoglóssi folio, Tourn. inst. p. 140. Rhizoma creeping under ground. Stems numerous from the same root, smoothish, branched. Racemes bractless, long. Pedicels and calyxes beset with adpressed hairs. Calycine segments ovate, acute. Corolla blue; tube white; throat yellow; scales in the throat floccose, of an obscure violet-colour. Membrane of nuts toothed.

Shining Venus Navel-wort. Fl. April, June. Clt. 1812. Pl. 2 to 4 feet.

2 O. CORNIFÒLIA (Lehm. in new. schrift, gesell. berol. 8. p. 97. t. 5. asper. 182.) radical leaves on long petioles, ovate-cordate, acuminated, nerved: cauline ones nearly sessile: lower ones lanceolate: upper ones ovate; racemes solitary, many-flowered. ♃. H. Native of Cappadocia. Cynoglóssum Cappadócicum, Willd. spec. 1. p. 767. Pers. ench. 1. p. 161. Cynoglóssum omphalòdes, β, Lam. dict. 2. p. 239. Picòtia cornifòlia, Rœm. et Schultes, syst. 4. p. 85. Omphalòdes Orientàlis cornifolio, Tourn. cor. p. 7. Rhizoma creeping under ground. Stems filiform, a span high, hairy. Leaves nearly glabrous. Flowers distant. Calyx pilose at the base; with ovate, acuminated segments.

Dogwood-leaved Venus Navelwort. Pl. ½ foot.

3 O. VE'RNA (Mœnch. meth. p. 420.) radical leaves ovate-cordate: cauline ones ovate-lanceolate, petiolate, nearly glabrous; racemes conjugate, few-flowered. ♃. H. Native of Piedmont, Carniola, Transylvania, and Caucasus, in mountain woods. Lehm. new. schrift, gesell. berol. 8. p. 98. asper. p. 183. O. rèpens, Schrank, in denks. acad. wiss. munch. 1811, 1812. p. 221. Cynoglóssum omphalòdes, Lin. spec. ed. 2d. vol. 1. p. 193. Pall. fl. ross. p. 96. Lois. fl. gall. 1. p. 107. Willd. spec. 1. p. 766. Jaume St. Hil. pl. fr. 2. t. 116. Curt. bot. mag. 7. Scop. fl. carn. 1. no. 190. t. 3. Mill. fig. 2. t. 190. f. 2. Sturm. fl. germ. fasc. 21. icone.—Mor. hist. 3. sect. 11. t. 26. f. 2.—Lob. icon. p. 577. f. 1.—Bull. herb. t. 309.—Knor. del. 2. t. e. 7. Rhizoma creeping under ground. Stems many: floriferous ones erect, glabrous, simple, emitting

stolons from their base. Petioles ciliated at the base. Racemes bractless. Flowers distant, on long pedicels. Calyx beset with incumbent hairs. Corolla fine blue, with a white throat.

Spring Venus Navel-wort. Fl. March, May. Clt. 1633. Pl. $\frac{1}{2}$ foot.

4 O. amplexicau'lis (Lehm. new. schrift, gesell. berol. 8. p. 98. t. 6.) lower leaves spatulate: the rest cordate, stem-clasping, glabrous, with smooth margins; racemes erect, many-flowered. ♃. H. Native of Spain and Portugal; particularly of Corduba. Lehm. asper. p. 185. O. Lusitánica, Schrank, denks. acad. wiss. munch. 1811, 1812. p. 221. Cynoglóssum brassicæfòlium, Lag. gen. et spec. 1816. p. 10. Cynogl. Lusitánicum, Lin. spec. p. 193. Vahl, symb. 2. p. 34. exclusive of all synonymes. Willd. spec. 1. p. 765. exclusive of the synonymes of Lin., Mill., and Tourn. Picòtia brassicæfòlia, Rœm. et Schultes, syst. 4. p. 85. Plant glabrous, glaucous-green. Stem branched. Racemes bractless. Calyx glabrous, with ovate-lanceolate segments. Corolla white.

Stem-clasping-leaved Venus Navel-wort. Fl. June, Aug. Clt. 1823. Pl. 1 to $1\frac{1}{2}$ foot.

5 O. sempervi'rens (D. Don, prod. fl. nep. p. 101. in a note) leaves ovate, obsoletely denticulated, hispid: lower ones on long petioles: superior ones sessile; peduncles axillary, 2-leaved; racemes conjugate, subcapitate. ♃. H. Native of the South of Europe; and in England, but a doubtful native. Anchùsa sempervírens, Lin. spec. ed. 2d. vol. 1. p. 192. hort. cliff. 47. Hoffm. et Link, fl. port. 1. p. 178. Smith, engl. bot. t. 45. Vill. dauph. 2. p. 456. Lehm. asper. p. 236.—Mor. hist. 3. sect. 11. t. 26. f. 2.—Sabb. hort. rom. 2. t. 23.—Lob. icon. 775. f. 2. Plant hispid. Stem erect, hispid from retrograde strigæ. Calycine segments lanceolate. Corolla blue, with a short white tube. Perforations of nuts closed by a scale, ex Lehm.

Evergreen Venus Navel-wort. Fl. May, July. Britain. Pl. 1 to 2 feet.

6 O. myosotoi'des (Schrank, densk. acad. wiss. munch. 1811, 1812. p. 222. Lehm. in new. schrift. gesell. berol. 8. p. 99.) radical leaves spatulate-lanceolate: cauline ones sessile, linear-lanceolate, strigose, rough; flowers loosely racemose. ♃. H. Native on the top of Mount Lebanon; and of Candia, on the Sphaciotic mountains. Lehm. asper. p. 188. Cynoglóssum myosotoìdes, Labill. pl. syr. dec. 2. p. 6. t. 2. Smith, prod. fl. græc. 1. p. 118. Cynoglóssum lithospermifòlium, Lam. dict. 2. p. 240. ill. no. 1805. Picòtia lithospermifòlia, Rœm. et Schultes, syst. 4. p. 86. Stems many from the same root, filiform, tufted, hairy. Corolla funnel-shaped, small, blue, hardly longer than the calyx; tube very short. Calyx pilose, with subovate segments. Nuts flat, ovate, acute, glabrous.

Mouse-ear-like Venus Navel-wort. Pl. $\frac{1}{2}$ foot.

7 O. interme'dia; leaves strigose, rough: radical ones spatulate-lanceolate: cauline ones linear-lanceolate; flowers loosely racemose; calyx equal in length to the tube of the corolla; carpels girded by a toothed, membranous margin, muricated in the centre. ♂. H. Native of Arabia, on rocks. Cynoglóssum intermèdium, Fres. fl. egypt. et arab. p. 169. Nearly allied to *Omph. myosotoìdes*.

Intermediate Venus Navel-wort. Pl. $\frac{1}{2}$ foot.

§ 2. *Annual, erect, glaucous plants, with fibrous roots, and terminal racemes of white, or very pale blue flowers.*

8 O. littora'lis (Lehm. in new. schrift. gesell. berol. 8. p. 98. asper. p. 187.) radical leaves spatulate: cauline ones sessile, oblong: superior ones ovate, dilated at the base, papillose, with strigose edges; racemes bracteate. ⊙. H. Native of the West of France, on the sea shore. Picòtia littoràlis, Rœm. et Schultes, 4. p. 186. Cynoglóssum littoràle, Spreng. syst. 1. p. 567. Root simple. Plant glaucous-green. Racemes axillary and terminal, rather strigose. Calycine segments ovate-lanceolate. Corolla white, as in *O. linifòlia*. Nuts with an inflexed, ciliated membrane.

Sea-shore Venus Navel-wort. Fl. June, Aug. Clt. 1826. Pl. $\frac{1}{2}$ foot.

9 O. linifòlia (Mœnch. meth. p. 419. Schrank, densk. acad. wiss. munch. 1811, 1812. p. 221. Lehm. in new. schrift. gesell. berol. 8. p. 99. asper. p. 187.) radical leaves cuneiform: cauline ones linear-lanceolate, glabrous, with denticulately ciliated margins; racemes bractless. ⊙. H. Native of Portugal, France, and Italy, on the sea shore. Hoffm. et Link, fl. port. 1. p. 193. Cynoglóssum linifòlium, Lin. spec. p. 193. hort. cliff. p. 43. Vahl, symb. 2. p. 35. Gærtn. fruct. 1. p. 324. t. 67. f. 4. Cynogl. Lusitánicum, Mill. fig. 2. t. 190. f. 1. Picòtia linifòlia, Rœm. et Schultes, syst. 4. p. 86.—Sabb. hort. rom. 2. t. 38.—Barrel. icon. 1234.—Mor. hist. 3. sect. 11. t. 30. f. 11. Omphalòdes Lusitánica lini folio, Tourn. inst. 140. Plant glaucous-green, glabrous. Branches terminating in loose racemes. Calyx strigose at the base; segments lanceolate, with denticulately ciliated edges. Corolla white, rarely with a tinge of blue; processes of the throat nearly globose. Nuts with a toothed, inflexed margin.

Flax-leaved, or Common Venus Navel-wort. Fl. June, Aug. Clt. 1748. Pl. $\frac{1}{2}$ to 1 foot.

10 O. scorpioìdes (Schrank, l. c. Lehm. l. c. t. 8. asper. p. 189.) stem prostrate, dichotomous; leaves scabrous: radical ones spatulate: cauline ones lanceolate, sessile: lower ones opposite, the rest alternate; pedicels axillary. ⊙. or ♂. H. Native of Bohemia, in shady places; and in the valley of Oycow, about Cracow. Cynoglóssum scorpioìdes, Hænke, in Jacq. coll. 2. p. 3. Wulf, in Rœm. arch. 3. p. 336. Schmidt, fl. boh. 3. no. 220. Sturm. fl. germ. fasc. 21. icon. Bess. fl. gall. 2. p. 149. Picòtia scorpioìdes, Rœm. et Schultes, syst. 4. p. 87. Root branched, fibrous. Plant glabrous, pale green. Stems somewhat tetragonal. Flowers solitary, in the axils of the upper leaves. Calyx rather strigose, with lanceolate-acute segments. Corolla small, of a watery-blue colour; processes of the throat yellow. Nuts glabrous. Habit of *Myosòtis palústris*.

Scorpion-like Venus Navel-wort. Pl. prostrate.

11 O.? Forti'sii; leaves ovate-lanceolate, quite entire, villous, ciliated at the base; stem obsoletely striated, scabrous; flowers opposite the leaves; seeds small, muricated. ♂. H. Native of the Island of Cherso. Cynoglóssum Lusitánicum, Fortis, osserv. cherso, ed. osero. p. 68. Lehm. schrift. gesell. berol. 2. p. 97. Picòtia Fortísii, Rœm. et Schultes, syst. 4. p. 87. Root woody. Flowers small, bluish white.

Fortis's Venus Navel-wort. Pl.?

Cult. All the species are elegant border flowers, and of the most easy culture. The perennial kinds grow well under the shade of trees or shrubs, and are increased by division. The seeds of annual species should be sown in spring, in the open border.

XXXIII. CYNOGLO'SSUM (from κυων κυνος, *kyon kunos*, a dog; and γλωσσα, *glossa*, a tongue; from the form of the leaves of most of the species; in English, however, the generic name is *Hound's-tongue*, instead of *Dog's-tongue*.) Tourn. inst. t. 57. Lin. gen. no. 183. Schreb. gen. no. 243. Juss. gen. 131. ed. Usteri, p. 147. Lam. ill. no. 256. t. 94. Gærtn. fruct. 1. no. 416. t. 67. f. 4. A. B. Lehm. asper. p. 134. exclusive of Máttia and Rindèra.

Lin. syst. *Pentándria, Monogýnia*. Calyx 5-parted. Corolla

funnel-shaped, or subrotate; throat furnished with erect processes. Stamens inclosed. Stigma nearly simple. Carpels 4, 1-celled, depressed, echinated, imperforated at the base, fixed to the central column.—Tall, robust, downy plants, soft to the touch. Leaves large, broadest at top. Racemes usually bractless, secund, terminal, simple, bifid, or twin. The prickles on the outside of the carpels are usually glochidate.

§ 1. *Stamens inclosed.*

1 C. pauciflòrum (Ruiz. et Pav. fl. per. 2. p. 6.) stem erect; leaves lanceolate, narrowed towards the base; peduncles usually 7-flowered; flowers on short pedicels. ⊙. H. Native of Chili, in fields about Conception. Lehm. asper. p. 139. Plant densely hispid, canescent. Peduncles axillary. Corolla twice as long as the calyx.

Few-flowered Hound's-tongue. Pl. 1 to 2 feet?

2 C. Japónicum (Thunb. fl. jap. p. 81. icon. dec. 3. t. 2.) stems prostrate; leaves oblong, stem-clasping, acute, villous, finely serrulated. ⊙. H. Native of Japan. Lehm. asper. p. 139. Root fibrous. Calyx villous. Corolla purple, longer than the calyx.

Japan Hound's-tongue. Pl. decumbent.

3 C. diffu'sum (Roxb. fl. ind. ed. Wall. 2. p. 7. Lehm. asper. p. 140.) stems ascending, diffuse; leaves obovate-spatulate, petiolate, strigosely pilose, terminated by a short acumen; racemes leafy. ⊙. H. Native of Bengal. Root fusiform, fibrous. Calyx pilose, with ovate-lanceolate, acuminated segments. Stems and pedicels canescent from long hairs. Corolla with a gibbous tube; its mouth contracted by 5 broad, emarginate scales. Carpels obovate, scabrous.

Diffuse Hound's-tongue. Pl. ascending.

4 C. prostra'tum (Hamilt. mss. ex D. Don, prod. fl. nep. p. 100.) plant hispid from bristles, prostrate; radical leaves obovate, on long petioles: cauline ones elliptic, sessile; flowers on short pedicels, generally extra-axillary; nuts muricate. ⊙. H. Native of Nipaul, at Baguanpur.

Prostrate Hound's-tongue. Pl. prostrate.

5 C. furca'tum (Wall. in Roxb. fl. ind. 2. p. 6. D. Don, prod. fl. nep. p. 100.) stem erect; leaves elliptic-oblong, acute, half stem-clasping, silky on both surfaces, as well as the stem; racemes erect, thin-flowered. ♃. F. Native of Upper Nipaul, at Suembu. C. cærùleum, Ham. mss. Racemes twin, woolly, bractless. Calycine segments ovate, obtuse, bristly. Corolla blue. Carpels glochidate. Very like a species of *Myosòtis*.

Forked-racemed Hound's-tongue. Pl. 1½ foot.

6 C. marifòlium (Roxb. fl. ind. ed. Wall. 2. p. 8.) plant diffuse, hairy; leaves bifarious, oblong; flowers solitary, between the leaves; corolla half the length of the calyx. ⊙. H. Native of Bengal. Leaves ½ inch long. Flowers on short pedicels, of a pale, whitish blue. Stigma emarginate. Nuts rough, round, almost hid by the calyx.

Marum-leaved Hound's-tongue. Pl. procumbent.

7 C. panicula'tum (Hook. et Arn. in Beech. bot. p. 37.) plant clothed with adpressed hairs; leaves lanceolate, very acute, gradually tapering into the petioles, ciliated, shining, clothed with hoary, silky down beneath; racemes terminal, panicled, loose, few-flowered, bracteate; fruit bearing pedicels, very long, spreadingly deflexed; carpels glochidate. ♂.? F. Native of Chili, at Conception; and of Peru, in Murilla Bay.—The base of the plant is frutescent. Leaves 3-4 inches long, with slightly revolute edges.

Panicled Hound's-tongue. Pl. 1½ to 2 feet.

8 C. cheirifòlium (Roy. lugdb. p. 406. Lin. spec. p. 193.) stem erect; leaves lanceolate, obtuse, tomentose, hoary; racemes bracteate; corolla twice as long as the calyx. ♂.? ♃. F.? Native of the South of Europe, Levant, and Barbary. Horn. hort. hafn. 1. p. 177. Lapeyr. abr. p. 87. Hoffm. et Link, fl. port. 1. p. 191. Vill. dauph. 2. p. 457. All. ped. 1. no. 171. Gouan. hort. monsp. p. 82. Lehm. asper. 141. C. argénteum, Lam. fl. fr. 2. p. 277.—Dalech. hist. 2. p. 1261. f. 1. Stems many from the same root, simple. Plant hoary from fine tomentum. Racemes terminal, simple, rarely bifid. Calycine segments lanceolate, bluntish. Corolla rose-coloured; processes of the throat deep red. Carpels covered with glochidate prickles.

Var. β, lanàtum (Lehm. asper. p. 141.) leaves villous; calyxes hairy; stamens rather longer than the corolla. ♂. F. Native of Barbary. Anchùsa lanàta, Lin. spec. p. 192. Desf. fl. atl. 1. p. 158. Willd. spec. 1. p. 758. Lam. ill. gen. no. 1813.

Var. γ, calcaràtum (D. C. fl. fr. 6. p. 422.) ♂. H. Native of France.

Wall-flower-leaved Hound's-tongue. Fl. June, July. Clt. 1596. Pl. ½ to 1 foot.

9 C. decu'rrens (Ruiz. et Pav. fl. per. 2. p. 6. no. 1.) stem erect, angularly winged; leaves broad, lanceolate, acute, decurrent, veiny, hispid. ⊙. H. Native of Chili, in groves. Lehm. asper. p. 143. Feulle, chil. 2. t. 49. Hook. et Arn. in Beech. voy. pt. bot. p. 37. Plant hispid. Flowers distant. Corollas whitish-blue. Carpels echinated with glochidate bristles. Racemes terminal, leafy.

Decurrent-leaved Hound's-tongue. Pl. 1 to 2 feet?

10 C. Mexica'num (Cham. in Linnæa, 5. p. 114.) stem erect, hairy, leafy, branched at the top; radical leaves elliptic, mucronate, on long petioles, clothed with hair-like down, rough above: cauline leaves similar to the radical ones: uppermost ones lanceolate, sessile; racemes loose, panicled; carpels furnished with glochidate prickles on the outer sides. ♂. H. Native of Mexico, on Mount Macultipec. Flowers blue. Nuts size of grains of pepper.

Mexican Hound's-tongue. Pl. 2 to 3 feet.

11 hi'spidum (Thunb. in Schrad. journ. 1. p. 1806. p. 46. prod. p. 34.) stem erect; lower leaves oblong-lanceolate, obtuse: upper ones lanceolate, acute, hispid; racemes bractless, usually 3-flowered; stamens shorter than the corolla, which is ventricose. ⊙. H. Native of the Cape of Good Hope. Lehm. asper. p. 143. Stem hispid from adpressed hairs. Racemes constituting a terminal panicle. Calyx hispid; segments oblong, obtuse. Corolla rufescent; processes of the throat fleshy.

Hispid Hound's-tongue. Pl. 1 to 1½ foot.

12 C. tomentòsum (Lehm. asper. p. 144.) stem erect; lower leaves oblong-lanceolate, bluntish: superior ones linear-lanceolate, half stem-clasping, clothed with dense, yellow, golden tomentum; racemes terminal, bractless, many-flowered. ♃. H. Native of Italy. Stems angular, canescent. Radical leaves 3-4 inches long. Racemes twin, terminal. Calycine segments oblong-lanceolate, obtuse. Carpels covered with short glochidate prickles.

Tomentose Hound's-tongue. Pl. ½ to 1 foot.

13 C. lanceola'tum (Forsk. descr. p. 41.) stem erect; leaves sessile, lanceolate, acute, entire, attenuated at the base, hairy, veined, downy beneath; racemes solitary, bractless; stamens inclosed. ⊙. H. Native of the Cape of Good Hope, and Arabia. Vahl, symb. 2. p. 34. Willd. spec. 1. p. 761. Lehm. asper. p. 145. C. hirsùtum, Thunb. in Schrad. journ. 1. p. 1806. p. 47—48. prod. fl. cap. p. 34. Willd. spec. 1. p. 763. Stems hairy, canescent. Young branches densely clothed with yellow hairs. Leaves hairy or strigose above.

Racemes simple, hairy. Calycine segments oblong, obtuse. Tube of corolla length of calyx. Carpels covered with glochidate bristles.

Lanceolate-leaved Hound's-tongue. Pl. 1 to 1½ foot.

14 C. vesiculòsum (Wall. cat. no. 920.) hispid from strigæ; stem much branched; leaves oval, attenuated at both ends; racemes terminal, solitary or twin, slender; calycine segments ovate, acute; carpels beset with glochidate prickles on the margins, and smooth in the centre. ♂. H. Native of Nipaul. Corollas rather small, white. Racemes bractless.

Bladdery Hound's-tongue. Pl. 2 to 3 feet.

15 C. He'ynei; plant hispid from strigæ; leaves ovate-lanceolate, acuminated; racemes slender, terminal twin, or axillary solitary; carpels beset with glochidate prickles along the margins, and tubercled in the centre, shorter than the calycine segments, which are bluntish. ♂. H. Native of the East Indies, at Dindigul. C. lanceolàtum, Heyne, herb. ex Wall. cat. no. 921. but not of Forsk. Racemes bractless.

Heyne's Hound's-tongue. Pl. 1 to 2 feet.

16 C. Walli'chii; stem erect, angular, rather strigose; leaves oblong-lanceolate, 3-nerved; racemes twin or solitary, elongated, terminal, or from the axils of the upper leaves; flowers distant; calyx spreading, longer than the carpels, with ovate, mucronate segments; carpels beset with glochidate prickles along the margins, and tubercles in the centre. ♂. F. Native of Nipaul, in Gosainsthan. C. calycìnum, Wall. cat. no. 923. but not of Meyer. Leaves 3-5-nerved. Racemes bractless.

Wallich's Hound's-tongue. Pl. 2 to 3 feet.

17 C. cane'scens (Horn. hort. hafn. 1. p. 177. Willd. enum. 1. p. 180.) stem erect, branched at top; cauline leaves lanceolate, acute, petiolate, erosely denticulated, hairy, clothed with soft hairs beneath, somewhat 3-nerved; racemes conjugate, divaricate, bractless. ⊙. H. Native of the East Indies. Lehm. asper. p. 144. C. micránthum, Desf. pl. hort. par. 1804. p. 220. C. hirsùtum, Jacq. hort. schœnbr. 4. t. 489. exclusive of the synonymes. C. racemòsum, Roxb. fl. ind. ed. Wall. 2. p. 6. ex Lehm. Plant hispid. Flowers secund. Calycine segments ovate, obtuse. Corolla white; throat and scales blue. Carpels ovate, clothed with glochidate prickles.

Canescent Hound's-tongue. Fl. June, Aug. Clt. 1819. Pl. 2 feet.

18 C. hirsutíssimum (Lehm. asper. p. 145.) stem erect, simple; leaves narrow-lanceolate, half stem-clasping, acute, papillosely-hairy on both surfaces; hairs spreading; racemes solitary, elongated, bractless. ⊙. ? H. Native of Africa. Stem very hairy. Peduncles hairy, terminal and lateral, racemiferous. Calyx hairy, with oblong, obtuse segments. Carpels beset with glochidate prickles.

Very-hairy Hound's-tongue. Pl. 1 to 1½ foot.

19 C. revolu'tum (Ruiz. et Pav. fl. per. 2. p. 6. no. 3.) stem erect, branched; leaves lanceolate, acute: cauline ones sessile, hispid; racemes subspicate, leafy, revolute at apex; pedicels lateral. ⊙. H. Native of Peru, in Huassa-Huassi, in shady places. Pers. ench. 1. p. 160. Lehm. asper. p. 148. Plant hispid. Stem angular. Pedicels drooping. Corolla whitish-blue. Carpels beset with glochidate prickles.

Revolute-racemed Hound's-tongue. Pl. 3 feet

20 C. suave'olens (R. Br. prod. p. 495. Lehm. asper. p. 148.) leaves lanceolate, strigose; those of the branches half stem-clasping; racemes bracteate; carpels echinated with equal glochidate prickles.—Native of New Holland.

Sweet-scented-flowered Hound's-tongue. Pl.

21 C. Austra'le (R. Br. l. c.) stems erect; leaves lanceolate, strigose on both surfaces; racemes bractless; carpels echinated with glochidate prickles: the prickles on the back fewer, and with a single row of longer ones along the margin.—Native of New Holland.

Southern Hound's-tongue. Pl.?

22 C. lanuginòsum (Lehm. asper. p. 148.) stem erect; leaves linear-lanceolate, acute, half stem-clasping, woolly, and hoary; racemes terminal, loose, bractless.—Native country unknown. Stem furrowed, simple, white from wool. Calyx woolly, with lanceolate, bluntish segments. Corolla very like that of *C. officinàle*. Carpels ovate, covered with glochidate prickles.

Woolly Hound's-tongue. Pl. 1 to 2 feet.

23 C. clandesti'num (Desf. fl. atl. 1. p. 159. t. 42.) stem erect; leaves narrow-lanceolate, bluntish, half stem-clasping, hairy; racemes bractless; corolla villous at top. ♂. H. Native of Portugal and Algiers. Hoffm. et Link. fl. port. 1. p. 190. Horn. hort. hafn. 1. p. 117. Lehm. asper. p. 149. C. officinàle, Brot. fl. lus. 1. p. 295. C. fúlvum, Rudolph. in Schrad. journ. 1795. p. 295. Pers. ench. under *Auchùsa Itálica*. Root fusiform. Plant pilose. Pedicels and calyxes clothed with dense, yellow, silky hairs. Calycine segments lanceolate, obtuse. Corolla violaceous, hardly longer than the calyx; limb tomentosely villous at apex. Carpels ovate, covered with glochidate prickles.

Clandestine Hound's-tongue. Fl. June, Aug. Clt. 1821. Pl. 1 to 2 feet.

24 C. Dioscóridis (Vill. dauph. 2. p. 457. prosp. p. 21. exclusive of the synonymes. Lehm. asper. p. 150.) stem erect; leaves narrow-lanceolate, acuminated, dilated at the base, rather hispid; racemes elongated, bractless, loose. ♂ H. Native of Dauphiny. C. elongàtum, Horn. hort. hafn. 2. p. 956. C. Virgínicum, Willd. enum. 1. p. 180. exclusive of the synonymes. C. remòtum, Mœnch, meth. p. 419. Root fusiform. Stem simple, canescent, beset with retrograde hairs. Racemes pilose, terminal and axillary in the spontaneous plant; but terminating the stem and branches in the cultivated plant. Calycine segments ovate, obtuse. Corolla red or flesh-coloured, with deeper veins. Carpels ovate, clothed with short glochidate bristles.

Dioscorides's Hound's-tongue. Fl. June, Aug. Clt. 1820. Pl. 1½ to 2 feet.

25 C. officina'le (Lin. spec. p. 192. fl. suec. 162. hort. cliff. 47.) stem erect, leafy; lower leaves broad-lanceolate: superior ones broadest at the base, acute, canescent from downy tomentum; racemes bractless, panicled at the time the flowers are open. ♂. H. Native of Europe, Asia, Africa, and North America, in waste places, and by way sides and margins of fields, and particularly near towns; in Britain, in like situations, but a doubtful native. Scop. fl. carn. ed. 2d. p. 124. Vill. dauph. 2. p. 456. All. ped. 1. no. 124. Desf. fl. atl. 1. p. 158. Suter, fl. helv. 1. p. 105. Smith, engl. bot. t. 921. Oed. fl. dan. t. 1147. Curt. fl. lond. t. 149. Regnault, bot. 3. t. 364. Sturm, fl. germ. fasc. 9. icone. Baumg. fl. trans. 1. p. 122. Pursh. fl. 1. p. 123. Mayrhoff, fl. mon. t. 23. Led. fl. alt. 1. p. 196.—Blackw. herb. t. 249.—Plenck. icon. t. 76. Stem sulcately angular, branched at top, beset with soft, incumbent hairs. Flowers nutant, secund. Racemes terminating the stem and branches, canescent, villous. Calycine segments oblong, connivent. Corolla reddish; processes of the throat purple. Carpels ovate, densely clothed with glochidate prickles. The whole plant has a disagreeable smell, like most of the species, much resembling that of mice. It is suspected to possess narcotic qualities. It has formerly been used in medicine; and Mr. Ray informs us, from Dr. Hulse, that a decoction of the roots inwardly, and cataplasms of them outwardly,

were used in strumose and scrophulous cases. It is, however, discarded from the present practice. All animals are said to dislike it, and leave it untouched. The large Dutch Hound's-tongue is only a variety of this.

Var. β, bícolor (Lehm. asper. p. 153.) leaves lanceolate, narrowed at the base, downy: upper ones sessile, cordate. ♂. H. Native of Germany and Siberia. Corolla white; with the processes in the throat red, and the limb marked with 5 red spots. C. hýbridum, Thuill. fl. par. 1. p. 94. C. angustifòlium, Hort. C. officinàle, var. flore albo, Roth, tent. fl. germ. 2. p. 170.

Officinal, or Common Hound's-tongue. Fl. June, July. Britain. Pl. 2 feet.

26 C. píctum (Ait. hort. kew. ed. 1. vol. 1. p. 179.) stem erect, leafy; leaves lanceolate, acute: upper ones ovate-lanceolate, cordate, finely tomentose; racemes bractless; limb of corolla dilated, veiny. ♂. H. Native of the South of Europe, Iberia, Barbary, and Madeira. Vahl, symb. 2. p. 34. Willd. spec. 1. p. 761. Willd. enum. 1. p. 180. Lehm. asper. 154. Hoffm. et Link. fl. port. 1. p. 189. t. 24. Bieb. fl. cauc. 1. p. 128. Sims, bot. mag. t. 2134. Mœnch, suppl. 147. C. amplexicaúle, Lam. ill. no. 1794. C. cheirifòlium, Jacq. coll. 3. p. 30. Scop. fl. carn. ed. 2d. vol. 1. p. 125. Root fusiform, Stem bluntly angular, furnished with axillary, racemiferous branches at top, and canescent from short, soft, retrograde hairs. Leaves canescent. Calyx clothed with incumbent hairs; segments oblong-lanceolate, bluntish. Corolla a little longer than the calyx, purple or blue, elegantly marked with deeper dichotomous veins, which are branched at top. Carpels covered with glochidate prickles.

Painted-flowered Hound's-tongue. Fl. Aug. Clt. 1658. Pl. 2 feet.

27 C. cilia'tum (Dougl. mss. ex Lehm. pug. 2. p. 24.) stem erect, simple, hairy; leaves linear, acute, elongated, 3-nerved, clothed with hair-like tomentum, ciliated; racemes terminal, bracteate, secund; stamens inclosed. ♂. H. Native of North-west America. Stem terete, canescent; hairs on the base of the stem retrograde, but those at its top are spreading. Racemes subcorymbose. Calyx villous; with lanceolate, obtuse segments. Corolla blue, one half longer than the calyx.

Ciliated-leaved Hound's-tongue. Pl. 1½ foot.

28 C. gra'nde (Dougl. mss. ex Lehm. pug. 2. p. 25.) stem erect, glabrous, naked above; leaves petiolate, pilose beneath: lower ones large, cordate-ovate, undulated: superior ones oblong-lanceolate; racemes bractless, glabrous, pedunculate, few-flowered; calyx villous. ♂. H. Native of North-west America. Stem rather angular, destitute of leaves at top. Leaves acute, ciliated, beset with adpressed hairs above, and paler beneath, 9 inches long, and 4 lines broad. Racemes constituting a loose, terminal panicle. Pedicels glabrous, pilose at top. Calycine segments elliptic-lanceolate, obtuse. Corolla blue, twice as long as the calyx, larger than those of *C. officinàle*.

Great Hound's-tongue. Pl. 2 to 3 feet.

29 C. Virgínicum (Gron. virg. p. 19. Lin. spec. p. 193.) stem erect; leaves oval-oblong, acute: upper ones cordate at the base, stem-clasping, veiny, hairy; racemes short, corymbose, bractless. ♃. H. Native of Virginia and Pennsylvania; and Arkansas, in woods. C. amplexicaúle, Michx. fl. amer. bor. 1. p. 132. Pursh, fl. 1. p. 133. Pers. ench. 1. p. 159. Stems terete, beset with retrograde hairs, branched at top. Leaves green. Racemes canescent from hairs. Calycine segments oblong-lanceolate, bluntish. Corolla blue, twice as long as the calyx. Carpels ovate, furnished with glochidate prickles.

Virginian Hound's-tongue. Fl. May, July. Clt. 1812. Pl. 2 to 3 feet.

30 C. pilòsum (Nutt. gen. amer. 1. p. 114.) erect and hairy; radical leaves spatulate-oblong, obtuse; the rest lanceolate-oblong, obtuse; flowers axillary, almost spiked, unilateral; stamens very short, inclosed; carpels scabrous, depressed, oblong, acute, muricate on the margins. ♃. ? H. Native of Missouri, on arid hills above Rapid River. Flowers small, white.

Pilose Hound's-tongue. Pl. erect.

31 C. sylva'ticum (Smith, fl. brit. 1. p. 216. engl. bot. t. 1642.) stem erect; lower leaves somewhat spatulate-lanceolate: superior ones half stem-clasping, ovate-oblong, acute, smoothish above and shining, but scabrous beneath; racemes bractless. ♂. H. Native throughout Europe, in shady places, in elevated situations; in England, about hedges in several parts, especially in Essex; but, like many other biennials and annuals, changes its abode; it is also found in like situations in North America. Gmel. fl. bad. 1. p. 421. Sut. fl. helv. 1. p. 105. Hænke, in. Jacq. coll. 2. p. 77. Baumg. fl. trans. 1. p. 122. Pursh, fl. 1. p. 133. C. officinàle, β, sylváticum, Willd. spec. 1. p. 760. Germánicum, Jacq. obs. 2. p. 31. under Arenària mucronàta.—Hall. helv. no. 588.—Column. ecphr. 176. t. 175. C. folio virente, Bauh. hist. 3. p. 600. Root fusiform, fibrous. Stems many from the same root, hairy, branched at top. Leaves pale green. Calyx rather hairy, with oblong, obtuse segments. Corolla a little longer than the calyx, purplish-blue, with deeper coloured veins; processes of the throat obtuse, with white, pilose edges. Carpels ovate, beset with glochidate prickles.

Wood Hound's-tongue. Fl. June, July. Britain. Pl. 2 to 3 feet.

32 C. Hæ'nkii (Schultes, oestr. fl. ed. 2d. vol. 1. p. 362. syst. 4. p. 74.) plant of a hoary green; leaves lanceolate, scabrous on both surfaces, flat, nearly sessile, remote; carpels rugged. ♂. H. Native of Bohemia, Galicia, and Hungary, in hedges and margins of woods. C. sylváticum, Schmidt, fl. boh. no. 219. Hænke, in Jacq. coll. 2. p. 77. Bess. fl. gal. 1. p. 149. C. officinàle, β, Willd. spec. 1. p. 760. C. hýbridum, Thuill. fl. par. 1. p. 94. ? C. officinàle, β, D. C. fl. fr. no. 2736. ? This plant is said to differ from *C. officinàle* in the character given above; in the stem being more humble; in the flowers being smaller, blue, verging to red or purple. Perhaps not distinct from *C. Dioscóridis*, or *C. sylváticum*.

Hænke's Hound's-tongue. Fl. June, Aug. Clt. 1819. Pl. 1½ to 2 feet.

33 C. clava'tum (Viv. fl. libyc. p. 11. t. 5. f. 2.) hoary; cauline leaves half stem-clasping: racemes secund, leafy; processes in the throat of the corolla cylindrically clavate, emarginate, equal in length to the limb; style permanent, elongated, subulate, exceeding the calyx. ♂. H. Native of Libya. Stem branched, terete. Floral leaves lanceolate-linear, longer than the flowers. Calycine segments lanceolate, acuminated. Corolla glabrous. Carpels beset with stellate, glochidate bristles.

Clavate-appendaged Hound's-tongue. Pl. erect.

34 C. viridiflòrum (Willd. herb. ex Lehm. asper. p. 160. Ledeb. fl. alt. 1. p. 196. fl. ross. alt. ill. t. 106.) stem erect, simple; leaves oblong, acute: lower ones petiolate: upper ones sessile, attenuated at the base, glabrous, and pale green

above, tomentose or downy beneath; racemes erect, loose, panicled: lower ones bracteate: upper ones bractless. ♂.? H. Native near Schemanaika and Schulba, in sandy places. Stems simple, glabrous. Racemes constituting a terminal, pyramidal panicle, a foot or a foot and a half long. Calyx and pedicels grey from silky hairs. Calycine segments obtuse. Corolla salver-shaped, twice as long as the calyx, yellowish green. Carpels ovate, densely beset with glochidate prickles.

Green-flowered Hound's-tongue. Pl. 4 to 6 feet.

35 C. calyci'num (Meyer. verz. pflanz. p. 100.) annual, glaucous; stems branched, assurgent; leaves sessile, thick, oblong, bluntish, entire; racemes bracteate; corollas small; calyx in the fructiferous state large, with ovate, connivent lobes; carpels oblong, convex, scabrous; style marcescent. ⊙. H. Native of Caucasus, near the Caravansarai Koete-Koili, in the desert between Baku and Sallian. Corollas blue.

Large-calyxed Hound's-tongue. Pl. assurgent.

36 C. divarica'tum (Steph. in litt. ex Lehm. asper. p. 161.) stem erect, branched; branches divaricate; lower leaves oval, petiolate: superior ones sessile, lanceolate, attenuated at both ends, nearly glabrous above, and downy beneath; racemes bracteate. ♃. H. Native of Siberia. Root perpendicular. Stems beset with incumbent hairs. Pedicels and calyxes hairy, cinereous. Leaves pale green. Calycine segments ovate, bluntish, a little shorter than the corolla, which is small. Carpels ovate, densely covered with glochidate prickles.

Divaricate Hound's-tongue. Pl. 1½ to 2 feet.

37 C. latifòlium (R. Br. prod. p. 496.) stem prickly; floral leaves ovate, on short petioles, acuminated, scabrous; peduncles extra-axillary. ♂.? H. Native of New Holland.

Broad-leaved Hound's-tongue. Pl.

38 C. Ròylei (Wall. cat. no. 917.) rough from strigæ; radical leaves wanting in the specimens examined: cauline ones cordate, petiolate, acuminated, nerved, and canescent from down; racemes short, canescent, bracteate. ♂. H. Native on Choor Mount.

Royle's Hound's-tongue. Pl.

39 C. la'xum; stem erect, branched at top; leaves ovate, acuminated, 7-nerved, all petiolate, and beset with short strigæ, as well as the upper part of the stem and branches; racemes terminating the stem and branches, twin, loose, few-flowered, with a solitary flower in the fork; corolla rotate; carpels compressed, beset with glochidate prickles outside. ♂. H. Native of Emodus and Gosainsthan, in Nipaul. Rindèra glochidàta, Wall. cat. no. 926. Picòtia glochidàta, Wall. mss. Perhaps a species of *Máttia*, or *Omphalòdes*. Corolla blue. Leaves distant. Racemes bracteate at the base.

Loose Hound's-tongue. Pl. 3 to 5 feet.

§. 2. *Stamens exserted. Perhaps a distinct genus.*

40 C. longiflòrum (Lehm. asper. p. 162.) stem erect; leaves lanceolate, acute, strigosely muricated, scabrous; racemes bracteate, few-flowered; pedicels in the axils of the bracteas; tube of corolla twice as long as the calyx; and the segments of the limb linear; stamens equal in length to the corolla. ♂.? H. Native of Syria, about Aleppo. Lycópsis Dioscóridis nondum cognita, Rauwolf, trav. syr. 1. ch. 9. p. 120. t. 22.? Stem glabrous. Pedicels nutant. Calycine segments lanceolate, having the margins and keel tubercularly ciliated. Corolla glabrous. Anthers beyond the throat of the corolla. Carpels ovate, beset with glochidate prickles.

Long-flowered Hound's-tongue. Pl. 2 feet?

41 C. Stamíneum (Desf. am. mus. 10. p. 431. t. 36. journ. bot. par. 1. p. 358.) stem erect, simple; cauline leaves lanceolate, obtuse, sessile, silky above, and finely tomentose beneath; flowers minute, disposed in short, bractless racemes, the whole forming a terminal panicle; stamens twice as long as the corolla. ♂.? H. Native of Syria and Cappadocia. Cynoglóssum Orientàle vulgari simile, flore minimo longis staminibus donato, Tourn. cor. p. 7. Stem tomentose. Calyx tomentose, with linear-lanceolate segments. Corolla salver-shaped, rose-coloured; length of calyx; limb length of tube, with bluntish segments. Stamens inserted in the throat of the corolla, rather unequal. Anthers incumbent. Carpels ovate, prickly on the outer side. Habit of a species of *E'chium*.

Long-stamened Hound's-tongue. Pl. 2 to 3 feet.

42 C. Apenni'num (Lin. spec. p. 193.) stem erect, leafy; cauline leaves linear-lanceolate, attenuated at the base, sessile, acute, very long, rather villous; racemes bractless, compact before expansion; stamens a little longer than the corolla. ♂. H. Native of the South of Europe; as of Italy, in subalpine places. Lehm. asper. p. 164. Lapeyr. abr. p. 87. Smith, prod. fl. græc. 1. p. 118. Willd. spec. 1. p. 762. Gærtn. fruct. 1. p. 324. t. 67. f. 4. Sabb. hort. rom. 2. t. 36. Willd. enum. 1. p. 181. D. C. fl. fr. syn. no. 2740.—Column. ecphr. 1. p. 168. t. 170. Stem simple, villous. Racemes forming large, dense, ovate, leafy, terminal panicles. Pedicels and calyxes hoary and villous. Calycine segments lanceolate-acute. Corolla length of calyx, at first red, afterwards violaceous, with short segments. Anthers incumbent. Nuts not seen.

Apennine Hound's-tongue. Fl. April, July. Clt. 1731. Pl. 1 to 3 feet.

43 C. molli'ssimum (Lehm. asper. p. 165.) stem erect; leaves oblong, on long petioles, almost glabrous above, and downy beneath; flowers in short, compact, bractless racemes, the whole forming a terminal panicle; stamens twice as long as the corolla. ♂. H. Native of Persia, in the province of Djilan. Root perpendicular. Stem hoary, pilosely tomentose. Pedicels and calyxes canescent from villi. Calycine segments oblong, obtuse. Corolla a little longer than the calyx, veined. Stamens fleshy, alternating with the bearded processes of the throat. Habit of *C. Apennìnum*.

Very soft Hound's-tongue. Pl. 1½ foot.

† *Species hardly known.*

44 C. Borbónicum (Bory. St. Vinc. trav. p. 383.) leaves lanceolate, acute, pilose; branches forked; seeds rough.—Native of the Island of Bourbon.

Var. α; leaves broader, oblong. Bory. l. c.

Var. β; leaves narrower, linear. Bory. l. c.

Bourbon Hound's-tongue. Pl.?

45 C. Lime'nse (Willd. spec. 1. p. 762. Lehm. asper. p. 177.) leaves oblong, acuminated, sessile, glabrous. ♂.? G. Native of Peru, in the valley called Ylo, near Lima. Poir. suppl. 2. p. 432. Cynogl. foliis nervosis acutissimis, Feuille, per. 1. p. 71. t. 49. Plant pale green. Racemes terminal, simple. Calyx glabrous, with ovate, acute segments. Corolla having the margin white, and the centre blue. Carpels tubercled.

Lima Hound's-tongue. Pl. 1 to 1½ foot.

46 C. Valenti'num (Lag. gen. et spec. nov. p. 10. no. 133.) leaves narrow-linear, hairy: cauline ones sessile; calycine segments ovate; spikes or racemes bractless. ♂.? H. Native of Spain, in Valentia, Cavanilles. Plant herbaceous, with the habit of *Anchùsa angustifòlia*.

Valentia Hound's-tongue. Pl.

47 C. Lusita'nicum (Lin. spec. 193. exclusive of the synonymes.) leaves linear-lanceolate, scabrous.—According to Hoffmansegg and Link, the plant named *C. Lusitánicum*, by Linnæus,

is not a native of Portugal, but of Siberia, according to the Linnean herbarium. See Schrad. new. journ. bot. p. 183. If the plant should prove distinct, it is undoubtedly referrible to the genus *Omphalòdes*.

Portugal Hound's-tongue. Pl.

48 C. pellu'cidum (Lapeyr. abr. suppl. p. 28.) lower leaves on long petioles: cauline and rameal ones half stem-clasping; all lanceolate and acute; calyxes pellucid; peduncles axillary, elongated; flowers secund. ♂. H. Native of the Pyrenees. Stem erect, simple, furnished with a few white hairs. Cauline leaves ciliated, diaphanous, furnished with some callous warts. Peduncles naked, or furnished with leaves. Calycine segments spatulate. Corolla blue, almost inclosed in the calyx. Carpels prickly.

Pellucid Hound's-tongue. Pl. 2 to 3 feet.

49 C. holoseríceum (Stev. in act. mosq. p. 12.) clothed with silky tomentum; leaves oblong-lanceolate; racemes terminal, simple; flowers drooping; segments of corolla blunt. ♃. H. Native of Caucasus, on the tops of the alps of Chinalug and Wander. Corolla rose-colour. Carpels muricate.

Silky Hound's-tongue. Fl. June, Aug. Clt. 1821. Pl. 2 feet?.

50 C. Baicale'nse (Willd. herb. ex Rœm. et Schultes, syst. 4. p. 764.) leaves spatulate, hispid; racemes of flowers capitate; stamens longer than the corolla. ♃?. H. Native of Siberia, at Lake Baical. Stem a little longer than the radical leaves, which are obtuse and petiolate, furnished with 4-5 sessile leaves. Calyx densely woolly. Corolla tubular, hardly longer than the calyx. Stamens filiform. Carpels marginate, inclosed in the calyx. Perhaps a species of *Rindèra* or *Máttia*.

Baical Hound's-tongue. Pl. ½ foot.

51 C. rugòsum (Sestini, in Willd. herb. ex Rœm. et Schultes, syst. 4. p. 764.) leaves lanceolate, strigose; carpels rugose from impressed dots.—Native of Galatia, Sestini.

Rugose-fruited Hound's-tongue. Pl.

Cult. All the species are coarse growing plants, but the flowers of some of them are very pretty. They are of the most easy culture, growing in any soil or situation. They are generally increased by seed, which should be sown in spring in the open border. The greater number of the species are biennial, and none are perhaps truly perennial.

XXXIV. ASPERU'GO (from *asper*, rough; from the asperity of the whole plant.) Tourn. inst. t. 54. Lin. gen. no. 189. Schreb. gen. no. 249. Juss. gen. p. 131. Lam. ill. no. 264. t. 94. Schkuhr, handb. t. 31. Lehm. asper. p. 208. Schrad. comm. asper. f. 9.

Lin. syst. *Pentándria, Monogýnia.* Calyx compressed in the fruit-bearing state, with plano-parallel, sinuately-toothed segments. Corolla funnel-shaped; throat closed by vaulted processes. Carpels 4, 1-celled, ovate, compressed, smooth, glabrous, not perforated at the base, fixed to the central column, which is 4 winged.—An annual, rough, procumbent plant: with nearly opposite, distant, oblong, obtuse leaves; and lateral, usually solitary, small blue flowers, on short pedicels.

1. A. procu'mbens (Lin. fl. lapp. 778. spec. 198.) ☉. H. Native throughout Europe and Siberia, by way-sides, hedges, and on walls, and among rubbish. In Britain, at Wangford, near Brandon, and about Newmarket church; also in Durham, as well as in Scotland, about Dunbar and near Edinburgh. Hall. helv. no. 606. All. ped. 1. no. 171. Roth. tent. fl. germ. 2. p. 217. Willd. spec. 1. p. 778. Smith, fl. græc. t. 177. engl. bot. t. 661. Œder, fl. dan. t. 552. Fl. Bat. t. 152. Bieb. cauc. 1. p. 134. Ledeb. fl. alt. 1. p. 192. Wahl. fl. lapp. p. 57. Lapeyr. abr. p. 89. Baumg. fl. trans. 1. p. 128. A. vulgàris, Tourn. inst. p. 135.—Mor. hist. 3. sect. 11. t. 26. t. 13.—Column. ecphr. p. 183. f. 2. Stem branched, tetragonal, beset with small hooked spines or bristles. Leaves alternate, but nevertheless nearly opposite, attenuated at the base, beset with hispid pili on both surfaces, having the margin and midrib furnished with hooked hairs. Corolla with a cylindrical white tube; and obovate, roundish, blue segments. Calyx hairy, terete when in flower, deeply 5-cleft; with lanceolate, distant segments, intersected by teeth.

Procumbent German Madwort, or Great Goose-grass. Fl. April, May. Britain. Pl. procumbent.

Cult. This is a weed-like, rough plant, of no beauty. The seeds only require to be sown in the open border.

Tribe V.

HELIOTRO'PEÆ (this tribe contains plants agreeing with *Heliotròpium* in the characters indicated below.) D. Don, in edinb. phil. journ. Corolla salver-shaped, or funnel-shaped, having the throat naked or bearded, and the limb plicate. Carpels 4, 1-celled, combined into a single fruit, closed at the base, not perforated, without any manifest torus or receptacle.

XXXV. HELIOTRO'PIUM (from ἡλιος, *helios*, the sun; and τροπη, *trope*, a turning; the spikes of flowers are circinnate, and face outwardly.) Tourn. inst. t. 57. Lin. gen. no. 179. Schreb. gen. no. 239. Juss. gen. p. 130. ed. Usteri. p. 145. Lam. ill. no. 253. t. 91. Gærtn. fruct. 1. p. 423. t. 68. f. 2. Schkuhr, handb. t. 29. Lehm. asper. p. 19.

Lin. syst. *Pentándria, Monogýnia.* Corolla salver-shaped; throat usually naked, but in some bearded; segments of the limb furnished with a simple plicature, or a tooth between each. Stigma sub-conical. Carpels 4, 1-celled, combined, closed at the base, without any manifest receptacle.—Strigose, annual, or shrubby plants with alternate leaves, and circinnate, secund spikes of small blue or white flowers.

Sect. I. Gyróstachys (from γυρος, *gyros*, curved or bent; and σταχυς, *stachys*, a spike; in reference to the spikes being spirally revolute.) Spikes of flowers bractless, spirally revolute in the young state.

1 H. amplexicau'le (Vahl. symb. 3. p. 31.) stem shrubby; leaves half stem-clasping, lanceolate, obtuse, obsoletely repand, rather canescent; spikes terminal, aggregate; tube of corolla twice as long as the calyx. ♄. S. Native of Brazil. Willd. spec. 1. p. 740. Lehm. asper. p. 25. Habit of *H. Peruviànum*. Branches pilosely tomentose. Leaves 2 inches long, greenish grey. Peduncles pilose, 2 or 3 times forked. Corollas large.

Stem-clasping-leaved Heliotrope, or Turnsole. Shrub 1 to 3 feet.

2 H. Peruvia'num (Lin. spec. p. 187.) stem shrubby; leaves petiolate, oblong-lanceolate, wrinkled, repand; spikes terminal, branched; tube of corolla hardly the length of the calyx. ♄. G. Native of Peru. Ruiz. et Pav. fl. per. 2. p. 2. no. 1. Willd. spec. 1. p. 740. Lehm. asper. p. 26. Curt. bot. mag. t. 141. Mill. fig. t. 144. H. odoràtum, Mœnch. meth. 415. Stems hairy. Leaves clothed with soft hairs above, and somewhat canescent beneath. Spikes by threes and fours rarely compound. Flowers sweet-scented, smelling like vanilla. Corolla intersected by 5 plicatures of a purple-lilac colour, with a greenish throat.

Var. β, *hýbridum;* flowers larger. This hybrid was raised from seed by Mr. More, of the King's Road, London.

Peruvian Heliotrope, or Turnsole. Fl. May. Sept. Clt. 1757. Shrub 1 to 2 feet.

FIG. 37.

3 H. corymbòsum (Ruiz. et Pav. fl. per. 2. p. 2. no. 1. t. 107. f. a.) stem shrubby; leaves oblong-lanceolate, attenuated at the base, acute, deflexed; spikes collected into corymbs; tube of corolla twice as long as the calyx. ♄. G. Native of Peru. Bonpl. malm. t. 32. Sims bot. mag. t. 1609. H. grandiflòrum, Schrank, hort. mon. fasc. 1. p. 2. t. 2. Branches downy. Leaves white from hairs beneath, and downy above, but in the cultivated plant they are hairy on both surfaces, and not white beneath. Corolla of a lilac-purple colour, with 5 plicatures, and greenish throat.

Corymbose-flowered Heliotrope, or Turnsole. Fl. May, Sept. Clt. 1808. Shrub 2 to 6 feet.

4 H. oppositifòlium (Ruiz. et Pav. fl. per. 2. p. 2. no. 2. t. 108. f. b.) stem shrubby; leaves broad-ovate, acute, quite entire, clothed with retrograde asperities; spikes dichotomously corymbose. ♄. G. Native of Peru, in arid places in Muna. Lehm. asper. p. 28. Plant densely hispid. Branches clothed with rusty tomentum. Calyx small. Corollas white, hispid outside, twice as long as the calyx.

Opposite-leaved Turnsole. Shrub 3 to 6 feet.

5 H. inca'num (Ruiz. et Pav. fl. per. 2. p. 2. no. 4. t. 108. f. a.) stem shrubby; leaves thick, ovate, acute, crenulated, very much wrinkled above, and lined with retrograde asperities, but softer and hoary beneath; spikes dichotomously corymbose. ♄. G. Native of Peru, at Huanuca, on arid hills. Lehm. asper. p. 29. Branches villous, hoary. Peduncles hairy. Calyx villous. Corolla white, twice as long as the calyx, rather hispid outside. Carpels wrinkled.

Hoary Turnsole. Shrub 2 to 3 feet.

6 H. viridiflòrum (Lehm. asper. p. 30.) stem shrubby, erect, rather hispid; leaves thickish, petiolate, ovate, quite entire, rather scabrous above, and velvety beneath; peduncles bifid, divaricate; spikes terminal, sub-corymbose. ♄. S. Native of the East Indies. Lithospérmum viridiflòrum, Roxb. Calyx hispid. Corolla green, nearly twice as long as the calyx, densely clothed with hairs outside.

Green-flowered Turnsole. Shrub

7 H. lanceola'tum (Ruiz. et Pav. fl. per. 2. p. 4. no. 9. t. 111. f. a.) stem shrubby, erect; leaves on short petioles, lanceolate, wrinkled, rough; spikes terminal, dichotomously corymbose. ♄. G. Native of Peru, in the groves of Pillao and Huanaco. Lehm. asper. p. 31. Plant hispid. Corolla twice as long as the calyx, pale blue.

Lanceolate-leaved Turnsole. Shrub

8 H. citrifòlium (Lehm. asper. p. 32.) stem shrubby, erect, glabrous; leaves thick, petiolate, oblong, glabrous, shining above; spikes terminal, aggregate, disposed in sub-capitate corymbs. ♄. S. Native of South America. Corolla twice or thrice as long as the calyx, hairy outside.

Citron-leaved Turnsole, or Heliotrope. Shrub.

9 H. latifòlium (Willd. herb. ex Lehm. asper. p. 33.) stem shrubby, erect, glabrous; leaves alternate, on very short petioles, ovate, acute, nearly glabrous, narrowed at the base, ciliated; spikes elongated, conjugate and solitary, terminal and lateral. ♄. S. Native of Cumana, in arid places. H. scorpioìdes, H. B. et Kunth, nov. gen. 3. p. 89. Stem branched, angular at top, beset with adpressed hairs. Leaves nearly opposite and alternate, green above and paler beneath, beset with adpressed hairs. Peduncles and calyxes hispid. Corollas small, white. Carpels roundish, scabrous.

Broad-leaved Heliotrope, or Turnsole. Shrub 1 to 1½ foot.

10 H. stenophy'llum (Hook. et Arn. in Beech. voy. pt. bot. p. 38.) shrubby, densely leafy; leaves in fascicles, very narrow-linear, fleshy, obtuse, with revolute edges, scabrous from short strigæ; spikes conjugate, bractless, hardly longer than the superior leaves. ♄. F. Native of Chili, about Coquimbo. Allied to *H. Curassávicum*, but that has plane and somewhat spatulate, glaucous leaves, and is quite glabrous.

Narrow-leaved Heliotrope or Turnsole. Shrub.

11 H. Curassa'vicum (Lin. spec. 188.) stem herbaceous; leaves nearly opposite and alternate, narrow-lanceolate, or oblong-lanceolate, obsoletely veined, glabrous, glaucous; spikes conjugate, compound, or solitary. ⊙. H. Native of South America, by the sea-side; Sandwich Islands; North America, on the sandy banks of the great salt river, and similar situations on those of the Arkansas.—Forsk. fl. arab. p. 38. Swartz. obs. bot. p. 56. Desf. fl. atl. 1. p. 153. Ruiz. et Pav. fl. per. 2. p. 4. no. 10. Horn. hort. hafn. 1 p. 172. Willd. enum. 1. p. 175. Lehm. asper. p. 34. H. glaucophýllum, Mœnch. meth. suppl. p. 147.—Sloane. hist. 1. t. 132. f. 3. —Mor. hist. 3. sect. 11. t. 31. f. 12. Plant quite glabrous, glaucous-green. Corolla a little longer than the calyx, white, with a yellowish-green bottom. Carpels ovate, rugose.

Var. β, *chenopodioìdes* (Lehm. l. c.) leaves lanceolate, spatulate, glaucous, glabrous, obsoletely veined, opposite and alternate; spikes conjugate. ⊙. H. H. chenopodioìdes, Humb. et Bonp. ex Horn. hort. hafn. 2. p. 956. Willd. enum. 1. p. 175.—Pluk. alm. t. 36. f. 3.—Herm. par. bat. t. 138.

Curaçoa Heliotrope, or Turnsole. Fl. June, July. Clt. 1731, β, 1823. Pl. procumbent, or ½ to 1 foot.

12 H. cane'scens (H. B. et Kunth, nov. gen. amer. 3. p. 88.) erect, clothed with adpressed villi; leaves obovate, obtuse; spikes terminal and lateral, by threes. ♃. S. Native near Cumana, Bordones, and Cumanacoa, in woody places. Plant canescent. Leaves having the veins and nerves prominent beneath. Spikes woolly. Corolla white. Very nearly allied to *H. Coromandelìana*, Retz.

Canescent Turnsole, or Heliotrope. Pl. erect.

13 H. cine'reum (H. B. et Kunth, nov. gen. amer. 3. p. 89. t. 206.) erect?, clothed with spreading villi; leaves petiolate, obovate, obtuse; spikes terminal and lateral by threes, bractless. ♃. S. Native on the banks of the river Apures, near Arichuna. Stem branched. Branches and leaves white from villi. Calyx hispid, unequal. Corollas small, white. Fruit hispid.

Grey Turnsole, or Heliotrope. Pl. erect?

14 H. Partibilce'nse (H. B. et Kunth, l. c. p. 87.) erect?; leaves oblong-lanceolate, acute, hispid from pili on both surfaces; spikes terminal and lateral, solitary or twin. ♃. S. Native on the shores of the Pacific Ocean, between Santa and Partibilca. Stem and branches hispid. Calyx sub-strigose. Corolla pilose outside. Fruit bipartible, scabrous.

Partibilca Turnsole or Heliotrope. Pl. erect.

15 H. lana'tum (H. B. et Kunth, l. c. p. 89.) shrubby, clothed with white wool; leaves ovate, acute, nearly sessile; peduncles lateral, dichotomously multifid, of many spikes. ♄. S. Native of New Granada, near Loxa and Gonzanama, on the eastern declivities of the Andes, at the altitude of 1000 hexapods. H. argénteum, Willd. herb. ex Lehm. asper. p. 73. Corollas unknown. Perhaps a species of *Tournefórtia*.

Woolly Turnsole, or Heliotrope. Shrub

16 H. coria'ceum (Lehm. pug. 1. p. 20.) stems shrubby, erect; leaves petiolate, broad-lanceolate, acute, scabrous, canescent beneath, coriaceous; spikes terminal, aggregate; tube of corolla 3 times longer than the calyx. ♄. G. Native of Mexico. Stem branched. Spikes sub-corymbose, many-flowered; flowers sessile, secund, aggregate. Calycine segments linear. Corolla lilac. Segments roundish, obtuse. Carpels 4, oblong, wrinkled.

Coriaceous-leaved Heliotrope. Shrub

17 H. linifòlium (Lehm. in act. soc. scrut. hal. 3. p. 8.) stems shrubby, panicled, glabrous; leaves linear, nearly glabrous; spikes racemose, solitary, filiform, lateral and terminal, elongated; flowers distant, pedicellate. ♄. G. Native of the Cape of Good Hope. Myosòtis fruticòsa, Lin. mant. p. 201. Willd. spec. 1. p. 748. Lam. ill. 1. p. 395. no. 1773. Lehm. asper. p. 35. Leaves glaucous green, beset with minute, incumbent strigæ on both surfaces. Corolla white, twice or thrice longer than the calyx. Fruit hispid. This differs from *H. Zeylánicum*, particularly in the stem and leaves being nearly glabrous, and in the flowers being pedicellate.

Flax-leaved Heliotrope, or Turnsole. Fl. June, Sept. Clt. 1815. Shrub 1 to 2 feet.

18 H. Zeyla'nicum (Lam. dict. 3. p. 94. ill. p. 393. no. 1762.) stem shrubby, branched, pilose; leaves linear, scabrous above and villous beneath; spikes terminal, filiform, solitary, elongated; flowers sessile. ♄. S. Native of Ceylon and Arabia Felix. Willd. spec. 1. p. 744. Lehm. asper. p. 37. H. Curassávicum, *β*, Zeylánicum, Burm. ind. p. 41. t. 16. f. 2. H. fruticòsum, Forsk. descr. p. 38. Flowers small, white.

Ceylon Turnsole. Fl. July, Aug. Clt. 1818. Shrub 1 foot.

19 H. Willdenòwii; stem shrubby, erect; leaves lanceolate, narrowed at the base, mucronate at the apex, clothed with strigose down, hoary while young; spikes conjugate, or by threes, axillary. ♄. S. Native of Brazil. H. canéscens, Willd. herb. ex Lehm. asper. p. 38. but not of Kunth. Stem strigose above; young branches hoary. Corollas small, white. Carpels rather hispid.

Willdenow's Heliotrope, or Turnsole. Shrub.

20 H. inunda'tum (Swartz, prod. p. 40. fl. ind. occ. 1. p. 343.) stem frutescent; leaves oblong, obtuse, canescent from hairs; spikes terminal, erect, by fours. ♄. S. Native of the West Indies, Mexico, and Brazil, along the sea-shore. Willd. spec. 1. p. 741. Lehm. asper. p. 39. H. procúmbens, Lehm. H. canéscens, Willd. and H. cinèreum, Willd. are said to be the same, ex Cham. in Linnæa, 4. p. 456. Stem and branches canescent from adpressed villi. Spikes sessile. Flowers white?

Inundated Turnsole, or Heliotrope. Shrub.

21 H. decu'mbens (Lehm. in act. nat. scrut. hal. 3. p. 16.) stem shrubby, decumbent; leaves elliptic, roundish-obovate, obtuse, strigose; spikes filiform, solitary, conjugate, or by threes, lateral or terminal. ♄. S. Native of Cumana, Bardones, and Cumanocoa, in woody places, where it is called *Rava de Alaras*. Lehm. asper. p. 39. H. procúmbens, H. B. et Kunth, nov. gen. amer. 3. p. 88. Stem and branches beset with incumbent hairs at top, as well as the leaves. Calyx unequal. Flowers small, white, much crowded. Carpels rugose, hispid.

Decumbent Heliotrope, or Turnsole. Shrub decumbent.

22 H. gra'cile (R. Br. prod. p. 493.) stem erect; leaves oblong-lanceolate, flat, acutish, greyish on both surfaces from adpressed hairs; spikes conjugate or solitary; calyxes unequal. ♄. S. Native of New Holland, and of Brazil, on the sea-shore. Lehm. asper. p. 40. The var. *β*, depréssum, Cham. in Linnæa, 4. p. 457. a native of Brazil, may be a distinct species. Stem decumbent.

Slender Turnsole, or Heliotrope. Shrub erect.

23 H. syenìtes (Spreng. syst. 1. p. 539.) stem shrubby, branched, very villous; leaves ovate-oblong, attenuated at both ends, entire, villous, on long petioles; spikes conjugate, lateral; tube of corolla equal in length to the calyx. ♄. F. Native of Upper Egypt. H. villòsum, Sieb. H. cinèreum, R. Br. H. Kúnzii, Lehm.

Syenite Heliotrope. Shrub.

24 H. pilòsum (Ruiz. et Pav. fl. per. 2. p. 3. no. 7. t. 110. f. a.) stem suffruticose, procumbent; leaves broad-lanceolate, pubescently pilose; spikes short, usually by fours. ♄. G. Native of Peru, on arid hills about Lima. Lehm. asper. p. 41. Plant canescent. Spikes lateral and terminal. Calyxes unequal. Corolla white; tube pilose outside, longer than calyx. Fruit hispid.

Pilose Turnsole, or Heliotrope. Pl. procumbent.

25 H. microca'lyx (Ruiz. et Pav. fl. per. 2. p. 3. no. 5. t. 109. f. b.) stem shrubby, erect; leaves oblong-lanceolate, subacuminated; spikes dichotomous, opposite the leaves; calyx small, 5-toothed. ♄. G. Native of Peru, on hills. Lehm. asper. p. 42. Plant very downy. Corolla white, twice as long as the calyx.

Small-calyxed Turnsole, or Heliotrope. Shrub erect.

26 H. hu'mile (Lam. ill. p. 393. no. 1757. Lehm. in act. nat. scrut. hal. 3. p. 11.) stem suffruticose, depressed; leaves petiolate, lanceolate-ovate, acute, repand, villous; spikes solitary, lateral, pedunculate. ♄. S. Native of the West Indies. Lehm. asper. p. 43. Branches pilose. Leaves green above, and paler beneath. Flowers crowded. Corolla white; tube length of calyx. Nut rugose from numerous dots.

Humble Turnsole, or Heliotrope. Fl. May, June. Clt. 1752. Shrub 1 foot.

27 H. parviflòrum (Lin. mant. p. 201.) stem herbaceous, erect; leaves opposite, petiolate, oblong-ovate, hairy; spikes solitary and conjugate; flowers small. ⊙. S. Native of the East Indies, and of the West Indies, in St. Thomas, by waysides. Willd. spec. 1. p. 741. enum. 1. p. 174. Horn. hort. hafn. 1. p. 172. H. angiospérmum, Murr. prod. goett. p. 217. —Dill. elth. p. 178. t. 146. f. 175. Stem pilose. Lateral spikes usually solitary: terminal ones conjugate. Calyxes unequal. Corollas small, a little longer than the calyx; tube green, ventricose; limb white; segments intersected by plicæ; throat pilose. Carpels rugose and hispid.

Small-flowered Turnsole, or Heliotrope. Fl. July, Sept. Clt. 1732. Pl. 1½ foot.

28 H. Coromandelia'na (Retz. obs. 2. p. 9. Vahl. symb. 1. p. 13.) stems herbaceous, prostrate; leaves petiolate, obovate-oblong, canescent from incumbent hairs; spikes solitary or conjugate, lateral or terminal; calyxes unequal. ⊙. S. Native of Coromandel and Bengal. Willd. spec. 1. p. 743. Lehm. asper. p. 46. Roxb. in Wall. fl. ind. 2. p. 2. Root simple, woody. Stems many from the same root, at first prostrate, then ascending, grey from adpressed hairs. Spikes and calyxes pilose. Corolla white, pilose outside; tube longer than the calyx.

Var. β, ovalifòlium (Lehm. asper. p. 47.) leaves oval, villous, silky; spikes conjugate and simple; calyxes unequal; stigma nearly sessile, bearded at apex; stem erect or decumbent. ⊙. H. Native of Arabia Felix, and New Holland, within the tropic. H. ovalifòlium, Forsk. descrip. p. 38. R. Br. prod. p. 493. This variety differs from the species in its larger stature; in the branches and leaves being densely villous and silky; and in the carpels being pilose. Perhaps a distinct species.

Coromandel Turnsole, or Heliotrope. Fl. July, Nov. Clt. 1812. Pl. prostrate.

29 H. Cape'nse (Swartz, in litt. Lehm. in act. nat. scrut. hal. 3. p. 13, asper. p. 50.) stem herbaceous, erect, branched; leaves

ovate-roundish, plicate, strigose above, and rather tomentose beneath; spikes pedunculate, solitary, and conjugate; calyx closed, with 5 short connivent segments, falling off in the fruit-bearing state. ⊙. H. Native of the Cape of Good Hope. Plant hoary and downy. Leaves undulately plicate. Spikes axillary. Carpels large, wrinkled, glabrous.

Cape Turnsole. Fl. June, July. Clt. 1824. Pl. 1 to 2 feet.

30 H. EUROPÆ'UM (Lin. spec. p. 187. hort. ups. p. 33.) stem herbaceous, erect; leaves ovate, flat, lined, finely tomentose; lateral spikes solitary: terminal ones conjugate; calyx stellately spreading in the fruit-bearing state. ⊙. H. Native of the South of Europe, and in the regions of Caucasus. Gmel. sib. 4. p. 74. no. 11. Scop. fl. carn. ed. 2d. vol. 1. p. 120. Poll. pal. 1. p. 177. All. ped. 1. no. 187. Vill. dauph. 2. p. 450. Jacq. fl. austr. 3. p. 4. t. 207. Sabb. hort. rom. 2. t. 33. Regn. bot. 1. t. 32. Roth. tent. fl. germ. 2. p. 211. Sut. fl. helv. 1. p. 101. Bieb. fl. cauc. 1. p. 118. Lapeyr. fl. pyr. p. 84. Baumg. fl. trans. 1. p. 115. Hoffm. et Link. fl. port. 1. p. 166. D. C. fl. fr. no. 2705. H. supìnum, Pall. ind. taur. H. canéscens, Mœnch. meth. p. 415. H. eréctum, Lam. fl. fr. 2. p. 281.—Hall. helv. no. 593.—Plenck. off. t. 74.—Mor. hist. 3. sect. 11. t. 31. f. 7. Tourn. inst. p. 139. Stem grey from villi. Leaves smoothish above, canescent, obtuse or terminated by a small acumen. Corolla white, plicate above, intersected by 5 teeth. Stigma bifid at top. Carpels rugose, warted.

Var. β; flowers larger, sweet-scented. ⊙. H. Native of Caucasus, Tauria, and Switzerland. Bieb. fl. cauc. 1. p. 118. Suter, l. c. Haller, l. c. H. Europæ'um, Pall. ind. taur.

European Turnsole, or Heliotrope. Fl. June, Oct. Clt. 1562. Pl. ¼ to ½ foot.

31 H. OBLONGIFÒLIUM (Link. enum. 1. p. 163.) leaves petiolate, oblong, obtuse, quite entire, rough, beset with scattered hairs. ⊙. H. Native of the South of Europe. Very like *H. Europæ'um*, and hardly distinct. Corolla white.

Oblong-leaved Heliotrope, or Turnsole. Fl. June, Oct. Clt. 1824. Pl. ½ to 1 foot.

32 H. ÆGYPTI'ACUM (Lehm. in. sem. hort. hamb. 1820. p. 8.) stem erect, branched, soft, downy, pale green; branches spreading; leaves elliptic, or ovate, quite entire, clothed with fine tomentum; spikes terminal, much branched. ⊙. H. Native of Egypt. H. pállens, Cailliaud voy. pl. meroe. no 55. t. 3. f. 4. Habit of *H. Europæ'um* and *H. suavèolens*, but differs in the much greater stature. Corollas large, white. Nuts glabrous, reticulated, scabrous, ex Cailliaud.

Egyptian Heliotrope. Fl. June, July. Clt.? Pl.

33 H. COMMUTA'TUM (Rœm. et Schultes. syst. 4. p. 29.) leaves ovate, wrinkled, petiolate; corolline segments obtuse. ⊙. H. Native of Galicia. H. hùmile, Schultes, obs. bot. p. 27. This is much smaller than *H. Europæ'um*, but otherwise much like it.

Changed Turnsole. Fl. June, Oct. Clt. 1800. Pl. ¼ foot.

34 H. VILLÒSUM (Willd. spec. 1. p. 744.) stem herbaceous, erect, very villous; leaves ovate, flat, villous; spikes lateral and terminal, solitary and conjugate; corollas large; calyx spreading in the fruit-bearing state. ⊙. H. Native of the Islands in the Archipelago. Desf. ann. mus. 10. p. 427. t. 33. Lehm. asper. p. 53. H. hirsutíssimum, Weber, pl. kil. 1783. no. 1. Heliotr. màjus, flore magno inodoro, Tourn. cor. inst. p. 7. Habit of *H. Europæ'um*. Plant densely villous; hairs yellowish. Corollas large, white, with a yellow throat, densely villous outside. Fruit wrinkled, glabrous.

Villous Turnsole, or Heliotrope. Pl. 2 feet.

35 H. BOCCÒNI (Guss. sem. hort. Bocc. 1825. ex Linnæa, 4. p. 37.) perhaps the same as *H. suavèolens*, from Buccone's synonymes, but in Gussone's the leaves and calyxes are tomentose. ⊙. H. Native of the South of Europe. Calyxes not subulate, nor the stem less divaricate, and the seeds smaller than in *H. Europæ'um*.

Boccone's Heliotrope or Turnsole. Pl. ½ foot.

36 H. OBOVA'TUM (Roxb. mss. ex D. Don. prod. fl. nep. p. 101.) herbaceous; stem decumbent, divided; leaves obovate, petiolate, nerveless, flat, silky on both surfaces; spikes conjugate; calyx shorter than the tube of the corolla. ⊙. H. Native of Nipaul, towards the banks of the river Morshidabad.

Obovate-leaved Turnsole, or Heliotrope. Fl. May, June. Clt. 1825. Pl. decumbent.

37 H. GLANDULÒSUM (R. Br. prod. p. 493.) stem suffruticose; leaves oval, obtuse, wrinkled, tomentose; spikes conjugate; calyx glandular. ♄. G. Native of New Holland, on the south coast.

Glandular-calyxed Turnsole, or Heliotrope. Shrub.

38 H. ERÒSUM (Lehm. in act. nat. scrut. hal. 3. p. 15. asper. p. 54.) stem suffruticose, decumbent; leaves oblong, obtuse, tapering into the petioles, erosely denticulated, beset with retrograde stiff hairs; spikes terminal, conjugate, rarely by threes. ♄. G. Native of Teneriffe. Plant canescent. Spikes compact. Peduncles and calyxes hairy. Corolla white; tube longer than the calyx, pilose; limb curled. Fruit glabrous.

Erose-leaved Heliotrope, or Turnsole. Shrub decumbent.

39 H. ERIOCA'RPUM (Delile, in litt. ex Lehm. asper. p. 55.) stem shrubby, erect, much branched, hoary; leaves sessile, ovate, villous, warted, with waved, repand, revolute margins; spikes conjugate. ♄. G. Native of Egypt. Lithospérmum dígynum, Forsk. fl. arab. descrip. p. 40. H. lineàtum, Delile, fl. ægypt. p. 37. t. 16. f. 2. but not of Vahl. Branches dichotomously divided, hoary, tomentose at top, spinescent and naked in summer. Leaves canescent. Spikes sessile, terminal. Calyx villous. Corolla glabrous, red?; tube ventricose above. Carpels hoary from very long villi.

Hairy-fruited Turnsole, or Heliotrope. Shrub.

40 H. UNDULA'TUM (Vahl. symb. 1. p. 13.) stem shrubby, procumbent; leaves lanceolate, hispid, with undulately curled margins; spikes conjugate, axillary and terminal. ♄. G. Native of Egypt, in sandy places. Willd. spec. 1. p. 743. H. críspum, Desf. fl. atl. 1. p. 151. t. 41. Lithospérmum híspidum, Forsk. descr. p. 38. no. 24. Branches grey from short tomentum. Leaves rather cinereous. Calyx pilose. Corolla small, white, pilose outside, longer than the calyx, with teeth-formed plicæ between the segments of the limb. Carpels clothed with white villi.

Undulated-leaved Turnsole, or Heliotrope. Fl. July, Aug. Clt. 1820. Shrub procumbent.

41 H. LINEA'TUM (Vahl. symb. 1. p. 13.) stem shrubby, procumbent; leaves petiolate, elliptic, villous, flat, with revolute margins; spikes conjugate, bracteolate, lateral and terminal. ♄. G. Native of Egypt. Willd. spec. 1. p. 743. Lehm. asper. p. 58. Lithospérmum heliotropioìdes, Forsk, descr. p. 39. no. 25. Branches villous, tomentose above. Bracteas linear, acute. Calyx villous. Corolla glabrous, longer than the calyx, having teeth between the segments of the limb. Carpels villous. Stigma entire.

Lined-leaved Turnsole, or Heliotrope. Shrub procumbent.

42 H. ASPE'RRIMUM (R. Br. prod. p. 493.) plant strigose, very rough; spikes capitate; leaves oblong, obtuse, sessile, with revolute, undulated margins; stem erect. ♄?. G. Native of New Holland, on the south coast. Lehm. asper. p. 56.

Very-rough Turnsole, or Heliotrope. Pl. erect.

43 H. MOROCCA'NUM (Lehm. asper. p. 56.) stem shrubby,

erect, strict; leaves lanceolate, beset with incumbent hairs, with undulated, revolute margins; spikes conjugate and compound, lateral and terminal. ♄. G. Native of the kingdom of Morocco. Stem hispid. Branches beset with incumbent pili, as well as the leaves, rather hispid. Spikes at first horizontal. Calyx grey, hispid, with ciliated segments. Corolla large; tube nearly twice as long as the calyx, beset with white hairs above; limb undulately curled. Carpels wrinkled, glabrous. Nearly allied to *H. undulàtum*.

Morocco Turnsole, or Heliotrope. Fl. June, July. Clt. 1823. Shrub 1 to 2 feet.

44 H. Ambaine'nse (Fres. fl. egypt. et arab. p. 168.) plant clothed with glandular hairs; stem shrubby at the base, branched, clothed with canescent villi; leaves petiolate, ovate-lanceolate, pilose, with undulated margins; spikes almost solitary, bractless, spiral while young; tube of corolla twice as long as the calyx. ♄. G. Native of Arabia, at Thal Ambain.

Ambain Heliotrope, or Turnsole. Shrub.

Sect. II. Orthóstachys (from *ορθος, orthos,* straight; and *σταχυς, stachys,* a spike; the spikes of flowers are straight at first, not circinnate or revolute as in the preceding section.) R. Br. prod. p. 493. Spikes generally solitary, bracteate or leafy, not spiral or circinnate in the young state. Bracteas opposite the flowers, or nearly so.

45 H. brevifòlium (Wall. fl. ind. 2. p. 2.) plant suffruticose, covered with adpressed greyish hairs; stems prostrate, densely tufted; leaves approximate, sessile, narrow-linear, somewhat falcate, with recurved margins, canescent; racemes solitary, terminal, slender, straight: with short, ovate bracteas, opposite to, and equalling the pedicels, linear; calyx and nuts strigose. ♂?. F. Native of Nipaul, in the vicinity of Katmandu and Gosainsthan. H. compáctum, D. Don, prod. fl. nep. p. 101. Plant greyish. Racemes at first slightly recurved. Corolla white, twice as long as the calyx, with a yellow tube; limb plicate; segments slightly crenulated.

Short-leaved Turnsole, or Heliotrope. Fl. June, July. Clt. 1824. Pl. prostrate.

46 H. salicoìdes (Cham. in Linnæa, 4. p. 117.) plant shrubby, canescent from silky strigæ; branches terete, slender; leaves scattered, nearly sessile, oblong, ovate-lanceolate, acute, keeled from the nerve, with reflexed margins; spikes simple, terminal, revolute, sometimes lateral, and opposite the leaves, bracteolate, dense flowered; flowers sessile; calycine segments ovate, acute, nearly equal; tube of corolla equal in height to the calyx; limb strigose outside; carpels strigose, shorter than the calyx; anthers connivent and cohering at top. ♄. S. Native of Brazil. A small trailing or creeping shrub, with the habit of *Sàlix incubàcea*, and *S. rèpens*. Said to be nearly allied to *H. Ottònis* and *H. fruticòsum*.

Willow-like Heliotrope. Shrub creeping.

47 H. Ottònis (Lehm. asper. p. 59.) stem shrubby; leaves linear-lanceolate, erect, with revolute edges, canescent from somewhat silky, incumbent hairs, or strigæ; spikes solitary, terminal, elongated, bracteate. ♄. S. Native of Caraccas. H. stríctum, H. B. et Kunth, nov. gen. amer. 3. p. 87. Tournefórtia monostàchya, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 540. Stem branched at top. Carpels rather hispid. Branches linear, acuminated, hispid. Calyxes unequal.

Otto's Heliotrope. Shrub 1½ foot.

48 H. fruticòsum (Lin. spec. p. 187. amœn. 4. p. 394.) stem shrubby; leaves linear-lanceolate, pilose, recurved at apex; spikes lateral, nearly sessile, solitary, bracteolate. ♄. S. Native of South America. Lam. ill. no. 1766. Lehm. asper. p. 60. Tournefórtia hùmilis, Swartz. obs. bot. p. 55, exclusive of the syn. of Lin. Willd. spec. 1. p. 793. H. demíssum, Rœm. et Schultes, syst. 4. p. 27.—Plum. pl. amer. t. 227. f. 2.—Sloane, hist. t. 132. f. 4. Stem much branched; branches scabrous. Leaves with revolute edges, green above, and hoary beneath, from the hairs being more copious. Bracteas linear. Flowers on short pedicels. Peduncles and calyxes pilose. Corolla white. Stigma capitate. Carpels rather hispid.

Shrubby Heliotrope. Shrub 2 feet.

49 H. terna'tum (Vahl. symb. 3. p. 21.) stem shrubby; leaves lanceolate, 3 in a whorl, those on the younger branches alternate, hoary beneath; spikes terminal, pedunculate, conjugate; bracteas linear. ♄. S. Native of the West Indies. Willd. spec. 1. p. 745. Lehm. asper. p. 61. Branches canescent from soft hairs. Leaves beset with white callous dots above. Lateral spikes, if any, usually simple. Flowers on short pedicels. Calyx pilose. Corolla white, large; tube longer than the calyx, pilose above; limb plicate.

Ternate-leaved Heliotrope. Shrub.

50 H. hírtum (Willd. herb. no. 3247. Lehm. in act. nat. scrut. hal. 3. p. 10. asper. p. 62.) stem shrubby, hairy; leaves linear-lanceolate, hairy, hoary beneath, rather soft; spikes lateral and terminal, solitary, bracteolate. ♄. S. Native of Cumana, and New Andalusia, and Brazil, in sandy places. H. híspidum, H. B. et Kunth, nov. gen. amer. 3. p. 87. Branches canescent, pilose. Leaves with revolute edges. Spikes compact. Bracteas minute. Calyx hairy; tube of corolla longer than the calyx, villous under the limb. Carpels rather hispid.

Hairy Heliotrope. Shrub.

51 H. polyphy'llum (Lehm. l. c. p. 9. asper. p. 63.) stem shrubby, erect, or prostrate; leaves linear-lanceolate, strigosely pilose; spikes terminal, solitary, leafy, recurved at top. ♄. S. Native about the Orinoco, and of Brazil. Cham. in Linnæa, 4. p. 462. H. foliòsum, Willd. herb. no. 3252. Branches strigose, when young canescent. Leaves very numerous, on short petioles. Flowers nearly sessile, opposite the leaves or interfoliaceous. Calyx strigose, unequal. Tube of corolla length of calyx, rather pilose; segments acute, lanceolate. Carpels rather hispid.

Many-leaved Heliotrope. Shrub.

52 H. folia'tum (R. Br. prod. p. 493.) plant annual, strigose from decumbent hairs; branches ascending; leaves lanceolate, flat; spikes few-flowered; bracteas lanceolate, on short petioles, twice as long as the calyx. ⊙. H. Native of New Holland, within the tropic.

Leafy-spiked Heliotrope. Pl. ascending.

53 H. Africa'num (Schum. pl. guin. p. 87.) leaves ovate, acuminated at both ends, glabrous; spikes solitary; corollas 3 times longer than the calyx, with a narrow neck. ⊙. H. Native of Guinea. Stem procumbent, branched, pilose. Corollas pale blue.

African Heliotrope. Pl. erect.

54 H. strigòsum (Willd. spec. 1. p. 743. Pers. ench. 1. p. 743. Schum. pl. guin. 86.) stem shrubby, ascending; leaves linear-lanceolate, strigosely papillose; spikes leafy: lateral ones solitary: terminal ones conjugate. ♄. S. Native of Guinea. Lehm. asper. p. 64. Root fusiform. Stem covered with adpressed white hairs, branched. Leaves on short petioles, beset with white adpressed hairs on both surfaces, which rise from papillæ. Bracteas sessile, lanceolate, length of flowers, which are distant. Corolla white, with a tooth between each of the segments. Carpels strigose.

Strigose Heliotrope. Shrub ½ to 1 foot.

55 H. myosotoìdes (Lehm. in act. nat. scrut. hal. 3. p. 18. asper. p. 65.) stem frutescent, erect, purplish; leaves linear,

sessile, strigose; spikes solitary, bracteate; bracteas longer than the calyx. ♄. F. Native of the Levant. Habit of *Myosòtis*. Stem beset with adpressed, stiff hairs, as well as the calyx and pedicels. Young branches hoary from copious hairs. Leaves deep green. Spikes lateral and terminal. Flowers pedicellate. Carpels rather hispid.

Mouse-ear-like Heliotrope. Shrub erect.

56 H. Rottle'ri (Lehm. asper. p. 66.) stem shrubby, erect; leaves oval-lanceolate, hispid; spikes lateral and terminal, solitary; bracteas lanceolate, nearly the length of the calyx. ♄. S. Native of the East Indies. Root fusiform, woody, with horizontal fibres. Stems many from the same root, beset with small white hairs or strigæ. Flowers on short pedicels. Calyx hispid, length of the tube of the corolla. Corolla pilose outside. Carpels hispid when examined by a lens.

Rottler's Heliotrope. Shrub ½ to 1 foot.

57 H. thymifòlium (Vahl, in litt. ex Lehm. in act. nat. scrut. hal. 3. p. 17.) stem shrubby, depressed; leaves oblong, strigose; spikes solitary, terminal, elongated, leafy. ♄. S. Native country unknown. Lehm. asper. p. 67. Stem hispid at top; branches floriferous. Bracteas lanceolate, on short petioles, length of the cauline leaves. Calyx hispid, length of the tube of the corolla. Corolla small, downy outside. Nuts rather villous.

Thyme-leaved Heliotrope. Shrub depressed.

58 H. pauciflòrum (R. Br. prod. 493.) annual, erect, much branched, strigose; hairs decumbent; leaves lanceolate, linear, shorter than half an inch, with recurved margins; spikes few-flowered; bracteas linear, length of calyx, equalling the tube of the corolla, which is acutish. ⊙. H. Native of New Holland, within the tropic.

Few-flowered Heliotrope. Pl. erect.

59 H. Pe'rsicum (Lam. dict. 3. p. 94. ill. p. 393. no. 1761.) stem shrubby, branched; leaves linear-lanceolate, oblique, recurved, silky, hoary; spikes terminal, leafy. ♄. F. Native of Persia. Lehm. asper. p. 68. Heliotròpium Persicum incanum, floribus variegatis, Burm. fl. ind. p. 41. t. 19. f. 1. Branches grey from adpressed hairs. Leaves hoary from copious, prostrate hairs. Flowers on short pedicels. Carpels minute, rather hispid.

Persian Heliotrope. Shrub ½ to 1 foot.

60 H. fasciula'tum (R. Br. prod. p. 494.) suffruticose, much branched, strigose; hairs spreading; leaves linear, acute, sessile, with recurved margins, a line and a half long, in fascicles; flowers scattered. ♄. G. Native of New Holland, within the tropic.

Fascicled-leaved Heliotrope. Shrub.

61 H. Campechia'num (Willd. herb. ex Lehm. asper. p. 69. H. B. et Kunth, nov. gen. amer. 3. p. 86.) stem shrubby, branched, procumbent; leaves lanceolate, strigose, acute at both ends; spikes terminal, solitary, elongated, leafy; calyx subbilabiate, with unequal segments. ♄. or ♃. S. Native about Campeachy. Branches filiform, strigose. Lower flowers on short pedicels: upper ones sessile. Tube of corolla length of the larger calycine segments, pilose outside; segments acutish. Carpels hispid when examined by a lens.

Campeachy Heliotrope. Shrub procumbent.

62 H. bractea'tum (R. Br. prod. p. 493.) annual, strigose from decumbent hairs; branches erect; leaves lanceolate, flat; spikes few-flowered; bracteas lanceolate, nearly sessile, a little longer than the calyx. ⊙. H. Native of New Holland, within the tropic, on the sea-shore.

Bracteate-flowered Heliotrope. Pl. erect.

63 H. marifòlium (Retz. obs. 2. p. 8-9. no. 8.) stem fruticulose, procumbent, filiform; leaves petiolate, lanceolate, acute, pilose; spikes usually solitary; bracteas linear-lanceolate, shorter than the calyx. ♄. S. Native of India. Willd. spec. 1. p. 742. Lehm. asper. p. 70. Stem beset with incumbent hairs. Leaves figure of those of *Teùcrium Màrum*, but narrower and smaller. Flowers distant, on short pedicels. Nuts hispid, or prickly at the base.

Cat-thyme-leaved Heliotrope. Shrub procumbent.

64 H. sca'brum (Retz, obs. 2. p. 8. no. 7.) stem herbaceous, depressed, branched; leaves linear-lanceolate, oblique, strigose, with revolute edges; spikes solitary, lateral and terminal; bracteas lanceolate, longer than the calyx. ⊙. H. Native of India, in rice-fields. Lehm. asper. p. 70. Plant small. Root fusiform, simple. Stem nearly simple, strigose from adpressed hairs. Leaves nearly sessile: upper ones opposite. Flowers small, distant. Calyx hispid. Carpels villous at apex.

Var. β, hùmile (Lehm. asper. p. 71.) stem more humble and more branched. ⊙. H. Native of India, in waste places.

Scabrous Heliotrope. Pl. small.

65 H. ventricòsum (R. Br. prod. p. 494.) annual, erect, branched, strigose from rather spreading hairs; leaves linear, acute, with recurved margins; spikes many-flowered; bracteas equalling the acuminated calyxes; tube of corolla exserted near the top, and ventricose. ⊙. H. Native of New Holland, within the tropic, on the sea-shore.

Ventricose-flowered Heliotrope. Pl. erect.

66 H. panicula'tum (R. Br. prod. p. 494.) suffruticose, much branched, strigose from rather adpressed pili; leaves narrow-linear, with recurved margins; spikes alternate, panicled; bracteas shorter than the acute calyxes. ♄. S. Native of New Holland, within the tropic, on the sea-shore.

Panicled-spiked Heliotrope. Shrub.

67 H. tenuifòlium (R. Br. l. c.) plant erect, clothed with hoary tomentum; leaves linear-filiform; spikes alternate or solitary; bracteas subulate, shorter than the calyx, which is silky. ⊙. H. Native of New Holland, on the sea-shore, within the tropic.

Thin-leaved Heliotrope. Pl. erect.

68 H. glabe'llum (R. Br. l. c.) suffruticose, much branched, glabrous; leaves linear-filiform, with recurved margins, beset with a few hairs beneath; spikes few; bracteas subulate, hardly equalling the calyxes, which are ciliated; limb of corolla shorter than the tube. ♄. S. Native of New Holland, within the tropic.

Glabrous Heliotrope. Shrub.

69 H. prostra'tum (R. Br. l. c.) annual, prostrate, strigose from adpressed pili; leaves lanceolate, acuminated, flat, nearly sessile; bracteas hardly equal in length to the calyx. ⊙. H. Native of New Holland, within the tropic, on the sea-shore.

Prostrate Heliotrope. Fl. June, July. Clt. 1826. Pl. prostrate.

70 H. humistra'tum (Cham. in Linnæa, 4. p. 462.) tufted and trailing; stems simple, many from the same root, villous; leaves densely imbricate, villous, lanceolate, acute; racemes leafy; flowers pedicellate, extrafoliaceous, equal in length to the leaves; pedicels length of calyx. ⊙. F. Native of tropical Brazil, in argillaceous soil. Habit of *Paronychia*, or *Herniària*. Flowers size of those of *H. parviflòrum*. Calycine segments equal, lanceolate, acute, rather villous. Corolla villous outside, bearded in the throat. Anthers bearded at apex.

Trailing Heliotrope. Pl. trailing.

71 H. ocella'tum (Cham. in Linnæa, 4. p. 463.) erect, cinereous, strigose; leaves lanceolate, bluntish, sub-cuneated, petiolate; spikes simple, terminal, bracteate; bracteas equalling or exceeding the flowers. ⊙. H. Native of Brazil. The whole

plant is greyish from strigæ. Leaves ½ an inch long. Flowers small, size of those of *H. parviflòrum*. Calycine segments unequal, lanceolate, acute. Corolla slender, pale, strigose outside; tube shorter than the calyx; limb with a tooth between each lobe. Carpels smooth.

Ocellate-fruited Heliotrope. Pl. ½ to ¾ foot.

72 H. humifu'sum (H. B. et Kunth, nov. gen. amer. 3. p. 85. t. 205.) plant suffruticose, creeping, leafy; leaves crowded, lanceolate-oblong, acute, 1-nerved, stiff, hispid; flowers in the axils of the superior leaves. ♄. S. Native of Cuba, near Havana, in dry places. Lithospérmum humifûsum, Spreng. syst. 1. p. 548. Leaves 3 lines long, on short petioles, which are dilated and sheathing at the base. Calyx hispid, rather unequal. Corollas size of those of *Myosòtis arvénsis*, hispid outside; tube inflated in the middle, hardly equal in length to the calyx; limb plicate, 5-lobed. Stigma capitate, depressed. Fruit hispid. Said to be nearly allied to *H. orientàle*, Lin. Perhaps a proper genus.

Trailing Heliotrope. Shrub creeping.

73 H. filifórme (H. B. et Kunth, l. c. p. 86. t. 204.) procumbent, hispid from strigæ; leaves lanceolate-spatulate, obtuse; spikes terminal and lateral, solitary and conjugate, filiform, bracteate; bracteas minute, linear. ♃. S. Native on the sandy banks of the river Apures, between El Diamante and San Fernando. H. tènue, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 737. Stems diffuse. Leaves ½ inch long, with the petioles. Spikes revolute at top. Calyx unequal, hispid. Corolla white; tube about equal in length to the calyx. Carpels downy.

Filiform Heliotrope. Pl. procumbent.

Sect. III. Heliotrophy'tum (derivation the same as that of the genus, with the addition of *φυτον*, *phyton*, a plant.) Cham. in Linnæa, 4. p. 458. Carpels 2, 2-celled, 2-seeded. This section joins this genus with *Tournefórtia*.

74 H. tomentòsum (Poir. suppl. 3. p. 23.) plant clothed with white tomentum; stem shrubby; leaves ovate, obtuse, on long petioles, nerveless; spikes lateral, twin, bracteate. ♄. S. Native of the East Indies. Rœm. et Schultes, syst. 4. p. 39. Stem branched from the base. Leaves 8-10 lines long. Spikes an inch long, a little revolute at apex. Calyx hispid, acute, a little shorter than the corolla, which is small.

Tomentose Heliotrope. Shrub.

75 H ?. nicotianæfòlia (Poir. suppl. 3. p. 23.) stem herbaceous, villous; leaves broad-lanceolate, nearly glabrous, with undulated margins; spikes twin, terminal, bracteate. ⊙ ?. H. Native of Buenos Ayres. Leaves petiolate, 3-4 inches long, and 2 broad; petioles an inch long, pilose, with usually a pair of smaller leaves in the axils of the larger ones. Peduncles compressed, pilose, length of petioles. Calyx hispid, a little smaller than the corolla, which is small. Perhaps a species of *Tiarídium*.

Tobacco-leaved Heliotrope. Pl. 1 to 2 feet ?

76 H ?. anchusæfòlium (Poir. suppl. 3. p. 23.) stem shrubby; leaves stem-clasping, linear-lanceolate, roughish; peduncles terminal, solitary; spikes bifid, or trifid; flowers spicately capitate, bracteate. ♄. S. Native of Buenos Ayres, and Brazil. Rœm. et Schultes, syst. 4. p. 40. The whole plant is velvety from strigose canescent tomentum. Leaves crowded, 2 inches long, and 6-8 lines broad, obtuse. Peduncles villous. Spikes 2-3 together, crowded into a head. Calyx hispid. Corollas blue, size and form of those of *H. Peruviànum;* tube clothed with viscid villi outside. Perhaps the same as *H. amplexicaùle*, Vahl. symb. 3. p. 21.

Bugloss-leaved Heliotrope. Shrub ½ to 1½ foot.

77 H ?. polysta'chyum (Poir. suppl. 3. p. 23.) plant yellow; leaves ovate-lanceolate, on long petioles, tomentose beneath; spikes numerous, terminal. ♄. S. Native of Pondicherry. Commerson in herb. Desf. Rœm. et Schultes, syst. 4. p. 40. Branches spreading, villous. Leaves thickish, 1-2 inches long, rather pilose above. Spikes 3-4 together, unequal, very long. Calyx hispid. Corolla small, white. Carpels involucrated by the undurated angular calyx, form of a capsular pericarp.

Many-spiked Heliotrope. Shrub.

78 H. sidæfòlium (Cham. in Linnæa, 4. p. 460.) stem shrubby; leaves lanceolate and ovate-lanceolate, petiolate, acute, or bluntish; spikes terminal, and from the axils of the upper leaves. ♄. F. Native of Brazil. This species agrees with *H. anchusæfòlium* in the stature, habit, hairiness, inflorescence, flowers, and fruit, but differs in the leaves. Plant strigose. Flowers nearly sessile. Corolla hairy outside. Fruit tubercled.

Sida-leaved Heliotrope. Shrub ½ to 1½ foot.

79 H. phylicoìdes (Cham. in Linnæa, 4. p. 460.) shrubby, clothed with white villi; lower leaves ovate, acute, becoming narrower as they ascend, until they are almost linear; spikes terminal, trifid, or twice bifid. ♄. F. Native of the South of Brazil. Leaves with reflexed margins. Corolla having the tube villous outside; limb blue. Stigma depressedly conical. Carpels tubercular. Very nearly allied to *H. anchusæfòlium*.

Phylica-like Heliotrope. Shrub ½ to 1½ foot.

† *Species hardly known.*

80 H ?. anómalum (Hook. et Arn. in Beech. voy. pt. bot. p. 66.) plant suffruticose; leaves linear-lanceolate, attenuated at the base, hispid from strigæ; racemes glomerate; calycine segments very unequal; carpels 5. ♄. G. Native of the Society Islands. Root fusiform. Racemes usually bifid. Plant strigose. Corolla 5-6 cleft, plicate. Stamens 5-6. Stigma capitate, pencilled. Perhaps the same as *Lithospérmum incànum*, Forst. or perhaps a new genus. Two of the calycine segments are spatulate, the others linear.

Anomalous Heliotrope. Shrub.

81 H. tomentòsum (Burm. prod. fl. cap. p. 4. Lehm. asper. p. 73.) stem shrubby; leaves linear, repand, villous; spikes lateral, conjugate. ♄. G. Native of the Cape of Good Hope.

Tomentose Heliotrope. Shrub.

82 H. orienta'le (Houtt. pfl. syst. 5. p. 402.) leaves linear, glabrous, veinless; flowers scattered, lateral. ⊙. H. Native of Asia. Lin. spec. 1. p. 188. Willd. spec. 1. p. 745. Lithospérmum Javánicum, Spreng. syst. 1. p. 547. Plant small, procumbent, creeping. Flowers nearly sessile, solitary among the leaves.

Eastern Heliotrope. Pl. procumbent.

83 H. baccíferum (Forsk. descrip. p. 38.) stem frutescent, prostrate; leaves oblong, or roundish, hispid, with reflexed margins; spikes bracteate. ♄. G. Native of Arabia. Vittm. summ. 1. p. 379. Lehm. asper. p. 74. H. villòsum, Spreng. syst. 1. p. 541. Corolla with a yellowish tube, which is twice as long as the calyx; limb white; throat naked. Style thickened in the middle with a broad ring under the bifid stigma. Seeds contained in an umbonate 4-angled berry.

Berry-bearing Heliotrope. Shrub.

84 H. tetra'ndrum (Lour. coch. p. 103. ed. Willd. 1. p. 183.) leaves ovate-lanceolate, glabrous, opposite; spikes crowded, terminal. ♃. F. Native of Cochinchina, among luxuriant herbs. Stems erect, multiple, diffuse, whitish, bluntly tetragonal. Flowers reddish, in long dense spikes. Corolla campanulate, 5-cleft. Stamens 4, about equal in length to the

corolla. Stigma bifid. Seeds 4, naked. Calyx small, 5-cleft. Perhaps a species of *Verbèna*.

Tetrandrous-flowered Heliotrope. Pl. 1 foot.

N.B. In Salt's trav. in abys. p. 475, there are 3 species enumerated, but without any diagnosis. 1. H. cinèreum, R. Br. 2. H. ellípticum, R. Br. and H. dùbium, R. Br.

Cult. Several of the species of *Heliotropium*, or *Turnsole*, are valued on account of the fragrance of their blossoms, so that a few of them are to be met with in almost every collection of plants. The shrubby and perennial kinds thrive in any kind of rich, light soil; and young cuttings of them root readily under a hand-glass. The European annual species should be treated as other hardy annuals, by sowing the seeds in the open ground: the tropical species, like other tender annuals, by being reared on a hot-bed, and afterwards planted out.

XXXVI. PIPTOCLA'INA (from *πιπτω, pipto*, to fall; and *κλαινα, klaina*, a cloak; in reference to the calyx being deciduous.) Heliotròpium, species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubular, 5-toothed, deciduous. Corolla salver-shaped; throat furnished with a tooth between each of the segments. Stamens inclosed. Stigma simple. Carpels solitary, or 4, 1-celled.—Diffuse or canescent annual plants. Leaves petiolate, alternate. Flowers disposed in solitary, or twin spikes.

1 S. Malaba'rica; stems herbaceous, depressed; leaves ovate, plicate, entire, clothed with hoary tomentum on both surfaces, pilose; spikes lateral and terminal, generally solitary; calyx large, deciduous in the fruit-bearing state. ⊙. H. Native of Malabar. Heliotròpium Malabáricum, Retz. obs. 4. p. 24. Willd. spec. 1. p. 742. Lehm. asper. p. 48. H. Europæ'um, Forsk. descr. p. 38. H. Europæ'um, var. Malabáricum, Burm. ind. p. 40 ?. Plant soft to the touch. Spikes sometimes conjugate. Corolla white, longer than the calyx. Carpels rugose, glabrous. Calycine teeth short, connivent.

Malabar Piptoclaina. Pl. trailing.

2 S. supìna; stems herbaceous, decumbent; leaves oval, obtuse, plicate, with the margins a little reflexed, and obsoletely crenulated, hoary beneath, villous; spikes generally solitary, seldom conjugate, usually lateral; calyx closed, deciduous in the fruit-bearing state. ⊙. H. Native of Portugal, South of France, Islands of the Archipelago, Barbary, Arabia, and the Cape of Good Hope. Heliotròpium supìnum, Lin. spec. 187. Lehm. asper. p. 48. Gouan. hort. monsp. p. 17. t. 1. Desf. fl. atl. 1. p. 152. Sibth et Smith, fl. græc. t. 157. Lapeyr. abr. suppl. 27. D. C. fl. fr. no. 2706. Thunb. fl. cap. prod. p. 33. Hoffm. et Link. fl. port. 1. p. 167. Heliotròpium humifùsum, flore minore, &c. Tourn. cor. p. 7. voy. 1. p. 342. t. 23.—Mor. hist. 3. sect. 11. t. 31. f. 10. Stems many from the same root, hairy, canescent. Calycine teeth linear. Corolla with a yellow tube, length of the calyx, and a short white limb; segments of the limb reniform, intersected by teeth, which hardly close the throat. Carpels scabrous, solitary, the other 3 being abortive.

Trailing Piptoclaina. Fl. June, July. Clt. 1640. Pl. trailing.

Cult. This species of the genus being annuals, the seeds only require to be sown on a hot-bed in spring, and about the end of May the plants should be planted out in the open border, in a sheltered situation.

XXXVII. TIARI'DIUM (from *τιαρα, tiara*, a Persian diadem; and *ειδος, eidos*, like; in reference to the form of the capsule.) Lehm. asper. p. 13. Blum. bijdr. 845.—Heliotròpium species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft, or 5-parted. Corolla salver-shaped; tube angular; throat coarctate, 5-rayed; segments of the limb undulated. Style very short. Stigma capitate. Carpels 4, 2-celled, mitre-formed, acuminated, cohering, closed at the base, without any manifest receptacle.—Plant with the habit of *Heliotròpium*.

1 T. I'ndicum (Lehm. asper. p. 14. Blum. bijdr. p. 846.) stem herbaceous, erect, hairy; leaves ovate-cordate, acuminated, hairy at the base; tube of corolla twice as long as the calyx. ⊙. H. Native of both Indies and North America, in rather dry places. Heliotròpium I'ndicum, Lin. spec. 187. Swartz. obs. p. 54. Willd. spec. 1. p. 740. Willd. enum. 1. p. 174. Pursh. fl. amer. sept. 1. p. 130. Horn. hort. hafn. 1. p. 172. Michx. fl. bor. amer. 1. p. 129. Sims bot. mag. t. 1837. Heliotròpium cordifòlium, Mœnch. meth. p. 415.—Sabb. hort. rom. 2. t. 34.—Mor. hist. 3. sect. 11. t. 28. f. 1.—Plukn. phyt. 245. f. 4. Plant scabrous. Stem branched. Leaves running into the petioles at the base, 3 inches long, and 2 broad, subserrate. Spikes terminal, solitary, hairy, reflexed at first. Calycine segments rather unequal. Corolla with a white tube, a cream-coloured throat, and a lilac or bluish limb. In spontaneous specimens of this plant the leaves are nearly opposite, and the spikes terminal; but in cultivated specimens the leaves are often alternate, and the spikes conjugate. "Nuts 2-celled," ex Cham. in Linnæa.

Indian Tiaridium. Fl. June, July. Clt. 1820. Pl. 1 to 2 feet.

2 T. anisophy'llum; stem branched, hardly villous; leaves petiolate, ovate-lanceolate, glabrous, nearly entire, opposite, or alternate, unequal at the base; spikes solitary, terminal, and axillary. ⊙. H. Native of Guinea, on the gold coast. Heliotròpium anisophýllum, Beauv. fl. d'ow. 2. t. 94. Flowers white.

Unequal-leaved Tiaridium. Fl. June, July. Clt. 1823. Pl. 1 foot.

3 T. velutìnum (Lehm. asper. p. 15. Blum. bijdr. 846.) stem erect, herbaceous, villous; branches decumbent; leaves ovate, bluntish, undulated, canescent on both surfaces, velvety; tube of corolla a little longer than the calyx, villous outside. ⊙. H. Native of the East Indies. In Java this and *T. I'ndicum* are called *Bunta-tikus*. Bena-patsja, Rheed. mal. 10. p. 95. t. 48 ?. Leaves opposite, petiolate, obsoletely crenulated on the margins, hoary from tomentum while young, running obliquely into the petioles at the base. Spikes lateral and terminal, pilose, solitary, revolute before florescence.

Velvety Tiaridium. Fl. June, July. Clt. 1820. Pl. 1 foot.

4 T. elonga'tum (Lehm. asper. p. 18.) stem suffruticose, decumbent; leaves rhomb-lanceolate, acuminated, hairy; tube of corolla thrice as long as the calyx, hairy outside. ♄. G. Native of Brazil, in sandy places. Heliotròpium elongàtum, Willd. herb. no. 3228. Stem woody at the base, herbaceous and hairy at top. Leaves tapering into the petioles at the base, obsoletely crenulated. Spikes lateral and terminal, solitary, very long, pedunculate at first, revolute. Calycine segments incurved. Carpels 1-celled, ex Cham. in Linnæa, 4. p. 452.

Elongated-spiked Tiaridium. Shrub decumbent.

5 T. heliotropioi'des (Cham. in Linnæa, 4. p. 453.) shrubby, beset with adpressed pili; leaves nearly opposite and attenuate, broad, lanceolate, acute at both ends, strigose above, downy beneath; tube of corolla exceeding the calyx. ♄. G. Native of the South of Brazil, Sello. Heliotròpium tiaridioìdes, Cham. in Linnæa, 4. p. 453. Leaves $2\frac{1}{2}$ to 4 inches long, and 1 to $1\frac{1}{3}$ broad. Spikes twin at first, terminal, bractless. Calycine segments narrow, acute. Corolla downy outside. Stigma conical. Fruit divisible into two 2-celled parts.

Heliotrope-like Tiaridium. Shrub $1\frac{1}{2}$ foot.

6 T. monosta'chyum (Cham. in Linnæa, 4. p. 455. under Heliotròpium); this species is very nearly allied to *T. heliotropioìdes*, but differs in the spikes being simple and solitary, never twin; and in the leaves not being so opposite; stem dichotomous; strigæ adpressed. ♄. S. Native of tropical Brazil. Leaves with the petioles, 4-4½ inches long, and 15 lines broad. Spikes half a foot long.

One-spiked Tiaridium. Shrub ½ to 1½ foot.

Cult. The three first species being annuals, the seeds of them should be sown on a hot-bed early in spring; and the plants may be planted out in the open border, in a warm, dry, sheltered situation, about the middle of May. The rest should be treated in the manner recommended for the shrubby species of *Heliotròpium*.

XXXVIII. COLDE'NIA (named by Linnæus in honour of Conwallades Colden, a North American botanist, who discovered many new plants; these are published in the Upsal Acts for 1743.) Lin. gen. no. 173. Schreb. gen. no. 233. Juss. gen. 130. edit. Usteri, p. 145. Lam. ill. no. 248. t. 89. Gærtn. fruct. 1. no. 424. t. 68. f. 3. Lehm. asper. p. 7.—Tiquília, Pers. ench. 1. p. 57.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped; throat wide, naked; limb flat; segments equal. Style bifid at apex. Carpels 4, 1-celled, convex outside, coherent, closed at the base, beaked, without any manifest receptacle.—Prostrate plants, with alternate leaves, and axillary flowers.

1 C. procu'mbens (Lin. fl. zeyl. p. 69. spec. p. 182.) leaves cuneiform, petiolate, having one of the sides shorter than the other, coarsely serrated, plicate; flowers axillary, usually solitary; carpels wrinkled. ⊙. S. Native of the East Indies. Willd. spec. 1. p. 712. Lehm. asper. p. 8. Lam. ill. t. 89.—Plukn. alm. t. 64. f. 6. Stem villous. Leaves ½ to 1 inch long, beset with adpressed hairs above, except in the plicæ, villous beneath. Flowers supra-axillary, sessile, white.

Procumbent Coldenia. Fl. July, Aug. Clt. 1699. Pl. procumbent.

2 C. dichótoma (Lehm. asper. p. 9.) leaves lanceolate, attenuated at the base, lined, hoary; flowers crowded; carpels smooth. ♄. S. Native of Peru, in sandy places about Lima. Lithospérmum dichótomum, Ruiz. et Pav. fl. per. 2. p. 5. t. 3. f. c. Tiquília dichótoma, Pers. ench. 1. p. 157. Plant hispid, hoary. Stems dichotomous, geniculate, hispid at top. Leaves rather plicate, pilose, with reflexed, subrepand margins. Flowers sessile, axillary, violaceous; segments of the limb emarginate.

Dichotomous Coldenia. Shrub procumbent.

Cult. For culture and propagation see *Tiarídium* above.

XXXIX. HALGA'NIA (named by Gaudichaud after Admiral Halgan, of the French navy.) Gaud. in Freyc. voy. pt. bot. p. 448. t. 59.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft, regular. Corolla funnel-shaped; tube short; segments spreading, obtuse. Stamens inclosed; anthers erect, fixed by the base, where they are cordate and cohering, drawn out each into a linear appendage at apex. Style longer than the stamens; stigma simple, obtuse. Fruit obliquely and tetragonally ovate, coriaceous, bipartible; divisions 2-celled; cells 1-seeded; premature seeds linear-reniform, suspended towards the middle of the inner parietes of the cell.—A branched, pilose shrub. Branches scattered. Leaves scattered, lanceolate, cuneated, a little toothed, 3-lobed at apex, and sometimes entire. Corymbs terminal, bractless. Flowers blue.

1 H. littora'lis (Gaud. l. c. p. 449.) ♄. G. Native of New Holland, on the western coast, along the shore in Shark's Bay.

Sea-shore Halgania. Shrub.

Cult. For culture and propagation see *Heliotròpium*, p. 364.

XL. PRESLÆ'A (named after J. and C. B. Presl, of Prague, brothers, experienced naturalists.) Mart. bras. 2. p. 75. t. 164.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped; limb 5-cleft, with a plica between each of the segments, which are falcate and bent inwards; throat furnished with 5 fascicles of pili just above the connivent anthers. Anthers appendiculate at the base. Style from the top of the ovarium; stigma from a conical disk. Fruit dry, divisible into 4 1-seeded parts or carpels.—A branched diffuse herb, with the habit of *Lithospérmum orientàle*, clothed with simple hairs. Leaves alternate, lanceolate. Flowers axillary, solitary, on short pedicels. Corollas yellow. Perhaps *Lithospérmum Orientàle* is a species of *Preslæ'a*.

1 P. paradóxa (Mart. l. c. p. 76.) stem much branched, diffuse, hoary and hispid; leaves narrow-lanceolate, acute. ♃. G. Native of Brazil, in the province of Bahia, on the sandy banks of the river St. Francisco, near Joazeiro. Ovarium ovate. Carpels perforated at the base, fixed to the central column? cohering.

Paradoxical Preslæa. Pl. diffuse.

Cult. For culture and propagation see *Heliotrópium*, p. 364.

XLI. EU'PLOCA (from *ευ, eu*, well; and *πλεκω, pleco*, to fold; in reference to the peculiar character of the corolla.) Nutt. in amer. phil. trans. n. s. 5. p. 189.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped; limb flat, plicate, 5-angled; throat naked. Genitals inclosed. Stigma annular, bearded at apex. Carpels 4, approximate, by pairs, angular, imperforated at the base, oblique, fixed to the calyx.—Herbaceous. Leaves rough, alternate. Flowers scattered, with a plicate limb, as in *Convolvulàceæ*. Said by Nuttall to be allied to *Messerschmídtia* and *Argùzia*, but the fruit is different.

1 E. convolvula'cea (Nutt. l. c. p. 190.) ⊙. H. Native of North America, on the sandy banks of the Arkansas. Stem angular, 4-6 inches high. Leaves scabrous from adpressed hairs: lower ones alternate. Flowers lateral, approximating, and nearly sessile. Corolla rough, pilose outside, size of those of *Quámoclit vulgàris*. Perhaps this plant ought to be united with *Tournefórtia Argùzia* of Siberia.

Convolvulaceous-flowered Euploca. Pl. ½ foot.

Cult. For culture and propagation see *Tiarídium* above.

XLII. TOURNEFO'RTIA (so named by Linnæus in memory of Joseph Pitton de Tournefort, the famous author of an elegant arrangement of plants, under the title of "Institutiones Rei Herbariæ," 1694, 8vo. and 1700, in 3 vols. 4to. with figures of all the genera then known; also author of "Corollarium Inst." &c. 1793; "Catalogue of the Plants about Paris," 1698; "Relation d'un Voyage du Levant," 1717, &c. The first-mentioned work is the foundation of the arrangement now followed, called the Jussieuan, or Natural System.) Lin. gen. no. 192. Schreb. gen. no. 253. Gærtn. fruct. 1. p. 365. t. 76. Juss. gen. 129. R. Br. prod. 496. H. B. et Kunth, nov. gen.

amer. 3. p. 78.—Messerschmídtia species, Lin.—Pittònia, Plum. gen. 5. icon. 227. f. 2.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla salver-shaped, or somewhat rotate, with a naked throat. Stamens inclosed. Stigma peltate, somewhat conical. Berry containing 2 nuts; nuts 2-seeded.—Twining, scandent, or erect shrubs. Leaves scabrous or tomentose, scattered, rarely by threes, petiolate. Peduncles usually terminal, rarely axillary or lateral, generally bearing many spikes, which are usually cymose. Spikes secund, revolute at top, bractless. Embryo inverted.

Sect. I. Pittònia (see genus for derivation). H. B. et Kunth, nov. gen. 3. p. 80. Limb of corolla plicately 5-cleft. Berry more or less globose, containing 2, 2-celled, 2-seeded nuts.

* *Species natives of America.*

1 T. cymòsa (Lin. spec. 202.) branches compressed, angular, glabrous; leaves ovate, acuminated at apex, and attenuated at the base, naked, glabrous; peduncles axillary and terminal, glabrous; spikes cymose. ♄. S. Native of Jamaica. Jacq. coll. 1. p. 96. icon. rar. t. 31. Swartz, obs. p. 57.—Sloane, jam. hist. 2. p. 109. t. 212. f. 2. T. macrophýlla, Lam. ill. p. 416. no. 1874. Poir. dict. 5. p. 356. Pers. ench. 1. p. 165. Leaves 6 inches long, and 1-2 broad, veiny. Spikes long, pendulous. Calycine segments narrow, acute. Corolla flesh-coloured, or pale red, short, rusty or greenish-white. Berries white.

Cymose-flowered Tournefortia. Fl. July. Clt. 1777. Shrub 8 to 10 feet.

2 T. fœtidíssima (Lin. spec. 201. hort. cliff. p. 48.) branches angular, hairy? leaves ovate-lanceolate; peduncles axillary and terminal; spikes pendulous, cymose. ♄. S. Native of Mexico, Jamaica, and other West India Islands. Willd. spec. 1. p. 792. T. cymòsa, var. β, Poir. dict. 5. p. 336. Pittònia racemòsa, nicotianæ foliis fœtidissimis, Plum. gen. 5. icon. 220.—Plukn. alm. 182. Leaves 5 inches long and 2 broad, hairy on the under side, fetid when bruised. Peduncles bearing 2-3-4, or 5 pendulous spikes. Flowers dirty white, crowded. It differs principally from *T. cymòsa* in the leaves being hairy or villous beneath.

Very fetid Tournefortia. Fl. July. Clt. 1739. Shrub 10 to 12 feet.

3 T. bícolor (Swartz, prod. p. 40. fl. ind. occ. 1. p. 344.) branches glabrous, compressed, rather angular; leaves ovate, acuminated, glabrous, veiny, wrinkled above; peduncles terminal, glabrous; spikes erect, cymose. ♄. S. Native of Jamaica, Martinico, and Guadaloupe. Willd. spec. 1. p. 793. T. lævigàta, Lam. ill. no. 1875.? Poir. dict. 5. p. 357. Leaves rarely rather hairy above, smooth and pale beneath, 3-4 inches long. Flowers dirty white, or greenish white, crowded; tube of corolla hairy.

Two-coloured-leaved Tournefortia. Fl. July. Clt. 1812. Shrub 5 to 6 feet.

4 T. undula'ta (Ruiz. et Pav. fl. per. 2. p. 25. t. 149. f. b.) branches angular, downy; leaves oblong-lanceolate, lined, wrinkled, rather downy, undulated; peduncles dichotomously corymbose, lateral and terminal; spikes short, numerous, recurved. ♄. S. Native of Peru, on hills in the province of Cumana. Shrub rather downy. Corolla white, downy outside. Berry white. Nuts cornute at the base.

Undulated-leaved Tournefortia. Shrub 6 to 7 feet.

5 T. angustiflòra (Ruiz. et Pav. fl. per. 2. p. 25.) glabrous; branches angular; leaves ovate, unequal at the base, with an oblique acumen; peduncles bifurcate, terminal and axillary, therefore the spikes are conjugate; flowers somewhat pedicellate; corollas narrow. ♄. S. Native of Peru, in woods. Spikes 2 inches long, hardly recurved. Calyx small. Corolla white, very long, rather downy outside; tube swollen at the base; limb spreading, reflexed. Stigma nearly sessile. Anthers linear. Berry white, globose, 2-seeded. Perhaps a species of *Messerschmídtia.*

Narrow-flowered Tournefortia. Shrub 4 to 5 feet.

6 T. virga'ta (Ruiz. et Pav. fl. per. 2. p. 25. t. 50. f. a.) stems terete, and are, as well as the branches, which are angular, hispid; leaves ovate-oblong, acuminated, hardly petiolate, hispid; peduncles terminal, subdichotomous, cymose; spikes few; flowers crowded. ♄. S. Native of Peru, in woods. Branches attenuated. Leaves alternate, or 3 in a whorl, rather wrinkled. Corolla white.

Twiggy Tournefortia. Shrub.

7 T. macula'ta (Jacq. amer. p. 47. Lam. ill. no. 416. Poir. dict. 5. p. 357.) glabrous; branches twiggy, rather angular; leaves ovate, acuminated, petiolate; peduncles of many spikes; spikes pendulous; flowers few, in a single row. ♄. S. Native of Carthagena, among bushes, and in hedges. Leaves 4 inches long, and 2 broad. Spikes short. Corolla yellow, with a long slender tube, and acute segments, ex Poir. Fruit yellow, with 4 roundish dark spots at the base.

Spotted-fruited Tournefortia. Shrub.

8 T. Caraccasa'na (H. B. et Kunth, nov. gen. amer. 3. p. 80.) branches terete, hairy when young, angular; leaves ovate-oblong, acuminated, narrowed at the base, strigose above, and clothed with hair-like, canescent tomentum beneath; peduncles lateral, dichotomously multifid, usually bearing 8 spikes; calyx strigosely downy, 4 times shorter than the tube of the corolla. ♄. S. Native near the town of Caraccas, on the banks of the river Anauco. T. acutifòlia, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 540. Leaves 4 inches long, and 2 broad. Peduncles downy. Spikes diffuse. Segments of calyx ovate, acute. Corolla with a green, downy, angular tube, and a white, blunt limb. Stigma sessile.

Caraccas Tournefortia. Shrub.

9 T. fuliginòsa (H. B. et Kunth, l. c. p. 81. t. 203.) branches compressedly tetragonal, clothed with rusty tomentum; leaves oblong, acute at both ends, wrinkled, hispid above, and clothed with rusty tomentum beneath; peduncles lateral, dichotomously multifid, of many spikes; calyx clothed with rusty tomentum, much shorter than the tube of the corolla; corolla also clothed with rusty tomentum; drupes glabrous. ♄. S. Native near Cumana and Bordones. T. rugòsa, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 540. Leaves 4-5 inches long, and 1½ to 2 broad. Peduncles clothed with rusty tomentum. Spikes narrow, 4 inches long. Calycine segments ovate, acute. Limb of corolla obtuse.

Sooty Tournefortia. Shrub.

10 T. suave'olens (H. B. et Kunth, l. c. p. 81.) branches angular, hispid; leaves ovate-oblong, acute at both ends, beset with adpressed hairs above, and soft hair-like tomentum beneath; peduncles terminal, somewhat dichotomously multifid, of many spikes; calyx, peduncles, and petioles hispid; calyx a little shorter than the tube of the corolla. ♄. S. Native of Peru. Leaves canescent beneath, 3 inches long, and 1½ inch broad. Spikes numerous, corymbose, short. Calycine segments linear. Corolla beset with adpressed hairs outside; lobes ovate, acute. Fruit not seen.

Sweet-scented-flowered Tournefortia. Shrub.

11 T. Loxe'nsis (H. B. et Kunth, l. c.) branches terete,

hairy; leaves ovate, acuminated, narrow at the base, strigose above, but clothed with fine tomentum beneath; peduncles terminal and lateral, dichotomous, of many spikes; calyx and peduncles clothed with hoary tomentum; calyx one half shorter than the tube of the corolla; drupes glabrous. ♄. S. Native of Quito, in woody places between Alto de Pulla and Loxa, at the elevation of 1100 hexapods. Shrub with a very grateful scent. Leaves 3 inches long. Spikes linear. Flowers crowded, about the size of those of *Heliotròpium Peruviànum*. Calycine segments ovate-oblong, acute. Corolla white, clothed with hispid tomentum outside; lobes roundish, curled. Berry 3-celled, 3-seeded.

Loxa Tournefortia. Shrub 10 to 12 feet.

12 T. CANE'SCENS (H. B. et Kunth, l. c. p. 82. Willd. mss. ex Rœm. et Schultes, syst. 4. p. 540.) branches nearly terete when young, angular and villous; leaves ovate-oblong, acuminated, angular at the base, nearly sessile, strigosely villous above, but clothed with hoary tomentum beneath; peduncles terminal, dichotomously multifid, of many spikes, clothed with hoary villi; calyx hispid; drupes glabrous. ♄. S. Native near Cumana. Corolla unknown. Berry nearly globose, 4-celled; cells 1-seeded. This and the preceding species are very nearly allied to *T. polystàchya*, Ruiz. et Pav., both of which are probably species of *Messerschmídtia*.

Canescent Tournefortia. Shrub.

13 T. HI'SPIDA (H. B. et Kunth, l. c. p. 82.) branches rather angular, hispid; leaves ovate, acuminated, narrowed at the base, hispid on both surfaces, but canescent beneath; peduncles terminal, hispid, dichotomously multifid, usually of 10 spikes; calyxes hispid, much shorter than the corolla. ♄. S. Native on the shady banks of the river Magdalena, near Teneriffe. Leaves $3\frac{1}{2}$ inches long, and 2 broad. Spikes thick. Flowers approximate. Calycine segments roundish, obtuse. Corolla strigose outside; lobes obtuse. Fruit unknown.

Hispid Tournefortia. Shrub.

14 T. SCA'BRIDA (H. B. et Kunth, l. c. p. 83.) branches terete, even, clothed with adpressed hairs; leaves oblong-elliptic, acute at both ends, scabrous above from strigæ, canescent and hairy beneath, as well as the peduncles, which are terminal, dichotomous, of about 6 spikes; calyxes and drupes strigosely pilose. ♄. S. Native on the shady banks of the river Magdalena, near Teneriffe. Leaves stiff, bullated above, $3\frac{1}{2}$ inches long, and 20-21 lines broad.

Scabrous Tournefortia. Shrub.

15 T. CUSPIDA'TA (H. B. et Kunth, l. c. p. 83.) branches terete, hairy; leaves oblong, acuminately cuspidate, acute at the base, pilose on both surfaces, hairy on the veins beneath; peduncles terminal, dichotomously multifid, of many spikes, hairy. ♄. S. Native of Guayaquil, on the sea shore. Leaves $6\frac{1}{2}$ inches long, silky and rusty while young.

Cuspidate-leaved Tournefortia. Shrub.

16 T. LÆVIGA'TA (Lam. ill. p. 419. H. B. et Kunth, nov. gen. amer. 3. p. 83.) branches rather angular, and rather scabrous; leaves ovate-elliptic, short-acuminated, rounded at the base, coriaceous, glabrous; peduncles terminal, paniculately multifid, of many spikes, beset with scattered hairs; calyxes downy; drupes glabrous. ♄. S. Native of Guadaloupe, Martinico, and on the banks of the river Magdalena, near Monpox. F. latifòlia, Willd. mss. ex Rœm. et Schultes, syst. 4. p. 540. Leaves 5-6 inches long, and 3 broad. Spikes 10-12 on each peduncle, an inch long, diffuse.

Smooth Tournefortia. Shrub.

17 T. NI'TIDA (H. B. et Kunth, l. c. p. 84.) branches angular, smooth, glabrous; leaves somewhat elliptic, acuminated, acute at the base, coriaceous, glabrous, shining above; corymbs terminal, sessile, of many spikes; calyx puberulous; drupes glabrous. ♄. ◡. S. Native on the western declivities of the Andes of Quindiu, near Carthage, at the altitude of 500 hexapods. Leaves 4 inches long, and 2 broad.

Nitid-leaved Tournefortia. Shrub twining.

18 T. CORNIFÒLIA (H. B. et Kunth, l. c. p. 84.) branches nearly terete, striated, beset with hairs; leaves obovate-oblong, acute, narrowed at the base, stiff, rather scabrous on both surfaces; peduncles terminal and lateral, bifid, smoothish, with generally about 6 spikes; calyxes rather scabrous; drupes glabrous. ♄. S. Native along with the preceding. Leaves about 3 inches long, and 1 broad.

Dogwood-leaved Tournefortia. Shrub.

19 T. LU'CIDA (Desv. herb. ex Ham. prod. p. 24.) branches twiggy, clothed with rusty tomentum; leaves ovate, acute, quite entire, shining above, and nearly glabrous beneath; flowers racemose, lateral, opposite the leaves. ♄. S. Native of the Antilles.

Shining-leaved Tournefortia. Shrub.

20 T. TERNIFÒLIA (H. B. et Kunth, l. c.) branches terete, beset with adpressed hairs; leaves 3 in a whorl, oblong, narrowed at both ends, acute, membranous, glabrous; spikes terminal, twin. ♄. S. Native on the banks of the river Amazon, near Tomependa, and Jaen de Bracamoros. Leaves about 7 inches long, and $2\frac{1}{2}$ broad, sometimes beset with adpressed hairs on the nerves beneath. Spikes about an inch long. Flowers pedicellate. Calycine segments linear-lanceolate. Corolla strigose outside, 3 times as long as the calyx.

Tern-leaved Tournefortia. Shrub.

21 T. LEUCOPHY'LLA (H. B. et Kunth, l. c. p. 85.) branches terete, clothed with fuscescent tomentum; leaves oblong-elliptic, acuminated, rounded at the base, glabrous above, and shining, but clothed with fine white tomentum beneath; peduncles terminal, dichotomously multifid, of many spikes, clothed with pale rusty tomentum; calyxes clothed with rusty tomentum. ♄. S. Native of New Granada, near Ibague. Leaves rather membranous, 4 inches long, and nearly 2 broad. Spikes 7-8 on each peduncle, $\frac{1}{2}$ to 1 inch long.

White-leaved Tournefortia. Shrub.

22 T. BRASILIE'NSIS (Poir. dict. 5. p. 357.) branches terete, fuscescent, striated, with a few hairs; leaves ovate-lanceolate, subsinuated, rough on both surfaces, white beneath; cymes short, reflexed, downy. ♄. S. Native of Brazil. Leaves 2-3 inches long, and 1 broad. Calycine segments acute, a little recurved, villous.

Brazil Tournefortia. Shrub.

23 T. SUFFRUTICÒSA (Lin. spec. p. 202.) stem suffruticose; branches downy, cinereous, twiggy; leaves sub-lanceolate, hoary beneath; spikes short, terminal and axillary, cymose. ♄. S. Native of Jamaica, and tropical America, near the sea. Browne, jam. p. 170. Lam. ill. no. 1880. t. 95. f. 3.—Sloane, hist. 2. p. 29. t. 162. f. 4. Leaves 2 inches long, and 1 broad, dark green above, sessile. Corollas white, twice as long as the calyx.

Suffruticose Tournefortia. Fl. June, July. Clt. 1759. Shrub 3 to 4 feet.

24 T. SCA'BRA (Lam. ill. no. 1883. Poir. dict. 5. p. 359.) branches elongated, striated, rather downy; leaves oblong or linear-lanceolate, obtuse, reflexed, very scabrous, denticulated; peduncles branched, terminal, scabrous, as well as the calyxes; berry conical. ♄. S. Native of St. Domingo. Leaves 1-2 inches long, and 4 lines broad, villous and wrinkled beneath. Teeth of calyx acute, spreading. Berry rufescent.

Var. β; leaves narrower, and very long. ♄. S. Native of St. Domingo. Leaves acute, green, acuminated, twice as long

as those of the species. Perhaps a proper species, ex Poir. l. c.

Scabrous Tournefortia. Shrub.

25 T. microphy'lla (Desv. herb. ex Ham. prod. p. 24.) stem erect, mutic, branched, quite glabrous; leaves small, ovate, obtuse, quite entire, almost glabrous; flowers spicate, sub-bifid. ♄. S. Native of the Antilles.

Small-leaved Tournefortia. Shrub.

26 T. sessilifòlia (Poir. dict. 5. p. 360.) stems terete, beset with stiff hairs; leaves sessile, lanceolate, linear, villous on both surfaces; flowers crowded, terminal. ♄. G. Native of Buenos Ayres, Commerson. Leaves obtuse, half stem-clasping at the base, an inch and more long, and 3 lines broad. Peduncles divided into 2 branches, having the flowers densely glomerate on the top of each branch. Corolla tubular; limb short, dilated, obtuse. Peduncles and calyxes beset with numerous glandular pili.

Sessile-leaved Tournefortia. Shrub.

27 T. inca'na; hoary, villous; stems herbaceous; leaves sessile, linear, with revolute edges. ♃. S. Native about Essequibo. Messerschmídtia incàna, Meyer, esseq. p. 92. Stems angular, woody, and rather naked at the base; branches simple, spreading; corymbs racemose, terminal, having the branches twice bifid. Corolla hairy, coloured, funnel-shaped; throat naked. Berry corky, containing 2, 2-seeded pyrenæ. Said by Meyer to be the same as the preceding.

Hoary Tournefortia. Pl. ½ to 1 foot.

28 T.? ferrugi'nea (Lam. ill. no. 1882.) branches terete, striated, climbing a little, beset with numerous, stiff, straight, rust-coloured hairs while young, as well as the petioles and nerves of leaves; leaves subcordate, acute, villous beneath; peduncles much branched, villous; spikes short; calyx villous, scabrous. ♄. ◡. S. Native of St. Domingo. Leaves scabrous above, a little ciliated, deep green, 2-3 inches long, and 1 broad. Corolla short, tubular. Said to be very nearly allied to *T. volùbilis*, but is less sarmentose.

Rusty Tournefortia. Shrub climbing.

29 T. Schiedea'na; leaves elliptic-lanceolate, acuminated, attenuated at the base, glabrous; peduncles 3-4 times dichotomous, puberulous, as well as the calyxes; tube of corolla 4 times as long as the calyx; fruit not seen. ♄. G. Native of Mexico, in the woods of Jalapa. Tourn. spec. nov. Cham. in Linnæa, 8. p. 514.

Schiede's Tournefortia. Shrub.

30 T.? tomentòsa (Mill. dict. no. 4.) stems twining; branches flexile; leaves cordate, tomentose beneath; spikes short, racemose. ♄. ◡. S. Native of South America, near Carthagena. Leaves 2 inches long, and 15 lines broad, on very short petioles. Flowers small, dirty white. Berry 2-3-4-seeded. Pittònia scándens racemòsa, foliis subrotundis, subtus incanis, Plum. Perhaps a species of *Messerschmídtia*.

Tomentose Tournefortia. Shrub 10 to 12 feet, twining.

31 T.? carnòsa (Mill. dict. no. 6.) leaves ovate, wrinkled, petiolate; spikes racemose, axillary. ♄. S. Native about Carthagena. Pittònia frutéscens, folio carnoso hirsuto et obtuso, Plum. gen. p. 5.? Stem and branches strong; branches pale brown. Leaves thick, 4 inches long, and 3 broad, scabrous, dark green, paler beneath. Flowers small, white. Berry containing 2-3 oblong nuts. Perhaps a species of *Messerschmídtia*.

Fleshy-leaved Tournefortia. Tree 20 feet.

* * *Species natives of the East Indies, New Holland, and Isle of France.*

32 T. muta'bilis (Vent. choix. t. 3.) branches roughish, densely tomentose towards the tops; leaves ovate, lanceolate, scabrous, downy; cymes terminal, narrow, dichotomous, downy as well as the calyxes; lobes of corolla crenulated. ♄. S. Native of Java, Lahaye. Leaves 4 inches long, and 2 broad. Peduncles terminal, solitary, bifurcate. Calycine segments lanceolate, acute. Corolla greenish white, with a cylindrical tube, and obtuse limb. Berry white, containing a nut which is divided into 2, 1-seeded cells.

Changeable Tournefortia. Shrub.

33 T. sarmentòsa (Lam. ill. no. 1877. Poir. dict. 5. p. 835.) branches terete, striated, beset with adpressed, white hairs; leaves ovate-oblong, acute, villous, white beneath; spikes branched, very short. ♄. ◡. S. Native of the Isle of France, Sonnerat. Leaves nearly glabrous above, but white and villous beneath, 2-3 inches long, and 1 broad. Flowers terminal, hairy. Calycine segments acute.

Sarmentose Tournefortia. Shrub climbing.

34 T. arbore'scens (Lam. ill. no. 1878. Poir. dict. 5. p. 357.) branches angular, rough, or hispid; leaves ovate-lanceolate, attenuated at both ends, scabrous, but rather tomentose beneath while young; peduncles rough, white; spikes branched, very short. ♄. S. Native of India, Sonnerat. Leaves 4-5 inches long, and 1½ broad; petioles rather villous. Calyx divided nearly to the base, into broad, acute, firm, permanent segments. Corolla tubular, with obtuse segments.

Arborescent Tournefortia. Tree.

35 T. arge'ntea (Lin. suppl. p. 133. R. Br. prod. p. 497. Blum. bijdr. 844.) erect, clothed with velvety, silky tomentum; leaves ovate, approximate at the tops of the branches: ultimate ones obovate; cymes decompound; corolla campanulately rotate; stigma sessile, semi-bifid. ♄. S. Native of Ceylon, Java, &c., on the sea shore; Island of Carnicobar; Isle of France, and New Holland, within the tropic. Wall. fl. ind. 2. p. 4. Buglóssum lanuginòsum, Rumph. amb. 4. p. 119. t. 55. Branches spreading, hairy. Leaves crowded in a rosulate manner at the tops of the branches, in the same way as those of *Sempervìvum Canariénse* and its allies, sessile, white on both surfaces from silky hairs. Flowers white, with a short tube and a recurved limb. This is the prettiest species of the genus.

Silvery Tournefortia. Fl. June, Nov. Clt. 1822. Shrub 5 to 6 feet.

36 T. bífida (Lam. ill. no. 417. Poir. dict. 5. p. 360.) leaves ovate, glabrous, petiolate; peduncles axillary, bifid; spikes divaricate. ♄. S. Native of the Isle of France, Commerson. Bark cinereous, wrinkled. Leaves coriaceous, with yellowish nerves. Peduncles bearing 2 horizontal spikes. Calyx short, with 5 blunt teeth. Corolla tubular, elongated, cream-coloured.

Bifid Tournefortia. Shrub.

37 T. Orienta'lis (R. Br. prod. p. 497.) twining; leaves broad, ovate, subacuminated; cymes dichotomous; limb of corolla 5-cleft, with plicate sinuses; nuts cellular. ♄. ◠. S. Native of New Holland, within the tropic.

Eastern Tournefortia, Shrub twining.

38 T. tetra'ndra (Blum. bijdr. p. 843.) stem sarmentose, scabrous; leaves ovate-oblong, acuminated, quite entire, glabrous above, but rather roughish beneath; cymes terminal, dichotomous, or multifid; flowers secund, sessile, tetrandrous; tube of corolla tetragonal; stigma sessile, bifid. ♄. ◡. S. Native of Java, among bushes on the mountains, where it is called *Ojot Sisier*.

Var. β, *hirsùta* (Blum. l. c.) branches, leaves, and peduncles hairy. ♄. S. Native of the Moluccas.

Tetrandrous Tournefortia. Fl. Dec. Shrub rambling.

39 T. Urvillea'na (Cham. et Schlecht, in Linnæa, 4. p. 465.)

twining? branches angular, scabrous; leaves ovate, acute, oblong-lanceolate, and obovate, equal, and rounded at the base, or unequal and subcordate; cymes bractless, many times dichotomous; limb of corolla 5-cleft, with plicate sinuses. ♄. ⌒. S. Native of the Island of Luçon. This species differs from *T. Orientàlis* in the leaves being pilose or scabrous; from *T. tetrándra* in the flowers being pentamerous; and from *T. arboréscens*, Link, in the leaves being shorter and broader, and never tomentose beneath. Spikes or branches of cyme elongated, pilose. Calycine segments ovate, acute. Drupes glabrous.

D'Urville's Tournefortia. Shrub twining?

40 T. ova'ta (Wall. cat. no. 908.) branches striated, downy; leaves ovate-elliptic, acuminated, rather strigose; cymes terminal, branched; flowers on short pedicels, tubular. ♄. S. Native of Rangoon. Very nearly allied to *Heliotròpium viridiflòrum*, Lehm.; the *T. viridiflòrum*, Wall.; and *Lithospérmum viridiflòrum*, Roxb.

Ovate-leaved Tournefortia. Shrub.

41 T. Heynea'na (Wall. cat. no. 910.) rather strigose, or nearly glabrous; leaves ovate-lanceolate or ovate, acuminated; cymes axillary, on long peduncles; flowers on short pedicels, unilateral; corollas tubular. ♄. S. Native of the East Indies.

Heyne's Tournefortia. Shrub.

Sect. II. Messerschmi'dtiæ antiquæ. The following species have been formed by Linnæus and others into a distinct genus. Corolla funnel-shaped; limb swollen towards the top. Berry round, depressed, girded by 5 prominent teeth in a circle, divisible into 2, 2-seeded nuts.

42 T. fruticòsa (R. Br. prod. p. 496. Rœm. et Schultes, syst. 4. p. 539.) scabrous, branched, hairy; leaves ovate, lanceolate, petiolate; calyx short. ♄. G. Native of Teneriffe, in sterile places. Messerschmídtia fruticòsa, Lin. syst. 190. suppl. 132. Lher. stirp. 2. t. 1. Willd. spec. 1. p. 789. Desf. arbr. 1. p. 175. Hairy in every part. Spikes cymose, dichotomous, terminating the branches and stem. Corolla funnel-shaped, or salver-shaped, with a flat limb, ex Lin. Corollas white.

Shrubby Tournefortia. Fl. June, July. Clt. 1800. Shrub 5 to 6 feet.

43 T. angustifòlia (R. Br. l. c. Rœm. et Schultes, l. c.) stems nearly glabrous; leaves petiolate, narrow-linear-lanceolate, glabrous; spikes as in *T. fruticòsa*. ♄. G. Native of the Canary Islands. Messerschmídtia angustifòlia, Lam. ill. no. 1872. Poir. suppl. 1. p. 449. Habit of *T. fruticòsa*; but differs in the stems being nearly glabrous. Leaves scabrous on both surfaces. Flowers bluish.

Narrow-leaved Tournefortia. Fl. June, Nov. Clt. 1820. Shrub 5 to 6 feet.

44 T. tuberculòsa (Cham. et Schlecht, in Linnæa, 4. p. 467.) herbaceous, erect, branched, very scabrous from strigæ all over; leaves lanceolate, sinuately undulated, acute, opaque, attenuated into the short petioles; cymes terminal, bifid, or spikes twin; calyx small. ♃. G. Native of the Cape of Good Hope, at Gamka river, where it was collected by Mundt and Maire. Stems angular, a little dilated towards the ramifications. Spikes filiform, few-flowered. Calycine segments ovate, acute, callously ciliated. Corolla tubularly salver-shaped; segments of the limb triangular, long-acuminated. Drupe nearly dry, tubercled; pyrenæ tubercularly echinated on the back. Habit of a species of *Chenopòdium* or *Atriplex*. It differs from all other species in the tubercled fruit.

Tubercled-fruited Tournefortia. Pl. 2 to 3 feet?

45 T. Sibi'rica (Lin. spec. 202. act. petrop. 1763. p. 315. t. 11.) root creeping; stems herbaceous, branched; leaves sessile, ovate-oblong, hoary from tomentum; corymbs or fascicles usually twin. ♃. H. Native of Dahuria, and Tauria, in gravelly places; and of China, about Pekin, and from that to the northern limits of the empire. Messerschmídtia Argùzia, Lin. syst. p. 190. suppl. 132. mant. 42. 334. hort. ups. p. 36. Argùzia montàna, Amm. ruth. 38. Corolla white, funnel-shaped, with a naked throat. Calyx shorter than the tube of the corolla. "Corollas larger than those of *T. fruticòsa*, with a plicate limb, and membranous sides," ex Lin.

Siberian Tournefortia. Fl. June, Oct. Clt. 1780. Pl. ½ to 1 foot.

Sect. III. Heliotropioi'des. The species contained in this section have been referred by authors to *Heliotròpium*, from their habit, but they have nothing peculiar in character.

46 T. gnaphalioìdes (R. Br. prod. p. 496.) frutescent; the whole plant white from tomentum; leaves linear, obtuse; peduncles terminal; spikes bifid or twin, short. ♄. S. Native of Barbadoes, Jamaica, Grand Cayman Island, &c., by the sea side. Heliotròpium gnaphalioìdes, Lin. spec. 189. Jacq. amer. p. 25. t. 173. f. 11. pict. t. 264. f. 97.—Mor. hist. 3. sect. 11. t. 28. f. 6.—Plukn. alm. 182. t. 193. f. 3. Shrub erect. Leaves crowded at the tops of the branches. Spikes secund, usually bifid. Corolla white, small.

Gnaphalium-like Tournefortia. Fl. July, Sept. Clt. 1824. Shrub 1 to 2 feet.

47 T. microsta'chya (Rœm. et Schultes, syst. 4. p. 538.) stems herbaceous, procumbent; leaves ovate-oblong, flat, downy, hoary beneath; lateral spikes nearly sessile: terminal ones pedunculate, usually by fours, short. ⊙. H Native of Peru, in arid places about Tarma. Heliotròpium microstàchyum, Ruiz. et Pav. fl. per. 2. p. 3. t. 110. f. b. Lehm. asper. 40. Stems angular, downy. Calyx pilose, with lanceolate, acute, equal segments. Leaves petiolate. Corollas small, white. Berry containing 2 2-celled, 2-seeded nuts, as in the other species.

Small-spiked Tournefortia. Pl. procumbent.

48 T. synzysta'chya (Rœm. et Schultes, syst. 4. p. 539.) plant herbaceous, procumbent; branches angularly furrowed; leaves opposite and alternate, ovate, wrinkled, pilose; lateral spikes solitary, very long: terminal ones twin, shorter. ⊙. S. Native of Peru, in fields about Lima. Heliotròpium synzystàchyum, Ruiz. et Pav. fl. per. 2. p. 3. no. 6. t. 109. f. a. b.? Plant villous. Leaves petiolate. Spikes 2-3 inches long: terminal ones 1-2 inches. Calycine segments linear, acute. Corolla funnel-shaped, white; tube longer than the calyx, villous inside above. Fruit as in the preceding species.

Twin-spiked Tournefortia. Pl. procumbent.

† *Species hardly known.*

49 T. rufe'scens (Willd. rel. in Rœm. et Schultes, syst. 4. p. 541.) leaves ovate-oblong, rugosely veined, clothed with rufous tomentum beneath. ♄. S. Native of South America. Humb. et Bonpl.

Rufescent Tournefortia. Shrub.

50 T. gla'bra (Aubl. guiana. 1. p. 118.) much branched, glabrous; berries white. ♄. S. Plum. mss. t. 6. f. 53. ex Vittm. summ. pl. 1. p. 402.?

Glabrous Tournefortia. Shrub.

N.B. What are *Tournefórtia lùcida*, and *T. angulòsa*, Desf. tabl. de l'Ecole de bot. 1815. p. 85.?

Cult. None of the species of *Tournefórtia* are worth cultivating for ornament; therefore the species are only to be seen

in botanical gardens. They are of the most easy culture, and are readily increased by cuttings under a hand-glass, in heat. *T. Sibírica*, being a rare, nearly hardy plant, should be grown in a pot, and placed among other alpine plants.

XLIII. MESSERSCHMI'DTIA (in honour of Daniel Gottlieb Messerschmidt, a traveller in Siberia.) Rœm. et Schultes, syst. 4. p. li. and p. 541.—Tournefórtia species of authors.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped; throat naked, swollen; segments of the limb usually subulate. Stigma conical. Berry 4-lobed, containing 4 1-seeded nuts, but often fewer by abortion.—Shrubs with the habit of *Tournefórtia*. This genus is principally distinguished from *Tournefórtia* by the berry containing 4 1-seeded nuts, instead of 2 2-seeded nuts. Berries generally white.

§ 1. *Segments of corolla linear-subulate. Berry 4-lobed; each lobe containing a 1-celled, 1-seeded nut. Embryo arched, with the cotyledons at the back of the cell, and the radicle in the front.—Twining shrubs.*

1 M. VOLU'BILIS (Rœm. et Schultes, syst. 4. p. 841.) branches strigose; leaves ovate, acuminated, nearly glabrous; petioles and peduncles hairy; cymes terminal; spikes much branched; berries hairy; segments of corolla subulate. ♄. ⌒. S. Native of Jamaica, St. Thomas, and Mexico. Tournefórtia volùbilis, Lin. spec. p. 201. Willd. enum. 1. p. 188. Lam. ill. t. 95. f. 2. Tourn. microphýlla, Bert. in Spreng. syst. 1. p. 644.—Sloane, hist. 1. p. 234. t. 143. f. 2.—Plukn. alm. 389. t. 235. f. 6. Branches weak, rufescent. Leaves an inch long, and 3-4 lines broad. Peduncles downy. Corollas greenish-yellow.

Twining Messerschmidtia. Fl. July, Aug. Clt. 1739. Shrub tw.

2 M. SCA'NDENS (Rœm. et Schultes, l. c. p. 542.) glabrous; leaves ovate-oblong, acuminated, reflexed; calyx campanulate, 5-toothed; segments of corolla subulate. ♄. ◡. S. Native of Peru, in groves. Tournefórtia scándens, Willd. enum. 1. p. 188. Tournefórtia volùbilis, Ruiz. et Pav. fl. per. 2. p. 24. t. 148. Tourn. Peruviàna, Poir. suppl. 4. p. 425. Flowers greenish-yellow, or whitish, corymbosely dichotomous. Very nearly allied to the preceding, but is 4 times the size in all its parts.

Climbing Messerschmidtia. Fl. July, Aug. Clt. 1816. Shrub climbing.

3 M. PANICULA'TA; branches obsoletely angled, downy at top; leaves ovate, rounded at the base, acuminated and acute at the apex, rather downy on both surfaces; panicles terminal, large, bractless, pyramidal, erect, decompound. ♄. S. Native of tropical Brazil, Sello. Tournefórtia paniculàta, Cham. et Schlecht, in Linnæa, 4. p. 468. This species differs from *M. scándens* in its downiness; in the pyrenæ being 1-seeded; and in the ample panicle. Calyxes downy and ciliated, acute.

Panicled-flowered Messerschmidtia. Shrub erect?

4 M. SUBSE'SSILIS (Cham. in Linnæa, 8. p. 118. under *Tournefórtia)* branches obsoletely angular, or nearly terete; leaves on short petioles, roundish or long, ovate, subcordate, acutely acuminated, glabrous and smooth above, and inconspicuously strigose beneath, with reflexed edges; panicles clothed with rufescent, velvety strigæ, composed of short, dense-flowered spikes; calyxes sessile, somewhat immersed in the dilated rachis. ♄. ⌒.? S. Native of Brazil, Sello. Nearly allied to *M. paniculàta* and *M. scándens*. Branches strigose at top. Calycine segments narrow, acute. Drupe glabrous; one or two of the pyrenæ usually abortive.

Subsessile-flowered Messerschmidtia. Shrub twining?

5 M. SERI'CEA (Rœm. et Schultes, l. c.) branches cinereous from villi at top; leaves ovate-lanceolate, clothed with silky tomentum beneath; spikes lateral and terminal, dichotomous, panicled; segments of corolla setaceous. ♄. ◡. S. Native of the Islands of Mont Serrat, St. Domingo and Jamaica. Tournefórtia serícea, Vahl, eclog. 1. p. 17. Willd. spec. 1. p. 749. Tourn. incàna, Lam., and Tourn. canéscens, Willd. ex herb. Balb.—Frùtex Marcgr. hist. p. 78. Habit of *M. volùbilis*. Leaves 1½ inch long, acute, glabrous above. Peduncles villous. Corollas small, villous outside.

Silky Messerschmidtia. Shrub climbing.

6 M. SYRINGÆFÒLIA (Rœm. et Schultes, l. c.) branches, petioles, ribs of leaves on both surfaces, veins beneath, and peduncles villous; leaves subcordate-ovate, acuminated, glabrous, except the nerves and veins; peduncles terminal, many times forked; spikes downy; segments of the corolla very narrow, somewhat setaceous. ♄. S. Native of Cayenne. Tournefórtia syringæfòlia, Vahl, symb. 2. p. 23. Willd. spec. 1. p. 792. Leaves 2 inches long, almost like those of *Syringa vulgàris*. Corolla villous outside.

Lilac-leaved Messerschmidtia. Shrub climbing? or erect?

7 M. PSILOSTA'CHYA; twining; branches terete, glabrous, but while young downy; leaves oblong, acuminated, acute at the base, strigose on both surfaces; peduncles terminal, usually of 5 spikes; calyx strigosely downy, one half shorter than the tube of the corolla; segments of corolla subulate. ♄. ⌒. S. Native on the shores of the Pacific, near the Port of Guayaquil. Tournefórtia psilostàchya, H. B. et Kunth, nov. gen. amer. 3. p. 78. Tourn. tristàchya, Willd. herb. no. 3433. Leaves 2 or 2½ inches long, and 1 broad. Peduncles downy. Spikes filiform, 1 to 1½ inch long. Corolla downy outside, with an inflated throat; stigma subconical.

Naked-spiked Messerschmidtia. Shrub twining.

8 M. FLORIBU'NDA; scandent; branches terete, clothed with hoary tomentum; leaves ovate-oblong, acuminated, rounded at the base, clothed with fine pubescence above, and hoary tomentum beneath; peduncles lateral, dichotomously multifid, of many spikes; calyx tomentose, one half shorter than the tube of the corolla; segments of the corolla linear-subulate: berries glabrous. ♄. ◡. S. Native of New Andalusia, near Cumana and Cumanacoa; also of Brazil. Tournefórtia floribúnda, H. B. et Kunth, nov. gen. amer. 3. p. 79. Willd. herb. no. 3434. Peduncles tomentose, bearing 20-24 filiform spikes, which are 3-4 inches long. Calycine segments ovate-lanceolate, acuminately subulate. Corolla downy outside.

Bundle-flowered Messerschmidtia. Clt. 1828. Shrub climbing.

9 M. VELUTÌNA; scandent, clothed with hoary tomentum all over; branches terete; leaves ovate-oblong, acuminated, rounded at the base, white beneath; peduncles terminal, dichotomously panicled, of many spikes; calyx villous, twice shorter than the tube of the corolla; berries hispid. ♄. ◡. S. Native of Mexico, near Acapulco. Tournefórtia velutìna, H. B. et Kunth, nov. gen. amer. 3. p. 79. t. 201. Leaves about 3 inches long, with an obtuse acumen. Spikes about 10 on each peduncle, filiform, about 3 inches long. This is a very elegant species.

Velvety Messerschmidtia. Shrub climbing.

10 M. PUNCTA'TA (Spreng. new entd. 3. p. 2.) stem scandent; leaves oblong, attenuated at both ends, ciliated, beset with white dots above, but smooth beneath; spikes panicled, axillary, dichotomous. ♄. ◡. S. Native of Martinico. Tournefórtia punctàta, Spreng. syst. 1. p. 643. Tourn. scándens, Sieb. mart. no. 63. Lobes of corolla unknown. Perhaps the same as *M. psilostàchya*.

Dotted-leaved Messerschmidtia. Shrub climbing.

11 M. umbella'ta; young branches angular, downy; leaves lanceolate-oblong, acute, narrowed at the base, undulated, beset with fine strigæ on both surfaces; peduncles terminal, of about 7 spikes; spikes subumbellate; calyxes downy, about equal in length to the tube of the corolla; segments of corolla linear, revolute. ♄. ◡. S. Native of Mexico, near Campeachy, along the shore. Tournefórtia umbellàta, H. B. et Kunth, nov. gen. amer. 3. p. 79. Leaves 2-4 inches long. Peduncles downy. Spikes linear, 2-3 inches long, spreading. Calycine segments linear-lanceolate.

Umbellate-spiked Messerschmidtia. Shrub climbing.

12 M. laurifòlia (Rœm. et Schultes, syst. 4. p. 543.) twining, glabrous; branches terete; leaves ovate-oblong, acute, repand, glabrous; petioles geniculated; peduncles terminal, bifurcate; spikes cymose; calyx glabrous, twice shorter than the tube of the corolla; segments of the corolla ovate, elongated at top, very acute. ♄. ◠. S. Native of Porto Rico, and the Island of St. Thomas. Tournefórtia laurifòlia, Vent. choix, t. 2. Poir. suppl. 4. p. 425. Leaves deep green above, but paler beneath, finely dotted, 4-6 inches long and 2 broad. Flowers pale yellow. Calycine segments very acute. Hairs on the corolla manifest. Berry glabrous, 4-furrowed.

Laurel-leaved Messerschmidtia. Fl. July. Clt. 1819. Shrub twining.

13 M. Mille'ri (Rœm. et Schultes, syst. 4. p. 544.) twining; leaves cordate, hairy; spikes racemose, reflexed. ♄. ◠. S. Native of Jamaica. Tournefórtia scándens, Mill. dict. no. 4. Poir. dict. 5. p. 360. Pittònia scándens racemòsa, flore fusco, Houst. mss. Leaves rather thin, 3 inches long, and 1½ broad, acute, on short petioles. Spikes slender. Flowers dirty brown. Berry small, fleshy, containing 4 1-seeded nuts.

Miller's Messerschmidtia. Shrub twining.

14 M. e'legans; leaves petiolate, from ovate-elliptic to lanceolate, attenuated at both ends, long-acuminated, downy from short scattered hairs on both surfaces; panicles terminal, with cymose branches; lower cymes generally bifid; the common peduncles furnished with a leaf; limb of corolla 5-cleft, expanded. ♄. S. Native of Brazil, Sello. Tournefórtia élegans, Cham. et Schlecht, in Linnæa, 4. p. 469. and 8. p. 118. Branches obsoletely angular, downy at top. Calyx minute, with narrow, acute, pilose, and erectly ciliated segments. Corolla tubularly salver-shaped, downy outside, with a slender tube and expanded segments, which are narrow-acute, from a broader base; having the sinuses intraplicate. Anthers a little exserted. Drupe 4-sided, depressed; pyrenæ spheroid, chartaceous, 1-seeded.

Elegant Messerschmidtia. Shrub.

15 M. piliòchros; stem scandent; leaves lanceolate, petiolate, rather villous above, and clothed with white wool beneath; spikes terminal, dichotomously panicled, divaricate; fruit scabrous. ♄. ◡. S. Native of Jamaica. Tournefórtia piliòchros, Spreng. syst. 1. p. 644. Flowers white?

Yellow-haired Messerschmidtia. Shrub climbing.

16 M. tomentòsa; stem twining; leaves cordate, oblong, green above, and very soft, but clothed with white stellate tomentum beneath; spikes short, dichotomous, divaricate, tomentose. ♄. ◠. S. Native of America, about Carthagena. Tournefórtia tomentòsa, Mill. dict. no. 4. Leaves 2 inches long. Flowers small, dirty white; lobes of corolla unknown. Berry containing 2-3, but usually 4 nuts.

Tomentose Messerschmidtia. Shrub twining.

17 M. corymbòsa; stem scandent; leaves oblong, attenuated at both ends, veiny, glabrous; spikes paniculately corymbose, coarctate, elongated, many-flowered; tube of corolla elongated: segments of the limb acuminated. ♄. ◡. S. Native of tropical America. Tournefórtia corymbòsa, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 540. Spreng. syst. 1. p. 644.

Corymbose Messerschmidtia. Shrub climbing.

18 M. ferrugi'nea; stem twining a little; leaves subcordate, ovate, acuminated, acute, entire, thickish, rather villous on both surfaces, green above; spikes terminal, branched, corymbose, clothed with rusty villi: branches short; corolla short, tubular: segments unknown. ♄. ◠. S. Native of St. Domingo. Tournefórtia ferrugínea, Lam. ill. no. 1882. Branches terete, striated, beset with rusty stiff hairs. Leaves 2-3 inches long, and an inch broad. Peduncles much branched, villous; spikes short. Flowers unilateral. Calyx scabrous, villous.

Rusty Messerschmidtia. Shrub twining.

§ 2. *Segments of the corolla short. Berry even, roundish, containing* 4 1-*celled*, 1-*seeded nuts. Embryo straight, with a superior radicle. Erect trees or shrubs.*

19 M. hirsuti'ssima (Rœm. et Schultes, syst. 4. p. 541.) branches terete, hispid; leaves ovate-oblong, acuminated, narrow at the base, hispid above, strigosely pubescent beneath; peduncles terminal and axillary, dichotomous, of many spikes; calyx one half shorter than the tube of the corolla, and are, as well as the berries, hispid; limb of corolla plicate, having the segments short, ovate, and acute. ♄. S. Native of America, especially near Cumana and Bordones; and of the Island of St. Thomas. Tournefórtia hirsutíssima, Swartz, obs. p. 56. Willd. spec. 1. p. 791. H. B. et Kunth, nov. gen. amer. 3. p. 80. Tourn. corymbòsa, Sieb. pl. trin. no. 439. Cordìa pellìta, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 800. Ehrètia cymòsa, Willd. herb. no. 4529. Pittònia hirsutíssima et ramosíssima, baccis albis, Plum. gen. 5. icon. 209. Heliotropii flore frutex baccifer ramosus, folio rugoso fœtido, &c. Sloane, jam. 173. hist. 2. p. 108. t. 212. f. 1. Leaves about 4 inches long. Peduncles hispid. Spikes linear, diffuse. "Berry 4-celled, bipartible; cells 1-seeded," ex Kunth, l. c. "Ovate, containing 4 1-seeded nuts," ex R. Br. prod. p. 496. Embryo straight, with a superior radicle.

Var. β, mìnus (Lam. ill. no. 1873.) smaller, hairy; spikes shorter. ♄. S. Native of South America. Stems nearly terete. Leaves pale green, nearly glabrous; fruit roundish, containing 4 oval-oblong nuts.

Very hairy Messerschmidtia. Fl. May, July. Clt. 1818. Tree 10 to 20 feet.

20 M. polysta'chya (Rœm. et Schultes, syst. 4. p. 542.) branches angular, compressed while young; leaves ovate, acute, wrinkled, hairy; peduncles terminal and lateral, corymbosely dichotomous, composed of loose spikes. ♄. S. Native of Peru. Tournefórtia polystàchya, Ruiz. et Pav. fl. per. 2. p. 24. t. 149. f. a. Leaves 4-5 inches long, and 3 broad. Corollas white; tube green, exceeding the calyx. Berry white, containing 4 1-seeded nuts.

Many-spiked Messerschmidtia. Shrub.

21 M. longifòlia (Rœm. et Schultes, syst. 4. p. 543.) branches angular, channelled; leaves oblong-lanceolate, oblique, very veiny, with subrevolute edges; peduncles corymbose, terminal; spikes few-flowered. ♄. S. Native of Peru, in woods. Tournefórtia longifòlia, Ruiz. et Pav. fl. per. 2. p. 25. t. 150. f. b. Shrub glabrous, very like in habit a large species of *Sýmphytum*. Leaves a foot long. Berry containing 4 trigonal nuts.

Long-leaved Messerschmidtia. Shrub or tree.

† *Species doubtful or hardly known.*

22 M.? MONTA'NA (Lour. coch. p. 122. ed. Willd. 1. p. 150. under *Tournefórtia*) branches scandent, hairy; leaves ovate-lanceolate, wrinkled, glabrous; spikes nearly simple, recurved, terminal. ♄. ⏑. G. Native of Cochinchina, in mountain woods. Leaves incurved, reflexed, on short petioles. Flowers pedicellate. Corolla white; tube urceolate at the base; limb acutely 5-cleft. Anthers and stigma sessile. Berry inversely pear-shaped, 2-celled, 2-seeded, imperforated at top.

Mountain Messerschmidtia. Shrub climbing.

23 M.? ROSMARINIFÒLIA (Willd. herb. ex Rœm. et Schultes, syst. 4. p. 844.) stem branched, herbaceous, hispid from villi; leaves sessile, linear, with revolute edges; corollas funnel-shaped. ♃. F. Native of Siberia, Pallas. Lower leaves alternate: superior ones opposite: uppermost ones aggregate, pilose above, and clothed with white villi beneath. Cymes terminal, few-flowered. Calyx one half shorter than the corolla; calycine segments acute, villous. Tube of corolla downy; limb 5-parted, spreading. Fruit elliptic, globose, woody, striated, tomentose, 2-celled.

Rosemary-leaved Messerschmidtia. Pl. ½ foot.

24 M. MÌNOR; stem erect; leaves lanceolate-linear, obtuse, scabrous; spikes bifid, few-flowered. ♄. S. Native of Jamaica. Tournefórtia minùta, Bertero, ex Spreng. syst. 1. p. 644.

Smaller Messerschmidtia. Shrub small.

Cult. For culture and propagation see *Tournefórtia*, p. 369.

XLIV. CANA'LA (named in honour of Joseph Count Malabaila de Canal, Chamberlain, and one of the Privy Council to the King of Bavaria, a promoter of botany.) Pohl, pl. bras. 2. p. 62.

Lin. syst. *Pentándria, Monogy'nia.* Calyx 5-parted. Corolla tubularly ventricose, 5-toothed, constricted at the base into a short tube. Stamens inclosed; anthers sagittate. Style inclosed; stigma capitate, warted. Nuts 2, combined, stony, roundish. Seeds 4 in each cell.—Small shrubs. Leaves ovate or oblong, opposite, entire. Spikes axillary and terminal, unilateral, revolute at apex, bracteate. Flowers beautiful pure red or scarlet. The species have the habit of *Spigèlia.*

1 C. HELIOTROPIOI'DES (Pohl, pl. bras. 2. p. 63. t. 142.) leaves ovate, beset with stellate hairs above, and yellowish tomentum beneath; corolla 5-toothed; calyx beset with stellate hairs. ♄. S. Native of Brazil, in the province of Minas Geraes, in fields about Villa St. Joao d'el Rey. Flowers large, scarlet.

Turnsole-like Canala. Pl. 2 feet.

2 C. MACROCA'RPA (Pohl, l. c. p. 64.) leaves oblong, acute, glabrous above, and rather pilose beneath; corolla 5-toothed; calyxes pilose. ♄. S. Native of Brazil, about Rio Janeiro.

Large-fruited Canala. Shrub 2 feet.

3 C. RUBIÆFÒLIA (Pohl, l. c. p. 65.) leaves twin: superior ones 4 in a whorl, lanceolate, acuminated, and are, as well as the calyxes, glabrous; corolla 5-toothed. ♄. S. Native of Brazil, in the province of Goyaz, on Mount Clara, and on Serra de Cristaes.

Rubia-leaved Canala. Shrub 2 feet?

Cult. For culture and propagation see *Tournefórtia*, p. 369. All the species are extremely elegant when in blossom.

Additional Boragineous plants.

1 Merte'nsia alpìna; smoothish; stem simple, assurgent; leaves ovate-spatulate: lower ones acute: superior ones acuminated, rather pilose above, minutely ciliated on the margins; flowers in terminal fascicles, on short pedicels; corolla hardly twice as long as the calyx; calycine segments oblong, bluntish, ciliated. ♃. H. Native of the Rocky Mountains. Pulmonària alpìna, Torrey, in ann. lyc. 2. p. 224. Corolla sub-campanulate, with 5 minute scales in the throat; border 5-lobed; lobes obtuse. Stamens inclosed; anthers linear-oblong. This species is said to be nearly allied to *M. parviflòra.*

Alpine Mertensia. Pl. ½ foot assurgent.

2 Merte'nsia ciliа'ta; glabrous, erect? leaves ovate-lanceolate, attenuated at both ends, with ciliated margins; flowers fasciculately-panicled, pedicellate; corolla tubularly campanulate; calyx short, 5-parted, with ovate-obtuse segments. ♃. H. Native of the Rocky Mountains, in the crevices of rocks along streams. Pulmonària ciliàta, James, cat. ex Torrey, ann. lyc. 2. p. 224. Stems smooth, simple. Leaves dotted above. Corolla blue; border erect, 5-lobed; tube slightly ventricose; throat partially closed by 5 yellowish protuberances. Stamens inclosed; anthers linear. Allied to *M. paniculàta.*

Ciliated-leaved Mertensia. Pl. 1 foot.

3 Merte'nsia oblongifòlia; smooth; stem simple, erect; leaves lanceolate-oblong, bluntish: superior ones acute; flowers panicled, pedicellate; calyx short, with linear, acute, ciliated segments; corolla tubularly campanulate. ♃. H. Native of North America, towards the sources of the Columbia river. Pulmonària oblongifòlia, Nutt. in journ. acad. nat. sc. phil. 7. p. 43. Leaves all more or less pubescent above: upper ones sessile. Panicle formed of axillary approximate clusters of flowers. Corolla bright blue, similar to those of *M. Virgínica*, except in size; the lobes obtuse.

Oblong-leaved Mertensia. Pl. ½ to ¾ foot.

4 Ba'tschia pilòsa; simple, pilosely hairy; leaves linear, acuminated, sessile, approximate; flowers fascicled, sessile, small, yellow; segments of the corolla oblong, entire. ♃. H. Native of North America, at Flat Head river. Lithospérmum pilòsum, Nutt. in journ. acad. nat. sc. phil. 7. p. 43. Leaves almost hoary, strigosely pubescent. The flowers sessile, and similar to other species of the genus. Stem clothed with brown scales at the base, which gradually become the leaves as they ascend the stem.

Pilose Puccoon. Pl. ½ to ¾ foot.

5 Ba'tschia Torre'yi; plant strigosely hispid; leaves oblong-linear, bluntish, scattered; stem dwarf, branched; fascicles terminal, few-flowered; lobes of corolla oblong, entire. ♃. H. Native of North America, at Flat Head river; and of the Rocky Mountains. Lithospérmum decúmbens, Torrey, in ann. lyc. 2. p. 225, but not of Nutt. Lithospérmum Torrèyi, Nutt. l. c. Stem a span high, without any brown scales. Leaves less crowded than in the preceding; the stem at length branched, and not near so hairy. Segments of the calyx linear, a little shorter than the tube of the corolla.

Torrey's Batschia. Pl. ½ to ⅝ foot.

6 Nònea sórdida (Fisch. et Meyer. sem. cat. hort. petrop. 1836. p. 43.) annual, diffuse, clothed with glandular down, intermixed with stiff strigæ or bristles; leaves lanceolate, acute, a little toothed; tube of corolla 3 times shorter than the calyx, and hardly longer than the campanulate limb; carpels downy, depressed, sub-plicate at the base, and entire. ☉. H. Native of the eastern shore of the Caspian Sea. Very nearly allied to *N. pícta.* Corolla dirty, yellowish-red.

Dirty-flowered Nonea. Fl.? Clt. 1836. Pl. diffuse.

7 Myosòtis Califórnica (Fisch. et Meyer. sem. cat. hort. petrop. 1836. p. 42.) annual, strigose, much branched, procumbent; leaves linear, acute, ciliated; racemes elongated, leafy at

the base; pedicels very short; calyxes rather longer than the corolla, spreading in the fruit-bearing state; carpels wrinkled. ⊙. H. Native of New California, about the Russian colony, Ross. Corolla white, with 10 yellow glands at the throat; segments of the limb roundish, hardly emarginate. Very nearly allied to *M. Chorisiàna*, Cham.; but differs in the flowers being nearly sessile.

Californian Scorpion-grass. Fl.? Clt. 1836. Pl. ½ foot.

8 Myosòtis suffruticòsa (Torrey, in ann. lyc. 2. p. 225.) stem suffruticose, much branched, hairy; leaves linear-lanceolate, hispidly pilose; spikes terminal, numerous; flowers pedicellate; calyxes closed; nuts smooth, depressed. ♄. H. Native of North America, in barren deserts along the river Platte. Flowers unilateral, on short pedicels. Corolla as large as that of *M. palustris*, blue, salver-shaped; lobes obtuse, entire. This is the only frutescent species.

Suffruticose Scorpion Grass. Shrub ½ to ¾ foot.

9 Echinospe'rmum leioca'rpum (Fisch. et Meyer. cat. sem. hort. petrop. 1836. p. 36.) annual, branched, diffuse, rather hoary from erectly spreading hairs; leaves rather linear, obtuse; racemes leafy; fructiferous calyx closed; carpels unarmed, very smooth. ⊙. H. Native of New California, about the Russian colony, Ross. Flowers minute, white, with small yellow scales in the throat. This species differs from others in habit, and the closed calyx and smooth carpels.

Smooth-fruited Echinospermum. Fl.? Clt. 1836. Pl. ½ foot.

10 Echinospe'rmum Szovitsia'num (Fisch. et Meyer. sem. cat. hort. petrop. 1836. p. 36.) annual, hairy from spreading pili; leaves linear-lanceolate; racemes leafy; calyxes oblique, spreading while bearing the fruit, shorter than the spreading thickened pedicels; corollas length of calyx; carpels tubercled on the disk and sides, and furnished with a single row of glochidate prickles along the margins, which are dilated at the base, and often connate. ⊙. H. Native of the North of Persia, on the edges of fields. Very nearly allied to *E. mínimum;* but the prickles on the fruit are fewer, a little shorter, broader at the base, and often connate.

Szovits's Echinospermum. Fl.? Clt. 1836. Pl. ½ foot.

11 Echinospe'rmum pa'tens; strigosely pilose; leaves oblong-linear, bluntish; stem simple, nearly naked; floriferous branches spreading; flowers pedicellate, loose. ♃. H. Native of North America, at Flat Head river. Rochèlia pàtens, Nutt. in journ. acad. nat. sc. phil. 7. p. 43. Radical leaves on long petioles; those of the stem remote and sessile. Flowers in all respects almost similar to those of *Myosòtis scorpioìdes;* rather large, and apparently red. Calycine segments small, linear, obtuse. Nuts wrinkled.

Spreading Echinospermum. Pl.?

XLV. PLAGIOBO'TRYS (from πλαγιος, *plagios*, transverse; and βοθρυς, *bothrys*, a pit; in reference to the pits at the base of the carpels being transverse, and not longitudinal.) Fisch. et Meyer. cat. sem. hort. petrop. 1836. p. 46.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped; throat closed by 5 inclosed plicæ. Stamens inclosed. Stigma capitate, 2-lobed. Carpels 4, distinct, nearly ovate, 1-celled; having the insertion of the areola lateral, perforated; receptacle elevated, hemispherical. This genus is distinguished from *Lithospérmum* in the carpels being perforated, and the receptacle elevated; from *Anchùsa* and *Myosòtis*, in the lateral insertion of the areola; as well as in the elevated receptacle; and from *Cynoglóssum* and *Echinospérmum*, in the carpels being perforated.

1 P. rufe'scens (Fisch. et Meyer. l. c.) ⊙. H. Native of Chili.—An annual herb, with the habit of *Lithospérmum arvénse*, beset with spreading simple hairs. Leaves scattered, nearly linear, bluntish. Racemes terminal, conjugate, almost leafless. Flowers almost sessile, erect. Calyx beset with rufous hairs, conniving while bearing the fruit. Corolla white. Carpels very like those of *E'chium*, rugose, tubercled, marked by a lateral circular areola. Cotyledons flat, nearly orbicular, undivided.

Rufescent Plagiobothrys. Fl.? Clt. 1836. Pl. 1 foot.

Cult. For culture and propagation see *Amsínckia*, below.

XLVI. CRYPTA'NTHA (from κρυπτος, *cryptos*, hidden; and ανθος, *anthos*, a flower.) Lehm. sem. hort. hamb. 1832.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft, with ovate or lanceolate segments. Corolla funnel-shaped, shorter than the calyx; throat naked? Stamens inclosed. Carpels 4, 1-seeded, tubercled or nearly smooth, fixed to the bottom of the calyx, imperforated at the base?—Annual plants, with the habit of *Echinospérmum.*

1 C. glomera'ta (Lehm. ex Fisch. et Meyer, sem. cat. hort. petrop. 1836. p. 35.) leaves ovate-lanceolate, bluntish; calycine segments ovate; carpels obsoletely tubercled, or nearly smooth. ⊙. H. Native of Chili. Leaves pale green, broader than those of *C. microcárpa.*

Glomerate-flowered Cryptantha. Fl.? Clt. 1836. Pl.

2 C. microca'rpa (Fisch. et Meyer, l. c. p. 35.) leaves lanceolate, acute; calycine segments linear-lanceolate; carpels rough from acute tubercles. ⊙. H. Native of Chili. Lithospérmum clandestìnum, Trev. Echinospérmum cynoglossoìdes, Hort, but not of Lehm. Herb glaucescent. Carpels minute.

Small-fruited Cryptantha. Fl.? Clt. 1836. Pl. ½ foot.

Cult. For culture and propagation see *Amsínckia*, below.

XLVII. AMSI'NCKIA (meaning unknown to us.) Lehm. delect. sem. hort. hamb. 1831-2.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted; segments linear, gibbous. Corolla funnel-shaped; segments of the limb equal, roundish; throat naked. Stamens inclosed. Stigma capitate, emarginate. Nuts 4, 1-seeded, fixed to the bottom of the calyx, imperforated and ovate at the base, gibbous outside, conniving at top, wrinkled from tubercles.

1 A. lycopsoìdes (Lehm. l. c. Fisch. et Meyer, sem. cat. hort, petrop. 1836. p. 26.) throat of corolla bearded; limb 3 times shorter than the tube; stamens inserted a little above the base of the tube. ⊙. H. Native of America. Tube of corolla 3½ lines long. Limb 2 lines in diameter.

Lycopsis-like Amsinckia. Fl. June, July. Clt. 1836. Pl. ½ foot.

2 A. angustifòlia (Lehm. l. c. 1832. Fisch. et Meyer, l. c.) throat of corolla glabrous, naked; limb twice shorter than the tube; stamens inserted in the throat of the corolla. ⊙. H. Native of Chili. A. parviflòra, Bernh. sem. hort. erf. 1833. Lithospérmum calycìnum, Moris, enum. sem. hort. Taur. 1831, and in mem. acad. Torino, 37. p. 108. t. 22. Tube of corolla hardly 2 lines long; limb hardly 2 lines in diameter. This differs from the preceding in the smaller flowers, and distinct insertion of the stamens.

Narrow-leaved Amsinckia. Fl.? Clt. 1836. Pl. ½ foot.

3 A. interme'dia (Fisch. et Meyer, l. c.) throat of corolla glabrous, naked; limb rather shorter than the tube; stamens inserted in the throat of the corolla. ⊙. H. Native of New California, about the Russian colony, Ross. Tube of corolla 1½ lines long; limb nearly 3 lines in diameter, orange yellow, painted with 5 deeper spots. An intermediate species between

A. lycopsoides, and *A. spectábilis*. It differs from the first in the insertion of the stamens, and from the second in the corolla being smaller, and especially in the throat not being half closed by inclosed plicæ.

Intermediate Amsinckia. Fl.? Clt. 1836. Pl. ½ foot.

4 A. spectabilis (Fisch. et Meyer, l. c.) throat of corolla glabrous, half closed by thrust-in plicæ; limb length of tube: stamens inserted in the throat of the corolla. ⊙. H. Native of New California, about the Russian colony, Ross. Corolla beautiful yellow; limb 6 inches in diameter, furnished with 5 plicæ at the throat, which are similar to scales.

Showy Amsinckia. Fl. Clt. 1836. Pl. ½ foot.

Cult. The seeds of these plants only require to be sown in the open ground about the beginning of May in a dry, warm, sheltered situation. None of them are worth cultivation, except in botanical gardens.

Order CLXVII. CORDIA'CEÆ (the plants contained in this order agree with *Córdia* in the drupaceous fruit, and bifid or dichotomous style.)

Calyx 5-cleft, or 4-5-toothed. Corolla funnel-shaped; throat naked; limb 5-10-lobed. Stamens equal in number to the segments of the corolla, exserted or inclosed. Style semi-bifid, or dichotomous; stigmas obtuse. Berry or a drupe containing 2 2-celled, 2-seeded nuts, or 4 1-celled, 1-seeded nuts, or a 4-celled putamen, which is sometimes only 1-2-celled from abortion, partly or altogether covered by the calyx. Cotyledons plicate.—Trees or shrubs. Leaves entire, serrated, or cut. Inflorescence terminal, panicled, or corymbose, or spicate, usually bractless.

This order was formerly united with *Boragíneæ*, from which its habit, plaited cotyledons, and divided style, separate it. Little is known of the properties of the plants contained in it, except that the flesh of the fruit is emollient and mucilaginous. The nuts of *Córdia Sebestèna* are sometimes employed as laxatives.

Synopsis of the genera.

Tribe I.

Cordie'æ. Style [illegible]chotomous. Fruit drupaceous.

1. Córdia. Calyx 4-10-toothed. Limb of corolla 4-10-cleft. Stigmas 4. Drupe containing a 4-celled putamen, which is sometimes 1-3-celled by abortion.

2 Patagonu'la. Calyx 4-parted. Limb of corolla 4-cleft. Stigmas 4?. Drupe containing a 4-celled putamen.

Tribe II.

Ehretia'ceæ. Style semi-bifid; stigmas 2, obtuse. Berry containing 2-4, 2-celled, 2-seeded nuts, or 4, 1-celled, 1-seeded nuts. Cotyledons plicate?

3 Ehre'tia. Calyx 5-cleft. Corolla funnel-shaped, with a 5-lobed limb, and a naked throat. Stamens exserted. Berry containing 2 2-celled, 2-seeded nuts.

4 Beurre'ria. All as in *Ehrètia*, except that the berry contains 4 2-celled, 2-seeded nuts.

5 Corte'sia. Calyx 10-toothed. Corolla funnel-shaped; limb spreading, 5-lobed. Stamens 5, exserted. Style bifid at apex; stigmas peltately globose. Drupe containing 2 1-seeded? nuts.

6 Carmòna. Calyx 5-parted. Corolla campanulate, or rotate; limb 5-6-cleft. Stamens 5-6, inclosed. Styles 2, capillary; stigmas simple. Drupe containing a 5-6-celled putamen.

7 Lutróstylis. Calyx 5-parted. Corolla funnel-shaped, 5-cleft. Stamens a little shorter than the corolla. Styles 2, short; stigmas sub-capitate. Drupe small, containing 4 1-seeded nuts.

8 Rha'bdia. Calyx 5-parted. Corolla campanulate, 5-cleft. Stamens inclosed. Style simple; stigma 2-lobed. Drupe containing 4 1-seeded pyrenæ or nuts.

9 Morelòsia. Calyx 5-cleft. Corolla rotate, 5-cleft. Stamens exserted. Style forked; stigmas 2, capitate. Drupe containing a 4-celled, 4-seeded putamen.

Tribe III.

Erimata'leæ. Style hardly any. Stigma large, discoid, 5-grooved. Drupe containing only one 1-seeded nut.

10 Erysìbe. Calyx 5-parted. Corolla salver-shaped, 5-parted; segments of the limb bifid.

† *A genus not known whether belonging to the present order.*

11 Rochefórtia. Calyx 5-parted. Corolla funnel-shaped; limb spreading. Stamens inserted in the recesses between the lobes of the corolla. Styles 2, subulate; stigmas simple. Fruit globose, 2-celled; cells containing numerous angular seeds.

I. CO'RDIA (named after Euricius Cordius, whose true name was Henricus Urbanus, and Valerius his son, German botanists of the 16th century.) Plum. gen. 14. Lin. gen. no. 256. Schreb. gen. no. 350. Juss. gen. p. 128. ed. Usteri. p. 143. Gærtn. fruct. 1. t. 76. R. Br. prod. p. 498. Cordàna, Ruiz. et Pav. fl. per. 2. p. 47. t. 184. Sebestèna, Dill. elth. t. 255.

Lin. syst. *Tetra-Pentándria, Tretragýnia.* Calyx tubular, usually 5, rarely 3-4-6-10-toothed. Corolla funnel-shaped; limb from 4 to 10-cleft, but usually 5-cleft. Stamens equal in number to the divisions of the corolla. Style dichotomous; stigmas 4. Drupe partly or wholly covered by the calyx, containing a 4-celled putamen, which is sometimes only 1-3-celled by abortion. Cotyledons plicate.—Trees or shrubs. Leaves quite entire, or cut. Inflorescence terminal, panicled, corymbose, or spicate, bractless.

Sect. I. Sebeste'næ. Calyxes and fruit smooth. Inflorescence corymbose, or panicled. Segments of calyx acute. Throat of corolla glabrous. Flowers large.

1 C. Ru'mphii (Blum. bijdr. p. 843.) leaves on long petioles, ovate-oblong, acuminated, attenuated at the base, nearly equal, somewhat repand, smoothish above, but downy in the axils of the nerves beneath; corymbs length of petioles; segments of calyx without furrows, tridentate, tomentose inside. ♄. S. Native of the Moluccas. Novélla nìgra, Rumph. amb. 2. p. 226. t. 75. Allied to *C. Sebestèna*. Corollas orange-red.

Rumphius's Cordia. Fl. Aug. Sept. Tree.

2 C. dichótoma (Forst. prod. no. 110. R. Br. l. c.) leaves ovate, a little toothed, glabrous; cymes opposite the leaves,

pedunculate; flowers tetramerous; calyxes campanulate, and are, as well as the fruit, smooth. ♄. S. Native of New Holland, within the tropic.

Dichotomous Cordia. Clt. 1824. Tree 30 feet.

3 C. Sebeste'na (Jacq. amer. 42. ed. 2d. t. 44. Lin. spec. ed. 1. p. 1073.) leaves ovate, acute, or elliptic, quite entire, hispid, scabrous above; peduncles terminal, corymbose; calyx smooth, clothed with hispid tomentum; limb of corolla 7-cleft, with a glabrous throat. ♄. S. Native of Cuba, about the Havanna, St. Domingo, &c. Andr. bot. rep. t. 157. Curt. bot. mag. t. 794. Tratt. tab. t. 354. Lam. ill. no. 1898. t. 96. f. 1. C. juglandifòlia,, Jacq. amer. 43. C. speciòsa, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 799.—Plenck, icon. t. 115. —Plum. gen. 13. icon. 105.—Sloan, jam. 2. p. 20. t. 164. Branches glabrous in the adult state, but clothed with hispid tomentum while young. Leaves 4-5 inches long, rather unequal at the base. Calyx 2-6-toothed; teeth bluntish. Corolla funnel-shaped, orange coloured, or tawny yellow; limb spreading, 5-7 parted, with crenately undulated edges. Stamens exserted, glabrous. The young leaves are serrated, the full grown ones hardly repand, and the upper certainly quite entire. A small piece of the wood put on a pan of lighted coals will perfume the whole house with a most agreeable smell. The flower in Jacquin's figure is coloured like that of the bloody-wallflower. Browne says that the flower in the Jamaica plant is scarlet. Said by Cham. to be very nearly allied to *C. Abyssínica*.

Sebestena Cordia. Fl. June, Aug. Clt. 1728. Tree 10 to 35 feet.

4 C. Dille'nii (Spreng. syst. 1. p. 649.) leaves ovate-oblong, acutish, repandly serrated, scabrous on both surfaces; peduncles terminal, sub-corymbose; calyx tridentate; segments of corolla usually 7, roundish, undulated; stigmas revolute. ♄. S. Native of the Bahama Islands. C. Sebestèna, Willd. spec. 1. p. 1076.—Dill. elth, p. 341. t. 255. f. 331.—Catesb. car. p. 2. t. 91. Corolla orange-coloured or scarlet. Stamens exserted.

Dillenius's Cordia. Fl. June, July. Clt. 1728. Tree 10 to 30 feet.

5 C. læ'vis (Jacq. hort. schoenbr. 1. p. 39. t. 40.) leaves ovate, acuminated, smooth, repand; racemes short, branched; calyx glabrous, tubular, smooth; corolla wrinkled, with a 6-7-cleft, large spreading limb; stamens 6-7. ♄. S. Native about Caraccas. Habit of *Sebestèna*. Leaves shining above, 9 inches long. Corolla orange-red; segments semi-oval. Stamens exserted.

Smooth Cordia. Fl. June, Aug. Clt. 1826. Tree 14 to 20 feet.

6 C. Africa'na (Lam. ill. no. 1896.) leaves roundish, oval, entire, obtuse; panicles terminal; calyx turbinate; drupe containing a triquetrous putamen. ♄. S. Native of Abyssinia, Bruce. C. Sebestèna, β, Poir. suppl. 7. p. 45. C. Abyssínica, Salt. trav. p. 475, where there is also a species named *C. ovàlis*, but without any diagnosis. Wanzey Bruce, trav. 5. p. 54. t. 17. French. ed. p. 70. Perhaps the Sebestèna of Alpini. Branches inclinate. Leaves dark green, paler beneath. Corolla white. Stigma dark, bifid or trifid. Fruit at first soft and green, but at length bony and wrinkled.

African Cordia. Tree 18 to 20 feet.

7 C. subcorda'ta (Lam. ill. 1. p. 421. no. 1699.) leaves ovate subcordate, on long petioles, repand, acute, smooth; panicles lateral; calyx, stamens, and pistil almost like those of *C. Sebestèna;* corolla campanulate; drupe ovate, dry, hid in the calyx. ♄. S. Native of the East Indies, in various parts, Sandwich Islands, and of New Holland, within the tropic, &c. C. orientàlis, R. Br. prod. p. 498. C. campanulàta, Roxb. fl. ind. 2. p. 336. C. Rúmphii, Blum. bijdr. p. 843.? C. Sebestèna, Forst. prod. p. 18. no. 108. C. hexándra, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 799. Novella nìgra, Rumph. amb. 2. p. 226. t. 75.? Corolla large, white, suffused with red segments, 6-7, roundish, spreading. Calyx like that of a species of *Diánthus*. Stamens length of the tube of the corolla.

Subcordate-leaved Cordia. Tree.

8 C. latifòlia (Wall. cat. no. 893.) leaves broad, ovate-roundish, glabrous, with 5 nerves running from the base; panicles terminal and lateral, dichotomous; calyx smooth, cup-shaped, unequally toothed; drupe large, ovate, acuminated, surrounded by the calyx at the base. ♄. S. Native of Silhet. Flowers large.

Broad-leaved Cordia. Tree.

9 C. deca'ndra (Hook. et Arn. in Beech. voy. pt. bot. p. 38. t. 10.) leaves linear-lanceolate, attenuated, scabrous, sessile, with revolute edges, hoary from down; flowers disposed in a terminal leafy corymb; calyx 10-toothed, clothed with black down; corolla 10-lobed; stamens 10, inclosed. ♄. G. Native of Chili, about Coquimbo. Tops of branches scabrous. Flowers large, very showy white, fragrant. Stamens inclosed, pilose at the base. Capsule size of a filbert, covered by the calyx. The wood of this tree is very extensively employed in the production of charcoal, whence it is called *Carbon*, and likewise for fuel for smelting copper, as the withered stems of *Cáctus* are for refining metal.

Decandrous Cordia. Shrub 8 to 10 feet.

10 C. supe'rba (Cham. et Schlecht in Linnæa, 4. p. 474. and 8. p. 123.) leaves cuneate-oblong, to oblong-elliptic, acuminated, acute, toothed in front, glabrous above, except the nerves, which are strigose, but beset with short hairs beneath; cymes at first terminal, then lateral, pedunculate; calyx clavately tubular, irregularly cut at top, or with lacerated lobes, smooth; corolla campanulately funnel-shaped, 5-lobed: lobes roundish and acuminated. ♄. S. Native of Brazil, within the tropic, Sello. Young branches angular, scabrous from dense stiff short hairs. Leaves form of the leaflets of the horse-chestnut, firm and opaque, the largest $6\frac{1}{2}$ inches long, and $2\frac{1}{2}$ broad. Branches of cyme angular, compressed, and are, as well as the calyxes, scabrous from short dense stiff hairs. Flowers large, showy. Corolla glabrous, having the tube length of calyx, and the limb campanulate. Stamens 5, inclosed, hairy at the base. Stigmas lamellate.

Var. α, cuneàta (Cham. et Schlecht, l. c.) leaves cuneate, oblong.

Var. β, elliptica (Cham. et Schlecht, l. c.) leaves elliptic, obtuse at the base, and rounded, $8\frac{1}{2}$ inches long, and $4\frac{1}{2}$ broad.

Superb Cordia. Tree.

11 C. gla'bra (Cham. in Linnæa, 8. p. 124.) tops of branches, inflorescence, and petioles scabrous from small bristles, or stiff hairs, the rest glabrous; branches cinereous, terete; leaves scattered, opposite, and 3 in a whorl, on short petioles, lanceolate, narrowed at both ends, somewhat acuminated, acute, 6 inches long, membranous, flat; cymes scorpioid, terminal, but at length lateral; corolla campanulately funnel-shaped, glabrous. ♄. S. Native of Brazil, Sello. Leaves truncate and semi-erose, or sinuated on the margins. Cymes bifid or trifid. Corolla $1\frac{1}{2}$ inch long. Drupe inclosed, truncate at top.

Glabrous Cordia. Tree.

12 C. Molucca'na (Roxb. fl. ind. 2. p. 337.) leaves on long petioles, ovate-cordate, obtuse, entire, smooth; panicles axillary and terminal, shorter than the leaves; calyx gibbous, hairy inside; drupe pointed, and nearly hid in the calyx, containing a 4-celled nut. ♄. S. Native of the Moluccas. This species is often tetrandrous. The filaments are short and very hairy,

as is also the rim round the mouth of the gibbous tube of the corolla where they are inserted. Size of flowers not mentioned by Roxburgh.

Moluccas Cordia. Tree.

13 C. tomentòsa (Wall. in Roxb. fl. ind. 2. p. 339.) leaves round-ovate, more or less cordate at the base, repand, entire, smooth above, but very soft and tomentose beneath; calyx ovate, villous within. ♄. S. Native of the East Indies. C. oblìqua, var. Heyne, herb. The densely tomentose, soft, acute leaves distinguish this species from *C. Myxa*, of which *C. oblìqua*, Willd. is probably only a variety. *C. doméstica*, Roth, comes very near to this, but differs in the figure and comparative smoothness of the leaves. The flowers are largish.

Tomentose Cordia. Tree.

14 C. Collocócca (Lin. spec. 274.) leaves oblong-ovate, quite entire; corymbs loose, terminal, somewhat panicled; calyx tomentose inside. ♄. S. Native of Jamaica. C. glàbra, Lin. spec. ed. 1st. p. 191. Collocóccus foliis rugosis, &c. Browne, jam. p. 167.—Sloane, jam. p. 169. hist. 2. p. 95. t. 203. f. 2.—Plukn. phyt. t. 158. f. 1.? Leaves attenuated at the base, acuminated, wrinkled, nearly glabrous. Branches of corymb unequal. Corolla middle-sized, with deep green segments. Drupe red, clammy, villous, containing a wrinkled, lacunose putamen. Turkeys and other poultry feed much upon the fruit; the pulp is sweetish, and of a clammy consistence. In Jamaica it has the name of *Clammy-cherry* and *Turkey-berry tree*, ex Browne.

Neck-fruited Cordia. Fl.? Clt. 1759. Tree 20 to 50 feet.

15 C. tetraphy'lla (Aubl. guian. 1. p. 224. t. 88.) leaves obovate, narrowed at the base, 4 in a whorl, entire, glabrous; corymbs lateral, pedunculate; calyx smooth, with 5 acute teeth; drupe olive-formed, containing a 1-celled putamen. ♄. S. Native of Guiana, by the sea-side. Lam. ill. no. 1908. Willd. spec. 1. p. 1076. Branches nodose. Leaves nearly sessile, acutish. Corolla white, funnel-shaped: lobes 5, roundish, acutish. Stamens 5, exserted. Drupe yellowish, fleshy, size of an olive.

Four-leaved Cordia. Shrub 6 to 7 feet.

16 C. nodòsa (Lam. ill. no. 1905.) branchlets nodose, hispid; leaves ovate-oblong, acuminated, pilose, usually 3 in a whorl; calyx turbinate, villous, or bearded; corymbs terminal and axillary, hairy, pedunculate; drupe containing a 2-celled putamen. ♄. S. Native of Guiana and Cayenne, in woods. C. collocóccus, Aubl. guian. 1. p. 219. t. 86, but not of Willd. C. hirsùta, Willd. spec. 1. p. 1076. Meyer esseq. p. 114. Leaves sessile, green, pilose on both surfaces. Corymbs beset with rufescent hairs. Calyx 5-toothed, teeth very short. Corolla white, having the tube thickened at the throat. This species differs from *C. collocócca* in the characters given above, and in the narrower leaves; coarctate subumbellate corymbs, not dichotomous and divaricate; and in the white, oblique, acuminated fruit. The stamens are exserted.

Knotted-branched Cordia. Fl. June, July. Clt. 1803. Shrub 6 feet.

17 C. ellíptica (Swartz. prod. p. 47. fl. ind. occ. 1. p. 461.) leaves petiolate, oblong, entire, attenuated at apex, rather coriaceous, glabrous; racemes terminal, dichotomous, compound, diffuse; calyx coriaceous, tubular, glabrous, 2-5-toothed; drupe acuminated, nearly inclosed. ♄. S. Native of Jamaica and St. Domingo. Leaves shining above. Flowers rather large. Corolla white; tube hardly longer than the calyx, gibbous at the base; segments of the limb linear-lanceolate, reflexed. Filaments bearded in the tube of the corolla; anthers glandular at top. Putamen wrinkled.

Elliptic-leaved Cordia. Clt. 1804. Tree 30 to 50 feet.

18 C. aspe'rrima (Spreng. syst. 1. p. 649.) leaves ovate-oblong, obtuse, crenulated, rough from dots above, and hispid and tomentose beneath: floral ones obovate, entire, clothed with fulvous tomentum; peduncles cymose, panicled; calyx campanulate. ♄. S. Native of Brazil.

Very-rough Cordia. Shrub or Tree.

19 C. strigòsa (Spreng. syst. 1. p. 649.) leaves rhomboid, coarsely toothed, strigose on both surfaces; peduncles cymose, elongated; calyx strigose, campanulate, with subulate segments. ♄. S. Native of St. Domingo.

Strigose Cordia. Shrub or Tree.

Sect. II. Micra'nthæ (from μικρος, *micros*, small; and ανθος, *anthos*, a flower. The flowers are small compared with those of the preceding section.) Cham. et Schlecht in Linnæa, 4. p. 476. and 8. p. 124. All as in the preceding section, but the flowers are small.

* *Species natives of America.*

20 C. magnoliæfòlia (Cham. et Schlecht in Linnæa, 4. p. 476.) leaves on short petioles, cuneated at the base, elliptic, acuminated, acute, mucronate, entire, rarely furnished with an accessary tooth near the acumen, rather coriaceous, with reflexed margins, quite glabrous in the adult state, but when young rather strigose, as well as the buds and branches of inflorescence; inflorescence terminal, sessile; panicle subfastigiate, composed of 3-5 tri-dichotomous branches; calyx pilose outside; corolla salver-shaped, glabrous: tube length of calyx: segments narrow-elliptic, obtuse, one-half longer than the tube; drupe size of a cherry. ♄. S. Native of the south of Brazil, Sello. Branches densely leafy, bluntly, many angled from the decurrent insertion of the petioles, pilose at the internodes. Calyx irregularly 3-4-lobed. Stamens much exserted. Stigmas lanceolate. Leaves 9 inches long, and $2\frac{1}{2}$ broad, sometimes somewhat tricuspidate at apex.

Magnolia-leaved Cordia. Tree.

21 C. diospyrifòlia (Cham. et Schlecht, l. c. p. 477.) leaves on short petioles, elliptic or obovate, sometimes oblong, attenuated at the base, and acute, undulated on the margins, bluntly acuminated at the apex, mucronate, rather coriaceous, beset with a few scattered hairs on both surfaces, shining beneath, and more opaque above; panicles expanded, convex, on short or long peduncles, more pilose towards the top; calyx pilose outside and inside, usually 5-cleft; tube of corolla cylindrical; stamens shorter than the segments of the corolla. ♄. S. Native of the south of Brazil, Sello. This species is nearly allied to the preceding, but differs from it in the leaves being smaller, elliptic, or obovate, beset with scattered hairs on both surfaces; in the stamens being about equal in length to the segments of the corolla, not exceeding them.

Date-plum-leaved Cordia. Tree.

22 C. Sellowia'na (Cham. et Schlecht, l. c. p. 478.) leaves on short petioles, ovate, entire, bluntly cuneated at the base, and attenuated at the apex, acuminated, at first downy, in the adult state scabrous and shining above, but clothed with velvety tomentum beneath; inflorescence lateral; cymes large, 3-6 trichotomous and dichotomous, tomentose: calyx campanulate, 5-toothed: teeth acute; corolla salver-shaped, glabrous; stamens much exserted. ♄. S. Native of the south of Brazil. Very nearly allied to *C. macrophýlla*, Lin. and *C. pubéscens*, Willd. herb. Rœm. et Schultes, syst. 4. p. 803. See Desf. ann. mus. 1. p. 205. Branches terete, clothed with rufescent tomentum. Leaves 10 inches long. Corolla having the tube length of calyx; segments shorter, obtuse, reflexed. Stamens villous at the base, as well as the tube of the corolla at their insertion. Ovarium globose, glabrous; style hairy.

Sello's Cordia. Tree.

23 C. HETEROPHY'LLA (Willd. herb. 5474. Cham. et Schlecht, l. c. p. 480.) leaves form of those of *C. pubéscens*, tomentose, as in the preceding species; cymes pedunculate, terminal, lateral, and extra-axillary; calyx narrow, clavate, not globose; corolla narrower: segments short, exceeding the calyx a little; stamens rarely equal in length to the segments of the corolla; throat of corolla and filaments glabrous; ovarium oblong-elliptic, hairy on the top, as in *C. Sellowiàna*. ♄. S. Native of Cayenne.

Various-leaved Cordia. Tree.

24 C. OBSCU'RA (Cham. et Schlecht, in Linnæa, 4. p. 480.) very nearly allied to the preceding, but is distinguished by the nearly sessile, pergamaceous, less silky leaves, which are furnished on both surfaces with more numerous stiff short hairs, with the vascular rete finer, and more prominent on the upper surface; cymes smaller, on shorter peduncles, terminal, lateral, and axillary. ♄. S. Native of Brazil, within the tropic, Sello. Young branches angular, beset with brown hairs, as well as bark. Leaves 2 inches to ½ foot long, and 2½ inches broad. Cymes fastigiate. Calyx downy. Segments of the corolla obtuse, a little shorter than the tube. Stamens exserted, hardly the length of the segments of the corolla, inserted in the throat, where it is very villous.

Obscure Cordia. Tree.

25 C. SALICIFÒLIA (Cham. et Schlecht in Linnæa, 4. p. 481.) leaves thin, firm, hardly pellucid, lanceolate, acuminated, acute, tapering into the petioles; cymes lateral, on short peduncles, nearly sessile, or on long peduncles, erect, sub-fastigiate, beset with short hairs; flowers pedicellate; calyx short, campanulate, irregularly lobed, glabrous outside, but pilose inside; corolla salver-shaped; tube length of calyx; limb 5-cleft; segments reflexed, narrow-elliptic, obtuse, one-half the length of the tube, or a little longer; stamens much exserted, twice as long as the segments of the corolla. ♄. S. Native of the south of Brazil, Sello. Besides the buds, the tops of the inflorescence and branchlets are glabrous. Leaves 5 inches long, and an inch broad.

Willow-leaved Cordia. Tree.

26 C. AMBÍGUA (Cham. in Linnæa, 8. p. 125.) beset with stiff hairs all over, the upper surfaces of the leaves scabrous, and the inflorescence tomentose; branches angular and furrowed; leaves nearly opposite and scattered, 6-8 inches long, firm, membranous, flat, elliptic, drawn out into the petioles at the base, acute, obtuse and few-toothed at the apex, or acuminated, acute, and nearly entire; cymes small, terminal; calyx closed, clavate at first, at length obconically tubular, irregularly 5-toothed; corolla salver-shaped, having the tube dilated upwards, and the segments oblong, length of tube, a little dilated, and undulately plicate at top; drupe half-closed in the calyx. ♄. S. Native of Brazil, Sello. Córdia Anabaptísta, Cham. Very like *C. supérba, var. ellíptica*, but the flowers are much smaller. Stamens exserted. Drupe containing a 3-celled, 3 or 1 seeded putamen.

Ambiguous Cordia. Tree.

27 C. PUBE'SCENS (Willd. herb. ex Rœm. et Schultes, syst. 4. p. 803. Cham. in Linnæa, 8. p. 127, and 4. p. 479.) leaves on short petioles, ovate, or ovate-oblong, somewhat unequal-sided, rounded at the base, and subcordate, drawn out at apex into a fine tail-like acumen; others are nearly orbicular, acutely acuminated, on very short petioles, all are entire and discoloured, when young rather silky and shining above, and strigulose and velvety beneath, when old strigulose above and downy beneath; inflorescence cymosely panicled, sub-fastigiate, loose; calyx with 5 acutish, erect teeth, clothed with velvety tomentum inside; corolla salver-shaped: tube length of calyx: segments obtuse, reflexed; filaments bearded at their insertion, hardly exceeding the segments of the corolla; ovarium hairy at top; stigmas not dilated. ♄. S. Native of Brazil. Branches angular, tomentose, or villous. Leaves 10-12 inches long, and 4-5 broad. Calyx downy outside.

Downy Cordia. Tree.

28 C. CORDIFÒLIA (H. B. et Kunth, nov. gen. 3. p. 70.) leaves oblong, obtuse, cordate, quite entire, glabrous above, and pubescent beneath; corymbs terminal, dichotomous, diffuse; flowers sessile, glomerate; calyx campanulate, downy, smooth, with acute teeth; limb of corolla 5-cleft, with linear, reflexed segments; stamens pilose at the base. ♄. S. Native of the islands in the river Apures, near El. Diamante and Arichuna. Willd. rel. ex Rœm. et Schultes, syst. 4. p. 800. Branches terete, glabrous, white. Leaves 3-4 inches long, and 2 or more broad. Flowers sessile, size of those of *Myòsotis scorpioìdes*. Corollas white. Stamens much exserted. Style inclosed.

Heart-leaved Cordia. Tree or Shrub.

29 C. EHRETIOÌDES (Lam. ill. no. 1902.) leaves oblong-ovate, acute at the base, quite entire, glabrous; panicles lateral, shorter than the leaves. ♄. S. Native of Jamaica. C. collocócca, *β*, Poir. dict. 7. p. 42.?—Sloane, hist. 2. t. 203. f. 2. Flowers small. This differs from *C. collocócca* in the leaves not being cordate at the base. Said to be the same as *C. flavéscens*, by Spreng.

Ehretia-like Cordia. Tree.

30 C. FLAVE'SCENS (Aubl. guian. 1. p. 226. t. 89.) leaves oblong, acuminated, quite entire, glabrous; racemes simple, axillary; peduncles very long; calyx deeply divided into 5-6 rounded, acute segments; drupe dry, greenish-yellow, cherry-formed. ♄. S. Native of Guiana and Cayenne, on the edges of fields. C. sarmentòsa, Lam. ill. no. 1907. Stems many, sarmentose. Leaves sub-petiolate, 6-7 inches long, and 3 broad. Corolla yellowish, with rounded lobes. Stamens 5-6, exserted; anthers sagittate.

Yellowish-fruited Cordia. Clt. 1823. Shrub sarmentose, 8 to 9 feet.

31 C. TETRA'NDRA (Aubl. guian. 1. p. 222. t. 87.) leaves ovate, acute, somewhat cordate at the base, rough beneath, and glabrous above; corymbs or cymes terminal; calyx turbinate, with 4 rounded, acute teeth; limb of corolla of 4 rounded, acutish segments; stamens 4, inserted under the divisions of the limb, exserted; drupes small, containing 4 1-seeded nuts. ♄. S. Native of Guiana and Cayenne, on the banks of rivers, and on the sea-shore. Leaves 8-10 inches long, and 3-4 broad, sub-undulated. Cymes like those of *Sambùcus;* peduncles dichotomous. Corolla small, funnel-shaped, green; tube short.

Tetrandrous Cordia. Tree 40 to 50 feet.

32 C. TOQUE'VE (Aubl. guian. 1. p. 228. t. 90.) leaves cordate-ovate, acuminated, entire, villous; corymbs panicled, terminal, racemose; calyx tubular, 5-toothed; corolla with a short tube, and 5 roundish, spreading lobes. ♄. S. Native of Guiana, in woods near Sinemari. The whole plant villous, much branched. Leaves 4-6 inches long, and 3-4 broad. Common peduncles long and villous. Corolla white. Stamens exserted. Drupe oblong, 1-seeded, yellowish. *Toqueve* is the Guiana name of the shrub, ex Aublet.

Toqueve Cordia. Shrub 5 to 6 feet.

33 C. MACROPHY'LLA (Lin. spec. p. 273. Mill. dict. no. 3. Willd. spec. 1. p. 1075.) leaves ovate-oblong, villous, entire, or a little denticulated; racemes corymbose, small, villous; calyx villous, cup-shaped, with 5 obtuse teeth; corolla having the tube villous inside, and the segments of the limb deflexed and curled; drupe reddish, containing a 2-celled, 2-seeded putamen. ♄. S. Native of the Antilles, Jamaica, Porto Rico, St.

Domingo, &c. Lam. ill. no. 1901. Desf. ann. mus. 1. p. 205. Red. pict. mus. par. Prùnus racemòsa, &c. Sloane, jam. p. 184. hist. 2. p. 130. t. 221. f. 1. Branches inclinate, bitrifurcate, cinereous, downy, or villous. Leaves on short petioles, 1½ foot long. Racemes girded by 2-3 small leaves from the forks. Drupe size of a pea.

Long-leaved Cordia. Clt. 1752. Tree 40 to 60 feet.

34 C. salvifòlia (Juss. ex Poir. dict. 7. p. 46.) leaves ovate-lanceolate, obtuse, wrinkled, very rough, coriaceous; racemes lateral, small, with villous divisions. ♄. S. Native country unknown, but most probably of some part of tropical America. Branches cinereous, or yellowish, striated, rather downy while young. Leaves petiolate, very firm, beset with copious white dots above, 2 inches long, and 1 inch broad.

Sage-leaved Cordia. Tree or Shrub.

35 C. Domingen'sis (Lam. ill. no. 1900.) leaves ovate, entire, scabrous on both surfaces, whitish beneath; panicles terminal, downy; calyx tubular, with obtuse teeth, rufescent. ♄. S. Native of St. Domingo. Branches angular, very rough, blackish brown, downy at top. Leaves dark green above: upper ones 8-10 inches long, and 4-5 broad. Racemes shorter than the leaves, with short terete scabrous branches. Corolla unknown.

St. Domingo Cordia. Tree or Shrub.

36 C. ? buxifòlia (Juss. ex Poir. dict. 7. p. 45.) leaves coriaceous, ovate-cuneated, entire, nearly sessile, obtuse, scabrous; panicles corymbose, downy, lateral and terminal; calyx short, ovate, tubular, with 5 obtuse lobes. ♄. S. Native country unknown, but probably of some part of tropical America. Habit of *Ehrètia buxifòlia*. Branches terete, grey, glabrous. Leaves numerous, hardly an inch long, beset with copious white dots above. Corolla funnel-shaped, having the tube cylindrical and longer than the calyx, and the limb middle-sized and spreading. Style bifid, each division bearing a solitary capitate stigma, and is therefore probably a species of *Lutrostylis*.

Box-leaved Cordia. Shrub.

37 C. exalta'ta (Lam. ill. no. 1910. Poir. dict. 7. p. 47.) leaves ovate, acute at the base, rough, entire, coriaceous, on very short petioles; corymbs a little longer than the leaves, glabrous, terminal; calyx small, glabrous, campanulate, with 5 small acute teeth; limb of corolla 5-cleft. ♄. S. Native of Guiana, Richard. Branches glabrous, striated. Leaves almost shining above, and paler beneath, 4 inches long, and 2 broad. Branches of corymb diffuse. Pedicels thick, very short, 1-flowered. Drupe globose, size of a pea, containing a 2-celled, 2-seeded putamen.

Tall Cordia. Tree 60 feet.

38 C. nervòsa (Lam. ill. no. 1906. Poir. dict. 7. p. 47.) leaves alternate and opposite, ovate-oblong, acuminated, shining and dark green above, but pale yellow, and rather downy beneath, on short petioles; corymbs glabrous, short; bracteas subulate; calyx glabrous, with short, ovate, bluntish teeth. ♄. S. Native of Guiana, Richard. Nearly allied to *C. flavéscens*, Aubl. Branches scabrous, cinereous, angular. Leaves nearly glabrous, 8-10 inches long, and 4 broad; petioles nodose at the base. Corymb having the first branches somewhat dichotomous, the rest short and thick, rather woody. Corolla and fruit unknown.

Nerved-leaved Cordia. Clt. 1820. Shrub or tree.

39 C. reticula'ta (Vahl. eclog. amer. 3. p. 5.) leaves ovate-oblong, long-acuminated, reticulated, shining, scabrous beneath, and smooth above; racemes terminal, erect, branched, dichotomous, and are, as well as the calyxes, clothed with rusty tomentum; flowers 4-5 at the top of each peduncle, hardly pedicellate; calyx smooth, not striated, campanulate in the fruit-bearing state, trifid, with oblong, obtuse segments; stamens length of corolla; segments of the limb of the corolla oblong, bluntish. ♄. S. Native of Montserrat, Ryan. Branches terete, glabrous, but clothed with rusty tomentum at top. Leaves petiolate, glabrous, shining on both surfaces. Branches of raceme twice dichotomous. Tube of corolla length of calyx. Stigmas dilated, transverse. Drupe obovate, glabrous, larger than a pea.

Reticulated-leaved Cordia. Tree.

40 C. calophy'lla (Vahl. eclog. amer. 3. p. 5.) leaves elliptic-lanceolate, acuminated, quite entire, glabrous, rather coriaceous, smooth above, and rather scabrous beneath; corymbs axillary; calyx smooth, campanulate, 5-toothed. ♄. S. Native of Cayenne, Rohr. Branches angular, glabrous, dichotomous, yellowish. Leaves petiolate, 6-8 inches long, yellowish beneath. Corymbs at the sides of the forks and tops of the branches, with opposite leaves, 3 times longer than the petioles.

Beautiful-leaved Cordia. Tree.

41 C. formica'rum (Rœm. et Schultes, syst. 4. p. 800.) leaves oblong, acuminated, quite entire, scabrous; branches ventricose; corymbs pilose, coarctate. ♄. S. Native of Brazil, in the province of Para. Branches terete, smooth, dilated at the ramifications, hollow in the axils, and forming nests for ants, whence the tree is called *Pao de Formige* by the natives. Leaves nearly sessile, a foot long, and a hand wide, ciliated.

Ants' Cordia. Tree.

42 C. a'spera (Forst. prod. no. 109. Willd. spec. 1. p. 1074.) leaves ovate, acuminated, rough; flowers cymose, wrinkled. ♄. G. Native of the Island of Tongatabu. Forster does not mention the size of the flowers.

Rough Cordia. Tree.

* * *Species natives of Asia.*

43 C. latifòlia (Roxb. fl. ind. 2. p. 230.) leaves roundish, cordate, entire, repand, 3-nerved, smooth above and scabrous beneath; panicles terminal and lateral; flowers polygamous; calyx villous, campanulate, leathery, with an unequally-toothed mouth; corolla short, campanulate, with 5 linear-oblong segments; drupes oblately globose, on a smooth calyx, containing a 1-4-seeded nut. ♄. S. Native of Hindostan. Trunk short, generally crooked, as in *C. Myxa*. Branches spreading and drooping; young shoots smooth and angular. Leaves 3-7 inches long, and rather less in breadth. Panicles roundish. Flowers numerous, small, white. Stamens as long as the segments of the corolla, inserted immediately under the fissure. Drupe about an inch or more in diameter, yellow when ripe; pulp soft, clammy, and is eaten by the natives. Mr. Colebrooke says that the writers on Indian Materia Medica notice two sorts of Sepistan. The first as large as a prune, with its nut immersed in mucilaginous pulp, and separable from it. The second smaller, with its nut adhering to the pulp, (as described by the writers on Materia Medica in Europe,) but with less mucilage, and sweeter than the large one. The rest of the description, he observes, is common to both kinds, the fruit growing in clusters; when ripe yellow, but afterwards turning black. The first, or large sort, is, no doubt, the fruit of the present tree; and the small sort that of *C. Myxa*, which has hitherto been considered in Europe as the only tree that produces this drug. The Arabic and Persian names of *Sepistan* and *Pistan* are applicable to both sorts. Dr. Wallich proposes to give this species the specific name of *C. Sepistàna*, and the West Indian species, now called *Sebestèna*, *C. coccìnea*, Wall. in Roxb. fl. ind. 2. p. 332.

Broad-leaved Sepistan. Tree 8 to 12 feet.

44 C. My'xa (Lin. spec. 273. syst. p. 161. mat. med. t. 67.) leaves oval, ovate, or obovate, repand, smooth above, but rather scabrous beneath; panicles terminal and lateral, globular; flowers polygamous; calyx tubular, widening towards the mouth, and torn as it were into 3-5 divisions; divisions of corolla revolute. ♄. S. Native of the Circars, chiefly in gardens, hedges, &c. near villages; and of Nipaul on Bheempedi. Delile, fl. egypt. p. 47. t. 19. f. 1—2. Vidi-Marum, Rheed. mal. 4. t. 37. Sebéstena officinàlis, Gærtn. fruct. 1. p. 363. t. 76. Córnus sanguínea, Forsk. descr. p. 33. ex Vahl. symb. 1. p. 19. Sebestèna doméstica, or C. officinàlis, Lam. ill. p. 420. no. 1895. t. 96. f. 2. Mýxa, Commel, hort. 1. p. 139. Prùnus Sebestèna, &c. Plukn. alm. 306. t. 217. f. 3. C. doméstica, Roth. Sebestèna doméstica, Prosp. Alp. ægypt. p. 30. Bauh. hist. 1. p. 198. Prùnus Sebestèna Mathìoli, Plukn. alm. p. 306. t. 217. f. 2. Trunk generally crooked. Branches numerous, spreading, and bent in every direction, forming a dense shady head. Leaves 2-3 inches long, and from 1½ to 2 broad. Bracteas none. Calyx not in the least striated. Drupe globular, smooth, size of a cherry, yellow; pulp transparent, viscid, containing a sub-tetragonal, 4-celled nut, which is cordate at both ends; the cells rarely all fertile. The smell of the nut when cut is heavy and disagreeable, the taste of the kernels like that of fresh filberts. The fruit is not used medicinally among the Circars, but when ripe is eaten by the natives: the pulp is of a sweetish taste. The dried fruit is the *Sebestèna* of the Materia Medica. The Telinga name of the tree is *Neckra*, the Hindoostan one *Lusora* or *Lesoora*, and the Bengal name is *Bohoori*. Linnæus erroneously describes this plant as having a 10-striped calyx.

Myxa Sepistan. Clt. 1644. Tree 10 to 15 feet.

45 C. swave'olens (Blum. bijdr. p. 843.) leaves alternate, ovate, or ovate-oblong, bluntish, a little attenuated at the base, nearly equal, quite entire, or somewhat repandly angled, glabrous above, but tomentose in the axils of the nerves beneath; corymbs terminal; flowers spicate, secund; tube of corolla inclosed in the calyx, which is campanulate, without furrows, and downy outside. ♄. S. Native of Java, on the west side, in mountain woods. Allied to *C. I'ndica*, and *C. doméstica*.

Sweet-scented Cordia. Fl. Oct. Tree 40 feet.

46 C. Bantame'nsis (Blum. bijdr. p. 843.) ultimate leaves 3 in a whorl, oval, bluntish, almost quite entire, coriaceous, glabrous above, and tomentose beneath; corymbs terminal, dichotomous, divaricate; calyx without a furrow, 3-5-toothed. ♄. S. Native of Java, near Tjikandie, where it is called *Kandal*.

Bantam Cordia. Fl. Dec. Tree 30 feet.

47 C. Wallíchii; leaves broad, ovate-roundish, triple-nerved, acute, glabrous above, and densely clothed with tomentum beneath; corymbs lateral and terminal, dichotomous; calyx campanulate, downy, irregularly toothed; genitals exserted. ♄. S. Native of the East Indies. Córdia tomentòsa, Wall. cat. no. 897, but not of Cham. Allied to *C. Mýxa*.

Wallich's Cordia. Shrub.

48 C. poly'gama (Roxb. fl. ind. 2. p. 337.) leaves ovate-cordate, entire, scabrous; panicles terminal, in the male more divided; flowers polygamous; the male ones generally tetrandrous; the hermaphrodite ones often pentandrous; filaments in the male flowers as long as the corolla, in the hermaphrodite flowers shorter; calyx narrow, campanulate, 4-5-toothed, villous; corolla funnel-shaped, 4-5-cleft, with linear revolute segments. ♄. S. Native of the mountains of Coromandel. Trunk short. Young shoots terete, scabrous. Leaves from ovate to cordate, entire, or slightly scollop-toothed, when young soft and villous, 1-6 inches long, and about 3-fourths of that broad. Panicles pubescent. Flowers small, white. Drupes oval, size of a black currant, smooth, when ripe yellow, containing a 4-celled putamen; pulp mucilaginous, as in *C. Mýxa*.

Polygamous-flowered Cordia. Tree middle-sized.

49 C. monoíca (Roxb. cor. 1. p. 43. t. 58. Willd. spec. 1. p. 1072.) leaves ovate, toothed, scabrous; corymbs axillary and terminal, with many male flowers; drupe pointed, containing a 4-celled nut; calyx, corolla, and genitals as in the genus. ♄. S. Native chiefly in the Circar forests. Small tree. Leaves about 3 inches long, and 2 broad. Panicles dichotomous, composed of short, recurved, one-ranked spikes. Flowers white. Drupe size of a cherry, yellow, pulpy. Stigmas bifid, acute.

Monœcious-flowered Cordia. Fl. March, April. Clt. 1799. Tree small.

50 C. serra'ta (Juss. ex Roxb. fl. ind. 2. p. 333.) tender parts hairy; leaves ovate-cordate, acuminated, serrated; corymbs lateral; flowers usually octandrous, with from 7 to 9-cleft corolla; calyx sub-cylindrical, 3-5-toothed. ♄. S. Native of Travancore. Branches numerous, spreading in every direction. Leaves rather harsh, with few hairs, 4-6 inches long, and from 2 to 4 broad. Corymbs dichotomous. Flowers white, middle-sized. Corolla with a cylindrical tube, length of calyx; limb about 8-cleft; segments oblong, recurved. Filaments hairy, inserted in the tube of the corolla below its middle. Perhaps the same as *C. serràta*, Juss. ex Poir. dict. 7. p. 41.

Serrated-leaved Cordia. Tree.

51 C. gra'ndis (Roxb. fl. ind. 2. p. 335.) leaves round-cordate, obtuse, entire, scabrous, somewhat triple-nerved; panicles terminal, drooping; flowers tetramerous, tetrandrous; drupe containing a 4-celled nut, 2 or 3 of the cells usually abortive. ♄. S. Native of Chittagong. Córdia oblìqua, Herb. Madr. Leaves rounded, or retuse at the base; the apex acute or obtuse, often remotely toothed. Ramifications of the panicle many times dichotomous, those with the petioles and young leaves are beset with rusty villi. Calyx with an even surface, and 4-toothed mouth. Drupe dirty yellow, smooth, slightly-depressed at apex, half an inch long, supported by the enlarged, many-toothed, striated calyx; pulp gelatinous. Leaves often a foot long. Perhaps belonging to section *Gerascánthus*.

Great-leaved Cordia. Tree.

52 C. angustifòlia (Roxb. fl. ind. 2. p. 238.) leaves nearly opposite, lanceolate, obovate-lanceolate, obtuse, or emarginate, scabrous; panicles terminal, corymbose; flowers tetramerous and tetrandrous; calyx campanulate, obscurely 4-toothed; corolla having the tube longer than the calyx, and the limb of 4 linear revolute divisions. ♄. S. Native of Mysore. C. reticulàta, Roth. nov. spec. 124. Trunk short; branches numerous, spreading in every direction, often drooping. Leaves 4 inches long by one broad. Flowers small, white. Stamens 4, inserted just below the divisions of the corolla. Drupe size of a large pea, round, smooth, yellow; when ripe the pulp is yellow, gelatinous, and pellucid; putamen 4-celled, though seldom more than one of the cells comes to maturity.

Narrow-leaved Cordia. Clt. 1820. Tree 12 to 15 feet.

53 C. acumina'ta (Wall. in Roxb. fl. ind. 2. p. 339.) glabrous, smooth; leaves oblong-ovate, acuminated, entire; corymbs terminal, short, dichotomous; flowers with funnel-shaped corollas, and deeply divided calyxes. ♄. S. Native of Silhet, where it is called *Ramutti*. Córdia refléxa, Rœm. et Schultes, syst. 4. p. 800. Leaves about 5 inches long, smooth. Corymbs oval, rather downy, composed of unilateral spikes of small white flowers. Corolla having the tube twice as long as the calyx; segments of the limb lanceolate, ciliated, recurved, or bent backwards. Stamens elevated above the throat.

Acuminated Cordia. Tree middle-sized.

54 C. oblíqua (Willd. phyt. 1. p. 4. no. 16. t. 4. f. 1.) leaves roundish-cordate, nervosely veined, oblique. ♄. S. Native of the East Indies. Willd. spec. 1. p. 1072. C. Mýxa, γ, Poir. dict. 7. p. 40. Nearly allied to *C. Mýxa*, and probably only a variety of that species. Leaves quite entire, not repand. Calyx not striated. Stamens exserted.

Oblique-leaved Cordia. Clt. 1818. Tree.

55 C. spine'scens (Lin. mant. 206. syst. 230.) leaves ovate, serrated, scabrous above, and tomentose beneath; old petioles permanent, spinescent; racemes axillary, simple or bifid, filiform, length of leaves; calyx campanulate, obsoletely 5-toothed; corolla campanulate, 5-toothed, twice as long as the calyx; stigmas acute. ♄. S. Native of the East Indies. Branches strict, tomentose, rusty. Leaves size of those of the cherry-tree. Fruit sessile, black, size of currants.

Spinescent-petioled Cordia. Clt. 1824. Tree 40 to 60 feet.

56 C. Sine'nsis (Lam. ill. no. 1914. Poir. dict. 7. p. 49.) leaves oblong, obtuse, villous in the axils of the veins; panicles lateral and terminal, shorter than the leaves; calyx glabrous, hardly striated, campanulate, with 4-5 short, obtuse lobes; corolla funnel-shaped, twice as large as the calyx; drupe small, ovate, containing a 2-celled putamen. ♄. G. Native of China. Leaves elliptic, entire, 2-3 inches long. Branches of panicle glabrous, divaricate, dichotomous, usually recurved. Corolla white.

China Cordia. Tree or shrub.

57 C. In'dica (Lam. ill. no. 1913. Poir. dict. 7. p. 49.) leaves ovate, naked, obtuse, or acutish, entire, membranous; panicles terminal and lateral, elongated, composed of short pendulous racemes; flowers on short pedicels; calyx campanulate, with a torn mouth; tube of corolla inclosed; drupe containing a 2-celled nut. ♄. S. Native of the East Indies, Sonnerat. Branches terete, glabrous. Leaves 2-4 inches long, and 2 broad, paler beneath; petioles 1½ inch long. Corolla small, with a short spreading limb. Drupe small, ovate.

Indian Cordia. Tree or shrub.

58 C. panicula'ta (Roth. nov. spec. p. 124.) leaves roundish-ovate, somewhat emarginate at the base, and rather unequal, pilose above on the midrib and veins, entire; panicle terminal, composed of alternate, sub-corymbose branches; flowers sub-secund; calyxes smooth. ♄. S. Native of the East Indies. Leaves obtuse at both ends, quite glabrous beneath. Calyx beset with minute pili. Like most of the species of *Córdia* the calyx increases much in size after florescence, but in substance is coriaceous, and its form more campanulate, inclosing the fruit in the manner of the cup in acorns.

Panicled-flowered Cordia. Tree.

* * * *Species natives of Africa.*

59 C. crena'ta (Delile, fl. ægypt. p. 51. t. 20.) leaves ovate or rhomboid, glabrous on both surfaces, crenately serrated at the apex; cymes terminal; stigmas filiform. ♄. S. Native of Egypt. Cordia Mýxa, Forsk. arab. p. 63. no. 136. Sebestèna sylvéstre, Nep. egypt. 17. t. 8. Branches twiggy. Leaves same colour on both surfaces. Flowers scent of Jasmine. Calyx tubular, 4-5-toothed. Putamen 2-celled; cells 1-seeded.

Crenated-leaved Cordia. Shrub or tree.

60 C. Senegale'nsis (Juss. ex Poir. dict. 7. p. 47.) leaves membranous, ovate, acuminated, glabrous on both surfaces, quite entire, reticulately veined; panicles with short branches, which are hardly longer than the petioles; flowers on short pedicels, tetrandrous; corolla 4-cleft; calyx trifid. ♄. S. Native of Senegal, Adanson. A quite glabrous shrub, with slender, black, terete branches. Leaves alternate, 4-5 inches long, and 3 broad. Probably a distinct genus.

Senegal Cordia. Tree 20 feet.

Sect. II. Gerascanthus (from γηρασκω, *gerasco*, to grow old; and ανθος, *anthos*, a flower; probably in reference to the hoary appearance of the flowers.) Calyx 10-striped, or 10-ribbed. Flowers large, corymbose. Cerdàna, Ruiz. et Pav.

61 C. Gerasca'nthus (Jacq. amer. p. 43. t. 175. f. 16. pict. t. 259. f. 12. Swartz. obs. 86. Lin. spec. 273.) leaves ovate-oblong, acute, quite entire, glabrous; racemes terminal, aggregate; flowers verticillate, sessile; calyx 10-furrowed, 10-striped, downy, 5-toothed; limb of corolla 5-cleft; throat villous; stamens length of corolla. ♄. S. Native of the West Indies, in woods; and of Mexico, near Acapulco. Lam. ill. t. 96. f. 2.—Brown, jam. p. 107. t. 29. f. 3. Leaves unequal at the base, 3-4 inches long. Racemes usually 4 together, 3-4 inches long. Flowers verticillate; whorls distant. Corolla funnel-shaped, white; tube longer than the calyx; lobes of limb roundish. Stamens hardly exserted. There is a variety of this species with hexamerous hexandrous flowers. This is esteemed one of the best timber trees in Jamaica, of which it is a native. The wood is of a dark brown colour, and gently striped; it is tough and elastic, of a fine grain, and easily worked. It is called Spanish elm or Prince wood by the English, and *Bois de chypre* by the French. The leaves of the Jamaica tree are said to be rather scabrous. The plant of Jacquin differs from that of H. B. et Kunth, nov. gen. 3. p. 54. Poir. ency. 7. p. 42. t. 96. f. 2, and Browne, jam. 170. t. 29. f. 3, in the leaves, young branches, and inflorescence being beset with stellate hairs, not glabrous; in the leaves being lanceolate-oblong, acute at both ends, not obtuse at the base; in the stamens being equal in length to the segments of the corolla, not inclosed. We therefore propose to call the plant of Kunth *C. Kúnthei*, should it prove distinct.

Spanish-elm, or Grey Cordia. Fl. May. Clt. 1789. Tree 30 feet.

62 C. gerascanthoìdes (H. B. et Kunth, nov. gen. amer. 3. p. 69.) leaves oblong-lanceolate, acuminated at both ends, quite entire, glabrous, shining above; panicles terminal, spreading; flowers pedicellate, solitary; calyx 10-furrowed, 10-striped, hispid, 2-4-toothed: teeth acute; limb of corolla sub-quinquefid, with a glabrous throat, and roundish lobes. ♄. S. Native of Mexico, about Acapulco. Branches wrinkled, white, glabrous. Panicle clothed with fuscous tomentum. Corolla funnel-shaped, white. Genitals exserted.

Gerascanthus-like Cordia. Tree 30 feet.

63 C. lu'tea (Lam. ill. no. 1897. Poir. dict. 7. p. 45.) leaves ovate, obtuse, crenated above; corymbs lateral and terminal; calyx 10-furrowed, 10-striped, ovate-cylindrical: with 4 ovate, short teeth, having white, scarious margins; corolla funnel-shaped, having the tube length of the calyx, the limb rather large, of 6-8 segments; stamens 8, villous at the base; drupe ovate, acute, containing a 2-4-celled nut. ♄. S. Native of Peru, about Lima and Huanaca. C. Mýxa, Lin. spec. 273. syst. p. 230. mat. med. 67.? Branches glabrous, but downy towards the top. Leaves scabrous on both surfaces, beset with white dots above, when young downy beneath. Corymbs small, clothed with cinereous or yellowish tomentum; peduncles very short. Corolla yellow. Drupe white.

Yellow-flowered Cordia. Tree.

64 C. rotundifòlia (Ruiz. et. Pav. fl. per. 2. p. 24. t. 148. f. a. H. B. et Kunth, nov. gen. 3. p. 70.) leaves roundish-elliptic, obtuse at both ends, a little denticulated, scabrous above, and clothed with hoary tomentum beneath; peduncles dichotomously corymbose, many-flowered; flowers sessile; calyx furrowed, downy; limb of corolla 6-cleft; throat rather

pilose. ♄. S. Native of Peru, in flats at the bottom of the Andes, near Santa and Chala. C. lùtea, Lam. ill. 1. p. 421. no. 1897.? Pavònia lùtea, Dombey, herb.?—Prùnus Sebestèna, Plukn. alm. p. 306.? phyt. t. 217. f. 2.? Young branches villous. Flowers large, sessile, yellow. Corolla funnel-shaped; tube length of calyx; segments ovate, acute. Stamens 5-8, villous at the base. Drupe half inclosed, ovate, acuminated, containing a 5-furrowed, 2-celled putamen. Leaves 2-3 inches long, and 2 broad. Teeth of calyx acute.

Round-leaved Cordia. Tree 15 to 20 feet.

65 C. Cerda'na (Rœm. et Schultes, syst. 4. p. 467.) clothed with stellate down in all parts; leaves oblong and ovate; panicles terminal; stamens equal in length to the segments of the corolla. ♄. S. Native of Peru, in the woods of Pozuzo and Munna. Cerdàna alliodòra, Ruiz et Pav. fl. per. 2. p. 47. t. 184. Pers. ench. 1. p. 167. A tall tree, with fetid bark, smelling of garlic.

Cerdana Cordia. Tree.

66 C. Sellowia'na; leaves large, narrow, ovate, or elliptic, or rather oblong, obtuse, or subcordate at the base, acute, or acuminated at apex, very much wrinkled, scabrous above, and hairy along the midrib, but clothed with soft hairs or pubescence beneath, having the margins reflexed and unequally subsinuated; cymes or corymbs sessile, smaller than the leaves, composed of 3 main branches; branches 2-3 times forked; spikes dense-flowered; calyx tubular, obconical, 10-striped; corolla salver-shaped: tube length of calyx: limb 5-cleft: divisions narrow, elliptic, obtuse, one-half as long as the tube. ♄. S. Native of tropical Brazil, Sello. C. grándis, Cham. et Schlecht in Linnæa, 4. p. 473, but not of Roxb. Branches terete, but clothed with fuscescent hairs, and rather angular and striated while young. Largest leaves almost a foot long, and $4\frac{1}{2}$ inches broad, on short petioles. Calyx 3-5-toothed; teeth roundish, mucronate. Stamens exserted, villous at the base. Fruit not seen.

Sello's Cordia. Tree.

67 C. tomentòsa (Cham. et Schlecht. in Linnæa, 4. p 472.) leaves ovate, or elliptic, to ovate and obovate, rarely oblong, acuminated, acute, usually acute at the base, and drawn out a little into the petioles, rarely obtuse, generally unequal, clothed beneath with dirty, canescent, adpressed tomentum, as well as the young shoots, inflorescence, and calyxes, but beset with a few starry hairs on the upper surface; calyx 4 lines long; limb of corolla 5-cleft: segments rounded at top; stamens about a third part shorter than the segments of the corolla. ♄. S. Native of the South of Brazil, Sello. This species is said to differ from *C. Cerdàna*, in the larger flowers, in the stamens being shorter than the corolla, in the hairs being stellate and much more crowded, in the leaves being broader and shorter, &c. There is also a variety of this with narrower leaves.

Tomentose Cordia. Tree.

68 C. insígnis (Cham. in Linnæa, 8. p. 122.) leaves elliptic and obovate, acuminated, glabrous above, clothed with simple fuscous tomentum beneath, on short petioles; panicles terminal, sub-fastigiate, tomentose; calyx nearly sessile, cylindrical, deeply 10-furrowed, nearly an inch long: teeth unequal; corolla funnel-shaped, with a 5-cleft limb, and rounded, obtuse segments; stamens inclosed in the throat. ♄. S. Native of Brazil, in the province of Minas Geraes, Lhotzky and Sello. Branches irregularly many-angled, smoothish; angles obtuse; bark separating. Largest leaves $7\frac{1}{2}$ inches long, and $3\frac{1}{2}$ broad. Inflorescence somewhat cymose, smaller and denser than in *C. Gerascánthus*, hardly exceeding the leaves. Calyx clothed with velvety tomentum both inside and outside. Corolla with a short tube and wide limb. Stamens villous at the base. Ovarium obpyramidal, with a flattish top.

Showy Cordia. Tree.

69 C. calyptra'ta (Bertero ex Spreng. syst. 1. p. 649.) leaves roundish, sub-attenuated at the base, toothed, rough from dots above, scabrous beneath, veiny; calyx furrowed, truncate; corolla sub-rotate, wide; flowers polygamous. ♄. S. Native of South America, at St. Martha.

Calyptrate Cordia. Shrub or Tree.

70 C. tinifòlia (Willd. herb. no. 457. Rœm. et Schultes, syst. 4. p. 799.) leaves obovate-lanceolate, glabrous; inflorescence capitate; calyxes clothed with simple tomentum; tube of corolla twice as long as the calyx; limb funnel-shaped, 5-lobed: lobes dilated, short, somewhat emarginate; stamens short, inclosed in the throat. ♄. S. Native of South America. Leaves 4 inches long, and $1\frac{1}{2}$ broad. Heads of flowers dense, globose, size of a walnut. Diameter of the limb of the corolla 9 lines. Perhaps only a variety of *C. Gerascánthus*.

Tinus-leaved Cordia. Tree.

71 C.? dubiòsa (Blum. bijdr. 844.) leaves elliptic-oblong, bluntly acuminated, acutish at the base, setaceously serrated; serratures bearded, smooth above, and beset with a few hairs beneath; fructiferous calyx striated, tubular. ♄. S. Native of Java, in the province of Bantam, in the woods of Tjiangassa.

Dubious Cordia. Tree.

72 C. Cujabe'nsis (Manso et Lhotzky, fl. matto-grosso cujab. 2. no. 13.) leaves larger than those of *C. Gerascánthus*, Jacq.; elliptic-lanceolate, acuminated, acute at both ends, clothed with stellate down or tomentum beneath, and rather scabrous above; inflorescence, flowers, and the rest, as in *C. Gerascánthus*, Jacq.; of which it is perhaps only a mere variety. ♄. S. Native of Brazil.

Cujabo Cordia. Tree or shrub.

73 C. Chamissonia'na; leaves petiolate, large, broad-ovate, acute, rather wrinkled, scabrous above, and hairy beneath; panicles axillary, sessile, decompound, exceeding the leaves, having the rachi clothed with fuscous tomentum; calyx short, tubular, subglobose, rather velvety and canescent, obscurely 10-striped, 5-toothed: teeth short, bluntish, beset with silky hairs inside at top; corolla glabrous, salver-shaped, equal in length to the tube of the calyx, with narrow, spreading, or rather reflexed segments; stamens exserted, inserted in the throat of the corolla, which is villous. ♄. S. Native of Brazil, Sello. C. latifòlia, Cham. in Linnæa, 8. p. 126, but not of Roxb. Very nearly allied to *C. grándis*, Cham. in Linnæa, 4. p. 473.

Chamisso's Cordia. Tree.

74 C. denta'ta (Vahl. eclog. amer. 3. p. 5. Poir. dict. 7. p. 48.) leaves ovate-elliptic, acute, denticulated, scabrous above, and downy beneath; corymbs terminal, dichotomous, diffuse; flowers glomerate, sessile; calyx downy, 4-toothed, sulcately striated, with bluntish teeth; limb of corolla 5-cleft; throat pilose. ♄. S. Native of New Andalusia, near Cumana and Bordones, in open places; and of Mexico, near Actopan. H. B. et Kunth, nov. gen. amer. 3. p. 70. Tree much branched; branches terete, hoary. Leaves 2-3 inches long; petioles warted. Corymb downy. Flowers nearly sessile. Corolla funnel-shaped, white. Stamens hardly exserted. Drupe oblong, girded by the calyx at the base, size of a grain of Indian corn, containing a 4-celled putamen, 3 of which are abortive.

Toothed-leaved Cordia. Tree 20 feet.

75 C. scabe'rrima (H. B. et Kunth, nov. gen. amer. 3. p. 71.) leaves oblong, acuminated at both ends, wrinkled, serrated, scabrous on both surfaces; corymbs terminal, dichotomous; flowers sessile, glomerate; calyx striated? hispid. ♄. S. Native of Peru, between Lucarque and Ayavaca, at the altitude of 1300 hexapods. Branches terete, glabrous, but while

young tetragonal and scabrous. Corymb strigose. Corolla white.

Very scabrous Cordia. Tree.

76 C. micra'ntha (Swartz, prod. p. 47. fl. ind. occ. 1. p. 460.) leaves elliptic, acute, entire, membranous, hairy beneath; racemes compound, loose; calyx short, glabrous, striated; stamens exserted. ♄. S. Native of Jamaica, in woods on the mountains. Nearly allied to *C. collocócca;* but the leaves are less attenuated at the base and apex, hispid beneath; racemes small, and flowers much smaller. Branches glabrous, wrinkled, grey. Leaves dark green, and shining above, paler beneath, attenuated at the base, obtuse or acuminated.

Small-flowered Cordia. Fl. ? Clt. 1822. Tree 30 feet.

77 C. læviga'ta (Lam. ill. no. 1912. Poir. dict. 7. p. 46.) leaves ovate, veiny, shining, rather scabrous; panicles lateral and terminal, longer than the leaves, glabrous; calyx glabrous, or rather scabrous, striated; corolla salver-shaped, or subcampanulate; stamens villous at the base, shorter than the corolla. ♄. S. Native of the Antilles ?, Richard. Branches slender, nodose, grey, terete. Leaves roundish, entire, obtuse, or acute, attenuated at the base, rather small, coriaceous, pale beneath. Corollas like those of *Ehrètia tinifòlia;* with the lobes of the limb ovate, obtuse. "Cymes many times dichotomous. Drupe globose," ex Cham.

Smooth Cordia. Shrub or tree.

Sect. III. Varrònia (so named by Browne, from Marcus Tarrentius Varro, a learned Roman, author of a treatise de Re Rustica. He died in the year 27.) Flowers small, glomerate, capitate or spicate, always pentamerous, pentandrous, and hermaphrodiate. Throat of corolla pilose. Calycine segments acute, or subulately setaceous. Leaves on short petioles.—Varrònia, Browne, jam. t. 13. f. 2. Lin. gen. no. 258. Jacq. amer. p. 40.

§. 1. Cymòsæ. Cymes glomerate at the time of florescence, but evolute in the fruit-bearing state. Calycine teeth acute.

78 C. di'scolor (Cham. et Schlecht, in Linnæa, 4. p. 482.) leaves nearly opposite, ovate, obtuse at the base to ovate-lanceolate, acute at the base, or all acute, unequally and coarsely toothed, or almost entire, strigose on both surfaces: the hairs beneath tomentose, fine, adpressed, and of a lurid rust-colour, mixed with strigæ; cymes 2-3 times bifid, nearly capitate; spikes secund, dense; flowers usually pentamerous, rarely tetramerous; calyx obconically campanulate: teeth acute, erect, glabrous inside; corolla campanulately funnel-shaped, bluntly 5-lobed, glabrous outside, villous inside; stamens inclosed. ♄. S. Native of Brazil, within the tropic, at Rio Janeiro, Sello. Branches terete; young shoots tomentose. Largest leaves 2 inches long, and 10 lines broad, equal to the internodes. Cymes strigose. Calyx tomentose outside. Ovarium globose, inclosed in the calyx, 2-celled, having the calycine teeth conniving over its vertex.

Two-coloured-leaved Cordia. Shrub.

79 C. urticifòlia (Cham. et Schlecht, in Linnæa, 4. p. 483.) leaves ovate, subacuminated, acute, obtuse at the base, coarsely, simply, and doubly serrated, hairy beneath, and beset with fewer, shorter pili above, scabrous from short pili along the margins; cymes 2-3 times bifid; calyx cup-shaped or campanulate, hairy, ciliated, glabrous inside, 5-toothed: teeth acute, erect, acuminated; corolla tubularly campanulate; limb bluntly 5-lobed, glabrous outside, and villous inside; stamens inclosed. ♄. S. Native of the South of Brazil, Sello. Young shoots and inflorescence beset with spreading rufescent hairs. Leaves on short petioles, longer than the internodes, 3 inches long, and 1½ broad. Branches axillary, alternate, cymiferous, forming a leafy panicle at the tops of the branches. Corolla 2 lines long. Drupe ovate, inclosed in the calyx, with the top alone free; putamen of drupe usually 1-celled, 1-seeded from abortion.

Nettle-leaved Cordia. Shrub.

80 C. hermanniæfòlia (Cham. et Schlecht, 4. p. 484.) leaves nearly opposite, elliptic or ovate-lanceolate, with the base sometimes obtuse, and sometimes acute; sometimes bluntish, and sometimes acute at the apex, simply, or obsoletely doubly serrated on the margins; serratures acute or obtuse, granular above, and beset with short white strigæ between the nerves, scabrous along the margins, but clothed with longer, softer hairs beneath; cymes terminal, nearly sessile; calyx sub-campanulate, 5-toothed: teeth erect, acute, thicker, and acuminated at apex, glabrous inside; corolla tubularly campanulate, glabrous outside: tube villous inside: limb length of tube, bluntly 5-lobed; stamens villous at the base, inclosed. ♄. S. Native of Brazil. Shrub much branched. Leaves on short petioles, 1½ inch long, and ½ inch broad, larger than the internodes. Branches axillary, cymiferous, each furnished with a leaf. This species comes very near *C. discolor*, but the tomentum and hairs are larger.

Var. β, calycìna (Cham. et Schlecht, l. c. p. 486.) habit more slender and loose; leaves usually alternate, longer and broader, shorter than the internodes; inflorescence more loose; flowers a little larger; teeth of calyx more prolonged; tube of corolla smoothish inside; anthers exserted, exceeding the corolla. ♄. S. Native of Brazil, in humid places; and of Mexico, at Hacienda de La Laguna. Perhaps a proper species.

Hermannia-leaved Cordia. Shrub.

81 C. bifurca'ta (Rœm. et Schultes, syst. 4. p. 466.) leaves alternate, and nearly opposite, ovate-lanceolate, acute, serrated upwards; peduncles umbellately cymose, composed of unilateral, few-flowered, small racemes or spikes; calyx 5-toothed. ♄. S. Native of Peru, in stony places. Varrònia bifurcàta, Ruiz. et Pav. fl. per. 2. p. 24. t. 146. f. a. Desv. journ. bot. 1. p. 280. no. 26. Branches rather angular while young. Leaves on short petioles. Peduncles axillary and terminal. Corolla white, about half the length of the calyx. Stigmas 4, spreading. Drupe ovate, scarlet, half inclosed in the calyx; nuts 1-celled by abortion. Genitals inclosed ?

Bifurcate-corymbed Cordia. Shrub 3 to 4 feet.

82 C. parviflòra; leaves ovate-oblong, serrated; peduncles opposite the leaves, and alternating with them; spikes globose. ♄. S. Native of Peru ? Varrònia parviflòra, Ort. dec. 7. p. 86. Pers. ench. 1. p. 167. Perhaps the same as *C. bifurcàta*.

Small-flowered Cordia. Shrub or tree.

83 C. Loure'iri (Rœm. et Schultes, syst. 4. p. 466.) leaves on short petioles, ovate-lanceolate, quite entire, opposite and alternate, shining; peduncles lateral and terminal, many-flowered; calyx short, 5-cleft; stamens about equal in length to the corolla, inserted in the mouth of the tube. ♄. G. Native of China. Varrònia Sinénsis, Lour. coch. p. 138. ed. Willd. 1. p. 171. Desv. journ. bot. 1. p. 280. no. 27. Calyx subcampanulate. Corolla white, campanulate, with a short thick tube, and a 5-parted limb; segments ovate, spreading, equal. Drupe small, ovate, glabrous, red, acid, edible, containing a 4-celled nut.

Loureiro's Cordia. Tree middle-sized.

84 C. a'lba (Rœm. et Schultes, syst. 4. p. 466.) leaves ovate, toothed, subcordate at the base; cymes ½ a foot in diameter; calyx entire, bursting from which the corolla lies in a horizontal manner; stigmas obtuse. ♄. S. Native of Cura-

çoa, and about Carthagena. Varrònia álba, Jacq. amer. p. 41. ed. pict. p. 25. Desv. journ. bot. 1. p. 280. no. 28.—Commel. hort. 1. p. 155. t. 86.—Calabùra álba, Plukn. phyt. t. 152. f. 4. A tree with a tufted head; trunk half a *foot* in diameter; but shrubby in the hedges. Leaves 4-5 inches long, ovate, or roundish-ovate. Flowers white. Limb of corolla campanulate. Drupe large, oblong, whitish, subpellucid; pulp white, sweet, clammy; nut striated, oblong, blackish, Jacq.

White-fruited Cordia. Clt. 1820. Tree 30 feet.

§ 2. Dasyce'phalæ. Spikes capitate, globose. Throat of corolla pilose.

* *Calycine teeth acute.*

85 C. Mariquite'nsis (H. B. et Kunth, nov. gen. amer. 3. p. 75.) leaves nearly sessile, lanceolate, remotely and crenately serrated towards the apex, wrinkled, scabrous above, and clothed with rusty tomentum beneath; spikes subglobose, lateral, pedunculate; calyx strigose; throat of corolla pilose; stamens exserted. ♄. S. Native of New Granada, betwixt the towns of Honda and Mariquita, in rocky places. Varrònia lanceolàta, Willd. herb. no. 4546. fol. 2. Branches terete, glabrous, brown. Leaves on short petioles, nearly opposite, acuminated, acute at the base, 1 to $1\frac{1}{2}$ inches long. Spikes sometimes bifid, size of a pea. Corolla funnel-shaped, twice as long as the calyx. Drupe ovate-obtuse, half covered by the calyx, glabrous.

Mariquito Cordia. Shrub.

86 C. pa'tens (H. B. et Kunth, nov. gen. amer. 3. p. 75.) leaves ovate, acuminated, rounded at the base, remotely and sharply denticulated, scabrous from strigæ above, but clothed with fuscescent tomentum beneath; spikes globose, axillary and terminal, on long peduncles, spreading; calyx hispid from strigæ; throat of corolla villous; stamens exserted. ♄. S. Native of New Andalusia, in temperate places betwixt Guanaguana and the monastery of Caripe, at the altitude of 400 hexapods; as well as of Brazil. Young branches terete, densely clothed with fuscescent hairs, as well as the petioles and peduncles. Leaves 3 inches, and longer, on short petioles. Corolla funnel-shaped, white, twice as long as the calyx; limb nearly entire. Spikes size of a sloe. Drupe unknown.

Var. α, monocéphala (Cham. et Schlecht, in Linnæa, 4. p. 486.) head of flowers always solitary. ♄. S. Native of Brazil, within the tropic, Sello.

Var. β, polycéphala (Cham. et Schlecht, l. c.) heads of flowers usually by threes, the lateral 2 approximating the terminal one, on short peduncles. ♄. S. Native of tropical Brazil, Sello. Stamens hardly exserted. Drupe glabrous, covered by the calyx, but with the vertex free.

Spreading Cordia. Tree 15 feet.

87 C. serratifòlia (H. B. et Kunth, l. c. p. 76.) leaves oblong, acuminated, narrowly cuneated at the base, sharply and coarsely serrated, scabrous above, pubescent and canescent beneath; spikes globose, lateral, pedunculate; calyx strigose; throat of corolla pilose; stamens exserted. ♄. S. Native of Mexico, near Campeche. Branches terete, clothed with hair-like down. Leaves petiolate, about 3 inches long. Spikes size of a pea. Peduncles downy. Corolla funnel-shaped, white. Drupe not seen.

Serrated-leaved Cordia. Tree or shrub.

88 C. lanceola'ta (Desv. in journ. bot. 1. p. 277. under *Varrònia*. H. B. et Kunth, nov. gen. 3. p. 75.) leaves nearly sessile, lanceolate, crenately-serrated, wrinkled, hispid above, but clothed with hoary pubescence or tomentum beneath; spikes globose, pedunculate, lateral; calyx strigose; stamens exserted? ♄. S. Native of New Granada, near the city of Honda. Branches terete, hispid from strigæ. Leaves on short petioles, entire at the base, 1 inch long, and 2-3 lines broad. Spikes globose, size of a large pea. Peduncles downy. Calyx campanulate, clothed with hoary tomentum. Drupe globose, glabrous, inclosed in the calyx, 1-celled, 1-seeded.

Lanceolate-leaved Cordia. Tree or shrub.

89 C. lìma (Desv. journ. bot. 1. p. 278. no. 24. under *Varrònia*) leaves ovate, obscurely toothed, scrobiculate, pubescent beneath; spikes capitate, few-flowered, on short peduncles. ♄. S. Native of St. Domingo.

Rasp-leaved Cordia. Tree or shrub.

90 C. linea'ta (Desv. l. c. p. 278. no. 23. under *Varrònia*) leaves lanceolate-linear, acuminated, serrated, tomentose beneath, scabrous above; spikes pedunculate, lateral and axillary; peduncles elongated, adnate to the petioles, naked. ♄. S. Native of Jamaica. Varrònia lineàta, Lin. amœn. acad. 5. p. 394. Swartz, obs. p. 87. Varrònia polycéphala, Lam. ill. no. 1887.? ex Poir. dict. 4. p. 263. no. 2. Varrònia corymbòsa, Desf. tabl. jard. par. 171. Lantàna corymbòsa, Lin. spec. p. 628. —Plukn. alm. p. 395. t. 328. f. 5. Branches rather pilose. Leaves on short petioles, serrated by some crenatures. Spikes globose. Peduncles rather villous. Corolla funnel-shaped.

Lined Cordia. Clt. 1793. Shrub or tree.

91 C. hu'milis; leaves roundish, equal; fruit 2-seeded. ♄. S. Native of Carthagena. Varrònia hùmilis, Jacq. amer. p. 41.—Brown, jam. p. 172. t. 13. f. 2. This is a very doubtful species. Corolla tubular.

Dwarf Cordia. Shrub 4 feet.

92 C. villòsa (Spreng. syst. 1. p. 654.) leaves oblong, obtuse, lined with veins, clothed with white villi on both surfaces, undulately crenated; heads terminal, few-flowered, on short peduncles. ♄. S. Native of St. Domingo, Bertero.

Villous Cordia. Shrub or tree.

93 C. ra'dula (Spreng. syst. 1. p. 654.) leaves oblong, obtuse, attenuated at the base, stiff, wrinkled, hispid, shining above; heads few-flowered, nearly sessile, axillary; calyx hispid. ♄. S. Native of Hispaniola. Varrònia scabérrima, Bertero.

Rasp-leaved Cordia. Shrub or tree.

94 C. guazumæfòlia (Rœm. et Schultes, syst. 4. p. 463.) hairy; leaves ovate-lanceolate, on short petioles, acute, toothed, entire at the base, and rather oblique, hairy beneath, wrinkled, and very veiny; heads pedunculate, few-flowered, sub-corymbose. ♄. S. Native of Brazil. Varrònia, Desv. in journ. bot. 1. p. 276. no. 20. Branches alternate, terete, downy. Corolla tubularly funnel-shaped. Teeth of calyx very short.

Guazuma-leaved Cordia. Shrub or tree.

95 C. crena'ta (Rœm. et Schultes, syst. 4. p. 463.) stem much branched, fuscous; leaves ovate-roundish, crenated, veiny, wrinkled, canescent beneath, rather hairy on both surfaces, but most so beneath; peduncles lateral, generally 4-flowered; flowers capitate, loose; stamens exserted? ♄. S. Native of Peru. Varrònia crenàta, Ruiz. et Pav. fl. per. 2. p. 22. t. 146. f. b. Desv. journ. bot. 1. p. 276. no. 19. Córdia lantanoìdes, Spreng. syst. 1. p. 653. Habit of a species of *Lantàna*. Branches spreading, terete, rather hairy while young. Leaves obtuse, on short petioles. Peduncles a little longer than the leaves. Calyx downy, blackish outside, and white inside. Corolla white, plicate, a little longer than the calyx. Stigmas elongated. Drupe red, ovate, girded by the calyx to the middle, containing a 1-celled, rarely 2-celled putamen.

Crenated-leaved Cordia. Shrub 6 feet.

96 C. corymbòsa; scabrous; leaves ovate-lanceolate, sca-

brous, entire at the base, serrated at top; spikes globular, few-flowered, disposed in a corymbose or cymose manner; calyx villous, elongated; corolla campanulate; stamens inclosed. ♄. S. Native about Caraccas. Varrònia corymbòsa, Desv. in journ. bot. 1. p. 275. no. 18. Schrad. new journ. 4. p. 80. Varrònia monospérma, Jacq. hort. schoenbr. 1. t. 39. Willd. spec. 1. p. 1081. Varrònia ulmifòlia, Dum. Cours. bot. cult. 2. p. 148. Córdia monospérma, Rœm. et Schultes, syst. 4. p. 463. Varrònia polycéphala, Lam. ex Spreng. Córdia ulmifòlia, Spreng. syst. 1. p. 653. Branches terete, brownish-green. Leaves on short petioles, acute, deep green, 4 inches long. Peduncles terminal, bifid, trifid, about an inch long. Corolla dirty white, twice as long as the calyx; limb unequal, divided into many teeth. Stamens usually 6. Stigmas elongated, flat. Drupe roundish, size of a pea, shining, deep red, containing an ovate, rough, brown 1-celled nut, ex Jacq.

Corymbose-flowered Cordia. Clt. 1800. Shrub 12 feet.

* * *Calycine teeth long, subulately setaceous. Throat of corolla pilose.*

97 C. dasyce'phala (Rœm. et Schultes, syst. 4. p. 462.) leaves ovate-oblong, acuminated, narrowed at the base, coarsely serrated, hispid from strigæ on both surfaces; heads terminal, pedunculate; calyx tubular, glabrous: with subulately setaceous pilose teeth; throat of corolla pilose; stamens exserted? ♄. S. Native of New Andalusia, near Bordones and Cumana, in humid places, where it is called by the natives *Bretonica*. Varrònia dasycéphala, Desv. journ. bot. 1. p. 274. no. 15. Córdia sphærocéphala, Humb. in Rœm. et Schultes, syst. 4. p. 801. Branches terete, warted, strigose while young. Leaves petiolate, 2 inches long. Heads of flowers round, size of a cherry. Corolla funnel-shaped, with emarginate lobes. Very nearly allied to *C. globòsa*.

Thick-headed Cordia. Shrub or tree.

98 C. globòsa (Rœm. et Schultes, syst. 4. p. 464.) leaves ovate-oblong, obtuse, deeply serrated, stiff, hispid from strigæ on both surfaces, but softer beneath; heads globose, pedunculate, lateral; calyx strigose: with subulately-setaceous teeth; corolla funnel-shaped; throat of corolla pilose; stamens exserted. ♄. S. Native of Cuba, near Regla and Havana; as well as of Jamaica, and other of the West India Islands. H. B. et Kunth, nov. gen. amer. 3. p. 76. Varrònia globòsa, Lin. spec. 274. Jacq. amer. p. 41. Lam. ill. no. 1889. t. 95. f. 4. exclusive of var. β. Varrònia bullàta, Lin. spec. 274. Jacq. amer. pict. 4. t. 43. Swartz, obs. 48. Desv. journ. bot. 1. p. 274. no. 14. Córdia bullàta, Rœm. et Schultes, syst. 4. p. 462. Córdia pilulífera, Rœm. et Schultes, syst. 4. p. 801. Varrònia pilulífera, Willd. herb.—Sloane, hist. 2. t. 194. f. 2. Varrònia fruticòsa, Browne, jam. t. 13. f. 2. "Stems dichotomous. Peduncles naked from the forks of the stem," ex Lin. According to Jacquin, it agrees with *C. Martinicénsis* in many points, but differs from it in the globosity of the heads of flowers; in the segments of the corolla being emarginate, and in the blunt quadruple stigma.

Globose-headed Cordia. Fl. Aug. Clt. 1818. Shrub.

99 C. mirabiloi'des (Rœm. et Schultes, syst. 4. p. 465.) leaves ovate-oblong, on short petioles, hispid from strigæ on both surfaces, serrated; petioles inflexed and articulated at the base; heads of flowers roundish, simple or compound, pedunculate; calycine segments ovate at the base, ending each in a long setaceous point; corolla salver-shaped; stamens exserted. ♄. S. Native of St. Domingo, in hedges, in the vicinity of Porto Prince. Varrònia mirabiloìdes, Jacq. amer. p. 41. t. 33. Lam. ill. no. 1886. Swartz, prod. p. 48. fl. ind. occ. 1. p. 465. Varrònia geniculàta, Pers. ench. 1. p. 167. Varrònia bullàta, Cent. amer. 1. t. 55. ex Desv. journ. bot. 1. p. 278. no. 25. Tournefórtia serràta, Lin. spec. 201.—Plum. gen. 5. icon. 228. f. 1. and β. gen. 5. t. 228. f. 2. Leaves 2 inches long. Flowers size and figure of *Mirábilis Jálapa*, white. Limb of corolla flat, 5-rayed. Drupe size of a pea, covered by sweet clammy pulp. Stigmas subulate, obtuse. Perhaps the same as *C. globòsa*, or a variety of it.

Mirabilis-like Cordia. Fl. Sept. Clt. 1798. Tree 3-6 feet.

100 C. Bonplandia'na (H. B. et Kunth, nov. gen. amer. 3. p. 77.) leaves ovate, acuminated, narrowed at the base, doubly crenated, scabrous from papillæ above, but pilosely tomentose and hoary beneath; heads on short peduncles, axillary and lateral, crowded at the tops of the branches; calyx hairy; calycine teeth subulately setaceous; stamens exserted. ♄. S. Native of the shore of Caraccas, near Porto Cabello. Varrònia globulífera, Willd. herb. no. 4541. C. Bonplándii, Rœm. et Schultes, syst. 4. p. 462. Varrònia Bonplándii, Desv. journ. bot. 1. p. 275. no. 16. Branches hispid, terete. Leaves petiolate, 3-4 inches long. Heads of flowers size of a small cherry. Peduncles hispid. Calyx campanulate. Corolla funnel-shaped, white; limb nearly entire. This is a very elegant plant.

Bonpland's Cordia. Tree.

101 C. grandiflòra (H. B. et Kunth, nov. gen. amer. 3. p. 77. Rœm. et Schultes, syst. 4. p. 461.) leaves ovate, acuminated, narrowed at the base, serrated, clothed with silky strigæ above, and dense fuscescent pili beneath; heads globose, on long peduncles, lateral; calyx clothed with silky strigæ, with subulately setaceous teeth; stamens inclosed. ♄. S. Native of tropical America, on the sandy banks of the river Apures, near St. Fernando and Arichuna, in the province of Varinas. Varrònia grandiflòra, Desv. journ. bot. 1. p. 278. no. 12. Varrònia lantanoìdes, Willd. herb. no. 4543. Branches terete, strigose. Leaves petiolate, 2 inches long, having the serratures erect and mucronate. Heads globose, size of a cherry. Calyx fuscescent. Corolla campanulate, tapering into a tube at the base, white, $1\frac{1}{2}$ inch; with an entire, revolute limb, and pilose throat? This is a very elegant species.

Great-flowered Cordia. Shrub.

102 C. microphy'lla (Rœm. et Schultes, syst. 4. p. 463.) leaves small, nearly sessile, entire, tridentate or 3-lobed at apex; heads few-flowered, sessile. ♄. S. Native of New Spain. Varrònia microphýlla, Desv. journ. bot. 1. p. 275. no. 17. Calycine teeth elongated. Corolla funnel-shaped or tubular.

Small-leaved Cordia. Shrub.

103 C. macroce'phala (H. B. et Kunth, nov. gen. amer. 3. p. 77. Rœm. et Schultes, syst. 4. p. 462.) leaves ovate-oblong, narrowed at both ends, acutish, crenated, clothed with hoary tomentum on both surfaces, but most so beneath; heads globose, pedunculate, terminal and lateral; calyx clothed with rusty tomentum, with subulately setaceous teeth; throat of corolla rather pilose; stamens exserted? ♄. S. Native of the Andes of Peru, near Cascas, ex H. B. et Kunth; Brazil and Mexico, ex Desv. Varrònia macrocéphala, Desv. journ. bot. 1. p. 274. no. 13. Branches clothed with hoary tomentum when young, rather angular. Leaves petiolate, 2 inches long. Heads of flowers size of a walnut. Peduncles clothed with hoary tomentum, somewhat quadrangular. Corolla funnel-shaped, white, twice as long as the calyx. Drupe containing a 1-celled, 1-seeded nut.

Large-headed Cordia. Shrub or tree.

104 C. caloce'phala (Cham. et Schlecht, in Linnæa, 4. p. 488. and 8. p. 129.) leaves broad, lanceolate, subcordate, obtuse, crenated, canescent above and hoary beneath; heads on short peduncles, lateral and terminal, clothed with fuscescent

hairs; calycine teeth setaceous, hairy. ♄. S. Native of tropical Brazil, Sello. Leaves petiolate, 3 inches long and $2\frac{1}{2}$ broad. Branches obscurely angular, clothed with hairy tomentum. Peduncles 2 inches long. Drupe inclosed in the calyx. Corolla smaller than those of *C. macrocéphala*, to which species it comes nearest. In both the tomentum is stellate, according to Cham. l. c. Rachis of the head of flowers clavate.

Beautiful-headed Cordia. Shrub.

105 C. sessilifòlia (Cham. et Schlecht, l. c.) leaves sessile, lanceolate, acute, simply serrated, but sometimes the lower ones are doubly and deeply serrated, so as to be almost pinnatifid, hairy on both surfaces, softer beneath; heads pedunculate, terminal and lateral, nearly globose; calyx obconical, with somewhat setaceously acuminated teeth, hairy; segments of the corolla 2-lobed: lobes arched, blunt; stamens shorter than the limb. ♄. S. Native of tropical Brazil, Sello. A rough hairy shrub. Stems 10 inches high bearing 1 head of flowers, or 2 feet high bearing many heads of flowers, thickness of a hen's quill. Leaves $2\frac{1}{2}$ inches long, and about $\frac{1}{2}$ an inch broad. Hairs strigose. Peduncles a little shorter than the upper leaves, about an inch long, having the rachis hardly thickened, and beset with hairs between the calyxes, which are glabrous in their lower part. Corolla funnel-shaped, with a large 5-lobed limb. Stigmas slender, as in the congeners. Drupe partly covered by the calyx, containing a 2-celled nut, one of which is abortive.

Sessile-leaved Cordia. Shrub 1 to 2 feet.

§. 3. Spica'tæ. Spikes of flowers elongated. Calycine teeth short, acute. Throat of corolla pilose.

106 C. ripa'ria (H. B. et Kunth, nov. gen. amer. 3. p. 71. t. 207.) leaves ovate-oblong, acuminated, denticulated, scabrous above, and clothed with rusty tomentum beneath; spikes cylindrical, dense, disposed in a panicle; calyx, peduncles, and branches clothed with rusty hairs; throat of corolla pilose; stamens exserted. ♄. S. Native of New Granada, on the banks of the river Magdalena, near Monpox, in humid places. Leaves petiolate, 3-4 inches long. Spikes 2-3 inches long. Calyx campanulate, 5-6-toothed; teeth smooth. Corolla campanulately funnel-shaped, white, size of those of *Myosòtis scorpioìdes*; limb 5-cleft; lobes rounded. Stigmas subclavate. Drupe unknown.

River-side Cordia. Shrub.

107 C. ferrugínea (H. B. et Kunth, nov. gen. amer. 3. p. 71. Rœm. et Schultes, syst. 4. p. 458.) leaves ovate, acute, denticulated, pilose above, and clothed with rusty tomentum beneath; spikes terminal and axillary, interrupted; calyx hairy; throat of corolla pilose. ♄. S. Native of New Granada, near Gonzanama and Loxa. Varrònia ferrugínea, Lam. ill. p. 418. no. 1888. Desv. journ. bot. 1. p. 266. no. 1. t. 9. Varrònia Martinicénsis, Desf. tabl. de l'ecole. p. 71. but not of Lin. ex Desv. l. c. Córdia pyrifòlia, Rœm. et Schultes, syst. 4. p. 802. Varrònia pyrifòlia, Willd. rel. Floriferous leaves alternate, the rest opposite. Spikes an inch long. Calyx 5-toothed, length of corolla, which is yellowish.

Rusty Cordia. Shrub.

108 C. laxiflòra (H. B. et Kunth, nov. gen. 3. p. 72.) leaves broad-ovate, very shortly acuminated, denticulated, scabrous above, and clothed with rufescent down beneath; spikes axillary, interrupted; calyx hairy; throat of corolla pilose; genitals exserted. ♄. S. Native of New Granada, in hot places between Monpox and Morales, in the valley of the river Magdalena. Branches terete, clothed with fuscescent hairs, as well as the petioles and peduncles. Leaves subalternate, petiolate, 2-3 inches long, and $1\frac{1}{2}$ to 2 inches broad. Corolla somewhat campanulate, white. Drupe girded by the calyx, size of hemp-seed. Very nearly allied to *C. ferrugínea*.

Loose-flowered Cordia. Shrub.

109 C. lana'ta (H. B. et Kunth, l. c. p. 72.) leaves ovate-oblong, acute, serrated, woolly on both surfaces, but most so beneath; spikes terminal and axillary, panicled, dense; calyx hairy; throat of corolla pilose; genitals exserted. ♄. S. Native of New Granada, near the town of Santa Fe de Bogota. Branches terete, hairy, angular while young, and clothed with rusty hairs, as well as the peduncles. Leaves subalternate, petiolate, 3 inches long, hairy above, and clothed with fuscescent tomentum beneath. Calyx campanulate, with smooth teeth. Corolla funnel-shaped, white; tube length of calyx. Stigmas clavate. Very nearly allied to *C. tomentòsa*.

Woolly Cordia. Shrub.

110 C. tomentòsa (Rœm. et Schultes, syst. 4. p. 459.) leaves ovate, serrated, acute, tomentose; spikes thick, short, obtuse, forming a terminal panicle; peduncles dichotomous, axillary and terminal. ♄. S. Native of Cayenne, Richard. Varrònia tomentòsa, Lam. ill. p. 419. no. 1892. Desv. journ. bot. 1. p. 266. no. 3. The whole plant is clothed with tomentum, or very hairy. Leaves white beneath; petioles villous.

Tomentose Cordia. Shrub.

111 C. salviæfòlia (H. B. et Kunth, nov. gen. amer. 3. p. 72.) leaves lanceolate-oblong, narrowed at both ends, crenately serrated, wrinkled, scabrous from strigæ above, but clothed with hoary tomentum beneath; spikes terminal and lateral, dense, disposed in a panicle; calyx hairy; throat of corolla rather pilose; genitals exserted. ♄. S. Native along with *C. lanàta*. Córdia Humbóldtii, Rœm. et Schultes, syst. 4. p. 801. C. floribúnda, Spreng. syst. 1. p. 652. Varrònia floribúnda, Desv. journ. bot. 1. p. 267. no. 2. Branches terete, glabrous, but when young hairy, and rather angular. Leaves petiolate, 2-3 inches long, and $\frac{1}{2}$ to 1 inch broad; petioles hairy. Spikes 1 to $1\frac{1}{2}$ inch long. Flowers densely glomerate. Peduncles clothed with fuscescent hairs. Calyx campanulate. Corolla funnel-shaped, yellow? twice as long as the calyx. Stigmas capitately clavate.

Sage-leaved Cordia. Shrub.

112 C. cylindrista'chya (Rœm. et Schultes, syst. 4. p. 459.) leaves ovate, acute, densely serrated, wrinkled, hispid above, and tomentose beneath; spikes oblong, bifid and trifid, supra-axillary and terminal, dense-flowered; calyx hairy? genitals exserted? ♄. S. Native of Peru, in hedges. Varrònia cylindristàchya, Ruiz. et Pav. fl. per. 2. p. 23. Desv. journ. bot. 1. p. 269. no. 5. Varrònia macrostàchya, Ruiz. et Pav. fl. per. 2. p. 23. t. 147. f. a. Córdia macrostàchya, Spreng. syst. 1. p. 652. Branches terete, hairy, angular while young. Leaves alternate, hardly petiolate, rough beneath, 4-6 inches long. Spikes densely cylindrical. Calyx greenish yellow. Corolla white. Drupe white, inclosed in the calyx, containing a 1-2-celled nut.

Cylindrical-spiked Cordia. Shrub.

113 C. Portorice'nsis (Spreng. syst. 1. p. 651.) leaves lanceolate, attenuated at the base, dentately serrated, mucronate, scabrous, of the same colour on both surfaces; spikes terminal, solitary. ♄. S. Native of Portorico.

Portorico Cordia. Shrub or tree.

114 C. cane'scens (H. B. et Kunth, nov. gen. 3. p. 73.) leaves lanceolate, acute, serrated, wrinkled, scabrous above, but clothed with hoary tomentum beneath: spikes terminal and lateral, rather dense; calyx clothed with hoary down; throat of corolla pilose; stamens exserted. ♄. S. Native of New Granada, on the eastern declivities of the Andes of Quindiu, near the town of Ibaque, at the altitude of 760 hexapods. Varrònia rugòsa, Willd. herb. no. 4550. C. rugòsa, Rœm. et Schultes, syst. 4. p. 801. Branches terete, clothed with hoary down or hairs. Leaves petiolate, 2-3 inches long, and $\frac{1}{2}$ an inch broad.

Spikes 2 inches long, clothed with hoary down. Calyx campanulate. Corolla somewhat campanulate, white, twice as long as the calyx. Drupe ovate, inclosed in the calyx, size of a hempseed; nut 1-celled, 1-seeded by abortion.

Canescent Cordia. Shrub.

115 C. polysta'chya (H. B. et Kunth, l. c.) leaves obovate-oblong, acutish, cuneately narrowed at the base, remotely-toothed, scabrous and shining above, but clothed with fine hoary tomentum beneath; spikes terminal and axillary, disposed in panicles, a little interrupted; calyx downy; throat of corolla rather pilose; stamens exserted. ♄. S. Native on the banks of the river Orinoco, near the cataract of Maypure. C. canéscens, Willd. ex Rœm. et Schultes, syst. 4. p. 799. Branches terete, clothed with hoary down. Leaves subalternate, petiolate, often obtuse, 3 inches long, and 1½ broad. Spikes cylindrical, 1½ to 2 inches long. Flowers glomerate. Calyx campanulate, 4-6-toothed. Corolla campanulately funnel-shaped, white. Very nearly allied to *C. oblìqua*.

Many-spiked Cordia. Shrub.

116 C. grave'olens (H. B. et Kunth, l. c. p. 74.) leaves oblong, acute, narrowed at the base, toothed, scabrous above, but clothed with hoary down beneath; spikes lateral, elongated; calyx downy; throat of corolla rather pilose; stamens exserted? ♄. S. Native in woods of the Orinoco, between Villa Farrera and the town of Angostura. C. spicàta, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 799. Branches a little compressed, striated, scabrous, rather angular while young. Leaves alternate, petiolate, 2-3 inches long. Spikes on long downy peduncles, cylindrical, 2-3 inches long. Flowers dense, glomerate. Calyx campanulate. Corolla white; margins of the segments crenulated. This and the preceding are probably only varieties of the following.

Strong-scented Cordia. Shrub 6 feet.

117 C. obli'qua (H. B. et Kunth, l. c. p. 74.) leaves ovate-oblong, acute, cuneately-narrowed at the base, serrately toothed, scabrous from strigæ above, but clothed with hoary pubescence beneath; spikes lateral, elongated; calyx clothed with strigose down; throat of corolla pilose; stamens exserted? ♄. S. Native of Peru; and of Mexico, on the sea shore, near Campeachy. Varrònia oblìqua, Ruiz. et Pav. fl. per. 2. p. 24. t. 147. f. b. Desv. journ. bot. 1. p. 268. no. 4. Córdia Peruviàna, Rœm. et Schultes, syst. 4. p. 459. Branches terete, rather scabrous, but clothed with hoary down in the young state. Leaves nearly 3 inches long, on short petioles. Spikes 4 inches long; flowers rather distant, ex Kunth; dense, ex Ruiz. et Pav. Corolla white, ex Ruiz. et Pav.

Oblique-leaved Cordia. Shrub 5 to 6 feet.

118 C. Guiane'nsis (Rœm. et Schultes, syst. 4. p. 460.) leaves ovate-oblong, running into the petioles at the base, sharply serrated: serratures erectish; flowers loose, on the spikes, minute, very few towards the base of the spikes. ♄. S. Native of Guiana, and Cayenne, near towns. Varrònia Guianénsis, Desv. journ. bot. 1. p. 270. no. 7. Varrònia Martinicénsis, Aubl. guian. 1. p. 232. but not of others. Leaves large, 5-7 inches long; petioles short.

Guiana Cordia. Shrub.

119 C. divarica'ta (H. B. et Kunth, nov. gen. 3. p. 74.) leaves oblong-lanceolate, obtuse, cuneated at the base, crenated, wrinkled, scabrous above, but clothed with fuscescent tomentum beneath; spikes lateral, dense-flowered; calyx downy; throat of corolla pilose; stamens exserted? ♄. S. Native of New Andalusia, in woods near Cumana, Cariaca, and Quetepe. Córdia dentàta, Vahl, eclog. 3. p. 5. C. corylifòlia, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 801. C. corymbòsa, Schlecht, in Willd. herb, no. 4566. Rœm. et. Schultes, syst. 4. p. 801. Branches terete, glabrous, fuscous, downy while young. Leaves on short petioles, hardly an inch long, and 3-4 lines broad. Spikes pedunculate, 1 inch long, cylindrical. Calyx campanulate. Corolla subcampanulate, 6-cleft. Drupe ovate, glabrous, half covered by the calyx, size of a hempseed; nut 1-celled, 1-seeded by abortion.

Divaricate Cordia. Shrub 5 to 10 feet.

120 C. angustifòlia (Rœm. et Schultes, syst. 4. p. 460.) leaves linear, subdentate, bluntish, with revolute edges, scabrous above, and rather tomentose beneath; spikes linear-oblong, terminal; calyx villous; stamens almost length of the corolla. ♄. S. Native of the Island of Santa Cruz. Varrònia angustifòlia, West, St. Croix, p. 202. Willd. spec. 1. p. 1081. Desv. journ. bot. 1. p. 271. no. 8. Varrònia Curassávica, Lam. dict. 4. p. 264. Branches rusty. Leaves petiolate, crowded. Spikes dense, 2-3 inches long, length of peduncles. Calyx inflated, with 5 setaceous teeth, which are the length of its tube. Corolla white; tube length of calyx; lobes of limb short, emarginate. Style short; stigma simple, capitate? Drupe small, red. Poir. dict. suppl. 3. p. 729. under *V. Curassávica*.

Narrow-leaved Cordia. Clt. 1808. Shrub 12 feet.

121 C. Martinice'nsis (Rœm. et Schultes, syst. 4. p. 461.) leaves broad-ovate, acuminated, serrated, very much wrinkled, scabrous above, and downy or tomentose beneath? spikes terminal and axillary, dense-flowered; calyx downy? large, inflated; stamens exserted. ♄. S. Native of Martinico, on the edges of fields. Varrònia Martinicénsis, Jacq. amer. p. 41. t. 32. pict. t. 42. Willd. spec. 1. p. 1080. Gærtn. fruct. 3. p. 171. t. 212. f. 5. Desv. journ. bot. 1. p. 272. no. 10. Leaves 3 inches long. Spikes an inch long, oblong, ex Jacq. Habit of *C. macrostàchya* and *C. Curassávica*.

Martinico Cordia. Fl. Aug. Sept. Clt. 1795. Shrub 5 to 6 feet.

122 C. multispica'ta (Cham. et Schlecht, in Linnæa, 4. p. 490.) leaves ovate, acuminated, acute, toothed at top, bluntly cuneated, and running into the petioles at the base, scabrous from strigæ above, and downy beneath; spikes oblong-clavate, subcylindrical, terminal and axillary, forming the panicle, exceeding the leaves; calyx downy, 5-toothed: teeth acute, thicker, and somewhat acuminated at apex; corolla subcampanulate, with an almost entire limb, exceeding the calyx a little; stamens various in length, sometimes shorter than the limb of the corolla, and sometimes longer. ♄. S. Native of Brazil, within the tropic. Young branches, peduncles, and petioles, clothed with short hairs, which are less adpressed than those in *C. Martinicénsis;* and the petioles are combined with the peduncular, axillary branches at the base. Larger leaves 6 inches long and 3 broad. Style and ovarium glabrous. Drupe ovoid, loosely covered by the rather inflated calyx; putamen 1-celled, 1-seeded by abortion. This is probably a variety of *C. Martinicénsis*, or a very nearly allied species. It differs in the spikes being more slender, 3½ inches long, loose at the base; in the terminal ones being by threes, and the axillary ones solitary, the whole forming panicles at the tops of the branches. The calyx is very similar, but smaller; having the teeth acute and shorter, or less acuminated.

Many-spiked Cordia. Shrub 6 to 8 feet.

123 C. macrosta'chya (Rœm. et Schultes, syst. 4. p. 461.) leaves oblong-lanceolate; spikes oblong. ♄. S. Native of tropical America, about Carthagena. Varrònia macrostàchya, Jacq. amer. p. 41. Desv. journ. bot. 1. p. 272. no. 11. Shrub much branched. Leaves narrow, 6 inches long, length of spikes. The rest as in *C. Curassávica*. Calycine teeth ending in setaceous points.

Long-spiked Cordia. Shrub 12 feet.

124 C. integrifòlia (Rœm. et Schultes, syst. 4. p. 461.) shrub quite glabrous; leaves sublanceolate, obtuse, quite entire,

glabrous; spikes at first subglobose, then elongated and linear; calyx almost globose, downy, 5-toothed: teeth short, ovate, acute. ♄. S. Native of Hispaniola. Varrònia integrifòlia, Desv. journ. bot. 1. p. 271. no. 9. t. 10. Poir. suppl. 3. p. 729. Leaves on short petioles, 1½ inch long, and 3-4 lines broad, beset with white dots above, paler beneath. Peduncles and calyxes downy. Corolla a little longer than the calyx; with roundish segments.

Entire-leaved Cordia. Tree.

125 C. Curassa'vica (Rœm. et Schultes, syst. 4. p. 460.) leaves sublanceolate, acute, serrated, wrinkled, scabrous above, and clothed with white down beneath; spikes terminal, oblong, dense-flowered; calyx tubular, inflated, downy? 5-toothed: teeth ovate at the base, and ending each in a setaceous point; stamens a little shorter than the limb of the corolla. ♄. S. Native of Curaçoa, in hedges, and among trees. Varrònia Curassávica, Jacq. amer. p. 40. ed. 2. p. 25. Desv. journ. bot. 1. p. 269. no. 6. Swartz. obs. p. 88. Córdia Martinicénsis, Link, enum. 1. p. 162. Sieb. pl. trin. no. 42. Varrònia Martinicénsis, Lam. dict. 4. p. 264. ex Desv. l. c. Cent. amer. t. 56. according to Desv. l. c. and probably of Swartz. Lantàna Curassávica, Lin. spec. ed. 1. p. 627. Mill. dict. no. 7. Varrònia assúrgens, &c. Browne, jam. p. 172.?—Sloan. hist. 2. p. 81. Branches terete, scabrous, when old rusty. Spikes 2-3 inches long, pedunculate; flowers small. Corolla white; tube length of calyx; limb short, with the lobes short and emarginate. Drupe small, red. "Leaves alternate, elliptic-lanceolate, or oblong, obtuse or acutish, crenated or serrated, densely clothed with canescent down beneath, but scabrous above; spikes solitary, terminal and lateral, slender, loose-flowered; lower flowers abortive, gland-formed; calyx downy, 5-toothed: teeth acute, thickened, and a little acuminated at apex; corolla campanulate, 3 times as long as the calyx; with a 5-lobed limb, and elliptic, obtuse segments; stamens exserted, length of the segments of the corolla; style hardly higher than the insertion of the filaments, divided into 4 branches at top, as in the rest of the genus. ♄. S. Native of Brazil, in the island of St. Catharine, in gardens. Branches angular, striated, clothed with adpressed down at top. Calyx short, campanulate, glabrous inside. Corolla glabrous outside, villous downwards from the insertion of the filaments inside. Ovarium glabrous." Cham. et Schlecht, 4. p. 489. 490.

Curaçoa Cordia. Shrub 15 feet.

* * *Doubtful species belonging to Sect.* III. *Varrònia.*

126 C. ni'tida (Willd. herb. ex Rœm. et Schultes, syst. 4. p. 800.) leaves elliptic, quite entire, petiolate, obtuse, shining, reticulately veined; flowers cymose. ♄. S. Native country unknown.

Shining-leaved Cordia. Shrub or tree.

127 C. alnifòlia (Rœm. et Schultes, syst. 4. p. 801.) leaves ovate-oblong, downy, sharply and equally serrated. ♄. S. Native country unknown. Varrònia alnifòlia, Horn. hort. hafn. 1. p. 227. Very nearly allied to *C. parviflòra*, the *Varrònia parviflòra*, of Ortega, but differs in the form of the leaves.

Alder-leaved Cordia. Clt. 1818. Tree or shrub.

128 C. chamædryoi'des (Rœm. et Schultes, syst. 4. p. 801.) clothed with tomentose down; leaves ovate, doubly serrated, and cordate; peduncles axillary, cymosely capitate. ♄. S. Native country unknown. Varrònia chamædryoìdes, Willd. herb.

Germander-like Cordia. Shrub.

129 C. microce'phala (Rœm. et Schultes, syst. 4. p. 801.) leaves lanceolate-oblong, serrated, scabrous; spikes ovate. ♄. S. Native of Caraccas. Varrònia microcéphala, Willd. herb.

Small-headed Cordia. Shrub.

130 C. parviflòra (Desf. hort. par. ex Link, enum. 1. p. 162.) leaves oblong, acute, serrated, attenuated, and quite entire, scabrous, hairy; petioles downy. ♄. S. Native country unknown. Flowers cymose, as in *C. mirabiloìdes.*

Small-flowered Cordia. Clt. 1819. Shrub or tree.

131 C. grandiflòra (Lindl. bot. reg. 1491.) leaves alternate, serrated; flowers large, white, terminal, corymbose. ♄. S. Native of tropical America.? This is a very doubtful shrub.

Great-flowered Cordia. Fl. Aug. Clt. 1827. Shrub.

Cult. All the species of this genus are very pretty while in blossom, and are of the most easy culture. They thrive best in a mixture of loam, peat, and sand, or any light rich soil; and cuttings strike root readily when planted in sand, with a hand-glass placed over them in heat.

II. PATAGO'NULA (so called because a native of Patagonia.) Lin. gen. and Lam. ill. t. 96. Patagónica, Dill. elth. p. 304. t. 226. f. 293.

Lin. syst. *Pentándria, Monogýnia.* Calyx small, deeply 4-6-cleft, but usually 5-cleft, at length increasing much as the fruit comes to maturity. Corolla rotate, about 2 lines in diameter; limb 5-cleft, with acutish, elliptic segments; tube very short. Stamens 5, glabrous, shorter than the segments of the corolla, inserted in its throat. Ovarium and style glabrous. Style and stigmas as in *Córdia.* Drupe globose, acute, beaked by the permanent base of the style, dry, surrounded by the calyx as an acorn in its cup, containing a 1-celled, 1-seeded putamen by abortion. Embryo pendulous; cotyledons plicate.—A much branched shrub, with pale green, alternate or nearly opposite leaves, serrated towards the top. Inflorescence terminal, bractless, panicled, composed of few-flowered cymes. Flowers white.

1. P. America'na (Lin. spec. 212.) ♄. G. Native of Patagonia and the South of Brazil, Sello. Cordia Patagónula, Ait. hort. kew. 1. p. 259. ed. 2d. vol. 2. p. 10. Patagónica foliis partim serratis partim entegris, Dill. hort. elth. p. 304. t. 226. f. 293. Branches terete. Buds and tender parts of branches beset with longer hairs. Leaves glabrous on both surfaces, lanceolate, or oblong-lanceolate, tapering into the short petioles, and sub-cuneated at the base, generally acute, rarely obtuse at the apex: younger ones cuneately obovate, entire or serrated towards the top: largest ones 2½ inches long, with the consistence and smoothness of those of *Laúris nóbilis*, margined, when young furnished with cilia at the base. Flowers small, pedicellate, cymose, white, or greenish white, smelling like those of elder. Limb of corolla from 4 to 5-cleft, with an equal number of stamens.

Var. β, glàbra (Cham. in Linnæa, 4. p. 492.) shrub perfectly glabrous in every part. ♄. S. Native of the South of Brazil.

American Patagonula. Fl. June, Aug. Clt. 1732. Shrub 10 to 12 feet.

Cult. For culture and propagation see *Córdia*, above.

Tribe II.

EHRETIA'CEÆ. (The plants contained in this tribe agree with *Ehrètia* in the characters given below.) Style semi-bifid; stigmas 2, obtuse. Drupe containing 2-4 2-celled, 2-seeded nuts, or 2-4 1-celled, 1-seeded nuts, rarely a 5-6-celled, 5-6-seeded nut. Cotyledons plicate.? This tribe differs from Tribe I. *Cordiàceæ*, in the stigmas being 2, not 4, and in the

drupe containing generally more than one nut. Mart. in pl. bras. 1. p. 134. has made a distinct order of *Ehretiàceæ*.

III. EHRE'TIA (so named in memory of the ingenious artist and botanist, G. D. Ehret, in French Cabrillet.) Browne, jam. t. 16. Lin. gen. no. *275*. Schreb. gen. no. *352*. Jacq. amer. 45. Juss. gen. p. 128. ed. Usteri, p. 143. R. Br. prod. p. 497. Lam. ill. t. 96.

Lin. syst. *Pentándria, Monogýnia*. Calyx deeply 5-parted. Corolla funnel-shaped, with a naked throat, and a 5-cleft limb. Stamens exserted. Style semi-bifid; stigmas obtuse. Berry containing 2 2-celled, 2-seeded pyrenæ or nuts.—Trees or shrubs. Leaves petiolate, alternate, opposite, or 3 in a whorl, entire or serrated. Flowers terminal or axillary, panicled or corymbose.

* *Species natives of Asia.*

1 E. serra'ta (Roxb. fl. ind. 2. p. 240.) leaves alternate, broad-lanceolate, serrated, 5-pointed, glabrous; panicles terminal, and from the upper axils, with numerous short, spreading, compound, and simple ramifications. ♄. S. Native of the East Indies, at Bhotan; it is also a native in the eastern part of Bengal. Leaves 2-5 inches long, and 1-2½ inches broad; petioles short. Flowers small, numerous, collected into small, somewhat remote, nearly sessile fascicles, some of them hexandrous. Bracteas small, ovate, pressed to the calyx. Corolla having the tube as long as the calyx, and the segments of the limb oblong and spreading. Stamens inserted in the mouth of the tube of the corolla, rather shorter than the limb. Drupes round, pulpy, about the size of a pea, red when ripe. This is one of the commonest trees in Nipaul, where it is called *Nulshima*. The flowers spread a honey-like, powerful smell. In Silhet, where it is indigenous, and there called *Kala Oja*. The fruit is not esteemed like those of most of the species, there being little pulp.

Serrated-leaved Ehretia. Fl.? Clt. 1823. Shrub or Tree.

2 E. macrophy'lla (Wall. in Roxb. fl. ind. 2. p. 343.) arboreous; leaves alternate, coriaceous, ovate, acute, sharply-toothed, harsh, strigose above, and downy beneath; panicle terminal, composed of racemose branches. ♄. G. Native of Nipaul, on Chundragiri. Branches terete, with ash-coloured, dotted bark, rather villous while young. Leaves 5-10 inches long; nerves uniting in sub-marginal arches. Drupes round, ovate, obscurely 4-furrowed, slightly clothed, the size of a gooseberry, supported at the base by a 5-cleft calyx, whose segments are lanceolate, ciliated, and spreading. Embryo erect.? Cotyledons parallel.

Long-leaved Ehretia. Tree large.

3 E.? umbellula'ta (Wall. in Roxb. fl. ind. 2. p. 344.) arboreous; leaves ovate, nearly entire, glabrous; umbellets scattered, round, small, downy; stigma deeply and almost equally 4-lobed. ♄. S. Native of Silhet, where it is called *Kunuka*. Branches like those of *E. macrophýlla*. Leaves repand, slightly undulated, 3-5 inches long, generally with a retuse apex; nerves uniting into sub-marginal arches, elegantly reticulate. Flowers very small, white, fragrant, crowded together in lateral, simple, or corymbose heads. Calyx supported by an oval bractea; segments of the calyx round, ciliated. Corolla rotate, with reflexed lobes, shorter than the stamens. This seems to connect *Ehrètia* with *Córdia*, from the short style and deeply 4-lobed stigma, but the fruit is unknown.

Umbellate-flowered Ehretia. Shrub.

4 E. Wightia'na (Wall. cat. no. 7013.) glabrous; leaves oblong-lanceolate, or obovate-oblong, entire, coriaceous; peduncels terminal, corymbose; flowers secund, pedicellate. ♄. S. Native of the East Indies. Nearly allied to *E. umbellulàta*.

Wight's Ehretia. Shrub.

5 E. pyrifòlia (D. Don, prod. fl. nep. p. 102.) leaves ovate, acute, serrated, glabrous, rounded at the base: floral ones oblong; panicles terminal; flowers crowded. ♄. G. Native of Nipaul. Flowers small, disposed in an ample, crowded panicles. Nearly allied to *E. serràta*, Roxb., but the leaves of that plant are acute at the base.

Pear-leaved Ehretia. Tree or shrub.

6 E. Java'nica (Blum. bijdr. p. 842.) leaves alternate, oval, attenuated at both ends, quite entire, glabrous; corymbs lateral and terminal, divaricate; calyx deeply 5-cleft, with acuminated segments. ♄. S. Native of Java, on the declivities of mountains on the west side, where it is called *Sikup Burrum*.

Java Ehretia. Fl. Nov. Tree 60 feet.

** *Species natives of New Holland.*

7 E. acumina'ta (R. Br. prod. p. 497.) leaves oblong, acuminated, serrated, quite glabrous; panicles decompound, having the branches and branchlets quite glabrous. ♄. G. Native of New South Wales, about Port Jackson.

Acuminated-leaved Ehretia. Fl. July. Clt. 1823. Tree 15 feet?

8 E. salígna (R. Br. l. c.) leaves linear-lanceolate, subfalcate, elongated, quite entire, glabrous, 3-5 inches long; cymes panicled, dichotomous; flowers polygamous. ♄. G. Native of New Holland, within the tropic, on the sea-shore.

Willowy-leaved Ehretia. Shrub or tree.

9 E. membranifòlia (R. Br. l. c.) leaves long-lanceolate, quite entire, and quite glabrous, strict, membranous, 1½ to 2½ inches long; cymes dichotomous. ♄. S. Native of New Holland, within the tropic. The fruit being unknown the genus is doubtful.

Membrane-leaved Ehretia. Shrub or tree.

*** *Species natives of America.*

10 E. tinifòlia (Lin. spec. *273*. amœn. acad. *5*. p. *595*. Jacq. amer. p. 45. Swartz. obs. p. 87.) leaves oblong-ovate, or ovate, obtuse, quite entire, glabrous; panicles terminal, oblong; calyx 5-cleft, obtuse. ♄. S. Native of Jamaica, and Cuba.—Trew. ehret. t. 24.—Browne, jam. p. 168. t. 16. f. 1.—Sloan. jam. 2. p. 94. t. 203. f. 1. A tree with a dense, oblong head. Leaves about 4 inches long, on short petioles. Flowers numerous, small, white, strong-scented. Corolla a little longer than the calyx; with obovate, acute, reflexed segments, which exceed the tube in length. Stamens a little longer than the corolla. Stigma bifid. Drupe containing 4 nuts, ex. Jacq., 2 nuts, ex Lin., globular, at first yellow, then black, size of currants. They serve to feed poultry, and are sometimes eaten by the poorer sort of people. The tree is known in Jamaica by the name of *Bastard Cherry-tree*.

Tinus-leaved Ehretia. Fl. June, July. Clt. 1734. Tree 16 to 28 feet.

11 E.? internòdis (Lehr. stirp. 1. p. 47. t. *24*.) leaves alternate, oblong-ovate, quite entire, acute, glabrous; panicles intra-foliaceous; flowers corymbose, panicled; corolla campanulate, with reflexed segments. ♄. S. Native of the Antilles. E. petiolàris, Lam. dict. 1. p. 527. no. 5. ex Poir. suppl. 2. p. 1. Córdia petiolàta, Desf. hort. par. Branches loose, grey, tubercled. Leaves 4 inches long. Style simple. Stigma 2-lobed. Berries round, containing 4 1-seeded nuts.

Var. β, Sùbria (Commers. herb. ex Lam. dict. l. c.) very like the species; flowers hardly a line long, with acute segments; stamens inserted in the tube of the corolla; stigma capitate; panicles terminal and axillary. ♄. S. Native of the Mau-

ritius. E. internòdis, Roxb. fl. ind. 2. p. 343. This, as well as the species, are very doubtful from the form of the stigma.

Interknotted Ehretia. Fl.? Clt. 1819. Shrub 5 to 8 feet.

12 E. grandiflòra (Poir. suppl. 2. p. 3.) leaves alternate, ovate, smooth, with unequal sides, glabrous, quite entire, obtuse; flowers corymbose; calyx rather tubular, downy, grey, with 5 acute teeth; segments of corolla roundish, spreading. ♄. S. Native of St. Domingo. Branches terete. Leaves on short petioles, 2 inches long, and 1½ inch broad. Tube of corolla red, length of calyx. Stigma bifid, obtuse. Fruit unknown.

Great-flowered Ehretia. Shrub or tree.

13 E.? du'bia (Jacq. obs. 1. p. 19. Gmel. syst. 1. p. 394. Vittm. summ. 2. p. 15.) leaves alternate, oval-oblong, acute, quite entire, glabrous; peduncles 1-flowered, aggregate; calyx bilabiate: lower lip campanulate: superior one roundish, concave, spreading, at length not half the size of the lower one; segments of the limb of the corolla flat, ovate, obtuse. ♄. S. Native of Jamaica, about Kingston. Leaves 3-6 inches long, petiolate. Tube of corolla funnel-shaped, hairy inside. Stamens short, inserted in the upper part of the tube. Anthers didymous. Style subulate, semi-bifid at apex; segments bifid, inflexed. Stigmas acute. This is probably a species of *Córdia*, from the twice bifid style, or a new genus belonging to section *Cordiàceæ*.

Doubtful Ehretia. Clt. 1825. Tree 20 feet.

14 E. tomentòsa (H. B. et Kunth, nov. gen. amer. 3. p. 64. t. 208.) branches angular, clothed with hoary tomentum; leaves opposite, elliptic-oblong, acute, entire, glabrous above, and clothed with downy tomentum beneath, and hoary; flowers axillary, corymbose, about equal in length to the petioles; calyx clothed with hoary tomentum, almost entire, rather angular, loose. ♄. S. Native of New Granada, near Santa Fe de Bogota. Ehrètia Bogoténsis, Spreng. syst. 1. p. 648. Leaves running into the petioles at the base, 5 inches long. Peduncles axillary, short, many-flowered. Calyx turbinately campanulate. Corolla campanulate, glabrous; tube twice as long as the calyx; limb spreading, with ovate, oblong, obtuse segments. Stamens a little exserted, glabrous. Anthers 2 lobed at the base. Stigmas acute. Drupe depressed, globular, smooth, size of a sloe, surrounded by the calyx, which is warted at the base, and irregularly lobed, 4-celled; cells 1-seeded.

Tomentose Ehretia. Shrub or tree.

15 E. ternifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 66.) branches nearly terete, smoothish; leaves 3 in a whorl, oblong, obtuse, quite entire, glabrous, rather powdery; corymbs axillary, about equal in length to the petioles; calyx clothed with hoary powder, irregularly 4-lobed. ♄. S. Native of the province of Venezuela, near Los altos de San Pedro, at the altitude of 850 hexapods. Branches white. Leaves petiolate, furnished with minute, canescent atoms, pale beneath, 4-5 inches long, and 2½ broad. Petioles powdery. Flowers the size of those of *Lýcium bárbarum*. Calyx turbinately campanulate. Corollas white, funnel-shaped, glabrous; tube hardly equal in length to the calyx: limb spreading, with ovate-oblong, obtuse segments; throat puberulous. Stamens exserted. Stigmas acute. Drupe like that of the preceding.

Tern-leaved Ehretia. Tree 15 to 20 feet.

Cult. N.B. The following names occur in Salt. trav. abyss. append. p. 475, but without any definition. 1 E. obovàta, R. Br. 2 E. Abyssínica, R. Br.

Cult. For culture and propagation see *Córdia*, p. 387.

IV. BEURRE'RIA (named by P. Browne, after Mr. Beurrer, an apothecary of Nuremberg, who was a great promoter of natural history.) Brown, jam. p. 168. t. 15. f. 2. Jacq. amer. 45. t. 173. H. B. et Kunth, nov. gen. amer. 3. p. 67.—Ehrètia species of other authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx campanulate, 5-toothed, or 5-cleft. Corolla funnel-shaped; limb 5-parted; throat naked. Stamens a little exserted. Style usually bifid, rarely undivided; stigmas 2, sub-capitate. Drupe containing 4 pyrenæ or nuts; nuts 2-celled; cells 1-seeded.—Small trees or shrubs. Leaves alternate, nearly entire, or quite entire. Corymbs sub-terminal. Flowers white.

* *Species natives of America.*

1 B. exsu'cca (Jacq. amer. p. 45. t. 173. f. 17. ed. pict. t. 259. f. 13.) branches and leaves downy; leaves ovate, acute, or obovate and obtuse, quite entire; corymbs dichotomous; calyx downy, irregularly bifid or trifid; fruit dry, tetragonal, divisible into 4 parts. ♄. S. Native of South America, in hot places near Cumana, St. Thomas de la Guyana, and New Barcelona; and of Mexico, near Actopan, &c. H. B. et Kunth, nov. gen. amer. 3. p. 67. Ehrètia exsúcca, Lin. spec. p. 275. Lam. dict. 1. p. 527. Rhámnus Cumanénsis, Loefl. itin. p. 182. Guatacare of the natives of Cumana. Branches terete, hoary, glabrous, when young rather downy. Leaves 1½ to 2 inches long, petiolate, clothed with strigæ on both surfaces, sometimes nearly glabrous; petioles downy, glabrous, or ciliated. Flowers white, sweet-scented. Corolla white, salver-shaped; tube longer than the calyx; limb spreading, with roundish, cordate segments. Stamens length of corolla, villous at the base. Style bifid. Jacquin mentions his plant as glabrous, while that of Kunth is downy. They are, however, probably identical.

Dry-fruited Beurreria. Clt. 1804. Tree 20 feet.

2 B. revolu'ta (H. B. et Kunth, nov. gen. amer. 3. p. 67.) branches and leaves glabrous, ovate, obtuse, with entire revolute margins; corymbs dichotomous; calyx downy, 5-toothed. ♄. S. Native of New Spain, in temperate places near Hacienda de Regla. Shrub much branched. Branches terete. Leaves acute at the base, 1-2 inches long, petiolate. Corymbs terminal, downy. Calyx tubularly campanulate. Drupe red, size of a sloe, nearly globose, the rest as in the genus.

Revolute-leaved Beurreria. Shrub 5 to 6 feet.

3 B. divarica'ta; leaves oblong, entire, scabrous above, and downy beneath; flowers terminal, corymbosely racemose; calyx 5-cleft, downy. ♄. S. Native of Cuba, about the Havana. Ehrètia divaricàta, D. C. hort. monsp. 1813. p. 108. icon. ined. t. 4. Branches divaricate. Leaves firm. Flowers white. Drupe orange-coloured, globose; the rest as in the genus.

Divaricate Beurreria. Clt. 1820. Tree.

4 B. virga'ta; branches filiform; leaves oblong, entire, obtuse, hardly petiolate, scabrous above, and downy beneath; peduncles terminal, scattered, 1-flowered; calyx tubular, hairy, with 5 short, ovate, acuminated segments. ♄. S. Native of New Spain, in deserts. Ehrètia virgàta, Swartz. prod. p. 47. fl. ind. occ. 1. p. 463. This plant differs from *B. succulénta*, in being more twiggy, in the leaves being more scabrous, and in the inflorescence. Corolla white, twice as long as the calyx. Berry roundish, red; the rest as in the genus.

Twiggy Beurreria. Shrub 6 to 8 feet.

5 B. succule'nta (Jacq. amer. p. 44. ed. pict. p. 28. t. 45. obs. 2. p. 2. t. 26.) leaves oblong, quite entire, obtuse, or acute, smooth, or rather scabrous to the touch; corymbs loose, terminal, composed of irregular dichotomous cymes; calyx tubular,

glabrous, with ovate, acute segments. ♄. S. Native of Jamaica and Antilles, &c. Ehrètia Beurrèria, Lin. spec. 275. Mill. dict. no. 2. Willd. spec. 1. p. 1078. Desf. ann. mus. 1. p. 279. Córdia Beurrèria, Lin. amœn. acad. 5. p. 395.—Brown, jam. p. 168. t. 15. f. 2.—Sloane, jam. 2. p. 96. t. 204. f. 1.—Comm. hort. 1. p. 153. t. 79.—Pittònia símilis, Catesb. carol. 2. p. 79. Leaves 3 inches long, running into the short white petioles. Flowers white, sweet-scented. Segments of corolla obovate, with deflexed sub-undulated margins. Stigma green, depressed, 2-lobed. Drupe globose, smooth, size of a pea, orange-coloured, 4-angled; the rest as in the genus. The berry being sweet and succulent is eaten by children and natives. In Jamaica it is called *Poison-berries*. The French name is *Bois Cabril Batard*.

Succulent-fruited Beurreria. Clt. 1758. Tree 20 to 45 feet.

6 B. tomentòsa; leaves ovate, scabrous above, and tomentose beneath, obtuse, tapering into the short petioles at the base; calyx short, with 5 deep obtuse segments; tube of corolla twice as long as the calyx. ♄. S. Native of Jamaica and St. Domingo. Ehrètia tomentòsa, Lam. ill. no 1919. Poir. suppl. 2. p. 1. no. 7.—Sloane, jam. hist. 2. t. 204. f. 1.? Branches striated, rather nodose. Flowers white. Berry yellowish, roundish, containing 4 nuts; but the nuts are not said to be 2-celled and 2-seeded.

Tomentose Beurreria. Tree.

7 B. ra`dula; leaves coriaceous, obovate, obtuse, scabrous from dots; corymbs loose, terminal; calyx whitish grey, with dilated segments. ♄. S. Native of St. Domingo. Ehrètia ràdula, Poir. suppl. 2. p. 2. Leaves quite entire, attenuated at the base, 1-2 inches long, and 6-9 lines broad, beset with white dots above, and cinereous beneath: uppermost ones narrower, and nearly lanceolate. Corolla white, a little longer than the calyx. Berry containing 4 nuts; but it is not said whether these nuts are 1 or 2-celled, or 1 or 2-seeded.

Rasp-leaved Beurreria. Shrub.

* * *A species native of the Isle of Bourbon.*

8 B. la'xa; branches reclinate; leaves ovate, obtuse, or acutish, quite entire, or a little sinuated, glabrous; panicles corymbose, loose, terminal; calyx 5-cleft: segments of corolla ovate, obtuse, with reflexed margins. ♄. S. Native of the Island of Bourbon. Ehrètia láxa, Jacq. hort. schœnbr. t. 41. fragm. no. 31. t. 5. f. 2. Leaves petiolate, scattered, dark green, about 4 inches long. Flowers greenish white. Corolla twice as long as the calyx, with ovate, obtuse, reflexed segments. Berry fleshy, red, size of a pea, containing 4 nuts; but the nuts are not said to be 2-celled or 2-seeded.

Loose-flowered Beurreria. Clt. 1826. Shrub 6 to 10 feet.

* * * *Species natives of Asia. Drupe containing* 4 1-*celled*, 1-*seeded nuts. Perhaps a distinct genus.*

9 B. læ`vis; arboreous; leaves ovate, smooth, entire, or sometimes scalloped; corymbs lateral and axillary, composed of dichotomous, recurved, secund spikes; drupe containing a 4 partible nut, or 4 1-seeded, 1-celled nuts. ♄. S. Native of the Circar mountains, and Bengal, and on the banks of the Irawaddy. Ehrètia affìnis, Wall. cat. no. 900. Ehrètia læ`vis, Roxb. cor. 1. p. 42. t. 56. Seregada of the Telingas. Branches erect. Leaves on short petioles, pretty smooth, 3-4 inches long, and 2-3 broad. Flowers small, white. Nuts wrinkled outside. The wood of this tree is used by the hill people for many purposes.

Smooth Beurreria. Clt. 1823. Tree 12 to 20 feet.

10 B. a'spera; shrubby; leaves ovate, scabrous above, and downy below, entire; corymbs terminal, dichotomous; calycine segments ovate; drupe containing a 4-celled nut, or a nut divisible into 4 1-celled 1-seeded parts. ♄. S. Native of the East Indies. Ehrètia áspera, Roxb. cor. 1. p. 41. t. 55. Willd. spec. 1. p. 1077. E. tomentòsa, Roth, nov. spec. p. 126. Ehrètia Hèynii, Rœm. et Schultes, syst. 4. p. 532. Bark of the larger branches rust coloured; young shoots downy. Corymbs globular, composed of dense, recurved, naked, secund spikes of pedicellate flowers. Flowers very small, white. Stigmas simple. Drupe red, size of a grain of pepper, somewhat tetragonal. Nuts smooth outside.

Rough Beurreria. Clt. 1795. Shrub.

11 B. setòsa (Roxb. fl. ind. 2. p. 342.) tender parts bristly; leaves ovate-cordate, acuminated, entire; panicles terminal, composed of dichotomous, secund, recurved spikes; calycine segments lanceolate, as long as the corolla; drupe containing 4 1-celled, 1-seeded nuts. ♄. S. Native of the Island of Hamoa.

Bristly Beurreria. Shrub or tree.

12 B. retu`sa; leaves small, obovate, retuse or acute, downy, as well as the young branches and peduncles; peduncles simple, terminating the short stiff branches, few-flowered. ♄. S. Native on the banks of the Irawaddy. Ehrètia retùsa, Wall. cat. no. 903. A stiff, stunted, branched shrub. Nut containing 4 1-seeded nuts.

Retuse-leaved Beurreria. Shrub 3 to 4 feet.

13 B. uniflòra (Roxb. fl. ind. 2. p. 342.) shrubby, twiggy; leaves crowded, nearly sessile, oblong, entire, hairy; flowers solitary, nearly sessile; drupe containing 4 1-celled, 1-seeded nuts. ♄. S. Native of the Moluccas.

One-flowered Beurreria. Shrub.

14 B. puncta`ta; leaves oval, entire, glabrous on both surfaces, beset with dots towards the margins, which are excavated beneath, but elevated, and rather wrinkled above; corymbs terminal, dichotomous, divaricate, downy, composed of secund spikes of flowers. ♄. S. Native of the East Indies. E. punctàta, Roth, nov. spec. p. 126. Dots at the margins of the leaves, as in *Coffèa Arábica*, but more copious, and appear like secreting pores. It differs from *B. læ`vis*, in dots only being on the margins of the leaves, not throughout its surface as in it, and the leaves themselves are less coriaceous, and the corymbs and calyxes more hairy.

Dotted-leaved Beurreria. Shrub or tree.

15 B. dichótoma (Rottl. herb. Blum. bijdr. 842, under *Ehrètia*,) leaves oblong, acuminated, quite entire, coriaceous, glabrous; corymbs terminal, dichotomous; flowers secund; segment of calyx bluntly toothed. ♄. S. Native of Java, in the higher woods on mount Burangrang.

Dichotomous-corymbed Beurreria. Fl. June, July. Tree.

16 B. gla`bra; leaves oval-roundish, glabrous, quite entire; corymbs terminal, dichotomous, divaricate, composed of secund racemes or spikes of pedicellate flowers; calyx membranous in the fruit-bearing state, obovate, sub-inflated, 5-cleft, downy inside. ♄. S. Native of the East Indies. E. glàbra, Roth, nov. spec. p. 126. This species differs from all others in the calyx being membranous and somewhat inflated, and less divided.

Glabrous Beurreria. Shrub or tree.

Cult. For culture or propagation see *Córdia*, p. 387.

V. CORTE`SIA (so named in honour of Ferdinando Cortesio, of New Spain, who collected many specimens of plants, which he sent to Cavanilles.) Cav. icon. 4. p. 53. t. 377.

Lin. syst. *Pentándria, Monogýnia.* Calyx truncate, 10-

toothed. Corolla funnel-shaped; tube length of calyx; limb 5-parted, spreading, with rounded lobes. Stamens 5, exserted; anthers ovate. Style bipartite at top; stigmas peltately globose. Drupe ovate, containing 2 1-seeded? nuts.—A much branched shrub, with alternate, sessile, cuneiform, glabrous leaves, which are trifid at apex; and terminal, sessile, solitary flowers. Calyx surrounding the drupe at the base.

1 C. cuneifòlia (Cav. l. c.) ♄. G. Native of Buenos Ayres, in the plains called Pampas. Leaves tubercular; tubercles white, with a deciduous white hair rising from the centre of each. Calyx villous, turbinate, hemispherical in the fruit-bearing state. Flowers yellowish white.

Wedge-leaved Cortesia. Shrub 4 to 5 feet.

Cult. For culture and propagation see *Córdia*, p. 387.

VI. CARMO'NA (named by Cavanilles, after Brunond Salvatori Carmona, a painter, and companion of Lœfling in his travels up the Orinoco.) Cav. icon. 5. t. 438.—Ehrètia species of Roxb.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla campanulate, or rotate; limb 5-6-cleft. Stamens 5-6, inclosed, shorter than the corolla. Styles capillary; stigmas simple. Drupe succulent, small, containing a 5-6-celled nut.—Branched shrubs. Leaves alternate, on the older branches fascicled, coriaceous, stiff. Peduncles rising from the fascicles of leaves, 2-6 flowered; flowers pedicellate, small, white.

1 C. heterophy'lla (Cav. icon. 5. t. 438.) leaves alternate or in fascicles, cuneiform, tridentate at the apex, sessile, very scabrous from callous dots; peduncles racemose; flowers on short pedicels; calycine segments lanceolate, as long as the corolla. ♄. S. Native of the East Indies, in barren lands and forests. Ehrètia heterophýlla, Spreng. syst. 1. p. 648. Córdia retùsa, Vahl. symb. 2. p. 42. Ehrètia buxifòlia, Roxb. cor. 1. p. 42. t. 57.?—Plukn. alm. p. 159. t. 31. f. 1. Bapanabooree of the Telingas. Leaves very hard, shining above, ½ to 1 inch long, and ¼ to ½ inch broad. Corolla campanulately rotate, 5-6-cleft. Stamens 5-6. Drupe size of a pea, red, containing a 5-6-celled nut. *Ehrètia buxifòlia*, Roxb. is probably a true species of *Beurrèria*.

Variable-leaved Carmona. Clt. 1823. Shrub 5 to 8 feet.

2 C. microphy'lla; leaves cuneiform, obtuse, quite entire, scabrous above, dotted, 4-5 in a fascicle; peduncles short, axillary, 1-flowered, shorter than the leaves; calycine segments linear, scabrous. ♄. S. Native of the East Indies. Ehrètia microphýlla, Lam. ill. 1. p. 425. no. 1921.—Plukn. phyt. t. 31. f. 1.? Plant glabrous. Berry dry? globose, size of a grain of pepper, somewhat mucronate.

Small-leaved Carmona. Fl. June, Aug. Clt. 1818. Shrub 5 to 8 feet?

3 C. lycioi'des; branches numerous, short, ending in a spine; leaves in fascicles, small, obovate-lanceolate, entire, glabrous. ♄. S. Native of Pegamew. Ehrètia lycioìdes, Wall. mss.

Lycium-like Carmona. Shrub 4 to 6 feet.

4 C. vimínea; leaves alternate, cuneate-lanceolate, entire, mucronate, downy, as well as the branches and peduncles, which are terminal, few-flowered, corymbose; segments of the calyx long, linear, acuminated. ♄. S. Native of Martaban, on the banks of the Attran, and on the Pundua mountains. Ehrètia vimínea, Wall. cat. no 906.

Twiggy Carmona. Shrub.

Cult. For culture and propagation see *Córdia*, p. 387.

VII. LUTRO'STYLIS (from λυτρωσις, *lutrosis*, a freeing; and στυλος, *stylos*, a column; the styles are free to the base, not combined at the base as the other genera belonging to the present order.) Ehrètia species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped, ? 5-cleft. Stamens a little shorter than the corolla. ? Styles 2, short; stigmas sub-capitate. Drupe globose, usually containing 4 1-seeded nuts.—Much branched, glabrous shrubs. Leaves rather coriaceous, fascicled. Corymbs terminal, dichotomous. Flowers small, white, or yellowish.

1 L. ine'rmis; glabrous, unarmed; leaves fascicled, obovate-oblong, obtuse, quite entire, finely ciliated; corymbs terminal, dichotomous; calyxes ciliated. ♄. S. Native of America, near Cumana. Ehrètia fasciculàta, H. B. et Kunth, nov. gen. amer. 3. p. 66. Shrub much branched; branches terete, white. Leaves usually 3 in a fascicle, on the tops of very short branches, petiolate, acute at the base, deep green above, pale beneath, 2 inches long. Corymbs downy, with angular branches. Flowers sessile. Segments of the calyx ovate, acute, ciliated. Corolla and stamens hardly seen. Drupe size of a grain of pepper, somewhat tetragonal.

Unarmed Lutrostylis. Shrub 6 to 8 feet.

2 L. spinòsa; spinose, glabrous; leaves fascicled, oblong, attenuated at the base, sometimes sub-repand; corymbs racemose, short, terminal; calycine segments lanceolate, acute. ♄. S. Native of South America. Ehrètia spinòsa, Jacq. amer. 46. t. 80. f. 18. edit. pict. t. 259. f. 14. Spines on the branches short, and sub-axillary; those on the trunk strong, woody, and very thick. Leaves 3-4 inches long, usually 5-6 in a fascicle. Stipulas subulate, rising from the centre of the tubercles in the branches. Flowers small, numerous, yellowish. Corolla length of calyx; segments of the limb ovate, obtuse, reflexed, length of tube. Stamens a little shorter than the corolla. Styles subulate; stigmas simple. Drupe red, small.

Spinose Lutrostylis. Shrub 4 to 10 feet.

3 L.? Montevide'nsis; leaves oblong, bluntish, quite entire; when young serrated a little at the apex, coriaceous, shining above, and of a different colour beneath, having the axils of the veins villous; spines opposite the branches, supra-axillary; racemes lateral, simple, opposite the leaves. ♄. S. Native of Montevideo, Sello. Ehrètia Montevidénsis, Spreng. syst. 1. p. 647.

Monte-video Lutrostylis. Shrub.

Cult. For culture and propagation see *Córdia*, p. 387.

VIII. RHA'BDIA (ῥαβδος, *rhabdos*, a twig; in reference to the shrub being twiggy.) Mart. pl. bras. 2. p. 136. t. 195.

Lyn. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla campanulate, 5-cleft, with a naked throat. Stamens 5, from the base of the corolla, inclosed. Style simple; stigma 2-lobed. Berry or drupe usually containing 4 1-seeded pyrenæ.—Branches downy. Leaves alternate, sessile. Flowers axillary, or in few-flowered, bracteate corymbs.

1 R. lycioi'des (Mart. l. c. p. 137. t. 195.) leaves oblong-lanceolate, obtuse, undulated, adpressed to the stem, downy beneath, and pale green; inflorescence corymbose; peduncles trifid, 3-flowered, or bifid, 2-flowered; drupe ovate, globose, scarlet. ♄. S. Native of Brazil, in the province of Bahia, on the inundated banks of the river St. Francisco, near Joa Siero. Leaves sessile, green above, and glaucous beneath. Corolla small, of a rose-purple colour, with a white tube.

Lycium-like Rhabdia. Shrub 5 to 6 feet.

Cult. For culture and propagation see *Córdia*, p. 387.

IX. MORELO'SIA (meaning unknown to us.) La Lave et Lexarza, nov. veg. mex. p. 1.

Lin. syst. *Pentándria, Digýnia.* Calyx adherent, ventricose, rather coriaceous, 5-cleft. Corolla rotate; with rounded segments. Stamens 5, exserted. Style forked; stigmas 2, capitate. Drupe tetragonal, containing a 4-seeded, 4-celled nut. —A moderate-sized tree, with a scabrous trunk, and twisted, angular, green branches. Leaves quite entire. Flowers terminal, corymbose, articulated to the extremities of the peduncles, sweet-scented, falling spontaneously before fecundation.

1 M. Huani`ta (La Lave, ex Lexarz. l. c.) ♄. S. Native of Mexico. Branches difformed at the extremities. Leaves 3-4 inches long.

Huanita Morelosia. Tree.

Cult. For culture and propagation see *Córdia*, p. 387.

Tribe III.

ERIMATALIE`Æ (this tribe only contains the genus *Erysìbe.*) Style hardly any; stigma large, 5-groved. Drupe pulpy, containing only one 1-seeded nut.

X. ERYSI'BE (probably the East Indian name of *E. paniculàta.*) Roxb. cor. 2. t. 159. fl. ind. 2. p. 284. Blum. bijdr. p. 1046. Erimatàlia, Lam. dict. 2. p. 348.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, or 5-toothed; segments obtuse, imbricate. Corolla with a short tube, tomentose outside; limb spreading, 5-parted: lobes bifid, induplicate in æstivation. Ovarium 1-celled, 3-4-ovulate; ovula attached to the bottom of the cell. Stigma sessile, discoid. Berry 1-seeded, ex Roxb.—Climbing shrubs, with alternate leaves, and axillary and terminal panicles of flowers. This genus is nearly allied to *Moorcróftia* and *Marípa*, on the one hand, and *Apocýneæ* on the other.

1 E. paniculа`ta (Roxb. cor. 2. t. 159.) leaves oblong, pointed, glabrous; panicles large, terminal. ♄. ◠. S. Native of the Circars, and the eastern borders of Bengal. Branches and panicles clothed with rust-coloured farinæ. Leaves 4-5 inches long, and about 2 broad. Flowers small, rust-coloured: border yellow. Berry size of a cherry, black. On the mountains bordering on Silhet, the shrub blossoms in October, and is called there *Luta-Bichutti.*

Panicled-flowered Erysibe. Shrub tw.

2 E. Rhee`dii (Blum. bijdr. p. 1047.) leaves elliptic-oblong, bluntly acuminated, coriaceous, glabrous; panicles axillary and terminal. ♄. ◠. S. Native of the Malabar coast; and of Java, on the Salak mountains, where it is called *Mugmale-aroy.* Erìma-Tàli, Rheed. mal. 7. p. 73. t. 39. Lam. dict. 2. p. 348. Erimatàlia Rheèdii, Rœm. et Schultes, syst. 5. p. 331.

Rheede's Erysibe. Fl. July. Shrub tw.

3 E. glomera`ta (Blum. bijdr. p. 1047.) leaves elliptic-oblong, acuminated, coriaceous, glabrous; flowers axillary, glomerate. ♄. ◠. S. Native of Java, in woods, on mount Salak, where it is called *Kisimutti.*

Var. β, longifòlia (Blum. l. c.) leaves cuneate-oblong, bluntly acuminated. ♄. ◠. S. Native of the Island of *Nusæ-Kambanga.*

Glomerate-flowered Erysibe. Fl. Nov. Shrub tw.

4 E. tomentòsa (Blum. bijdr. p. 1048.) leaves ovate, acute, glabrous above, and tomentose beneath; racemes axillary, very short. ♄. ◠. S. Native of Java, on the mountains of Parang.

Tomentose Erysibe. Fl. July, Aug. Shrub tw.

5 E. expa'nsa (Wall. cat. no. 1331.) young branches, racemes, calyxes, petioles, and undersides of young leaves clothed with rusty tomentum, as in *E. paniculàta;* leaves coriaceous, elliptic, acuminated, mucronate, shining, entire; panicles axillary and terminal, many-flowered, solitary or aggregate; flowers racemosely fascicled. ♄. ◡. S. Native of Martaban, Moalmeyne, and Tavoy.

Expanded Erysibe. Shrub climbing.

6 E. subsɨica`ta (Wall. cat. no. 1332.) young branches, &c. as in the last; leaves obovate-oblong, acuminated, tapering to the base, or oblong-lanceolate; racemes spicate, solitary, terminal; flowers aggregate, crowded. ♄. ◡. S. Native of the Burman Empire, on Mount Taong-Dong.

Subspicate-flowered Erysibe. Shrub climbing.

7 E. Pri'ncei (Wall. cat. no. 1335.) young branches, &c. as in the two last species; leaves oblong, acuminated, on very short petioles, almost sessile; racemes axillary and terminal, solitary or twin, simple, short; flowers aggregate. ♄. ◡. S. Native of Singapore, J. Prince.

Prince's Erysibe. Shrub climbing.

8 E. fra`grans (Wall. cat. no. 1336.) racemes and calyxes clothed with rusty tomentum; leaves large, coriaceous, glabrous, acuminated; racemes usually aggregate, panicled or simple, axillary, very short. ♄. ◡. S. Native of the Burman Empire, at Amherst. Flowers aggregate.

Fragrant Erysibe. Shrub climbing.

9 E. læviga`ta (Wall. cat. no. 1333.) glabrous, except the outside of the inner calyxes; leaves coriaceous, oblong-lanceolate, acuminated, entire; calyxes ciliated; racemes short, axillary and terminal, panicled; flowers aggregate. ♄. ◡. G. Native of China and Silhet. Corollas white; anthers brown.

Smooth Erysibe. Shrub climbing.

10 E. glauce'scens (Wall. cat. no. 1334.) pedicels and calyxes clothed with velvety brownish down; leaves glabrous, glaucescent, but perfectly glaucous beneath, broad-elliptic, acuminated; racemes panicled, axillary and terminal, usually solitary, elongated, the whole forming a diffuse, terminal panicle; flowers aggregate. ♄. ◡. S. Native of Moalmyne.

Glaucescent Erysibe. Shrub climbing.

Cult. The species of *Erysìbe* are well fitted for training up rafters or pillars in stoves; they are of easy culture, will grow well in any rich light soil, and are readily propagated by young cuttings in sand, in heat, with a hand-glass placed over them.

† *A genus not known whether belonging to the order or not.*

XI. ROCHEFO'RTIA (named in honour of M. De Rochefort, author of Histoire naturelle et morale des Isles Antilles de l' Amerique; Rotterdam, 1639.) Swartz, prod. p. 54. fl. ind. occ. 1. p. 552. icon. t. 10.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-parted; with ovate-oblong segments. Corolla funnel-shaped, with a short tube and open throat; segments of the limb ovate-oblong, spreading. Stamens 5, inserted in the plicæ of the throat of the corolla. Styles 2, subulate; stigmas simple. Fruit globose, 2-celled. Seeds numerous, angular.—Branched shrubs, with alternate leaves; and corymbose, dichotomous, terminal, and axillary inflorescence.

1 R. cunea`ta (Swartz, fl. ind. occ. 1. p. 552. icon. t. 10.) leaves cuneiform, obovate, entire, alternate, fascicled; peduncles terminal and axillary, subdichotomous, cymose. ♄. S. Native of Jamaica, in stony mountain places. Branches flexuous, terete, spinose, smooth; spines close to the petioles, long. Leaves fascicled, 1-3 together, rarely more, rather emarginate at top, glabrous, of an obscure, shining, greenish brown colour above, and paler beneath. Cymes shorter than the leaves. Flowers small, greenish white. Calyx downy. Tube of corolla pentagonal. Stamens subulate, inserted in the recesses, between the lobes of the corolla. Stigmas villous, rather plumose. Seeds angular.

Cuneate-leaved Rochefortia. Shrub 3 to 4 feet.

2 R. ova`ta (Swartz, fl. ind. occ. 1. p. 554.) leaves ovate, emarginate, entire, villous; peduncles many-flowered, twin,

shorter than the leaves. ♄. S. Native of Jamaica, among bushes in stony places. Branches terete, glabrous. Leaves an inch long. Segments of calyx erect, incumbent, with villous margins. Tube of corolla campanulate, open, length of calyx, or a little shorter; segments oblong. Stamens shorter than the segments of the corolla. Stigmas acute.

Ovate-leaved Rochefortia. Shrub 3 to 4 feet.

3 R. Brasilie'nsis (Hoffm. in Willd. herb. ex Rœm. et Schultes, syst. 6. p. 210.) leaves ovate, acuminated, coriaceous, remotely subserrated; corymbs racemose. ♄. S. Native of Brazil.

Brasilian Rochefortia. Shrub.

Cult. For culture and propagation see *Córdia*, p. 387.

N.B. Varrònia móllis, Desf. tabl. de jard. par p. 220. is a species of *Melòchia*, according to Desvaux.

Córdia aspérrima, Spreng. syst. 1. p. 649. does not belong to the order, but is a plant of the order *Labiàtæ*.

Order CLXVIII. HYDROPHY'LLEÆ (this order contains plants agreeing with the genus *Hydrophyllum* in important characters.) R. Br. in bot. mag. vol. 50. t. 2373. append. to Frankl. journ. Benth. in Lin. trans. 17. p. 267. Boragíneæ, sect. II. Juss. gen. 129. ed. Usteri, p. 144.

Calyx inferior, permanent, deeply 5-cleft; the recesses between the segments often furnished with reflexed appendages. Corolla monopetalous, hypogynous, regular, shortly 5-cleft, rotately campanulate, rarely somewhat funnel-shaped. Stamens 5, perigynous, alternating with the lobes of the corolla, inflexed in æstivation; anthers versatile, 2-celled; cells parallel, dehiscing lengthwise. Ovarium superior, simple, 1-celled. Style elongated, bifid; stigmas 2, terminal. Placentas 2, free to the back, or adnate to the parietes of the fruit; their inner surface bearing 2 or many ovula. Fruit capsular, dehiscing by 2 valves; sometimes 1-celled, from the large placentas filling the capsule; but sometimes the dissepiment is hardly complete, therefore the capsule is half 2-celled. Seeds reticulated outside. Albumen copious, cartilaginous. Embryo conical, with the radicle looking to the hilum.—Elegant herbs, natives of America; hispid, like those of *Boragíneæ*. Leaves usually lobed, alternate, or the lower ones are opposite. Flowers disposed in unilateral, subdichotomous spikes or racemes, which are at first circinately scorpioid; rarely axillary, solitary, pedunculate. Corollas blue or pink, elegant.

This order is distinguished from *Boragíneæ*, and its nearest allies, by the capsular fruit, copious, cartilaginous albumen, placentation of the seeds, and generally by the compound, or deeply lobed leaves.

Synopsis of the genera.

1 Hydrophy'llum. Corolline processes 5, linear, adnate by the back, but with the top and margins free. Stamens exserted. Placentas large, biovulate.

2 Elli'sia. Calyx without appendages. Corolline processes 10, short, or wanting. Stamens rather shorter than the corolla. Placentas large, biovulate.

3 Nemóphila. Sinuses of the calyx furnished with reflexed teeth. Corolline processes 10, short or wanting. Stamens rather shorter than the corolla. Placentas large, 2-12-ovulate.

4 Eu'toca. Corolla deciduous. Ovarium pilose. Placentas linear, 4, or many-ovulate. Capsule half 2-celled.

5 Phace'lia. Corolla deciduous. Ovarium pilose. Placentas linear, 2-ovulate. Capsule falsely 2-celled.

6 Emmena'nthe. Corolla permanent. Ovarium clothed with glandular pubescence. Placentas linear, adnate by the back. Capsule falsely 2-celled.

I. HYDROPHY'LLUM (from ὑδωρ ὑδατος, *hydor hydatos*, water; and φυλλον, *phyllon*, a leaf. Miller supposes that Morinus gave it the name of *Water-leaf*, because the spring water stands in the cavity of the leaves, and not from its growing in water, as Tournefort conjectures.) Tourn. inst. t. 16. Lin. gen. p. 83. no. 284. Schreb. gen. no. 267. Juss. gen. p. 129. ed. Usteri, p. 144. Gærtn. fruct. 2. p. 133. t. 110. Lam. ill. t. 97. f. 1—2. Benth. in Lin. trans. 17. p. 272.—Nemóphila species, Spreng.

Lin. syst. *Pentándria, Monogýnia.* Corolline scales 5, linear, adnate by the back, but with the margins and top free. Stamens much exserted. Placentas large, free on the back, filling the ovarium, biovulate.—Radical leaves numerous: cauline ones few, alternate, broad, pinnately or palmately cut. Racemes bractless, scorpioid, dichotomous. Corollas blue or white.

1 H. appendicula'tum (Michx. fl. bor. amer. 1. p. 134.) lower leaves pinnate: cauline ones palmately lobed; racemes very loose; calyx very hispid: the sinuses furnished with reflexed appendages. ♃. H. Native of Virginia, near Harper's Ferry, Tennessee, Alleghanies, &c. on shady rocks near springs. Pursh, fl. amer. sept. 1. p. 134. Benth. l. c. p. 272. Nemóphila, paniculàta, Spreng. syst. 1. p. 569. Plant very hairy. The radical leaves are like those of *H. Virgínica*; and the upper ones like those of *H. Canadénsis*. Pedicels almost twice as long as the fructiferous calyx. Calyx of *Nemóphila*, but with the habit of the genus. Calyx almost the length of the corolla. Corollas pale blue. Fascicles of flowers panicled.

Appendiculate-calyxed Water-leaf. Fl. May, June. Clt. 1813. Pl. $\frac{3}{4}$ to 1 foot.

2 H. Canade'nse (Lin. spec. p. 208.) leaves palmately-lobed or angular; cymes of flowers loose; calyx glabrous. ♃. H. Native from Canada to Pennsylvania, on wet rocks and shady mountains. Lam. ill. t. 97. f. 2. Ker. bot. reg. t. 242. Pursh, l. c. Benth. l. c. p. 273. Plant smoothish, or a little hispid. Leaves broad, roundish, glabrous on both surfaces, or hispid from a few hairs, hardly divided to the middle into lobes, having the margins furnished with a few sharp teeth. Pedicels usually shorter than the calyx. Corollas white, tinged with blue or purple.

Canadian Water-leaf. Fl. June, July. Clt. 1759. Shrub $\frac{1}{2}$ to 1 foot.

3 H. Virgi'nicum (Lin. spec. 208.) leaves pinnate: segments deeply cut; cymes of flowers rather loose; calycine segments narrow-linear, ciliately hispid. ♃. H. Native from Canada to Carolina, in shady, rocky situations. Lam. ill. t. 97. f. 1. Ker. bot. reg. t. 331. Schkuhr, handb. 1. p. 114. t. 35. Pursh, fl. 1. p. 134.—Sabb. hort. rom. 1. t. 15.—Mor. hist. 3. p. 599. sect. 15. t. 1. f. 1.—Dod. pempt. 77. t. 77. Benth. l. c. Plant smoothish. Leaves hispid from a few scat-

tered pili above, pale and glabrous beneath, with 2-3 pairs of segments: lower segments on short petioles: upper ones usually combined with the terminal one. Corollas beautiful blue.

Virginian Water-leaf. Fl. May, June. Clt. 1739. Pl. ½ to 1 foot.

4 H. macrophy'llum (Nutt. in journ. acad. nat. scienc. phil. 7. p. 111.) leaves pinnate; segments or leaflets deeply toothed; cymes of flowers very dense; calycine segments lanceolate, ciliately hispid. ♃. H. Native of North-west America, in fissures of moist rocks, in the interior of Columbia, Douglas, 1826; in the forests of Kentucky, Mr. Short, ex Nutt, l. c. H. capitàtum, Dougl. mss. ex Benth. l. c. p. 282. H. cælestìnum, Dougl. mss. The specimens collected on moist rocks in the interior of Columbia, (H. capitàtum, Dougl. mss.,) have the leaves hispid on both surfaces; the segments or leaflets but little divided, and not narrowed at their base. The other specimens gathered in shady moist woods (H. cælestìnum, Dougl. mss.) have the leaves larger, with broader segments, much more cut, and the flowers fewer. The same plant also occurs in *Califórnia*, but with the leaves much more hispid on the upper surface, and clothed with whitish down beneath, ex Benth. All these differences are perhaps attributable to locality. Corollas blue.

Large-leaved Water-leaf. Pl. 1 foot?

† *A doubtful species.*

5 H. linea're (Pursh, fl. 1. p. 134.) pilose; leaves linear; racemes elongated. ♃. H. Native on the banks of the Missouri.

Linear-leaved Water-leaf. Fl. April. Pl.?

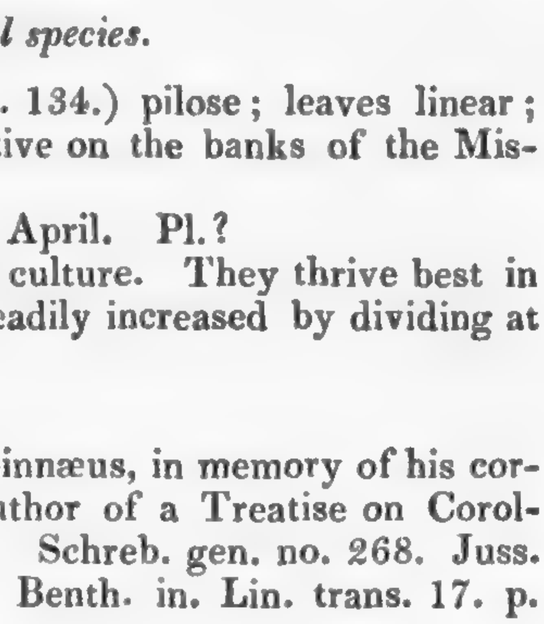
Cult. Plants of the most easy culture. They thrive best in a shady moist situation, and are readily increased by dividing at the root in spring or autumn.

II. ELLI'SIA (so named by Linnæus, in memory of his correspondent John Ellis, F.R.S., author of a Treatise on Corollines.) Lin. gen. p. 83. no. 244. Schreb. gen. no. 268. Juss. gen. p. 129. ed. Usteri, p. 144. Benth. in. Lin. trans. 17. p. 274.

Lin. syst. *Pentándria, Monogýnia.* Calyx without appendages at the sinuses. Corolline processes 10, short or wanting. Stamens rather shorter than the corolla. Placentas large, free on the back, filling the ovarium, biovulate.—North American small annual herbs. Leaves pinnately cut: lower ones opposite. Lower peduncles opposite the leaves: superior ones disposed in simple, unilateral, loose racemes.

1 E. Nyctele'a (Lin. gen. 97. syst. 195. mant. p. 336.) petioles without appendages; leaves pinnatifid, with cut lobes; calyx increasing much after florescence. ☉. H. Native of Virginia, on the banks of the Potomac river, and on the banks of the Missouri. Gærtn. fil. carp. 3. t. 184. f. 6. Lam. ill. t. 97.—Benth. l. c. p. 274. Polemònium Nyctelèa, Lin. spec. 231. Ehret, nov. act. ups. 1. p. 97. t. 5. f. 5. Trew. pl. sel. p. 56. t. 99. Planta Lithospérma affínis, Act. eph. nat. cur. 1761. p. 330. t. 7. f. 1.—Mor. hist. 3. p. 451. sect. 11. t. 28. f. 3. Segments of the fruit-bearing calyx ovate-lanceolate, acute, foliaceous, half an inch long. Stem dichotomous. Peduncles 1-flowered, opposite the leaves. Leaves downy. Flowers drooping. Corolla white, with minute, purple dots inside the divisions.

FIG. 38.



Nyctelea or Cut-leaved Ellisia. Fl. July, Aug. Clt. 1755. Pl. ½ foot.

2 E. ambi'gua (Nutt. gen. 1. p. 118.) plant decumbent, branched; stem glabrous, rather glaucous; leaves hairy, lyrately pinnatifid, almost sessile: segments nearly lanceolate, angularly toothed or lobed; racemes opposite the leaves, lateral and terminal; corolla small, hardly longer than the calyx: with emarginate segments. ☉. H. Native on the banks of the Missouri, in alluvial soils. Corolla white?

Ambiguous Ellisia. Pl. decumbent.

3 E. microca'lyx (Nutt. in amer. phil. soc. trans. n. s. 5. p. 191.) smoothish, decumbent; leaves lyrately pinnatifid, on long petioles; segments few (3-5): lateral ones oblique, deeply toothed: middle one trifid and obtuse; flowers solitary, minute. ☉. H. Native of the Arkansas, Alabana, &c. Hydrophýllum pusíllum, Muhl. herb. Leaves slightly hairy; lateral segments half reniform; the terminal division nearly entire, but trifid. Calyx minute. Corolla very small, subcampanulate; with 5 shallow lobes.

Small-calyxed Ellisia. Pl. decumbent.

4 E. ranuncula'cea (Nutt. l. c.) rather hairy; stems procumbent; leaves pinnatifid, somewhat 5-lobed: superior ones tripartite, deeply toothed, obtuse, on long petioles; racemes secund, few-flowered. ☉. H. Native of the Arkansas, in shady, alluvial, humid forests. Lateral segments of the superior leaves toothed on the lower side; the central segment trifid. Corolla pale blue, cylindrically campanulate, naked. Ovarium hairy. Nearly allied to *E. ambígua*, from which it differs in the less compound leaves, on conspicuous petioles.

Crowfoot-like Ellisia. Pl. procumbent.

5 E. membrana'cea (Benth. in Lin. trans. 17. p. 274.) quite glabrous; petioles exappendiculate; leaves pinnatifid: segments quite entire; calyx hardly increasing after florescence. ☉.? H. Native of California, Douglas. Leaves thin; lobes divaricate, broad-lanceolate, obtuse. Flowers small, pedicellate, loosely racemose. Corolla white.

Membranous-leaved Ellisia. Pl.?

6 E. chrysanthemifòlia (Benth. l. c.) hispid; petioles auriculately dilated at the base; leaves sub-bipinnatifid: lobes deeply toothed, obtuse; calyx increasing a little after florescence. ☉.? H. Native of California, Douglas. Flowers similar to those of *E. membranàcea*. Processes of corolla toothed.

Chrysanthemum-leaved Ellisia. Pl.?

Cult. The seeds of these plants only require to be sown in the open ground; and if allowed to scatter their seeds, will maintain themselves.

III. NEMO'PHILA (from *νεμος, nemos*, a grove; and *φιλεω, phileo*, to love; the plants delight in shady situations.) Barton, fl. amer. p. 61. Nutt. journ. acad. nat. scienc. phil. vol. 2. p. 179. Benth. in Lin. trans. 17. p. 272.—Phacèlia species, Juss. gen. p. 144. Pursh, fl. amer. sept. 1. p. 140.

Lin. syst. *Pentándria, Monogýnia.* Sinuses between the lobes of the calyx appendiculated by reflexed teeth. Corolline processes 10, short or wanting. Stamens rather shorter than the corolla. Placentas large, free on the back, filling the ovarium, 2-12-ovulate.—Diffuse, brittle, annual herbs. Lower leaves opposite; all pinnatifid. Peduncles sometimes axillary, 1-flowered; sometimes few at the tops of the branches, disposed in short racemes. Flowers usually blue.

1 N. parviflòra (Dougl. mss. ex Benth. l. c. p. 275.) leaves pinnatifid: lobes few, broad, a little toothed; sinuses of calyx with short appendages; corolla hardly exceeding the calyx; placentas 2-ovulate. ⊙. H. Native of Columbia, on the west coast of America, Douglas and Scouler. Flowers small. Appendages of calyx usually very short, sometimes hardly evident, rarely elongating after florescence. Processes of corolla small, narrow.

Small-flowered Nemophila. Fl.? Clt. 1826. Pl. 1 foot.

2 N. pedunculàta (Dougl. mss. ex Benth. l. c.) leaves pinnatifid; sinuses of the calyx furnished with short appendages; corolla hardly exceeding the calyx; placentas 6-ovulate. ⊙. H. Native of North-west America, on the Columbia, Douglas. Habit, calyx, and corolla, almost as in *N. parviflòra*. Leaves narrower, on longish petioles; and the lobes more entire and distinct.

Pedunculate Nemophila. Pl. 1 foot?

3 N. phacelioìdes (Bart. fl. amer. bor. p. 61.) petioles without appendages; corolla exceeding the calyx a little; sinuses of the calyx furnished with lanceolate appendages, which equal in length one half the calyx; placentas biovulate. ⊙. or ♂. H. Native of North America. Sweet, fl. gard. 1. t. 32. Sims, bot. mag. 2373. N. Nuttállii, Coll. hort. rip. append. t. 5. Corollas blue. This plant is nearly related to *N. parviflòra*; but differs in the flowers, which are twice the size, and the larger or longer appendages of the calyx.

Phacelia-like Nemophila. Fl. July, Aug. Clt. 1822. Pl. 1 foot.

4 N. aurìta (Lindl. bot. reg. t. 1601.) petioles auriculately dilated at the base; sinuses of the calyx furnished with elongated appendages; corolla twice as long as the calyx; placentas biovulate. ⊙. H. Native of California, Douglas. Leaves while opposite connate at the base; lobes lanceolate, quite entire, divaricate, or tending to the base of the leaf. Peduncles somewhat racemose at the tops of the branches. Corolla nearly an inch in diameter, purple. Benth. l. c. p. 275.

Eared-petioled Nemophila. Fl. May, Aug. Clt. 1831. Pl. prostrate.

5 N. insi'gnis (Dougl. mss. ex Benth. l. c. p. 275. Lindl. bot. reg. 1713.) petioles without appendages; corolla twice as long as the calyx; placentas 10-12-ovulate. ⊙. H. Native of California, Douglas. D. Don, in Sweet, fl. gard. n. s. t. 329. N. phacelioìdes, Ker. bot. reg. t. 740.? Herb deep green. Leaves with 3-4 lobes on each side, quite entire or cut. Peduncles longer than the leaves. Corolla blue, with a white centre, more than an inch in diameter. Processes of the corolla villous at the base.

Showy Nemophila. Fl. July, Aug. Clt. 1822. Pl. 1 foot.

6 N. atoma'ria (Fisch. et Meyer, cat. sem. hort. petrop. p. 42.) leaves opposite, pinnatifid: lobes 5-9, almost entire; peduncles axillary, elongated; corolla rotate, with a very pilose bottom, and obovate segments; placentas about 10-ovulate; seeds strophiolate, smooth. ⊙. H. Native of New California, about the Russian colony, Ross. Very like *N. insígnis*, but the herb is pale green; the flowers white, ornamented with violaceous spots. Seeds yellowish, beset with minute scales, as in *N. insígnis*. Corollas nearly an inch in diameter.

Atom Nemophila. Fl.? Clt. 1836. Pl. 1 foot.

7 N. Menzie'sii (Hook. et Arn. in Beech. voy. pt. bot. p. 152.) leaves all pinnatifid, scabrous: segments approximate, ovate, obtuse, ciliated, somewhat tridentately lobed; peduncles twice as long as the leaves, and opposite them; calyx with lanceolate segments, and minute appendages to the sinuses. ⊙. H. Native of Chili? Capsule many-seeded. Corollas blue?

Menzies's Nemophila. Pl. 1 foot?

Cult. These are all pretty plants, and worth cultivating. The seeds may be reared on a hot-bed, if the plants are wanted to flower early; but if otherwise, they may be sown in the open ground. They delight in a moist, shady situation, and peat or vegetable soil.

IV. EU'TOCA (from *ευτοκος, eutocos*, fruitful; in reference to the number of seeds in each capsule.) R. Br. in append. to Frankl. trav. ed. 2. p. 51. t. 27. Dougl. in bot. reg. t. 1180. Benth. in Lin. trans. 17. p. 276.—Phacèlia species, Pursh.

Lin. syst. *Pentándria, Monogýnia.* Corolla deciduous. Ovarium ovoid-globose, hispid from pili. Placentas linear, adnate by the back to the parietes of the ovarium, 4 to many-ovulate. Capsule half 2-celled, from the dissepiment being incomplete.—Annual herbs, usually erect, with the habit of *Phacèlia*, rarely diffuse or divaricate. Flowers racemose, dense and sessile, or loose and pedunculate. Cymes unilateral, simple or dichotomous.

1 E. Dougla'sii (Benth. in Lin. trans. 17. p. 276.) diffuse; leaves all pinnatifid: with ovate, almost entire lobes; placentas 12-20-ovulate. ⊙. H. Native of California, Douglas. Leaves nearly all radical, hispid; with 4-6 lobes on each side. Floriferous stems ascending, furnished with a few leaves at the base, naked and many-flowered at the apex. Peduncles elongated. Flowers as large as *Nemóphila insígnis*, to which plant the habit is referrible.

Douglas's Eutoca. Pl. 1 foot.

2 E. Cumíngii (Benth. in Lin. trans. 17. p. 276.) erect, clothed with scabrous pubescence; leaves elongated, pinnate: lobes or leaflets oblong, obtuse, cut a little; placentas 6-8-ovulate. ⊙. H. Native of the Andes of Chili. The corolla appears to be shorter than the calyx. Very nearly allied to *E. brachýloba.*

Cuming's Eutoca. Pl. 1 foot?

3 E. brachy'loba (Benth. l. c. p. 277.) erect, beset with scabrous pubescence; leaves long, pinnatifid: lobes ovate, obtuse, a little cut; placentas 6-8-ovulate. ⊙. H. Native of California, Douglas. Leaves petiolate, 2-3 inches long, with 6 lobes on each side. Pedicels short. Racemes dichotomous, almost as in *Phacèlia circinàta.*

Short-lobed-leaved Eutoca. Pl. 1 foot?

4 E. Mexica'na (Benth. l. c.) diffuse; leaves ovate-oblong, deeply pinnatifid: lobes ovate or oblong, glabrous on both surfaces; placentas, 6-8-ovulate. ⊙. H. Native of Mexico, in the neighbourhood of the mines of Tlalpuxahua, and between that place and the city of Mexico, G. J. Graham. Racemes elongated, simple. Flowers pedicellate, twice as large as those of *E. parviflòra*, to which the present species is nearly allied; the filaments are pilose as in it, and the processes of the corolla are wanting.

Mexican Eutoca. Pl. diffuse.

5 E. parviflòra (R. Br. append. to Frankl. trav. ed. 2d. p. 51, Benth. l. c.) diffuse; leaves pinnatifid or trifid: the superior ones sometimes undivided, and the lobes of the lower ones are ovate, or oblong, quite entire, hispid on both surfaces; placentas 6-8-ovulate. ⊙. H. Native of Pennsylvania, Schweinitz; Alleghanies, Drummond; on rocks near Harper's Ferry on the Potomac, Pursh. Phacèlia parviflòra, Pursh, fl. amer. sept. 1. p. 140. Polemònium dùbium, Willd. spec. 1. p. 887. —Polemonium, foliis inferioribus hastatis, superioribus lanceolatis, Gron. virg. p. 29.—Plukn. alm. t. 245. f. 5. Flowers small, pale blue.

Small-flowered Eutoca. Fl. May. Clt. 1826. Pl. 1 foot?

6 E. loasæfòlia (Benth. in Lin. trans. 17. p. 277.) erect,

very hispid; leaves ovate, pinnatifid: lobes broad, acute, deeply-toothed; corolla hardly exceeding the calyx; stamens exserted; placentas 6-8-ovulate. ⊙. H. Native of California, Douglas. Habit almost of *Phacèlia*. All parts of the plant very hairy from long stiff pili, intermixed with clammy down.

Loasa-leaved Eutoca. Pl. 1 foot?

7 E. Franklìnii (R. Br. in append. to Frankl. trav. p. *52*. Benth. l. c.) erect; leaves pinnatifid, or bi-pinnatifid; ovula 20 or more to each placenta. ⊙. H. Native of North America. Hook. bot. mag. 2985. Corollas with a blue limb and white tube.

Franklin's Eutoca. Fl. April, July. Clt. 1827. Pl. 1 foot.

8 E. Menzie'sii (R. Br. l. c.) erect, hispid; leaves linear, or lanceolate, quite entire, sometimes trifid or pinnatifid; placentas 20, or many-ovulate. ⊙. H. Native of North West America, on dry sandy soils, and California, Douglas. E. multiflòra, Dougl. in bot. reg. t. 1180. Lehm. pug. 2. p. 19. E. echioìdes, and E. glomeràta, Dougl. mss. E. congesta, Dougl. mss. Lehm. pug. 2. p. 18. Plant variable in the breadth of the leaves and stature. Corollas blue.

FIG. 38.

Menzies's Eutoca. Fl. May, July. Clt. 1826. Pl. 1½ foot.

9 E. serícea (Graham, in edinb. phil. journ. July 1830. p. 172.) erectish; leaves silky on both surfaces, pinnatifid; segments cut outwardly; superior leaves linear, entire; stamens 3 times as long as the corolla; placentas many-ovulate, several of which are abortive. ⊙. H. Native of North America. Hook. bot. mag. t. 3003. E. pulchélla, Lehm. pug. 2. p. 18. Flowers blue.

Silky Eutoca. Fl. May, July. Clt. 1827. Pl. 1 foot.

10 E. grandiflòra (Benth. in Lin. trans. 17. p. 278.) ascending; leaves broad, ovate, toothed, sub-cordate at the base; placentas above 50-ovulate. ⊙. H. Native of California, Douglas. Stem or branches nearly simple. Leaves 1½ inch long, and almost as broad, wrinkled, hispid, as well as stems and calyxes. Racemes numerous, at the top of the stem circinate. Calyxes nearly sessile. Corolla 1½ inch in diameter, without any processes. Filaments glabrous.

Great-flowered Eutoca. Pl. 1 foot?

11 E. divarica'ta (Benth. l. c.) stems dichotomously divaricate; leaves all ovate, undivided; placentas 12-20-ovulate. ⊙. H. Native of California, Douglas. Lindl. bot. reg. t. 1784. Leaves all alternate. Racemes many-flowered, unilateral. Flowers almost sessile. Calyx increasing much after florescence. Corolla pale blue, exceeding the calyx a little.

Divaricate Eutoca. Pl. decumbent.

12 E. phacelioìdes (Benth. l. c. p. 279.) erect, branched; leaves all ovate, undivided, quite entire; placentas 4-ovulate. ⊙. H. Native of California, Douglas. Habit of *Phacèlia circinàta*, but much smaller. Leaves all alternate, petiolate. Racemes many-flowered. Flowers nearly sessile. Calyxes very hispid. Corolla somewhat funnel-shaped, exceeding the calyx a little. Stamens inclosed within the tube.

Phacelia-like Eutoca. Pl. 1 to 2 feet.

13 E. Wrangelia'na (Fisch. et Meyer, cat. sem. hort. petrop. p. 37.) diffuse, downy; leaves ovate, acute, quite entire; corollas about twice as long as the calyx, and about equal in length to the stamens; placentas 8-10-ovulate. ⊙. H. Native of New California, about the Russian colony, Ross. Herb canescent, much-branched. Corollas an inch in diameter, bluish-violet.

Wrangel's Eutoca. Fl.? Clt. 1836. Pl. diffuse.

14 E. vi'scida (Benth. in bot. reg. t. 1808.) clothed with clammy pili; stem erect, branched; leaves cordate-ovate, a little angular, serrated; racemes elongated, forked and simple; placentas many-ovulate. ⊙. H. Native of California. Corolla fine blue; tube rose-coloured.

Viscid Eutoca. Fl. June, Aug. Clt. 1834. Pl. 2 feet.

Cult. All the species are elegant and hardy. They succeed best on rockwork, in dry, sandy, or gravelly soil. They are raised from seeds, which are produced sparingly.

V. PHACE'LIA (from φακελος, *phakelos*, a fascicle; in reference to the fascicles of flowers.) Juss. gen. p. 129. ed. Usteri, p. 144. Michx. fl. bor. amer. 1. p. 134. t. 16. Benth. in Lin. trans. 17. p. 279.

Lin. syst. *Pentándria, Monogýnia.* Corolla deciduous. Ovarium ovoid-globose, hispid from pili. Placentas linear, usually adnate by the back to the parietes of the ovarium, biovulate. Capsule falsely 2-celled, from the dissepiment being almost complete.—Annual or perennial, erect or diffuse herbs, natives of America. Flowers racemose, dense, sessile, or loose, pedicellate. Cymes unilateral, simple, or forked.

1 P. malvæflòra (Cham. in Linnæa, 4. p. 495.) hispid; leaves broadly cordate-ovate, lobed; calycine segments linear-spatulate, hispid: outer one large; stamens exserted. ♂. H. Native of California. Corolla campanulate, a little longer than the calyx; limb unequally 5-lobed. Plant beset with glandular and simple hairs.

Mallow-flowered Phacelia. Pl. 1½ foot.

2 P. brachya'ntha (Benth. in Lin. trans. 17. p. 279.) leaves ovate, quite entire, undivided, or furnished with 1-2 lobules at the base; corolla hardly exceeding the calyx; stamens inclosed. ♂. H. Native of the Andes of Chili, at the baths of Collina. Habit of *P. circinàta*. Flowers almost like those of *Eùtoca phacelioìdes*, but the placentas are constantly biovulate.

Short-flowered Phacelia. Pl. 1½ foot.

3 P. circina'ta (Jacq. fil. eclog. 1. p. 135. t. 91.) leaves usually pinnate, but sometimes undivided: lobes oblong or ovate, quite entire, unequal; corolla more than one-half longer than the calyx; stamens exserted. ♂. or ♃. H. Native of Chili, Straits of Magellan, Commerson; Peru, Ruiz. et Pavon; Mexico, on Mount Orizaba, Schiede and Deppe; California, Chamisso, Douglas, &c.; on the Columbia, Dougl. and Scouler; on the banks of the Kooskoosky, Lewis. P. Peruviàna, Spreng. syst. 1. p. 584. Cham. in Linnæa, 4. p. 494. P. Califórnica, Cham. l. c. P. heterophýlla, Pursh. fl. amer. sept. 1. p. 140. P. rùdis, Dougl. mss. P. hastàta, Dougl. mss. ex Lehm. pug. 2. p. 20. Heliotròpium pinnàtum, Vahl. symb. 3. p. 21. Hydrophýllum Magellánicum, Lam. journ. d'hist. nat. 19. p. 373. H. Aldèa, Rœm. et Schultes, syst. 4. p. 114. Aldèa pinnàta, Ruiz. et Pav. fl. per. 2. p. 8. t. 114. Aldèa circinàta, Willd. enum. suppl. p. 9. Leaves ternate, or pinnate, with 5 leaflets; leaflets unequal. Spikes glomerately capitate, circinate. Plant hispid, canescent from villi and pubescence. There are several varieties of this plant, differing in the pubescence, which variation is probably owing to locality. Flowers pale blue, or purplish. Floral leaves simple. Spikes dichotomous.

Circinate-spiked Phacelia. Fl. June, July. Clt. 1817. Pl. 1 to 2 feet.

4 P. INTEGRIFÒLIA (Torrey, in ann. lyc. new york, 2. p. 222. t. 3.) leaves ovate, undivided, crenately serrated; stamens exserted. ♃.? H. Native of the banks of the river Platte.

Entire-leaved Phacelia. Pl. 1½ foot?

5 P. CILIA'TA (Benth. in Lin. trans. 17. p. 280.) clothed with scabrous pubescence; leaves pinnate: leaflets oblong, obtuse, somewhat pinnatifid; calycine segments ovate, rather membranous, reticulated, ciliated on the margins; stamens about equal in length to the corolla. ♃.? H. Native of California, Douglas. Leaves almost like those of *Eùtoca Cumíngii*, and with the habit of *Eùtoca brachýloba*, but the placentas are biovulate.

Ciliated-calyxed Phacelia. Pl. 1 to 2 feet.

6 P. RAMOSÍSSIMA (Dougl. mss. ex Lehm. pug. 2. p. 21. Benth. l. c.) clothed with scabrous glandular pubescence or hispid; leaves pinnate: leaflets ovate, obtuse, somewhat pinnatifid; calycine segments oblong, green, hispid; stamens exserted. ♃.? H. Native of California, and on the Columbia, Douglas. Branches elongated, divaricately-branched, few-leaved. Flowers rather smaller than those of *P. circinàta*. Corolla and ovarium glabrous. Calyx ciliated with glandular hairs.

Much-branched Phacelia. Pl. 1 to 2 feet?

7 P. TANACETIFÒLIA (Benth. l. c.) clothed with scabrous pubescence, or hispid; leaves bi-pinnatifid: leaflets oblong, dentately pinnatifid; calycine segments oblong-linear, hispid; stamens exserted. ♃.? H. Native of California, Douglas. Lindl. bot. reg. t. 1696. Stem branched at the base. Flowers blue, a little smaller than in *P. circinàta*.

Tansy-leaved Phacelia. Pl. 1 to 1½ foot.

8 P. BIPINNATÍFIDA (Michx. fl. bor. amer. 1. p. 134. t. 16.) erect; leaves pinnatifid: segments deeply lobed; spikes for the most part bifid, oblong, many-flowered; lobes of corolla entire. ♃. H. Native of the Western counties, principally on the Alleghany mountains, and in Kentucky, and on the Missouri, and from Pennsylvania to Virginia. Pursh. fl. 1. p. 140. P. pubéscens, Poir. dict. 5. p. 239. Plant pubescent. Corollas blue.

Bipinnatifid-leaved Phacelia. Fl. June, July. Clt. 1824. Pl. 1 to 2 feet.

9 P. FIMBRIA'TA (Michx. fl. bor. amer. 1. p. 134. t. 16.) assurgent, pilose; leaves pinnate, or pinnatifid: leaflets entire; racemes loose; corolla fringed; ovaries seated on a very thick base. ♃. H. Native on high mountains in Carolina, Michx.; near Harper's Ferry on the Potomac, Pursh; in Kentucky, Torrey. Habit of *Eùtoca Mexicàna*. Leaves sessile, or on short petioles; leaflets lanceolate, acute, glabrous beneath, but hispid from pili above. Racemes solitary; pedicels elongated. Flowers beautiful blue, ex Pursh; white, ex Michx.

Fringed-flowered Phacelia. Pl. 1 foot.

10 P. GLA'BRA (Nutt. l. c. p. 192.) erect; leaves pinnatifid; superior ones stem-clasping, ciliated: segments almost entire; calycine segments ovate; lobes of corolla entire, naked; filaments bearded at the base. ⊙ or ♂. H. Native of the Arkansas, in humid and elevated woods, on the edges of rivulets, near the Dardanelle settlement. Very like the following, growing, however, not more than 5-6 inches high. Segments of the lower leaves 3-4 pairs, somewhat incisely toothed, and obtuse; the upper leaves pectinately pinnatifid. Calycine segments ovate, ciliated. Corolla lilac-blue, campanulate, rather large and pilose externally; the lobes sub-oval, having 10 purplish spots at the base of the corolla. Stamens a little exserted. Capsule smooth, 4 to 8-seeded.

Glabrous Phacelia. Fl. April. Pl. ½ foot.

11 P. HIRSU'TA (Nutt. in amer. phil. soc. trans. n. s. 5. p. 191.) stem erect, branched; leaves pinnatifid: superior ones sessile: segments nearly entire; calycine segments linear, spreading; lobes of corolla entire, naked; filaments bearded at the base. ⊙. ♂. H. Native of the Arkansas, in sylvan prairies; common from the Cadron to the garrison at Belle Point. The whole plant hairy. Upper leaves pectinately pinnatifid; the segments of the lower leaves sparingly toothed; those of the upper ones linear and entire. Spikes simple, rarely bifid; pedicels longer than the calyxes. Calycine segments linear. Corolla campanulate, purplish blue, 5-grooved, the grooves naked and melliferous. Capsule ovate, hairy, 4-8-seeded, the ovarium 8-10-ovulate.

Hairy Phacelia. Fl. April, May. Pl. ½ to 1 foot.

12 P. CONFE'RTA (Hook. bot. mag. t. 3452. D. Don, in Sweet. fl. gard. n. s. t. 327.) clothed with hoary down, intermixed with bristly hairs; leaves bi-pinnatifid: segments ovate-oblong, acute, deeply serrated; calycine segments linear-lanceolate, acute; stamens exserted. ⊙. H. Native of Texas. Racemes terminal, many-flowered, cymose, often forked, bractless. Corolla campanulate, pale blue. Placentas biovulate.

Crowded-flowered Phacelia. Fl. July, Oct. Clt. 1835. Pl. 1 to 1½ foot.

Cult. Some of the species of *Phacèlia* are pretty when in blossom. They all require a sheltered situation, and as they are apt to rot in the winter, the situation in which they are grown should also be dry. A few duplicate plants of each should be grown in pots, in order that they may be sheltered in winter. All are increased by seeds.

VI. EMMENA'NTHE (from εμμενης, *emmenes*, permanent; and ανθος, *anthos*, a flower; in allusion to the corolla being permanent.) Benth. in Lin. trans. 17. p. 281.

LIN. SYST. *Pentándria*, *Monogýnia*. Corolla permanent. Ovarium oblong compressed, clothed with glandular pubescence. Placentas linear, adnate by the back, 8-ovulate. Capsule falsely 2-celled, from the half complete dissepiment, which is thickened at the axis.—An elegant, erect, branched herb, clothed with rather clammy villi. Leaves alternate, pinnatifid, half stem-clasping, not auricled at the base. Racemes numerous, erect, slender, circinate before florescence; pedicels slender, longer than the flowers. Flowers pendulous, 5 lines long. Calyx pubescent, rather clammy. Corolla campanulate, white or yellowish? spotted with purple inside at the base; corolline processes 10, minute, at the base of the corolla. Stamens shorter than the corolla. The capsule is somewhat 4-celled from the placentas being thickened at the axils.

1. E. PENDULIFLÒRA (Benth. l. c.) ♃.? H. Native of California, Douglas.

Pendulous-flowered Emmenanthe. Pl. erect.

Cult. For culture and propagation see *Phacèlia*, above.

N.B. Phacèlia furcàta, Dougl. mss. is a Polemoniaceous plant allied to Gília, and probably a new genus, ex Benth. Convólvulus platycárpus, Cav. and a few others may be Hydrophyllaceous plants.

ORDER CLXVII. SOLANA'CEÆ (this order contains plants agreeing with *Solànum*, or the potatoe tribe, in particular characters.) Solàneæ, Juss. gen. p. 124. ed. Usteri, p. 138. R. Br. prod. p. 443. ed. Nees, p. 299. Bartl. ord. nat. pp. 122. 193.

Calyx usually 5-cleft, rarely 4-cleft, permanent, inferior.

Corolla monopetalous, hypogynous; limb 5-cleft, rarely 4-cleft, regular, or a little unequal, deciduous, with the æstivation plicate in the legitimate genera; but imbricate in the spurious ones. Stamens epipetalous, equal in number to the segments of the corolla, and alternating with them, one of which is sometimes abortive. Ovarium 1-2-3-4-celled, many-seeded. Style one; stigma obtuse, rarely lobed. Fruit or pericarp 2-4-celled; a capsule with a parallel or duplicate dissepiment; or a berry having the placentas adnate to the dissepiment. Seeds numerous, sessile. Albumen fleshy. Embryo inclosed, more or less arched, usually excentrical, with the radicle tending to the umbilicus.—Herbs or shrubs. Leaves alternate, undivided or lobed: floral ones placed nigh together, often twin. Inflorescence variable, usually extra-axillary; pedicels bractless.

This order is distinguished from *Scrophulárinæ*, particularly in the arched or spiral embryo; in the plicate æstivation of the corolla, and in the flowers being generally regular, and the stamens equal.—Perhaps those genera, having the æstivation of the corolla not plicate, and the embryo straight, should be excluded, or combined into a separate order with those having the æstivation of the corolla imbricate, the embryo arched, and the stamens didynamous.

The *Deadly Nightshade* represents this order, which participates very generally in its qualities, although they are very frequently hidden beneath a fairer form, and often much mitigated. Many of the *Solanums* are very handsome. The root of *S. tuberòsum* is the common potatoe. The *Verbáscums*, *Datùras*, *Solándras*, and *Brunfélsias*, &c. are all plants of great beauty, although the former, on account of their frequency, are despised in gardens. *Cápsicums* are famous for their pungent fruits and seeds; the Cayenne pepper being the pulverized fruit of several species; *Brunfélsias* for their fragrance and beauty; and *Nicotiànas* or *Tobacco* for their fetor. The leaves of the whole order have a disagreeable smell. The usual effect of solanaceous plants is narcotic; but it is thought that this has been exaggerated on account of the intense and deleterious properties of *A'tropa Belladónna*. These, according to the observations of Vauquelin, depend upon the presence of a bitter, nauseous matter, which is soluble in spirits of wine, forming with tannin an insoluble compound; and giving out ammonia when decomposed by fire. Notwithstanding the narcotic power of the roots of *Mandrake*, the *Belladónna*, and others, those of the potatoe are found to contain an abundant fecula, which is among the most valuable food for man. The leaves of many Solanaceous plants are exciting and narcotic, but in very unequal degree, as in *Tobacco*, *Physàlis*, *Henbane*, &c.; those of the *Nightshade* excite vertigo, convulsions, and vomiting. The juice of *Stramònium* is given in North America in doses of from 20 to 30 grains, in cases of epilepsy. The fruit of *Physàlis Alkekéngi* is a veterinary diuretic; those of *P. edùlis*, *pubéscens*, and others, are used in tarts; that of *Lycopérsicum vulgàre*, and that of the *Solànum Melongèna*, are served at tables in various forms, under the name of *Tomatoes* and *Aubergines*.

Synopsis of the genera.

TRIBE I.

SOLA'NEÆ. Limb of corolla plicate in æstivation. Stamens equal in number to the segments of the corolla. Anthers dehiscing lengthwise, except in the genus *Solànum*. Embryo much curved. Fruit baccate. Placentas usually adnate to the dissepiment.

1 SOLA'NUM. Calyx 5-cleft, rarely 4-cleft. Corolla rotate, rarely campanulate, usually 5-cleft. Anthers connivent, dehiscing by pores at apex. Berry 2, rarely 4-celled.

2 LYCOPE'RSICUM. Calyx 5-6-parted. Corolla rotate, 5-6-cleft. Anthers conniving, membranous at top, dehiscing lengthwise. Berry 2-3-celled. Seeds villous.

3 PELTANTHE'RA. Calyx 5-parted. Corolla rotate. Anthers hamately-sagittate, dehiscing lengthwise, furnished each with a peltate, sessile appendage on the back.

4 CA'PSICUM. Calyx 5-toothed. Corolla rotate. Anthers conniving, dehiscing lengthwise. Berry 2, rarely 3-celled, chartaceous, hollow, naked.

5 PHYSA'LIS. Calyx 5-toothed. Corolla campanulately rotate. Anthers connivent, dehiscing lengthwise. Berry 2-celled, hidden by the inflated calyx.

6 SARA'CHA. Calyx 5-cleft. Corolla campanulately rotate, reflexed. Stamens bearded. Anthers separate, dehiscing lengthwise. Berry 2-celled, covered by the calyx to the middle.

7 WITHERI'NGIA. Calyx 4-5-cleft. Corolla rotate, 4-5-cleft. Anthers connivent, dehiscing lengthwise. Berry 2-celled, propped by the calyx.

8 NETOU'XIA. Calyx 5-parted. Corolla salver-shaped; throat furnished with an entire, tubular, short corona. Anthers dehiscing lengthwise.

9 MANDRA'GORA. Calyx turbinate, 5-cleft. Corolla campanulate. Stamens dilated at the base, and connivent. Ovarium biglandular at the base. Berry solid, 1-celled.

10 A'TROPA. Calyx loose, 5-cleft. Corolla campanulate, ventricose. Stamens usually exserted. Stigma depressed. Berry 2-celled; placentas free.

11 ANISÒDUS. Calyx campanulate, unequally 5-lobed. Corolla campanulate. Stamens straight. Berry 2-celled, inclosed in the inflated calyx, operculate.

12 NICA'NDRA. Calyx 5-parted, inflated; segments sagittate. Corolla campanulate. Stamens incurved. Berry fleshy, dry, 3-5-celled, covered by the calyx.

13 LY'CIUM. Calyx 5-toothed, or 3-5-lobed. Corolla funnel-shaped or tubular. Stamens usually exserted. Stigma depressed. Berry 2-celled.

14 ACNÍSTUS. Calyx 5-toothed. Corolla funnel-shaped; limb imbricate in æstivation, reflexed. Stamens exserted. Stigma funnel-shaped. Berry 2-celled.

15 JABARÒSA. Calyx 5-cleft. Corolla campanulate or tubular; limb induplicate in æstivation. Stamens short, inserted towards the top of the tube. Berry 2-3-celled.

Tribe II.

Nicotia'neæ. Limb of corolla plicate in æstivation. Stamens equal in number to the segments of the corolla, rarely fewer. Fruit capsular, 2-celled, usually 2-valved; valves bifid at apex. Calyx and corolla 5-cleft. Embryo much curved.

16 Nicotia'na. Calyx tubular. Corolla funnel-shaped, or salver-shaped; limb equal. Stamens rather unequal, inclosed or exserted. Capsule dehiscing by 4 parts at apex; placentas free.

17 Saira'nthus. Calyx campanulately ventricose, unequal. Corolla funnel-shaped; tube ventricose above, a little curved; limb subringent, rather unequal. Stamens unequal, a little exserted. Capsule as in *Nicotiàna*.

18 Lehma'nnia. Corolla ringent, with a narrow, incurved tube; limb campanulate. Stamens exserted, unequal, recurved. Capsule covered by the calyx; placentas free.

19 Petu'nia. Segments of calyx foliaceous, spatulate. Corolla with a short tube, and a dilated, rather unequal limb. Stamens unequal, inclosed. Placentas adnate.

20 Nierembe'rgia. Calycine segments foliaceous, lanceolate, or spatulate. Corolla with a long slender tube; and an equal, dilated limb. Stamens exserted; filaments combined at the base. Stigma transverse or peltate. Placentas adnate.

21 Salpiglóssis. Calyx 5-angled, 5-cleft. Corolla funnel-shaped, 5-lobed; lobes 2-lobed. Stamens didynamous, with the rudiment of a fifth between the 2 longer ones. Style tongue-shaped at apex; stigma truncate, transverse.

22 Schiza'nthus. Calyx 5-parted. Limb of corolla 4-parted, lobed, irregular. Stamens 4, 2 upper ones sterile. Stigma compressed, obtuse.

23 Scopòlia. Calyx and corolla both campanulate, equal. Stamens approximate, bent towards the lower side of the corolla. Capsule operculate; placentas adnate.

24 Physoclœ'na. Calyx ventricose. Corolla campanulate, regular. Stamens inclinate. Capsule hidden by the calyx, operculate; placentas adnate.

25 Hyocy'amus. Calyx ventricose. Corolla campanulately funnel-shaped; limb unequal, with one of the segments larger than the rest. Stamens inclinate. Capsule immersed in the calyx, operculate; placentas adnate.

Tribe III.

Datu'reæ. Limb of corolla plicate in æstivation, repandly 5-toothed. Stamens equal in number to the teeth of the corolla. Capsule coriaceous, succulent, 2-celled, 4-valved at apex. Placentas septiform, free. Seeds reniform. Stamens inclosed.

26 Datu'ra. Calyx angular, 5-toothed, deciduous. Corolla conically funnel-shaped. Stigma 2-lobed. Capsule smooth, or echinated.

27 Brugma'nsia. Calyx ventricose, angular, 2-3-cleft, or entire, spathaceous, bursting lengthwise, on one side. Corolla clavately funnel-shaped. Stigma thickened, 4-furrowed. Capsule smooth.

28 Sola'ndra. Calyx tubular, angular, 3-5-cleft, bursting on one side. Corolla clavately funnel-shaped; lobes fringed. Capsule smooth, 4-celled.

29 Ullòa. Calyx inflated, large, 5-parted, permanent. Corolla clavately funnel-shaped, gibbous under the throat, and contracted above, short; limb small, with roundish, spreading segments. Berry girded by the calyx.

Tribe IV.

Francísceæ. Limb of corolla plicate in æstivation, 5-lobed, rather unequal. Stamens 4, didynamous, that is, 2 long and 2 short, without any rudiment of a fifth, inclosed. Ovarium girded by a cupulate disk. Capsule 2-celled, 2-valved; valves bipartible at top. Placentas inserted into the dissepiment. Seeds numerous, angular. Embryo terete, straight.

30 Brunfe'lsia. Calyx 5-toothed. Corolla salver-shaped; imbricate? Stigma bilabiate. Fruit baccate; dissepiment contrary, placentiferous.

31 Franciscea. Calyx 5-toothed. Corolla salver-shaped. Stigma 2-lobed. Capsule 2-celled; dissepiment parallel with the valves, separating from the parietes at the base.

32 Browa'llia. Calyx 5-toothed. Corolla salver-shaped, resupinate. Stigma 2-lobed, 4 tubercled. Capsule 2-celled. Dissepiment contrary; placentas fleshy.

Tribe V.

Anthoce'rceæ. Corolla regular, not plicate. Stamens 4, didynamous, with the rudiment of a fifth. Embryo arched. Pericarp capsular, or baccate, 2-celled, 2-valved.

33 Anthoce'rcis. Calyx 5-cleft. Corolla campanulate; limb equal. Stamens inclosed. Fruit capsular, having the margins of the valves bent in, and inserted in the parallel placentas. Seeds reticulated.

34 Duboísia. Calyx bilabiate. Corolla campanulately funnel-shaped; limb 5-parted, nearly equal. Stamens inclosed. Fruit baccate. Seeds sub-reniform.

Tribe VI.

Nolanie'æ. Corolla plicate in æstivation, 5-lobed. Stamens equal in number to the lobes of the corolla. Ovaria 1 to 5, or more, crowded, seated on a fleshy annular disk. Stigma capitate. Drupe solitary, or 5 together, containing each a 2-4-celled bony nut, marked by 3-4 grooves, and 3-4 little holes beneath. Embryo filiform, gyrate, somewhat perepheric.

35 Nola'na. Calyx 5-cleft. Corolla campanulate, regular. Drupes usually 5, containing each a 3-4-celled bony putamen. Seeds roundish.

36 Trigue'ra. Calyx 5-cleft. Corolla campanulate; limb somewhat bilabiate, the 2 superior segments sub-reflexed. Drupe solitary, containing a 4, rarely a 2-celled putamen. Seeds ovate, 2 in each cell, compressed.

37 Crabówskia. Calyx 5-toothed. Corolla funnel-shaped; limb convolute in æstivation, reflexed. Drupe solitary, containing 2 2-celled bony putamens; cells 1-seeded.

Tribe VII.

Cestríneæ. Limb of corolla plicate, valvate, or induplicate in æstivation. Calyx 5-toothed. Corolla funnel-shaped, 5-lobed, regular; tube elongated; limb usually spreading. Stamens equal in number to the lobes of the corolla. Anthers dehiscing lengthwise. Ovarium seated on a cupulate disk. Pericarp capsular, or baccate, 2-celled. Placentas adnate to the dissepiment, or free. Embryo nearly straight.

§ 1. *Fruit baccate.*

38 Ce'strum. Limb of corolla conduplicate in æstivation, ex Schotte, plicate, ex Kunth. Stamens inclosed. Berry 1-celled, few-seeded. Placentas central, free.

39 Duna'lia. Limb of corolla plicate in æstivation. Stamens inclosed; filaments tripartite. Berry 2-celled; placentas adnate. Seeds many, lenticular.

40 Meye'nia. Corolla clavately tubular; limb 5-toothed, contracted, conduplicate in æstivation. Stamens inclosed. Berry 2-celled; seeds irregularly ovate. Embryo straight.

41 Da'rtus. Calyx 5-cleft. Corolla with a globose tube, and a 5-cleft limb. Stamens inclosed. Stigma 5-lobed. Berry excoriate, diaphanous, 1-celled, many-seeded. Seeds small, unequal.

§ 2. *Fruit capsular.*

42 Ve'stia. Limb of corolla valvate in æstivation. Stamens exserted, bearded at the base. Capsule 2-celled, 4-valved, many-seeded. Placentas adnate. Embryo straight.

43 Se'ssea. Limb of corolla plicate in æstivation; tube globose. Stamens villous, curved at the base. Capsule cylindrical, 2-celled, 4-valved at apex. Seeds oblong-compressed, with membranous edges.

44 Fabia'na. Limb of corolla short, revolute, plicate in æstivation. Stamens unequal, 2 longer. Capsule 2-celled, 2-valved. Seeds dotted.

45 Laure'ria. Calyx 5-parted, alately pentagonal. Limb of corolla plicate? short, straight. Stamens inclosed, villous at the base. Capsule 2-celled, 2-valved. Seeds copious, full of impressed dots; placentas adnate, lamelliform. Embryo cylindrical, incurved.

46 Lama'rkia. Calyx tubular, pentagonally-prismatic, half 5-cleft. Corolla somewhat funnel-shaped; limb spreading, equal, blunt. Stamens equal in length to the tube. Capsule oblong, terete, coarctate at top, many-seeded.

Tribe I.

SOLA'NEÆ. Limb of corolla plicate in æstivation. Stamens equal in number to the segments of the corolla. Embryo curved. Fruit baccate.

I. Solanum.

I. SOLA'NUM (a name given by Pliny, but the derivation is uncertain, some derive it from *Sol*, the sun; others say it is *Sulanum*, from *Sus*, being serviceable in disorders of swine; and others from *Solor*, to comfort, from its soothing narcotic effects; all these conjectures are, however, improbable.) Tourn. inst. p. 149. t. 62. Lin. gen. no. 251. Schreb. gen. no. 337. Juss. gen. 126. ed. Usteri, p. 141. Gærtn. fruct. t. 131. Mœnch. meth. p. 473. R. Br. prod. 444. Dunal. mon. sol. 115.—Melongèna, Tourn. inst. p. 151. t. 65.—Psèudo-cápsicum, Mœnch. meth. p. 476.—Nyctèrium Vent. jard. malm. p. 85.—Aquártia Jacq. amer. p. 15. t. 12.

Lin. syst. *Pentándria, Monogýnia.* Calyx permanent, 5 rarely 4-cleft. Corolla rotate, rarely campanulate, 5 rarely 4-cleft. Anthers oblong, connivent, dehiscing by 2 pores at the apex. Berry almost globose, 2-3-4-celled, but usually 2-celled. —Herbs or shrubs, unarmed, or prickly, rarely spiny. Leaves undivided, sinuated, lobed, impari-pinnate, or decompound, usually alternate, but in many species twin, rarely tern. Peduncles solitary or numerous, simple or multifid, axillary, or extra-axillary, 1, or many-flowered, opposite the leaves, or scattered, or terminal. The pedicles in *Sol. tuberòsum* are articulated under the flower. The fruit of *S. esculéntum* is large and 5-celled. In some species the flowers are sometimes 6-9-cleft.

Sect. I. Ine'rmis. Unarmed shrubs or herbs.

Subsect. 1. Potatoe. *Leaves impari-pinnate, pinnatifid, ternate or entire. Flowers corymbose or racemose, terminal, lateral, and axillary.*

§ 1. *Leaves impari-pinnate. Racemes corymbose, terminal.*

1 S. tuberòsum (Lin. spec. ed. 1st. p. 185.) root bearing tubers; stems herbaceous; leaves unequally pinnate; leaflets entire; pedicels articulated. ♃. H. Native of South America, on the west coast every where. Bergeret, phyt. 1. p. 231. icon. Blackw. t. 523. Lycopérsicum tuberòsum, Mill. dict. Sol. tuberòsum esculéntum, Bauh. pin. 167. Tourn. inst. 149. Pàpas Americànum, Bauh. hist. 3. p. 621. icon. Batàta Peruviàna, Park. theatr. ger. hist. 927. Pàpas Peruanòrum, Besl. hort. eyst. 3. p. 1. f. 1. Clus. hist. 2. book. 4. p. 79. icon. The common potatoe varies much in the leaves, colour of the flowers, shape and colour of the roots, &c.

The potatoe is called *Pomme de Terre* in France, *Cartoffel* in Germany, *Pomo de Terra* in Italy, *Openauk* in Carolina, and *Papas* in Peru. It has been found wild in Chili, on the mountains near Valparaiso and Mendosa; and also near Lima, Quito, and Santa Fe de Bogota; and lately in Mexico, on the Pic d' Orizaba, by Deppe and Schiede. Sir Joseph Banks considers that the potatoe was first brought into Europe from the mountainous parts in the neighbourhood of Quito, where they were called *Papas*, to Spain in the early part of the 16th century. From Spain, where they were called *Batatas*, they appear to have found their way first to Italy, where they received the same name with the truffle, *Taratoufli*. The potatoe was received by Clusius, at Vienna, in 1598, from the governor of Mons, in Hainault, who had procured it the year before from one of the attendants of the Pope's legate, under the name of *Taratoufli*, and learned from him that it was then in use in Italy. In Germany it received the name of *Cartoffel*, and spread even rapidly in the time of Clusius. To England the potatoe found its way by a different route, being brought from Virginia by the colonists sent out by Sir Walter Raleigh in 1584, and who returned in July, 1586, and "probably," according to Sir Joseph Banks,

"brought with them the potatoe." Thomas Herriot, in a report on the country, published in De Bray's collection of voyages, vol. 1. p. 17, describes a plant called *Openawk*, with "roots as large as a walnut, and others much larger: they grow in damp soil, many hanging together, as if fixed on ropes; they are good food either boiled or roasted." Gerarde in his herbal, published in 1597, gives a figure of the potatoe, under the name of the potatoe of Virginia, whence he says he received the roots; and this appellation it appears to have retained, in order to distinguish it from the Batatas, or sweet potatoe (the *Batàtas edùlis*), till the year 1640, if not longer. "The sweet potatoe," Sir Joseph Banks observes, "was used in England as a delicacy long before the introduction of our potatoes; it was imported in considerable quantities from Spain and the Canaries, and was supposed to possess the power of restoring decayed vigour. The kissing comfits of Falstaff, and other confections of similar imaginary qualities with which our ancestors were duped, were principally made of these and eryngo roots." It appears from Gough's edition of Camden's Brittania, that the potatoe was first planted by Sir Walter Raleigh on his estate at Youghall, near Cork, and that it was "cherished and cultivated for food in that country long before its value was known in England, for though they were soon carried over from Ireland into Lancashire, Gerarde, who had this plant in his garden in 1597, under the name of *Batàta Virginiàna*, recommends the roots to be eaten as a delicate dish, not as common food. Parkinson mentions that the tubers were sometimes roasted, and steeped in sack and sugar, or baked with marrow and spices, and even preserved and candied by the comfit makers. In 1663 the royal society took some measures for encouraging the cultivation of the potatoe, with the view of preventing famine. Still, however, although their utility as a food was better known, no high character was bestowed on them; in books of gardening, published towards the end of the 17th century, a hundred years after their introduction, they are spoken of rather slightingly. "They are much used in Ireland and Amerıca as bread," says one author, "and may be propagated with advantage to poor people." "I do not hear that it hath been yet essayed," says another author, "whether they may not be propagated in great quantities for food for swine or other cattle." Even Evelyn seems to have entertained a prejudice against them. "Plant potatoes," he says, writing in 1699, "in your worst ground. Take them up in November for winter spending, there will enough remain for a stock, though ever so exactly gathered." The famous nurserymen, London and Wise, did not consider the potatoe as worthy of notice in their complete gardener, published in 1719; and Bradley, who about the same time wrote so extensively on horticultural subjects, speaks of them as inferior to skirrets and radishes. But the use of potatoes gradually spread, as their excellent qualities became better understood. It was near the middle of the 18th century, however, before they were generally known over the country; since that time they have been most extensively cultivated. In 1796 it was found that in the county of Essex alone about 1700 acres were planted with potatoes for the supply of the London market. This must form, no doubt, the principal supply; but many fields of potatoes are to be seen in other counties bordering on the capital, and many ship-loads are annually imported from a distance. In every county in England it is now more or less an object of field culture.

The cultivation of potatoes in gardens in Scotland was very little understood till about the year 1740, and it was not practised in fields till about 20 years after that period. It is stated in the general report of Scotland, vol. 2. p. 111, as a well ascertained fact, that in the year 1725-6 the few potatoe plants then existing in gardens about Edinburgh were left in the same spot of ground from year to year, as recommended by Evelyn; a few tubers were perhaps removed for use in the autumn, and the parent plants were then well covered with litter to save them from the winter's frost. Since the middle of the 18th century, the cultivation of potatoes has made rapid progress in that country, so that they are now to be seen in almost every cottage garden, and fields of them on every farm. "The potatoe is now considered the most useful esculent that is cultivated, and who," Neill asks, "could *à priori* have expected to have found the most useful among the natural family of the *Luridæ* (Solanaceæ) most of which are deleterious, and all of which are forbidding in their aspect."

Use.—The tubers of the potatoe, from having no peculiarity of taste, and consisting chiefly of starch, approach nearer to the nature of flour, or farina of grain, than any vegetable root production, and for this reason it is the most universally liked, and can be used longer in constant succession by the same individual without becoming unpalatable than any other vegetable, the seeds of grasses excepted. "So generally is it relished, and so nutritious is it accounted," Neill observes, "that on many tables it now appears almost every day in the year. It is commonly eaten plainly boiled, and in this way it is excellent. When potatoes have been long kept, or in the spring months, the best parts of each tuber are selected and mashed before going to table. Potatoes are also baked, roasted, and fried. With the flour of potatoes puddings are made nearly equal in flavour to those of millet. With a moderate proportion of wheat flour bread of excellent quality may be formed of it, and potatoe starch, independently of its use in the laundry, is considered an equally delicate food as sago or arrow-root."

Varieties.—These are very numerous, not only from the facility of procuring new sorts by raising from seed, but because any variety cultivated for a few years in the same soil and situation, as in the same garden or farm, acquires a peculiarity of character or habit which distinguishes it from the same variety in a different soil and situation. The varieties being so numerous, we shall only mention those generally cultivated. They may be distinguished in regard to precocity, lateness, form, size, colour, and quality. The earliest varieties are, 1. Hog's early frame, a small watery potatoe, fit only for very early forcing. 2. Royal dwarf, a mealy potatoe, much grown at Perth. 3. Early Manchester, waxy and red. 4. Common early frame, waxy. 5. Foxe's yellow seedling, similar to the last, but rather larger, waxy. 6. American early, much esteemed at Edinburgh. 7. Early dwarf, waxy. 8. Early ash-leaved, dry. 9. Early champion, large. 10. M'Cree's early, dry. None of the above sorts, when true, produce blossoms; they are roundish in form, small sized, white, and not of the best quality.

The latest sorts are, 1. The round purple, 2. The oblong purple, 3. The speckled purple or tartan, commonly grown in mossy soils in Scotland, 4. The American red, grown to a great extent in Scotland.

The form of potatoes is either round, oblong, or kidney shaped; of the round the most esteemed are, 1. The champion, late and early varieties. 2. The oxnoble, very large, and of a peculiar flavour, not generally esteemed. 3. The round-red, middle-sized, smooth. 4. The round-rough red, or Lancashire. 5. The small American. 6. The leathercoat, with a rough, brownish coat. Of the oblong the most esteemed are, 1. The red-nosed oval, often confounded with the red kidney. 2. The oblong-red, variegated with white. 3. The oblong white. 4. The American red, long and not thick. 5. The Irish red, or pink, oblong and entirely red, with hollow eyes. 6. The bright red, blood-red, or apple potatoe, ovate, with small full eyes, much grown in Cheshire and Lancashire. The kidney-shaped sorts are as follow. 1.

The common white kidney, of a peculiar flavour, esteemed by many. 2. The red kidney, reckoned somewhat more hardy. 3. The black kidney.

In size the early sorts are the least, and the oxnoble and late champion the largest. In colour the earlier sorts are in general white, the oblong sorts red, and the latest sorts purple.

In quality potatoes are either watery, as the very early sorts; waxy, as the American and Irish reds; or mealy, as the ash-leaved early, the champion, the kidney, &c.

The following sorts for forcing in frames, or for the first crop in the open garden are recommended by London nurserymen.

1. Foxe's seedling. 2. Early manly. 3. Early mule. 4. Broughton dwarf.

For general cultivation in the open garden or field.

1. Early kidney, good flavour and very early, keeps well. 2. Nonsuch, early, prolific. 3. Early straw, good early sort for general use. 4. Small American, small white, much esteemed.

For main crops the following sorts are arranged in order of their ripening.

1. Early champion, very generally cultivated, prolific and mealy. 2. Red-nose-kidney. 3. Large kidney. 4. Bread-fruit, prolific, white, and mealy. 5. Lancashire pink-eye, good. 6. Black skin, mealy, white, and good. 7. Purple, very mealy, productive, and keeps well. 8. Red apple, keeping the longest of any. 9. Red American, keeps well.

In general every town and district has its peculiar and favourite varieties, so that, excepting as to the best early kinds, and the best for a general crop in all soils, any list, however extended, could be of little use. Dr. Hunter, in his geological essays, has limited the duration of a variety to fourteen years, and Knight, Hort. trans. vol. 1, concurs with him in opinion. There are some excellent sorts of party coloured potatoes in Scotland, which degenerate when removed from one district to another; and most of the Scotch and Irish varieties degenerate in England. The best mode, therefore, to order potatoes for seed is to give a general description of the size, colour, form, and quality wanted, and whether for an early or late crop.

Propagation.—The potatoe may be propagated from seed, cuttings or layers of the green shoots, sprouts from the eyes of the tubers, or portions of the tubers containing a bud or eye. The object of the first method is new, or improved varieties; of the second little more than curiosity, or to multiply as quickly as possible a rare and excellent sort; and of the third to save the tubers for food. The method by portions of the tubers is the best, and that almost universally practised for the general purposes both of field and garden culture. One good eye to each set is sufficient, and in making the sets reject the extreme watery end of the tuber, as apt to run too much to haulm; reject also the extreme portion of the dry end, as more likely to be tardy in growth, and produce the curl. The middle portion is therefore the best.

When grown from seed the quality of the kinds cannot be ascertained till the end of the second summer. The earliest varieties of potatoes, it has been already remarked, do not produce flowers or seed. T. A. Knight, desirous of saving seed from one of these sorts took a very ingenious method of inducing the plants to produce flowers. "I suspected the cause," he says, "of the constant failure of the early potatoe to produce seeds to be the preternaturally early formation of the tuberous root, which draws off for its support that portion of the sap which in other varieties of the same species affords nutriment to the blossoms and seeds, and experiment soon satisfied me that my conjectures were perfectly well founded. I took several methods of placing the plants to grow in such a situation as enabled me readily to prevent the formation of the tuberous roots, but the following appeared the best. Having fixed strong stakes in the ground I raised the mould in a heap round the bases of them, and in contact with the stakes: on their south sides I planted the potatoes from which I wished to obtain seeds. When the young plants were about 4 inches high, they were secured to the stakes with shreds and nails, and the mould was then washed away by a strong current of water from the bases of their stems, so that the fibrous roots only of the plants entered into the soil. The fibrous roots of this plant are perfectly distinct organs from the runners which give existence, and subsequently convey nutriment to the tuberous roots; and as the runners spring from the stems only of the plants, which are, in the mode of culture I have described, placed wholly out of the soil, the formation of tuberous roots is easily prevented; and whenever this is done numerous blossoms will soon appear, and almost every blossom will afford fruit and seeds." Knight considering that the above facts, which are more fully explained in the philosophical transactions for 1806, were sufficient to prove that the same fluid or sap gives existence alike to the tuber, and the blossom, and seeds, and that, whenever a plant of the potatoe affords either seeds or blossoms, a diminution of the crop of tubers, or an increased expenditure of the riches of the soil, must necessarily take place, succeeded in producing varieties of sufficiently luxuriant growth and large produce for general culture which never produced blossoms. The paper from which we quote is concluded by some excellent observations on this subject, chiefly relative to field culture, and which ought to be studied carefully by whoever intends to attempt producing new varieties from seed.

Quantity of sets.—Abercrombie directs "for a plot of early and secondary crops 8 feet wide by 16 in length, planted in rows 15 inches asunder by 9 inches in the row, a quarter of a peck of roots or cuttings. For full-timed sorts, and main crops, a compartment 12 feet wide by 32 in length, planted in rows 2 feet distant, by 12 inches in the row, half a peck of roots or cuttings will be required."

Soil and Manure.—The best soil for the potatoe is light, fresh, unmixed loam, where they can be grown without manure. Here they have always the best flavour. In a wet soil they grow sickly, and produce watery tubers, infected with worms and other vermin. To a poor soil dung must be applied; littery dung will produce the earliest and largest crop, but mellow dung, rotten leaves, or vegetable earth, will least affect the flavour of the tubers.

Season for Planting.—"The last fortnight of March, and the first fortnight of April, is the most proper time for planting the main crops, a little earlier or later as the spring may be forward, the ground dry or wet. Occasional plantings may be made in May, or even the beginning of June."—Abercrombie.

Methods of Planting.—The sets of whatever kind, or the plants forwarded in pots to be turned out with their balls entire for producing an early crop in the open air, should always be inserted in regular rows, the object of which is to admit with greater facility the stirring the earth between, and the earthing up of the plants. The rows may be 15 inches apart for the small early sorts, and for the larger 20 inches, or 2 feet, according to the poorness or richness of the soil. In the lines traced make holes for the sets at 8, 12, or 15 inches distance, letting their depth not be less than 3, nor exceeding 5 inches. In light soil it is performed by a dibble with a blunt end, and a short cross iron shoulder, about 4 or 5 inches from the bottom, as a guide to make the holes of an equal depth; one person making the holes, and another dropping a set into each hole. Strike the earth in upon them fully with a dibble, hoe, or rake, either as each row is planted, or when the whole planting is finished. On strong heavy land the planting ought to be on raised beds, with alleys, or in drills on the crown or parallel

ridges. The beds may either be raised by previous digging, throwing on good earth till the terrace rise to the desired height, or in the different method described below. To plant in drills trace them at the medium distance above specified; form them to a proper depth with a narrow spade, or large hoe; in these place the sets a foot, or 15 inches apart, and earth over. In wet ground, however, potatoes are hardly worth growing.

Subsequent culture.—"From the March or April planting the stems generally rise fully in May: after the plants have appeared, give an effectual hoeing on dry days, cutting up all the weeds, and stir the ground about the rising stalks of the plants. When advanced from 6 to 12 inches high, hoe up some earth to the bottom of the stems, to strengthen their growth, and promote the increase below; continue occasional hoeing to eradicate weeds till the plants cover the ground, when but little farther care will be required. Permit the stalks to run in full growth, and by no means cut down, as is sometimes practised; the leaves being the organs for transmitting the beneficial influence of the rain and air to the roots, which is most necessary to the free and perfect growth of the tubers." Abercrombie. It is now generally admitted, that a certain advantage in point of produce is obtained by pinching off the blossoms as they appear on the plants. The fact has been repeatedly proved and satisfactorily accounted for by Mr. Knight, who imagines that it may add an ounce in weight to the tubers of each plant, or considerably above a ton per acre.

Taking the crop.—Clusters of roots in the early planted crops will sometimes by June or July be advanced to a sufficient size for present eating, though still small. Only a small portion should be taken up at a time, as wanted for immediate use, as they will not keep good above a day or two. In August and September, however, they will be grown to a tolerable good size, and may be taken up in larger supplies, though not in quantities for keeping a length of time. Permit the main crops to continue in growth till towards the end of October or beginning of November, when the stalks will begin to decay, an indication that the potatoes are fully grown, then wholly dig them up, and house them for winter and spring use before severe frosts set in.

Housing and Preserving the Crop.—Abercrombie recommends "housing potatoes in a close, dry, subterranean apartment, laid thickly together, and covered well with straw, so as to exclude damps and frosts. There they are to be looked over, and any that are decayed picked out. In spring, when they begin to shoot, turn them over, and break off the sprouts or shoots from each tuber perfectly close, in order to retard their future shooting as much as possible. Potatoes so stored will continue good all the winter and spring till May and June. Pieing as it is called in some places is a good method of preserving potatoes in winter. They are piled on the surface of the ground in a ridged form, of the width and length at pleasure, according to the quantity, but commonly 5-6 feet wide. This is done by digging a spit of earth, and laying it round the edge a foot wide, (if turf the better,) filling the space up with straw, and then laying on a course of potatoes; dig earth on the outside, and lay it upon the first earth. Put straw a few inches along the inside edge, then put in more potatoes, and so on, keeping a good coat of straw all the way up between the potatoes and the mould, which should be about 6 inches thick all over; beat it close together, and the form it lies in with the trench all round will preserve the potatoes dry, and the sharpest frost will hardly affect them, in a severe time of which the whole may be covered thickly with straw. In the spring look over the stock, and break off the shoots of those designed for the table, and repeat this business to preserve the potatoes the longer good."

Curl Disease.—The disease called curl has in many places proved extremely troublesome and injurious. It has given rise to much discussion, and to detail all the various opinions would be a useless task. It may, however, be remarked, that the experiments of J. Dickson (Caled. hort. mem. 1. p. 55.) show, that it arises from the vegetable powers in the parts of the tuber planted having been exhausted by over ripening, he has shown that cuts taken from the waxy end of the potatoe produce healthy plants, while those from the dry or best ripened end either did not vegetate at all, or produced curled plants. John Shirreff (Caledon. hort. mem. 1. p. 60.) takes a general and philosophical view of the subject, applying to the potatoe the doctrine by which Mr. Knight had accounted for the disappearance of the fine cedar fruits of the seventeenth century. "The maximum of the duration of the life of every individual, vegetable as well as animal, is pre-determined by nature, under whatever circumstances the individual may be placed: the minimum, on the other hand, is determined by these very circumstances. Admitting, then, that a potatoe might re-produce itself from tubers for a great number of years in the shady woods of Peru, it seems destined sooner to become abortive in the cultivated champaign of Britain, insomuch that not a single healthy plant of any sort of potatoe that yields berries, and which was in culture 20 years ago, can now be produced." Mr. Shirreff concludes, therefore, that the potatoe is to be considered as a short-lived plant, and that though its health or vigour may be prolonged by rearing it in elevated or in shady situations, or by cropping the flowers, and thus preventing the plants from exhausting themselves, the only sure way to obtain vigorous plants, and to ensure productive crops, is to have frequent recourse to new varieties raised from seed. The same view, it may be remarked, had occurred to Dr. Hunter. The fact ascertained by Mr. Knight deserves to be noticed, is that by planting late in the season, perhaps in June, or even in July, an exhausted good variety may in a great measure be restored; that is, the tubers resulting from the late planting when again planted at the ordinary season produce the kind in its pristine vigour, and of its former size. Mr. Crichton (Caled. mem. 1. p. 440.) who has made a variety of experiments on the effects of exposure to the air in hampers and open floors, and on exclusion of the air by covering with earth, concludes, "That the curl in the potatoe may often be occasioned by the way the potatoes are treated that are intended for seed. I have observed wherever the seed stock is carefully pitted, and not exposed to the air, in the spring the crop has seldom any curl, but where the seed stock is put into barns and out-houses for months together, such crop seldom escapes turning out in a great measure curled; and if but few curl the first year, if they are planted again it is more than probable the half of them will curl next season."

Forcing the Potatoe.—The potatoe is forced in a great variety of ways; but for a fair crop of tubers, which shall be somewhat dry and floury, and of the size of hens' eggs, plant sets of the ash-leaved variety in single pots, filled one-third with light earth, in January. Place them in a hot-house or hot-bed, earth them up as they appear, and about the middle or end of February, transplant them, with their balls entire, into a pit prepared as for asparagus. Distance from plant to plant 1 foot each way. Give water occasionally, and admit as much air as possible at all times. Potatoes so managed will produce a fair crop the end of March or beginning of April.

Forcing potatoes in hot-beds.—Abercrombie says, "A young crop is easily obtained soon in spring, by planting the early dwarf, or the sort called mules, on a slight hot-bed. Put in the sets pretty thickly, at 6 or 8 inches square distance, as the potatoes are not to grow large. If planted successively in January and February, they will produce young crops for use early in

April and May, to be taken up in small portions as wanted for present eating. During the growth of the plants, open the lights fully in the middle of fine dry days, but shut at night, to guard against frost. Water attentively, as the mould and weather may require. Nicol's plan is the same as that of Abercrombie. Mr. Hogg, a market-gardener in the neighbourhood of London, prepares an old cucumber or melon-bed, by removing the earth from its surface, and laying on instead an inch deep of fresh mould, on which he sets the potatoes, in rows 6 inches apart, and the potatoe sets the same distance from each other, which are then covered 4 inches deep with mould, and the frames and glasses placed upon the bed, and carefully protected from frost. At the end of the fifth day, the outside of the old dung should be cut away close to the frame, in a slanting direction inwards; and strong linings of hot dung applied instead, which should be renewed if necessary at the end of three weeks. Air and water must be carefully given. The potatoes grown in this way are generally ready for use seven weeks after planting. The variety thus cultivated by Mr. Hogg is *Foxe's yellow seedling*. Mr. Knight's mode is to plant the potatoes in pots 6 inches in diameter, in January, one set in each pot; and the pots are then set in the ground and covered with litter, to protect them from frost, and in this situation they remain till the hot-bed is ready to receive them, in which the pots are afterwards plunged.

Forcing potatoes in pots or boxes.—This is sometimes attempted in stoves. One set is placed near the bottom of a large pot, and gradually earthed up. When nearly full grown, it is taken to the cherry or peach-house, for the sake of more air. Another mode of planting in pans or boxes is thus described by Abercrombie: "Plant potatoes of the growth of the season before the last; that is, the produce of 1816 to be planted in December, 1817, or January, 1818. Potatoes so kept will appear as if surrounded by a brood of new potatoes in contact with the seed or parent potatoe. The leaf buds are removed, and the potatoes planted in a circle, and in layers, in earthen pans or wooden boxes, with alternations of fine loose earth. Such pans or boxes may be put into sheds or in shelves in the kitchen. By this treatment no leaves will emerge above the soil, and young potatoes may be reared at any required period. A similar mode has been described by Mr. Sherbrook. The boxes, containing alternate layers of light earth, and potatoes of the preceding year, are placed in a dry, covered place, free from frost; they receive no water, and produce "good, fine, young potatoes in December." For a succession, the process is to be repeated.

Incidental forcing of potatoes.—"Small young spring potatoes are likewise obtained from some of the winter store of old potatoes, as they lie in the house; especially where they have been mixed with sand, and permitted to shoot as they lie, when they produce a few small button potatoes in spring, some of which are occasionally brought to market, but only for immediate use. T. Moffat grows early potatoes thus: "A compost consisting of equal quantities of loam, sand, and coal ashes, with an addition of lime in powder, equal to about one-fifth of the whole, was formed into a bed four feet wide, and four inches deep, on the floor of a dark fruit room. Upon this bed, early in September, large potatoes, of the preceding year's growth, were laid, 3 inches apart every way, with their best eyes downwards; these produced young potatoes, which became fit for use about Christmas."

Forwarding to raise a crop in the open garden.—For this purpose some spread a layer of sets on hot dung, or in boxes placed in any warm situation, whether in the light or in the dark. After they have sprung 3 or 4 inches, they are to be transplanted into the open ground, which should not be sooner than May, unless they have some protection at night; such as fronds of fern, spruce-fir branches, &c. But the best method is to grow the sets one in each pot, and to plant them out with the balls entire, in May.

Substitutes for forcing potatoes.—Dr. Nochden describes the mode by leaves and layers of earth at length (in Hort. trans. 3. p. 48.), and subjoins a method of preserving young potatoes as such for winter use; but this method we consider not worth farther notice, as it appears of no practical utility.

Field culture of the potatoe.—Notwithstanding the value of the potatoe as an article of human food, it is doubtful whether they can be placed so high in the scale as several other articles of produce, when the profit and loss account of the agriculturist is to be ascertained. They require a great deal of manure from the farmer, while, generally speaking, little is returned by them; they are a bulky unhandy article, troublesome in the lifting and carrying processes, and interfering with the seed season of wheat, the most important one to the farmer. After all, from particular circumstances they cannot be vended unless when raised in the vicinity of large towns; hence they are, in most respects, an unprofitable article to the agriculturist. To him the real criterion is the profit which potatoes will return in feeding beasts; and here we apprehend the result will be altogether in favour of turnips and ruta-baga, or Swedish turnip, as the most profitable articles for that purpose, although potatoes are admitted to be more nutritious, and to fatten cattle much quicker.

The varieties of potatoes cultivated in fields are innumerable. The early field varieties are: 1. The early kidney. 2. The nonsuch. 3. The early straw. 4. The early Champion. The last is the most generally cultivated round London. Early varieties with local names are cultivated near most large towns. The late field varieties in most repute are: 1. The red-nose kidney. 2. Large kidney. 3. Bread-fruit, an excellent white, mealy, good-tasted sort, raised from seed in 1810. 4. The Lancashire pink-eye, good. 5. The black-skin, white interior, and good. 6. Purple, very mealy, productive, and keeps well. 7. The red apple, mealy, keeps the longest of any. 8. The Tartan, or purple and white-skinned, an esteemed Scotch potatoe, prolific, mealy, exceedingly well tasted, and keeps well. The varieties grown exclusively as food for live stock are: 1. The Yam or Surinam potatoe, large, red and white-skinned, and the interior veined with red; flavour disagreeable, and not such as to admit of its being used as human food. It succeeds best on heavy lands. This is a most valuable sort for the farmer; as with this variety he has an excellent assistant to his turnip crop, or rather a succedaneum, which is of material benefit when turnips are consumed, in feeding live stock; its produce is 12-15 tons per acre. 2. The oxnoble; large, yellow without and within, very prolific, unfit for human food. 3. The late Champion; large and prolific, white-skinned, and may be used as human food.

The soil in which the potatoe thrives best is a light loam, neither too dry nor too moist; but if rich it is so much the better. They are, however, grown on many other kinds of soil, where they are free from stagnant moisture, with a reasonable portion of manure added. The best flavoured table potatoes are almost always produced from a newly broken-up pasture ground, not manured, or from any new light soil. Repeated on the same soil, they very generally lose their flavour.

In preparing the soil for field potatoes, it is of much importance to free the soil as much as possible from weed roots; both because the horse-hoe must be excluded altogether when the vegetation is vigorous, and because at no period of their growth is it safe to work so near the plants, especially after they have made some progress in growth. The first ploughing is given

soon after harvest; and a second, and commonly a third, early in spring; the land is then laid up into ridglets, from 24 to 30 inches broad, as for turnips, and manured in the same manner.

The best manure for the potatoe appears to be littery farm-yard dung; and the best mode of applying it, immediately under the potatoe sets. Any manure may be applied; and no plant will bear a larger quantity of it, or thrive in coarser or less prepared manure.

The season of planting early potatoes in the fields depends much on the soil. Where the soil is very dry, the potatoe sets may be planted in March; but for a full crop April is the best time. Potatoes, indeed, are often planted in the end of May, or even in June; but the crops, although often as abundant, are neither so mellow or mature as when the sets are planted in April or in the first 8 or 10 days in May.

The time of cutting the sets should always be some days before planting, that the wounds may dry up; and no harm will result from performing the operation several weeks beforehand, provided the sets are not exposed too much to the drought. The sets ought to be large, rarely smaller than the fourth part of the potatoe. At all events, rather err in giving over large sets, than in making them too small; because by the first error, no great loss can be sustained, whereas, by the other, a feeble and late crop may be the consequence.

The modes of planting the potatoe are various; but the best modes are either to plant them by dibber on a plane surface in rows, or by spade in digging, or in drills, in the manner of turnips.

The after culture of potatoes consists in harrowing, hoeing, weeding, and earthing up. All potatoes require to be earthed up, extending 6 or 7 inches round their stem. The reason of this is, that the tubers do not, properly speaking, grow under the soil, but rather on, or partially bedded in its surface. The earth may be thrown up by a spade, draw-hoe, or with a small plough, drawn by one horse. Pinching off the whole of the potatoe blossoms is a part of after culture not unworthy of the attention of the farmer, for the reasons given by Mr. Knight.

A mode of taking part of the crop suited to cottagers and others, especially in years of scarcity, deserves to be mentioned. Having ascertained that some of the tubers have attained an eatable size, go along the rows, and loosen the earth about each plant with a blunt stick, taking 2 or 3 of the largest tubers from each plant, and returning the earth carefully. By this means the tubers which remain will increase in size, having now the nourishment destined to complete the growth of those removed.

Potatoes intended for seed should be taken up a fortnight or 3 weeks before fully ripe, for the reasons already given under garden culture.

Potatoes are stored and preserved in houses, cellars, pies, and camps. Whatever mode is adopted, it is essential that the tubers be perfectly dry, otherwise they are certain of rotting; and a few rotten potatoes will contaminate a whole mass. Putting them into close houses, and covering them well up with straw, is the most effectual mode, and that which is generally adopted. In some parts of Scotland, it is a common practice to dig pits in the potatoe-field, when the soil is dry and light, and putting in potatoes to the depth of 3 or 4 feet, to lay a little dry straw over them, and then cover them up with earth, so deep that no frost can affect them. Another method, which is practised in England as well as in Scotland, is to put them together in heaps, and cover them up with straw, and afterwards cover with earth, and so closely packed together as to exclude frost. Dry weather is absolutely necessary in storing potatoes, as they do not keep well when stored in a wet state; and all cut potatoes should be carefully picked out. Pieing is also a good means of preserving potatoes, which is described under garden culture. Several other modes of preserving potatoes are in use in different places. Capping is a method similar to pieing.

The produce of the potatoe varies from 5 to 8, and sometimes 10 or 12 tons per acre; the greatest produce is from the yam, which has been known to produce 12 tons, or 480 bushels per acre. The haulm is of no use but as manure, and is very generally burned for that purpose, being slow of rotting.

The application of the potatoe crop is of the greatest importance as human food; and is the only root grown in Britain which may be eaten every day in the year, without satiating the palate; they are, therefore, the only substitute that can be used for bread, with any degree of success, and indeed they often enter largely into the composition of the best loaf bread, without at all either injuring its nutritive qualities or flavour.

Among the extraordinary applications of the potatoe may be mentioned cleansing woollens, and making an ardent spirit.

Cleansing woollens.—The refuse of potatoes used in making starch when taken from the sieve, possesses the property of cleansing woollen cloths, without hurting their colour; and the water decanted from the starch powder is excellent for cleansing silks without the smallest injury to the colour.

Wine of considerable quality may be made from frosted potatoes, if not so frosted as to have become soft and waterish.

Ardent spirits.—Potatoes that have been injured by the frost produce a greater quantity of spirit, and of a much finer quality than those that are fresh; they require a proportion of malt-wash to promote the fermentation. About one-fourth part of malt-worts, or wash, ought to be fermented at least 6 hours before the potatoe-wash is joined to it; otherwise the potatoe-wash, having an aptitude to ferment, will be ripe for the still before the malt-wash is ready; hence the effect will be to generate an acid which renders the spirit coarse, and when diluted with water, of a milky or bluish colour. When the spirit is strong, the acid is held in solution, but appears as above when diluted with water. (Farmer's Mag. 17. p. 325.)

In the application of potatoes as food for live stock, they are often joined with hay, straw, chaff, and other similar matters; and have been found useful in many cases, in the later winter months, as food for horses, cows, and other sorts of live stock. With these substances, as well as in combination with other materials, as bean or barley-meal, and pollard, they are used in the fattening of neat cattle, sheep, and hogs. Potatoes are most nutritious when boiled; they were formerly cooked in this way, but are now very generally steamed, especially in the North. The practice has been carried to the greatest extent by Curwen in feeding horses. He gives to each daily $1\frac{1}{2}$ stone of potatoes, mixed with a tenth of cut straw. An acre of potatoes, he considers, goes as far in this way as four of hay. 120 stones of potatoes require $2\frac{1}{4}$ bushels of coals to steam them. The baking of potatoes in an oven has also been tried with success. They are also given raw to stock of every description, to horses and hogs washed, but not washed to cows or oxen. Washing was formerly a disagreeable and tedious business; but it is now rendered an easy matter, whether on a large or small scale, by the use of the washing machine.

Frosted potatoes may be applied to various useful purposes; for food by thawing in cold water, or being pared, then thawed, and boiled with a little salt. Salt and saltpetre, chaff, or bruised oats, boiled with them, will render them fit food for cattle, swine, poultry, &c. Starch and paste for weavers, bookbinders, and shoemakers, may be made from them, when too sweet to be rendered palatable.

The diseases of potatoes are chiefly the scab, the worm, and the curl. The scab, or ulcerated surface of the tubers, has never been satisfactorily accounted for. Some attributing it to the ammonia of horse-dung, others to alkali, and some to the use of coal ashes. Change of seed, and of ground are the only resources known at present for this malady. The worm and grub both attack the tuber; and the same preventative is recommended. The only serious disease of the potatoe is the curl; and this is now ascertained to be produced by the concentration of the sap in the tuber; and this concentration, or thickening, is prevented by early taking up. This discovery was first made by the farmers near Edinburgh observing that seed potatoes procured from the moors, or elevated cold ground, never suffered from the curl; and it consequently became a practice, every 3 or 4 years, to procure a change of seed from these districts. On inquiry, it was found that potatoes of these upland grounds continued in a growing state till the haulm was blackened by the first frosts of October. They were then taken up, when, of course, they could not be ripe. Subsequent experiments has established the fact, that the curl is prevented by using unripe seed. It is also a safe practice frequently to change the seed, and also to change the variety.

Tuberous-rooted Nightshade, or Common Potatoe. Fl. May, Sept. Clt. 1597. Pl. 1 to 2 feet.

2 S. etuberòsum (Lindl. bot. reg. 1712.) rhizoma thick, subterraneous, without tubers; stem herbaceous; leaflets unequal, complicate, much undulated, approximate: alternate ones minute; pedicels articulated; calyxes and corollas 5-angled, glabrous. ♃. H. Native of Chili. Habit of *S. tuberòsum;* but the roots are without tubers: the flowers larger, on shorter pedicels; the calyx glabrous and shining, not hispid. Corollas purple. There is a variety of *S. tuberòsum* with long, creeping rhizoma, without tubers, and white flowers, in the botanic garden of Chelsea, from Chili, which renders the present rather doubtful as a species. We suspect that this and *S. Commersònii* are only varieties of *S. tuberòsum.* The *S. stoloníferum,* Cham. in Linnæa, 8. p. 255. a native of Mexico, also appears to be a variety of *S. tuberòsum.*

Tuberless Nightshade, or Potatoe. Fl. July, Oct. Clt. 1833. Pl. 1-2 feet.

3 S. Commersòni (Poir. suppl. 3. p. 746. Dun. sol. ed. 2d. ined. t. 133. syn. p. 5.) herbaceous; leaves pinnate, sublyrate, pilose; pedicels articulate; corollas 5-cleft. ♃. H. Native of America, about Monte Video, Commerson. Hort. trans. 5. t. 10. Very nearly allied to *S. tuberòsum;* but the root is unknown; it differs, however, from that plant, in the leaves being more profoundly pinnatifid; but the leaflets are sessile, and not alternate, unequal; the terminal leaflet very large; and the corolla is 5-cleft, not 5-angled.

Commerson's Nightshade, or Potatoe. Fl. May, Oct. Clt. 1822. Pl. 1 to 2 feet.

4 S. appendicula'tum (Dun. syn. p. 5. H. B. et Kunth, nov. gen. 3. p. 19.) shrubby? or herbaceous? scandent; leaves quinately impari-pinnate, stipulate at the base; leaflets oblong, acuminated, beset with adpressed hairs above, but downy on the veins beneath; corymbs terminal, few-flowered. ♄.? ◡. G. Native of Mexico, near La Puente de La Madre de Dios, between Totonilco el Grande and Actopan. Branchlets puberulous. Leaflets opposite, terminal one large. Corymbs puberulous. Corolla 5-cleft, white, glabrous, with oblong, acute segments. Calyx half globose, 5-lobed.

Appendiculate-leaved Nightshade. Fl. June, Aug. Clt. 1823. Shrub climbing.

5 S. pinna'tum (Cav. icon. 5. p. 23. t. 439. f. 1.) stem herbaceous, furrowed; leaves impari-pinnate; leaflets decurrent; flowers terminal, corymbose. ♃. H. Native of Chili, near Coquimbo. Stem almost winged from the decurrent leaves. Leaves with 3 pairs of leaflets. Branches of corymbs dichotomous. Corollas deep yellow. Berry glabrous, black, size of a pea.

Pinnate-leaved Nightshade. Pl. 2 feet.

§ 2. *Leaves impari-pinnate. Racemes corymbose, lateral.*

6 S. Calda'sii (Dun. syn. p. 6. H. B. et Kunth, nov. gen. amer. 3. p. 19.) herbaceous; leaves impari or unequally pinnate, soft from tomentum, whitish beneath; racemes dichotomous, cymose. ♃. H. Native of Quito, near Chillo. Dun. sol. ed. 2d. ined. t. 85. f. 2. This species differs from *S. ochránthum,* which it is very like; in the stem being herbaceous; in the leaves being smaller; the leaflets being 3-pair; and in the racemes being spreading and cymose above; in the cymes being longer; and in the flowers being larger.

Caldas's Nightshade. Pl. climbing?

7 S. Jame'sii (Torrey, in ann. lyc. 2. p. 227.) herbaceous, rather pilose; stem unarmed, erect; leaves impari-pinnate; leaflets ovate-lanceolate, abruptly narrowed at the base, obsoletely sinuated; racemes extra-axillary, few-flowered. ⊙. H. Native of the Arkansas? Racemes about 4-flowered. Flowers white.

James's Nightshade. Pl. ½ to ¾ foot.

8 S. ochra'nthum (Dun. syn. p. 6. sol. ed. 2d. ined. t. 85. f. 1. H. B. et Kunth, nov. gen. 3. p. 20.) shrubby, scandent; leaves interruptedly pinnate, hairy above, but clothed with white tomentum beneath; leaflets oblong, nearly entire; corymbs lateral, subdichotomous, on long peduncles, about equal in length to the leaves. ♄. ◡. G. Native of Quito, near Chillo. Leaflets opposite, 4 pairs. Corymbs hairy. Corolla 5-cleft, yellow, hairy outside; segments acutish, rather unequal.

Yellow-flowered Nightshade. Shrub climbing.

9 S. juglandifòlium (Dun. syn. p. 6. sol. ed. 2d. ined. t. 86.) shrubby, scandent; leaves impari-pinnate, rough from hairs above, but clothed with soft hairs beneath; leaflets oblong, subcordate, quite entire; corymbs lateral, dichotomous, divaricate. ♄. ◡. S. Native of New Granada, in the province of Pasto, in humid places near Tusa et Cuesaca. H. B. et Kunth, nov. gen. 3. p. 20. Leaflets opposite, 3 pairs, on short petioles: terminal one rather the largest. Corymbs pilose. Corolla 5-parted, white? pilose outside.

Walnut-leaved Nightshade. Shrub climbing.

§ 3. Pteroi'dea (from πτερον, *pteron,* a wing; and ειδος, *eidos,* form; in reference to the pinnate leaves.) *Leaves impari-pinnate or ternate; leaflets quite entire, acuminated. Peduncles axillary, aggregate, racemose.*

10 S. mi'te (Ruiz. et Pav. fl. per. 2. p. 38. t. 173. f. a.) stem herbaceous, radicant; leaves impari-pinnate; leaflets oblong; racemes axillary, aggregate; berries globose. ⊙. H. Native of Peru, in the province of Panatahua, in forests at Pozuzo and Chincao, in humid places. Glabrous. Stem bluntly angular. Flowers small, secund, white. Berry white, size of a pea. Leaves 8-10 inches long.

Mild Nightshade. Pl. 2 feet, creeping.

11 S. cónicum (Ruiz. et Pav. l. c. t. 172. f. b.) stems herbaceous; leaves impari-pinnate; leaflets oblong-lanceolate; peduncles axillary, usually 3 together, spicate; berry conical. ⊙. H. Native of Peru, in groves at Chincao and Cuchero. Stem pilose, and angular at top. Peduncles solitary, twin or tern, almost the length of the petioles, recurved at top.

Flowers small, secund, whitish-blue. Corolla 5-lobed. Berry white, size of an olive.

Conical-fruited Nightshade. Pl. 2 feet.

12 S. DIFFU'SUM (Ruiz. et Pav. l. c. p. 37. t. 171. f. b.) stem suffruticose; branches twiggy, diffuse; leaves impari-pinnate; leaflets oblong; racemes axillary, few-flowered. ♄. S. Native of Peru, in groves in the province of Huanuco. Plant with the habit of *Jasmine*. Stem branched, angular. Petioles and peduncles downy. Corollas violaceous, 5-lobed.

Diffuse Nightshade. Shrub.

13 S. SEAFORTHIA'NUM (Andr. bot. rep. t. 504. Dun. syn. p. 7.) suffruticose, scandent; leaves pinnate, undulated: superior ones simple, lanceolate; racemes racemosely-panicled, sometimes longer than the petioles. ♄. ◡. S. Native of Barbadoes. Flowers pink. Leaves sometimes ternate.

Seaforth's Nightshade. Fl. July, Sept. Clt. 1804. Shrub climbing.

14 S. TERNA'TUM (Ruiz. et Pav. l. c. p. 38. t. 172. f. a.) stem suffruticose, tetragonal, scandent, radicant; leaves ternate; peduncles few-flowered. ♄. ◡. S. Native of Peru, in humid parts of woods. Plant glabrous. Leaves on long petioles. Leaflets oblong-lanceolate: middle one large. Peduncles many together. Flowers sub-umbellate. Calyx 5-crenated, small. Corolla purplish-violet. Deeply 5-parted.

Ternate-leaved Nightshade. Shrub climbing.

§ 4. *Leaves pinnatifid and entire.*

15 S. LACINIA'TUM (Ait. hort. kew. 1. p. 247.) shrubby or herbaceous, quite glabrous; leaves pinnatifid; segments linear-lanceolate: terminal one elongated; or the leaves are entire, linear-lanceolate, elongated; racemes lateral, corymbose, simple or bipartite, shorter than the leaves; calyx half 5-cleft; segments of corolla emarginate; berry oval. ♃. G. Native of New Zealand; New South Wales, about Port Jackson; and of Van Diemen's Land. Curt. bot. mag. t. 349. R. Br. prod. p. 445. S. pinnatífidum, Lam. dict. 4. p. 292. Poir. dict. 4. p. 287. but not of Ruiz. et Pav. S. aviculàre, Pers. syn. 1. p. 225. Forst. prod. no. 107. ? pl. esc. no. 12. ? S. reclinàtum, Hort. Plant quite glabrous, as in *Lactùca perénnis*. Stem juicy. Racemes corymbose. Corollas blue, size of those of *Gerànium praténse*. Anthers separated, not cohering, as in the rest of the species. Berry nearly globose, depressed, greenish-yellow, edible, size of a plum.

Var. α; shrubby; leaves pinnatifid.

Var. β; shrubby; leaves undivided.

Var. γ; herbaceous; leaves pinnatifid.

Jagged-leaved Nightshade. Fl. July, Aug. Clt. 1772. Pl. 2 to 3 feet.

16 S. QUERCIFÒLIUM (Lin. spec. p. 264.) stem sub-herbaceous, angular, flexuous, scabrous; leaves pinnatifid; racemes corymbose or cymose. ♃. H. Native of Peru; and of Chili, about Valparaiso. Dun. sol. 139. Pers. ench. 1. p. 225. exclusive of the syn. of Fl. per.—Feuill. obs. 2. p. 722. t. 15. ? Habit of *S. Dulcamàra*. Stem erect. Branches angularly winged; wings minutely toothed. Leaves ciliated a little, with usually 5 ovate segments, scabrous beneath, pilose in the young state. Corolla violaceous, with 2 green marks at the base of each segment. Berry ovate. Feuille's figure is referred to *Witheringia multífida* by Poir. in his encyl. 4. p. 287. and suppl. 3. p. 739. According to Dunal, S. rùncinàtum, Ruiz. et Pav. fl. per. 2. p. 36. agrees well with this species, but is perhaps distinct.

Oak-leaved Nightshade. Fl. June, July. Clt. 1787. Pl. 3 to 5 feet.

17 S. TRIFLÒRUM (Nutt. gen. amer. 1. p. 128.) stem unarmed, herbaceous, procumbent; leaves denticulately-pinnatifid, glabrous; segments acute, subundulated, having the margins more or less revolute; peduncles opposite the leaves, 2-3-flowered. ☉. H. Native near Fort Mandan, and elsewhere; and on the banks of the river Platte, commencing near the Pawnee village, and continuing to the mountains. Flowers small, white, revolute. Fruit size of a cherry, green in the mature state. Stems very hairy, diffuse. Leaves subruncinate.

Three-flowered Nightshade. Pl. procumbent.

18 S. RADI'CANS (Lin. fil. dec. 1. t. 10. Dun. sol. p. 140.) stem herbaceous, smooth, nearly terete, prostrate, radicant; leaves deeply pinnatifid; racemes cymose, about equal in length to the petioles. ♃. S. Native of Peru. S. quercifòlium, Ruiz. et Pav. fl. per. p. 36. exclusive of the syn. of Lin. and Feuille. Stems at length ascending, and angularly winged from the decurrent petioles. Leaves with 5 ovate, acute, or lanceolate segments. Racemes sometimes opposite the leaves, but not always. Corollas small, violaceous. Berry globose, size of a pea, red.

Rooting-stemmed Nightshade. Fl. July, Aug. Clt. 1771. Pl. creeping.

19 S. GLABE'RRIMUM (Dun. sol ed. 2d. ined. t. 133. syn. p. 9.) stem quite glabrous, furrowed; leaves rarely entire, usually pinnatifid: the terminal segment elongated; racemes aggregate, many-flowered; segments of corolla acute. ♃. S. Native of the Island of Timor. Habit of *S. laciniàtum*; but differs in the racemes being larger; in the flowers being more copious; in the calyxes being 5-parted; and in the segments of the corolla being acute, not emarginate.

Quite glabrous Nightshade. Pl. 2 to 3 feet.

20 S. RECLINA'TUM (Lher. ined. ex bot. cult. ed. 2. vol. 3. p. 168. Dun. syn. p. 8.) stem quite glabrous, thick, juicy; leaves pinnatifid, sometimes entire; racemes lateral, shorter than the leaves; corolla semiquinquefid, with emarginate segments. ♄. S. Native of Peru, Dombey. S. pinnatífidum, Lam. ill. t. 115. f. 4. Cav. descr. 111. S. laciniàtum, Dun. sol. p. 139. exclusive of the syn. Stem furrowed. Leaves tapering into the petioles; segments linear. Peduncles 2-3-flowered. Calyx deeply 5-toothed. Corollas azure-blue. Berry green, globose, edible, an inch in diameter.

Reclinate Nightshade. Shrub 3 feet.

21 S. SEPTE'MLOBUM (Bunge, in mem. acad. petersb. 2. p. 122.) stem herbaceous, erect, angular; leaves pinnatifid; lobes ovate-oblong, obtuse, entire, or deeply toothed, downy on both surfaces; panicles dichotomous, divaricate, lateral, exceeding the leaves; corollas 5-cleft. ♃. H. Native of China, in waste places about Pekin. Leaves obscure, green, with usually 7 lobes. Corollas deep violet, like those of *S. Dulcamàra*.

Seven-lobed-leaved Nightshade. Pl. 1 to 2 feet.

§ 5. *Leaves ternate or simple. Leaves and leaflets ovate or ovate-lanceolate.*

22 S. HEBE'PHORUM (Dun. syn. p. 7. H. B. et Kunth. nov. gen. 3. p. 21.) herbaceous, much branched; branches angular, puberulous; leaves ternate, clothed with silky down on both surfaces; leaflets oblong, acute, entire; peduncles long, lateral? flowers subracemose. ♃. H. Native of Peru, near Caxamarca, in frigid places, at the altitude of 460 hexapods. Leaflets about 2 inches long. Flowers subumbellate, ex Bonpl. Calyx 5-parted. Corolla quinquefid. The hairs in this and the 4 following species are simple.

Down-bearing Nightshade. Pl. 2 feet.

23 S. MURICA'TUM (Ait. hort. kew. 1. p. 250. Dun. sol. p.

162. syn. p. 8. H. B. et Kunth, nov. gen. 3. p. 21.) stem suffruticose, radicant, ascending; young branches muricated; leaves oblong-lanceolate, entire, downy, but sometimes ternate; racemes terminal, bifid. ♄. G. Native of Peru, common in cultivated places, ex Feuille; Teneriffe, in gardens, ex Broussonet; near the city of Mexico, ex Bonpl. S. scàbrum, Lam. ill. no. 2344. S. variegàtum, Ruiz. et Pav. fl. per. 2. p. 32. t. 162. f. a. Melongèna laurifòlia, fructu turbinato variegato, Feuill. per. 2. p. 735. t. 26. The plant is called *Pepo*, and *Pepino de la Tierra*, in Peru. Branches trigonal. Leaves 15-24 lines long, furnished with 2 small stipulas at the base. Racemes extra-axillary. Corollas size of those of *S. Dulcamàra*, white, painted with violaceous veins, puberulous outside; segments ovate, roundish. Calyx 5-parted, silky. Berry ovate, variegated with purple, drooping, edible; sarcocarp yellow, very thick.

Muricated Nightshade. Fl. July, Aug. Clt. 1785. Shrub 2 to 3 feet.

24 S. diversifòlium (Dun. syn. p. 8. sol. ed. 2d. t. 88. H. B. et Kunth, nov. gen. 3. p. 22.) shrubby; branches puberulous; leaves impari-pinnate, ternate or entire, downy; leaflets sessile, oblong, acuminated, entire: terminal one large; racemes extra-axillary, simple; calyx large, equal in length to the corolla. ♄. S. Native near Caraccas. Branches glandular and hairy. Racemes shorter than the leaves. Corolla rotately subcampanulate, 5-cleft, white, size of those of *Boràgo officinàlis*; segments ovate, acute.

Diverse-leaved Nightshade. Fl. June, July. Clt. 1825. Shrub 2 to 3 feet.

25 S. Caripe'nse (Dun. syn. p. 8. sol. ed. 2d. ined. t. 89. H. B. et Kunth, nov. gen. amer. p. 22.) shrubby, scandent; branches villous; leaves simple and ternate, elliptic-oblong, acutish, rounded at the base, quite entire, clothed with silky hairs, biauriculate at the base; racemes extra-axillary, and nearly terminal, simple, or bifid. ♄. ◡. S. Native of the province of Cumana, near the monastery of Caripe. Leaves $1\frac{1}{2}$ to 2 inches long. Flowers unilateral, size of those of *Veràtrum nìgrum*. Pedicels articulated. Calyx 5-parted, pilose. Corolla rotate, white, ? sinuately 5-lobed.

Caripe Nightshade. Shrub climbing.

26 S. Bulboca'stanum (Moc. et Sesse. fl. mex. icon. Dun. syn. p. 8. sol. ed. 2d. ined. t. 3.) root tuberous; stems herbaceous; leaves ovate, repand, auricled; peduncles 1-flowered, subumbellate. ↄ. H. Native of Mexico. Root solitary, globose, like that of *S. tuberòsum*, mucronate below, without any other radicle. Stem terete. Leaves undulated. Petioles auricled, from 2 sessile leaflets. Peduncles villous, violaceous. Corolla white, with lanceolate, bluntish segments.

Bulbocastanum Nightshade. Pl. 1 foot?

27 S. oliga'nthum (Dun. syn. p. 8. vol. ed. 2d. ined. t. 90.) shrubby, scandent?; branches clothed with hoary tomentum; leaves perhaps always simple, unequal, and cordate at the base, quite entire, glabrous above, but clothed with soft, yellowish, hoary tomentum beneath, auricled at the base; peduncles terminal, few-flowered. ♄. ⊙. ? S. Native near Maypure, on the banks of the Orinoco. H. B. et Kunth, nov. gen. amer. 3. p. 23. Hairs on the plant stellate. Leaves 2 inches long. Auricles sessile, obliquely ovate-sublunate, similar to the leaves.

Few-flowered Nightshade. Fl.? Clt. 1824. Shrub 3 feet.

§ 6. Pachyphy'lla (from παχυς, *pachys*, thick; and φυλλον, *phyllon*, a leaf.) *Leaves pinnate, pinnatifid, or entire. Leaves and leaflets cordate, acute, thick, beset with short simple hairs. Racemes cymose, pendulous. Corollas 5-parted. Berries oval.*

28 S. pe'ndulum (Ruiz. et Pav. fl. per. 2. p. 39. t. 174. f. a.) stem shrubby; leaves simple and irregularly pinnate; leaflets 2-6, obliquely cordate; racemes pendent, forked. ♄. S. Native of Peru, in the province of Panatahua, particularly in shady places about Munna. Dun. sol. p. 168. syn. p. 7. Branches hairy, dichotomous. Leaves pubescent on both surfaces. Corolla elongated, downy, purple, with acute, reflexed segments. Berry large, ovate, yellow, size of a middling pear.

Pendulous-racemed Nightshade. Shrub 10 feet.

29 S. oblìquum (Ruiz. et Pav. fl. per. 2. p. 35. t. 165. f. a.) stem suffruticose; leaves cordate, oblique, acute; racemes cymose, revolute, secund. ♄. S. Native of Peru, in groves at Chincao. Shrub glabrous. Leaves shining above, and downy beneath. Peduncles lateral. Calyx 5-cleft. Corolla purplish violet. Berry oblong, acutish at both ends.

Oblique-leaved Nightshade. Shrub 5 to 10 feet.

30 S. viridiflòrum (Ruiz. et Pav. fl. per. 2. p. 38. t. 173. f. b.) shrubby; leaves cordate-ovate, simple, villous; racemes dependent, about equal in length to the leaves. ♄. S. Native of Peru, in groves. Dun. sol. p. 169. Plant villous. Calyx semiquinquefid. Corolla green, almost 5-parted, with reflexed segments. Berry large, oblong, turbinate, villous, yellowish.

Green-flowered Nightshade. Shrub 6 feet.

31 S. beta'ceum (Cav. icon. 6. p. 599. t. 524. ann. d'hist. nat. 1. p. 44.) shrubby; branches and stem thick, succulent; leaves large, cordate, ovate-oblong, rather downy on both surfaces, with undulated margins; racemes cymose, pendulous, about equal in length to the petioles. ♄. G. Native of New Spain. Dun. sol. 169. Andr. bot. rep. t. 511. S. crassifòlium, Ort. dec. p. 117. Leaves a foot long. Petioles spotted. Racemes axillary and supra-axillary, many times bifid, sometimes simple and trifid. Calyx 5-cleft, spotted at top. Corolla white, tinged with red, small, thick, 5-parted. Anthers yellow. Berry ovate, size of a walnut, 2-celled at first, yellowish green, marked with longitudinal brown spots, afterwards reddish. The whole plant has an ungrateful scent, like that of *Stramònium* or *Henbane*.

Beet-leaved Nightshade. Fl. June, July. Clt. 1803. Shrub 3 to 5 feet.

Subsect. 2. *Leaves lobed, sinuated, angular, toothed, or entire.*

§ 1. *Leaves lobed, and entire.*

32 S. lepta'nthum (Moc. et Sesse, icon. mex. ined. Dun. syn. p. 9. Sol. ed. 2d. ined. t. 28.) stem terete, herbaceous, glabrous; leaves oblong, undulately repand, running into the petioles; racemes dichotomous, cymose at top; corolla pentagonal. ↄ. G. Native of Mexico. Flowers small. Teeth of calyx acute. Berry small, globose, from red to violet. Allied to *S. corymbòsum*. Plant glabrous, erect, or procumbent.

Var. β, parvifòlium (H. B. et Kunth, nov. gen. 3. p. 24.) leaves smaller, nearly sessile; racemes and pedicels shorter; corollas pale violet, not white. ↄ. S. Native of Peru, between Caxamarca and Magdalena.

Slender-flowered Nightshade. Pl. procumbent.

33 S. Línkii; leaves lanceolate, sub-sinuated, rather tomentose, green; peduncles few-flowered; calycine segments ovate, acute. ♄. S. Native country unknown. S. oligánthum, Link, enum. 1. p. 182, but not of Dun. Branches glabrous; petioles clothed with minute, stellate hairs. Leaves undulated, acute, with 1-3 deep recesses, beset with stellate hairs on both surfaces, which are most dense beneath. Pedicels drooping, and are, as well as the calyxes, rather tomentose. Corolla semi-quinquefid, sub-plicate, white.

Link's Nightshade. Fl.? Clt. 1824. Shrub 3 to 4 feet.

34 S. corymbòsum (Jacq. coll. 1. p. 78. icon. rar. t. 40.) stem suffruticose; leaves ovate-lanceolate, entire, or a little lobed; racemes cymose, opposite the leaves; corollas 5-parted. ♄. S. Native of Peru, in cultivated places, through the provinces of Lima and Chancay. Dun. mon. 142. S. corymbíferum, Gmel. syst. 384. S. parviflòrum, Nocca, in Usteri, ann. 6. p. 61. Vittm. summ. suppl. 283. Habit of *S. Dulcamàra*. Branches some erect, and some weak and procumbent, angular. Leaves glabrous, fetid. Racemes 2-3-4-cleft. Corolla small, blue, or violaceous, 5-cleft. Berry of a reddish orange colour, size of a pea.

Corymbose-flowered Nightshade. Fl. July, Aug. Clt. 1786. Shrub 2 to 3 feet.

35 S. cirrhòsum (Dun. syn. p. 9. sol. ed. 2d. ined. t. 91. H. B. et Kunth, nov. gen. 3. p. 24.) shrubby, scandent, tendrilled; leaves oblong, entire, or 3-lobed, acuminated, glabrous: middle lobe large; racemes terminal, panicled. ♄. ◡. S. Native near Cumana, in shady places. S. salígnum, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 663. Habit of *S. Dulcamàra*. Shrub glabrous. Tendrils spirally revolute, extra-axillary. Leaves entire, ternate, or 3-lobed. Flowers rose-coloured, size of those of *S. nìgrum*. Calyx small, angularly 5-toothed. Stamens sometimes 6.

Tendrilled Nightshade. Shrub climbing.

36 S. Dulcama'ra (Lin. spec. p. 264.) shrubby, scandent, flexuous; leaves ovate-cordate: superior ones jagged; corymbs almost opposite the leaves. ♄. ◡. H. Native of Europe, Asia, and North America, in hedges and among bushes; plentiful in Britain. Smith, engl. bot. t. 565. Pursh. fl. amer. sept. 1. p. 156. Curt. fl. lond. 1. t. 14. Fl. dan. t. 607. Bull. herb. t. 23. Reit. et Abel, t. 72. Dreves et Heyne, t. 60. Guimpel. t. 12. Plenck, off. t. 119. Svensk. bot. t. 20. Woodv. med. bot. 97. t. 33. Sav. mat. med. p. 47. t. 14. Stev. et Church. med. bot. icone. S. scándens, Neck. gallob. 119. Dulcamàra flexuòsa, Mœnch. meth. p. 514. Sol. scándens seu Dulcamàra, Tourn. inst. p. 149. Amàra dúlcis, Gerard, emac. 350. Dúlcis amàra, Trag. 816. Glycipìcros seu Dulcamàra, Bauh. hist. 2. p. 109. icone. La Morelle. Grimpànte, Regnault bot. icone. Shrub glabrous. Leaves cordate: superior ones hastate, all quite entire. Corymbs panicled. Corolla violaceous, with reflexed segments, each segment furnished with 2 green spots at the base. Berries elliptic, red. The roots and stalks of this, the *Woody Nightshade*, upon being chewed, first cause a sensation of bitterness, which is soon followed by a considerable degree of sweetness; whence it has obtained the names of *Dulcamàra*, or *Bitter-sweet*. The berries excite vomiting and purging. Floyer says, thirty of them killed a dog in less than 3 hours, remaining undigested on the stomach. As they are common in hedges, and may be mistaken by children for red currants, this circumstance is the more worthy of notice. In such a case it is advisable to pour down as much warm water as possible, to dilute the poison, and provoke vomiting. The old botanists recommend the plant as a medicine in many diseases. Ray informs us, that the inhabitants of Westphalia make use of a decoction of the whole plant as their common drink with success against scurvy. Boerhaave says, it is a medicine far superior to China and Sarsaparilla, as a sweetener and restorative: and Linnæus, that an infusion of the young twigs is an admirable medicine in acute rheumatisms, inflammations, fevers, and suppression of the lochia. Dr. Hallenberg advises it in ischiatic and rheumatic pains, jaundice, scurvy, and lues venerea. They direct a pint of boiling water to be poured upon 2 drachms of the stalks, sliced and dried; after standing half an hour it must be boiled 10 or 15 minutes. The dose is 2 tea-cups full or more morning and evening. Murray and Bergius regard it as promoting all secretions. Dr. Cullen says, "We have only employed the slender twigs, but some parcels of these were very mild, and most others considerably acrid. In the latter state we have employed a decoction of these in the cure of rheumatism sometimes with advantage, but at other times without effect. The *Dulcamàra* is inserted in the catalogue of diuretics, but this property it hardly, if at all, possesses. The twigs when gathered in autumn or spring will be most powerful; if used dry a somewhat larger dose must be taken. The plant is generally given in decoction or infusion, and to prevent it exciting vomit it should be diluted with milk: small doses also are recommended at the beginning, for large ones have been found to produce convulsion, delirium, and palsy of the tongue, ex Woodv.

Var. α, violàceum; corollas violaceous.—Hort. eyst. p. 385. t. 384. no. 3.

Var. β, álbum; corollas white.—Lin. fl. suec. p. 66.

Var. γ, cárneum; corollas flesh-coloured.—Cels. ups. 32. Lin. fl. suec. l. c.

Var. δ, plènum; corollas double.—Tourn. inst. 149. Hort. eyst. l. c.

Var. ε, variegàtum; leaves variegated.—Munt. fig. 156. Tourn. inst. 149.

Var. η, hirsùtum; plant hairy, or downy. Flowers violaceous. —On the sea-coast.

Var. ι, rupéstre (Schmidt, fl. boh. p. 96.) stem erect; leaves ovate, quite entire; racemes few-flowered, dichotomous.—Native of Bohemia.

Bitter-sweet, or Woody Nightshade. Fl. June, July. Britain. Shrub climbing.

37 S. Kieserílzkii (Meyer, verz. pfl. p. 113.) stem shrubby, unarmed, erect; leaves nearly glabrous, scattered, petiolate, ovate-oblong, quite entire, acuminated, attenuated at the base; racemes lateral, few-flowered; segments of corolla 5, reflexed, each marked with 2 spots at the base. ♄. H. Native of Caucasus, in woods near Lenkeron.

Kieserilzki's Nightshade. Shrub.

38 S. Pe'rsicum (Willd. mss. Ledeb. fl. alt. 1. p. 237.) stem terete, scandent; leaves rather downy, ovate-lanceolate, cordate, quite entire; racemes cymose, lateral, glabrous; corolla 5-parted; berries ovate. ♄. ◡. H. Native of Persia, and of Siberia, frequent on the banks of rivers and rivulets, in humid places near Uimon and Barnaoul. S. Dulcamàra, Patrin, fl. barn. ined. Similar to *S. Dulcamàra* in habit, inflorescence, flowers, and berries; but the leaves are always entire, never hastate or auricled. Calyx 5-toothed. Corolla pale violet. Berries red.

Persian Woody Nightshade. Shrub climbing.

39 S. Tegòre (Aubl. guian. 1. p. 212. t. 84.) shrubby, very hairy; lower leaves pinnatifidly sinuated: upper ones cordate. ♄. S. Native of Guiana, in cultivated places near the habitations of the natives. Dun. sol. p. 142. syn. p. 10. Lower leaves large, with acute lobes: upper ones smaller. Flowers small, greenish, corymbose in the forks of the branches. Berry yellowish, globose, size of a filbert. *Tegore* is the native name.

Tegore Nightshade. Fl. June, July. Clt. 1823. Shrub 5 to 6 feet.

40 S. lyra'tum (Thunb. jap. p. 92.) stem herbaceous, erect, tomentose, as well as both surfaces of the leaves: lower leaves lyrate: superior ones hastate. ♃. G. Native of Japan, near Nagasaki, where it is called *Fijodori Diogo* by the natives. Dun. sol. p. 143. Segments of the leaves nearly opposite, 4 or more, entire: the terminal one larger. Flowers panicled, axillary, and terminal. Panicles sub-dichotomous.

Lyrate-leaved Nightshade. Pl.

41 S. pygmæ'um (Cav. icon. 5. p. 23. t. 439. f. 2.) stem herbaceous, an inch in height; leaves ovate, 3-lobed: middle lobe elongated, obtuse. ⊙. H. Native of Buenos Ayres, in the plains called Pampas. Dun. sol. p. 145. Stem simple, usually terminating in two flowers. Leaves small. Peduncles at first erect, but afterwards deflexed. Corolla pale blue, 5-parted. Berry small, villous, globose.

Pygmy Nightshade. Fl. June, July. Clt. 1819. Pl. 1 inch.

§ 2. *Leaves sinuated, angular, or toothed.*

42 S. grandiflòrum (Ruiz. et Pav. fl. per. 2. p. 35. t. 168. f. b.) stem arboreous, woolly; leaves ovate, sinuated, or quite entire, hispid above, and woolly beneath; racemes cymose, recurved, short; flowers secund. ♄. S. Native of Peru, in groves at Pozuzo. Dun. sol. p. 143. t. 30. syn. p. 10. Stem clothed with stellate fulvous wool. Calyx increasing after florescence. Corolla large, violaceous, 5-parted, with 5 woolly zones outside. Berry large, woolly, yellowish, dependent.

Great-flowered Nightshade. Tree 15 to 30 feet.

43 S. Quitoe'nse (Lam. ill. no. 2326. Poir. encycl. 4. p. 285.) stem suffruticose; leaves subcordate, sinuately angular, tomentose on both surfaces; racemes lateral, very short, hairy. ♂. S. Native of Peru, in the gardens of Quito and Lima, where it is called *Narangitas de Quito* by the natives. Dun. sol. p. 144. ed. 2d. ined. t. 92. f. 6. syn. p. 10. Hook. bot. mag. t. 2739. S. angulàtum, Ruiz. et Pav. fl. per. 2. p. 36. t. 170. f. b.—Feuill. obs. 3. p. 61. t. 46.—Burm. pl. amer. 219. t. 224. f. 2.? exclusive of the syn. of Dill. and Lin. Lycospérmum arborescens foliis angulatis, fructu aureo, Plum. cat. p. 4. Tourn. inst. p. 150. Plant very hairy. Leaves large, with acute segments, and having the petioles and nerves purplish. Calycine segments acute. Corolla large, white inside, and violacèous outside. Berry globose, size and colour of a small orange, when young clothed with short wool. The natives of Peru call this species *Narangitas de Quito*, and some drops of the juice are mixed with the drink called matte.

Quito Nightshade. Fl. June, Aug. Clt. 1825. Shrub 6 feet.

44 S. Tweedia'num (Hook. bot. mag. 3385.) plant clothed with clammy down; leaves cordate, angularly-toothed at the base, on long petioles; racemes umbellate; flowers nutant. ♃. G. Native of Buenos Ayres, Tweedie. Corollas 5-cleft, large, pale blue. Peduncles opposite the leaves.

Tweedie's Nightshade. Fl. June, July. Clt. 1833. Pl. 1½ foot.

45 S. Sandwice'nse (Hook. et Arn. in Beech. voy. pt. bot. p. 92.) stem shrubby; branches terete; branchlets canescent; leaves angularly sinuated, ovate, glabrous above, clothed with hoary down beneath; racemes corymbose, terminal or lateral; corolla minute, 5-cleft; stamens equal. ♄. G. Native of the Sandwich Islands.

Sandwich-Island Nightshade. Shrub.

46 S. Topìro (Dun. syn. p. 10. sol. ed. 2d. t. 92. f. 1. H. B. et Kunth, nov. gen. amer. 3. p. 25.) stem herbaceous, tomentose; leaves somewhat ovate, acute, sinuately angular, unequal at the base, beset with adpressed pili above, and fine hoary tomentum beneath; flowers extra-axillary, aggregate; berry ovate. ♃. S. Native in humid places on the banks of the Orinoco, near San Fernando de Atabapo, &c., where it is called *Topiro*. Leaves 9-10 inches long, and 6 broad, with acute angles. Calyx tomentose. Corolla greenish, with rather unequal, ovate-oblong, acute segments, clothed with stellate tomentum outside. Berry 4-celled, edible, propped by the calyx.

Topiro Nightshade. Pl. 6 feet.

47 S. macroca'rpum (Lin. mant. p. 205.) stem herbaceous, glabrous; leaves cuneated at the base, sinuated, quite glabrous; peduncles few-flowered, short. ♃. S. Native of Peru. Mill. fig. t. 294. Willd. spec. 1. p. 1033, exclusive of the syn. of Feuill, and Plum. Lam. ill. no 2325. Dun. sol. p. 144. syn. p. 10.—Plum. spec. 4. icon. t. 224. f. 2.? Leaves large, repandly sinuated, sometimes obtuse, and sometimes acute. Calycine segments very long. Corollas large, blue, sub-campanulate, half 5-cleft, many sterile. Berry fleshy, globose, yellow, size of an apple.

Large-fruited Nightshade. Fl. May, Sept. Clt. 1759. Pl. 1 to 2 feet.

48 S. pentada'ctylum (G. Don, in Loud. hort. brit. p. 72.) stem erect, or flexuous, glabrous; leaves runcinately sinuated, with ăcute segments, glabrous, shining above; corymbs short, terminal, or in the forks of the stem; fruit large, ovate, furnished with 5 regular protuberances at the base. ♄. S. Native of Trinidad, about St. Ann's and the Port of Spain. Leaves large. Fruit large, yellow. Flowers middle-sized, blue.

Five-fingered-fruited Nightshade. Fl. June, Aug. Clt. 1818. Shrub 2 to 3 feet.

49 S. calycìnum (Moc. et Sesse. icon. mex. ined. Dun. syn. p. 10. sol. ed. 2d. t. 29.) stem twisted, glabrous, thick; leaves sinuately repand; peduncles short, 1-flowered, solitary; calyx increasing after florescence. ♃. G. Native of Mexico. Habit of *S. macrocárpum*. Plant glabrous. Calycine segments with many sinuated nerves. Corolla blue, 5-angled. Berry globose, yellow, size of a small apple.

Large-calyxed Nightshade. Fl. June, July. Clt. 1820. Pl. 1½ foot.

50 S. Baueria'num (Endl. fl. norf. p. 54. Bauer. icon. t. 158.) stem shrubby; leaves oblong, acuminated, angularly-toothed, glabrous; corymbs terminal, rather loose; peduncles drooping. ♄. G. Native of Norfolk Island. Leaves 1-2 inches long. Corollas white, size of those of *S. tuberòsum*. Berry ovate-oblong, of a vermilion colour.

Bauer's Nightshade. Shrub 1 to 2 feet.

§ 3. Pseudo-capsica (false capsicums.) *Leaves angularly repand, or entire. Corollas somewhat 5-parted. Berries spherical, torulose, or smooth.*

51 S. racemiflòrum (Dun. sol. 147. syn. p. 11.) stem herbaceous, scabrous; leaves ovate, repandly angular, scabrous; racemes lateral; berries furrowed. ⊙. H. Native country unknown. S. scàbrum, Jacq. schœnbr. 3. p. 45. t. 333, but not of Vahl. Plant scabrous from numerous pungent hairs or strigæ. Stem green, suffused with purple. Leaves thickish. Racemes many-flowered, more or less than an inch long. Calyx scabrous. Corolla white, rose-coloured beneath. Berry like that of *S. Æthiópicum*, but smaller.

Raceme-flowered Nightshade. Fl. July, Sept. Clt. 1818. Plant 2 feet.

52 S. Æthiópicum (Lin. amœn. 4. p. 307.) stem herbaceous; leaves ovate, repandly angular, glabrous; peduncles usually 1-flowered, drooping; berries torulose. ⊙. H. Native of Æthiopia, China, and Japan. Jacq. hort. vind. t. 12. Thunb. jap. p. 92. Dun. sol. p. 148. syn. p. 11. Pseùdo-cápsicum torulòsum, Mœnch. meth. p. 477. Lycopérsicum Æthiópicum, Mill. dict. no. 3.—Barrel. icon. 1108. Nussubi, or Ka and Kja of the Japanese ex Kœmpf. amœn. p. 810. Fokke, or Fokkes of the Dutch, ex Thunb. Leaves a hand long. Fruit large, red, depressed. Corymbs few-flowered. Corollas white. One of the pedicels in each corymb bears a fertile flower, the rest are usually sterile.

Var. β, violàceum; unarmed; flowers violaceous; berries white, or purple. ⊙. H. Native of China. S. Æthiópicum, Lour. coch. 1. p. 130. The name is *Ca Tien* in China. Flow-

ers solitary. Calyx and corolla 6-cleft. Berry spheroid, 6-lobed, large, edible. Perhaps a proper species.

Var. γ, aculeàtum (Dun. sol. p. 148.) ⊙. H. Native of Europe, in gardens. Stem prickly. Leaves rather tomentose beneath; umbels axillary. Calyx unarmed. S. integrifòlium, Lam. dict. 4. p. 301. Poir. suppl. 3. p. 740. Màla Æthiópica, Ray. hist. 673.—Dod. pempt. p. 459. icon. S. pomíferum herbariòrum, Lob. icon. 264.—Mor. hist. sect. 3. p. 525. sect. 13. t. 2.—Plukn. phyt. t. 226. f. 4. Lycopérsicum fructu striato duro, Tourn. inst. p. 150. Perhaps a species. Berries small, yellow, size of peas.

Æthiopian Nightshade. Fl. July, Sept. Clt. 1597. Pl. ½ to 1 foot.

53 S. Zuccagnia'num (Dun. sol. p. 149. t. 11. syn. p. 11.) stem sub-herbaceous; leaves ovate, angularly repand, glabrous, unequal at the base; peduncles usually 1-flowered, drooping; berries nearly globose. ♃. H. Native country unknown, but cultivated in the gardens of Florence and Montpelier. S. scàbrum, Zuccag. cent. no. 50, but not of Vahl. or Jacq. Plant green, beset with minute crystalline warts when examined by a lens. Corolla 5-parted, white, with acute segments. Berry cherry shaped, round, sub-umbilicate, mucronate, red when ripe. Peduncles solitary, or twin, 1 rarely 2-flowered. Habit of *S. Æthiópicum*, from which it differs in the leaves being minutely warted, in the berries being much smaller, smooth, or deeply furrowed. It also comes near to *S. racemiflòrum*.

Zuccagni's Nightshade. Fl. June, July. Clt. 1823. Pl. 2 feet.

54 S. tríquetrum (Cav. icon. 3. p. 30. t. 259. descr. p. 110.) stem frutescent, triquetrous; leaves cordate-deltoid, acuminated, glabrous; umbels opposite the leaves, pedunculate. ♄. S. Native of New Spain. Dun. sol. 147. syn. p. 11. Stems slender, sometimes erect, and sometimes trailing, triquetrous in the young state. Peduncles very short; pedicels 3-4 umbellate, drooping. Corollas small, white, somewhat 5-parted, with linear curled segments. Berry nutant, globose, red, size of a pea.

Triquetrous-stemmed Nightshade. Fl. June, July. Clt. 1820. Shrub 2 to 4 feet.

55 S. microca'rpum (Vahl, symb. 2. p. 40.) stem shrubby; leaves oblong-lanceolate, somewhat repand; racemes lateral. ♄. G. Native of Egypt. Dun. sol. p. 149. t. 10. S. pseùdo-cápsicum, var. microcárpum, Pers. ench. 1. p. 224. S. diphýllum, Forsk. pl. cat. ægypt. p. 63. no. 134. Leaves 3-4 inches long, green, glabrous. Racemes extra-axillary, 1 inch long. Flowers sub-cymose. Corolla white, 5-parted, pilose outside. Berries smooth, red, size of pepper berries.

Small-fruited Nightshade. Shrub 2 to 3 feet.

56 S. pseu'do-ca'psicum (Lin. spec. p. 263.) stem shrubby; leaves lanceolate, or oblong-lanceolate, sub-repand; peduncles generally 1-flowered, extra-foliaceous. ♄. G. Native of Madeira; and in gardens almost every where. Dun. sol. 150. syn. p. 11. Pseùdo-cápsicum undulatifòlium, Mœnch. meth. p. 477.—Sabb. hort. rom. p. 12. t. 59. S. fruticòsum baccíferum, Tourn. inst. 149. Mor. hist. 3. p. 526. S. arboréscens, Cæsalp. p. 215. Strychnodéndros, Bauh. hist. 3. p. 614. Besl. hort. eyst. p. 317. t. 316. Pseùdo-cápsicum, Dod. pempt. 718. icon. S. Americànum, Dalech. lugd. p. 599. icone. In Spain the fruit is called *Guindas de las Indias*; in France *Morelle cerisette, petit ceresier d'hiver, Amome des Jardiniers*; in England *Winter Cherries*, or *Tree Nightshade*. Plant glabrous. Corolla small, white, 5-parted. Berry globose, red, or scarlet, size of a cherry.

Var. β, lùteum; berries yellow, ex Poir. encycl. 4. p. 281.

False-Capsicum, or Tree Nightshade. Fl. June, Sept. Clt. 1596. Shrub 3 to 4 feet.

57 S. pseu'do-quìna (St. Hil. pl. usuell. bras. t. 21.) stem arboreous, unarmed; leaves lanceolate-oblong, narrow, acute, quite entire, glabrous above, but with fascicles of villi in the axils of the nerves beneath; racemes extra-axillary, short, bearing 1, or few-fruit; calyx glabrous. ♄. G. Native of Brazil, in the district of Curitiba in St. Paul, without the tropic. The bark is very bitter, and the inhabitants use it with great success in the cure of fevers, and for that reason is called by them *Quina*, from considering it the same as the Quina of Peru.

False-quina Nightshade. Shrub.

§ 4. More'lla (Morelle is the generic name of *Solànum* in French; and is from the Celtic word *mor*, black. In old French *mor* is the root of many names, expressing dark or black things.) *Stem herbaceous, or sub-herbaceous. Leaves acuminated at both ends. Racemes short, panicled, intra-foliaceous; pedicels subumbellate, or panicled, drooping. Flowers small, white, or pale violet. Berries small, globose.*

58 S. nodiflòrum (Jacq. coll. 2. p. 288. icon. rar. 2. t. 326.) stem suffruticose; branches terete, and are, as well as the leaves, glabrous; leaves ovate, quite entire; flowers sub-umbellate. ♄. S. Native of India, Lin.; Guiana, Aubl.; Brazil, Piso; Mauritius, Jacq. &c. Dun. sol. 151. S. stríctum, Zucc. cent. 1. p. 49. S. nìgrum, β, pátulum, Lin. spec. p. 267. Willd. spec. 1. p. 1035. Branches thickened at the nodi. Leaves half a foot long. Calycine segments oblong, obtuse. Corollas white, with a yellow base; segments lanceolate, acute. Berry small, black.

Knot-flowered Nightshade. Fl. June, July. Clt. 1822. Pl. 10 feet.

59 S. Desva'uxii (Hamilt. prod. p. 26.) stem about 2 feet high, erect; leaves ovate-lanceolate, quite entire, or sub-repand; berries small, globose, black. ⊙. H. Native of the Island of Nevis. S. nodiflòrum, Desv. herb. Stem herbaceous.

Desvaux's Nightshade. Pl. 2 foot.

60 S. Dille'nii (Schultes, œstr. fl. ed. 2d. 1. p. 393. Rœm. et Schultes, syst. 4. p. 586.) stem and branches terete, glabrous; leaves ovate, spreading horizontally, glabrous; peduncles filiform; fructiferous cymes erectly spreading. ⊙. H. Native of Hungary, in the woods of Matra, Kitaibel. S. nìgrum, β, pátulum, Willd. spec. 1. p. 1035. Roth. catalect. 2. p. 23.—Dill. elth. 367. t. 275. f. 355. Nearly allied to *S. pàtulum*, Ruiz. et Pav. Flowers white, much smaller than those of *S. nìgrum*. Berry marked with small white dots before maturity.

Dillenius's Nightshade. Fl. June, Sept. Clt. 1818. Pl. 2 feet.

61 S. microspe'rmum (Dun. syn. p. 12. sol. ed. 2d. t. 93. ined.) stem terete, herbaceous, glabrous; leaves solitary, or twin ovate, subcordate, entire, glabrous, shining; racemes subumbellate. ⊙. H. Native country unknown.

Small-seeded Nightshade. Pl. 1 to 2 feet.

62 S. Guinee'nse (Lam. ill. no. 2339. Mill. dict.) stem herbaceous; branches glabrous, angularly-toothed; leaves ovate, glabrous, quite entire; flowers numerous, somewhat umbellate. ⊙. H. Native of Guinea. Dun. sol. p. 152. syn. p. 12. S. nìgrum, δ, Guineénse, Lin. spec. p. 266 Willd. spec. 1. p. 1035.—Dill. elth. 360. t. 274. f. 354.—Boerh. lugdb. 2. p. 68. Bross. icon. t. 13. S. Memphíticum, Mart. mss. Nearly allied to *S. nìgrum*. Angles of the stem toothed. Corolla whitish, or pale violet. Berry globose, size of a small cherry, black and shining at maturity.

Guinea Nightshade. Fl. June, Sept. Clt. 1817. Pl. 1½ to 3 feet.

63 S. nìgrum (Lin. spec. p. 266. mat. med. 66.) stem herbaceous, angular; leaves ovate, toothed, nearly naked; flowers sub-umbellate. ⊙. H. Native throughout Europe; a weed in cultivated ground; as well as of Africa and Asia, in like situations. Dun. sol. p. 152. syn. p. 12. Willd. enum. 1. p. 236. S. nìgrum, α, vulgàtius, Lin. spec. 266. Smith, engl. bot. t. 566. Curt. lond. fasc. 2. t. 14. Plench, icon. t. 120. Oed. fl. dan. t. 460. Bull. herb. t. 67. Sturm. fl. germ. fasc. 1. icon. Hayne, term. bot. t. 28. Schkuhr, handb. t. 46. S. officinàrum acinis nigricantibus et acinis luteis, Tourn. inst. p. 148. S. officinàrum, Zanich. venez. t. 268. S. horténsis, Blackw. t. 107. &c.—Mor. hist. 3. p. 520. sect. 13. t. 1. f. 1. —Lob. icon. 262.—Tab. icon. 577. *Yerba mora* of Brazil, Peru, and Spain. *Morelle a fruits noir* and *Morelle creve chien* of the French. Plant downy. Stem branched, and is, as well as the branches, angular-toothed. Common peduncles short. Flowers few, 5-6 together, white. Berries size of currants, black, rarely yellow. The herb is fetid, and diuretic; it also promotes perspiration. Too large a quantity occasions violent sickness, with headache, giddiness, drowsiness, and other dangerous symptoms. In short its effects on the nervous system are so uncertain, and sometimes so considerable, that it must ever be administered with the greatest caution. S. nìgrum, Thunb. jap. p. 92, and Ruiz. et Pav. fl. per. p. 32, are probably distinct varieties.

Var. β, *melanocérasum* (Dun. sol. 153.) branches angularly toothed; leaves ovate, toothed, angular, glabrous; racemes sub-umbellate, extra-foliaceous. ⊙. H. Native of the South of Europe. S. melanocérasum, Willd. enum. p. 237.

Var. γ, *atriplicifòlium*; leaves sinuated, angular. ⊙. H. S. atriplicifòlium, Desportes in herb. D. C.

Black-fruited Nightshade. Fl. June, Sept. Britain. Pl. 1 to 1½ foot.

64 S. fistulòsum (Rich. herb. Dun. syn. p. 12. sol. ed. 2d. ined. Nees in Lin. trans. 17. p. 37.) branched, herbaceous; stem fistular, angular; leaves ovate, with a blunt acumen, somewhat repand, running into the narrow petioles at the base; pedicels when bearing the fruit equal in length to the common peduncle; pollen yellow. ⊙. H. Native of the Mauritius, East Indies, and cultivated in America. Very like *S. nodiflòrum*, and *S. Guineénse*, but differs from them in the peduncles being stronger and shorter, in the leaves being repand, and the stems being angular and more blunt, in the flowers being smaller, the anthers shorter, and in the pollen being yellow, not violaceous.

Var. α; berries black. ⊙. H. S. fistulòsum, Rich. l. c. Dun. syn. p. 12. S. Rhinoceròtis, Blum. bijdr. p. 695.? S. nìgrum, Wall. cat. no. 2615.

Var. β; berries red. ⊙. H. S. rùbrum, Gmel. syst. p. 384. Willd. spec. 1. p. 1034. S. erythræ'um, Dun. sol. 238. S. nìgrum fructu rubro, Hamilt. herb. Wall. cat. no. 2615.

Fistular-stemmed Nightshade. Pl. 1 to 2 feet.

65 S. ince'rtum (Dun. sol. 155. syn. p. 13. Nees in Lin. trans. 17. p. 38.) branched, diffuse, herbaceous; stem angular; angles smooth, or denticulated; leaves deltoid, or deltoid-oblong, triangularly acuminated, sinuately toothed in the middle; fructiferous pedicels reflexed, equal in length to the common peduncle. ⊙. H. Native of India, in sandy places, Silhet, Wallich. Flowers sub-umbellate, small, white. Berries round, size of peas.

Var. α; leaves narrower, sharply and sinuately toothed; fruit red, or yellow; stem rather scabrous. ⊙. H. S. nìgrum, Wall. cat. no. 2615, from Oude and Rungpur.

Var. β; leaves broadly deltoid, sparingly angular, or somewhat hastately angular.

* Berries red, or copper-coloured. ⊙. H. Native of India, Arabia, and the South of Europe. S. nìgrum, Forsk. fl. ægypt. p. 46. Wall. cat. no. 2615. C. N. S. miniàtum, Bernh. ex Willd. enum. 1. p. 236. Dun. sol. p. 156. S. nìgrum, β, Judàicum, Lin. spec. p. 266.? S. officinàrum acinis puniceis, Tourn. inst. p. 148. S. puníceum, Cord. hist. 158. Nelan Tsjunda, Rheed. mal. 10. p. 145. t. 73. Mesælleha hadie of the Arabs, ex Forsk. l. c.

** Berries black. ⊙. H. Native of Nipaul. S. nìgrum, var. melanocérasum, Wall. cat. no. 2615. F.

Uncertain Nightshade. Fl. June, July. Clt. 1823. Pl. 1½ to 3 feet.

66 S. ru'brum (Mill. dict. no. 4. Ait. hort. kew. 1. p. 249. Dun. sol. p. 155.) herbaceous, branched, diffuse; stem angular, with the angles and ribs of leaves denticulated; leaves ovate-oblong, attenuated at the base and apex, repandly toothed; fructiferous pedicels divaricate, shorter than the common peduncle, which is slender; pollen yellow. ⊙. H. Native all over India in cultivated places; and of Java, Amboyna; California (but with broader leaves). This species differs from *S. nìgrum* and *S. incértum*, in the stem being more elongated, in the angles of the stems, petioles, and ribs of the leaves on the under side being muricated, and furnished with strigulose down when young, in the leaves being attenuated at both ends, narrower and softer, never deltoid; in the umbels being smaller, and also the berries.

Var. α; berries red, or copper-coloured; flowers smaller; stem and leaves smoothish. ⊙. H. S. rùbrum, Roxb. fl. ind. 2. p. 216. S. nìgrum, η, rùbrum, Willd. spec. 1. p. 1036. S. Rúmphii, Dun. sol. p. 157. S. nìgrum, Wall. cat. part. S. ásperum, Horn. herb. Gunth. from California. S. nìgrum, fructu rubro, Wall. cat. no. 2615. A. B. Halicacabus Indicus minor niger, Rumph. amb. 6. t. 26. f. 2.

Var. β; berries red, or copper-coloured; flowers smaller; stem and leaves hairy, both erosely toothed. ⊙. H. India. S. Rúmphii, Blum. bijdr. p. 693, but not of Dun. S. chenopodioìdes, Lam. ill. no. 234. Dun. sol. p. 157.—Feuill. per. 2. t. 14. Berries pale, or whitish, and watery. S. nìgrum, herb. Heyne, part. Stems clothed with hoary villi, having the angles more muricated than in var. α, and the leaves are more rhomboid, and erosely toothed to the top, villous, obscure.

Var. γ; berries black, flowers larger. ⊙. H. Native of tropical America. S. oleràceum, Richard, herb. Dun. syn. p. 12. S. nìgrum, Blum. bijdr. p. 694. S. nìgrum fructu nigro, Wall. cat. no. 2615. H. Aquara-Quiya, Piso, lib. 4. cap. 50. f. 3. Branches downy at top.

Red-berried Nightshade. Fl. June, July. Clt. 1817. Pl. 1 to 3 feet.

67 S. erythroca'rpum (Meyer. esseq. p. 109.) stems permanent; leaves oblong-ovate, acuminated at both ends, quite entire; racemes subumbellate, interfoliaceous. ♃. S. Native in plantations about the Essequibo. S. rùbrum, Lin. syst. veg. p. 173. ed. 15.? Habit and stature of *S. nìgrum*. Stem branched, obsoletely angular, puberulous, as well as the branches. Leaves twin, or solitary, sometimes downy, sometimes glabrous. Corolla white, downy; segments oblong, acute. Berry pendulous, smaller than a pea, yellowish, and shining.

Red-fruited Nightshade. Pl. 2 to 3 feet.

68 S. furca'tum (Poir. suppl. 3. p. 750. Dun. syn. p. 13. sol. ed. 2d. ined. t. 135.) stem herbaceous, somewhat dichotomous, angularly-toothed; leaves ovate, toothed; racemes forked. ⊙. H. Native of Peru. The flowers are said to be the largest of its congeners.

Var. α, *glàbrum*; plant glabrous.

Var. β, *pilòsum*; plant pilose.

Forked Nightshade. Pl. 1 to 2 feet?

69 S. pterocau'lum (Dun. sol. p. 153. syn. p. 13.) stem

herbaceous, and is, as well as the branches, angular and toothed; leaves subovate, sinuately angular; flowers subumbellate. ⊙. H. Native of South America, in various places; and of New Holland. H. B. et Kunth, nov. gen. 3. p. 25. S. nìgrum, var. ε, Virgínicum, Lin. spec. 266. Aubl. guian. 1. p. 215. Swartz, obs. p. 83. R. Br. prod. p. 445. S. scàbrum, Mill. dict. no. 6, but not of Vahl. nor Jacq. S. alàtum, Mœnch. meth. p. 474.—Dill. elth. p. 367. t. 275. f. 256. Branches puberulous; angles somewhat ciliated, rather prickly at the base of the cilia. Leaves glabrous. Calyx downy. Corolla white, ex H. B. et Kunth, l. c. pale violet at first, at length pale, ex Dun. Berries round, black at maturity, size of peas. Anthers yellow.

Wing-stemmed Nightshade. Fl. June, Sept. Clt.? Pl. 1 to 2 feet.

70 S. Juda'icum (Schultes, æstr. fl. ed. 2d. vol. 1. p. 393. Bess. fl. gall. p. 183. no. 278. Rœm. et Schultes, syst. 4. p. 589.) stem herbaceous, almost unarmed; branches angular, muricated; prickles incurved; leaves ovate, sinuately-angular; corymbs distich, nutant. ⊙. H. Native of Austria and Galicia, &c. by way-sides. S. nìgrum, δ, Judàicum, Willd. spec. 1. p. 1035. S. nìgrum Virgínicum, β, Judàicum, Pers. syn. 1. p. 224. Stem nearly terete. Leaves almost glabrous. Corollas white. Anthers distinct, yellow, connivent. Pedicels deflexed. Berries black.

Jewish Nightshade. Fl. June, Aug. Clt. 1816. Pl. 1 to 2 feet.

71 S. suffruticòsum (Schousb. ex Willd. enum. p. 236. Dun. sol. p. 154. syn. p. 13.) stem unarmed, suffruticose; leaves ovate, dentately angular, nearly glabrous, ciliated; flowers sub-panicled, ex Dun.; umbels extra-foliaceous, pedunculate, ex Willd. ♄. H. Native of Barbary. Branches 2-edged, or quadrangularly-winged from the decurrence of the petioles; angles toothed. Leaves large, glaucous, covered with soft hairs above while young. Flowers white. Berries black. Very like *S. nìgrum*, but the stem is shrubby, the leaves larger, and the flowers more numerous, &c.; it also differs from *S. quadrangulàre*, in the leaves being always dentately angular, and in the flowers being white, not violaceous.

Suffruticose Nightshade. Fl. May, Sept. Clt. 1804. Shrub 4 feet.

72 S. quadrangula're (Thunb. prod. 36. Lin. suppl. p. 147.) stem shrubby, tetragonal; leaves ovate, entire, and angular; flowers panicled. ♄. G. Native of the Cape of Good Hope. This species is readily recognized by its tetragonal, hairy, scabrous stem; angles curled. Branches scabrous. Leaves glabrous. Flowers terminal, bluish.

Var. β; leaves lanceolate, entire.

Quadrangular-stemmed Nightshade. Pl. 2 to 3 feet.

73 S. triangula're (Lam. ill. no. 2342.) stem herbaceous, trigonal; leaves oblong-ovate, quite entire, naked; flowers panicled. ⊙. H. Native of the East Indies. Poir. encycl. 4. p. 290, exclusive of the synonyme of Rumph. S. quadrangulàre, var. triangulàre, Pers. ench. 1. p. 225. Stem trigonal, not winged. Leaves soft, acute. Corolla small, pale violet, with reflexed segments. Berries size of peas, greenish.

Triangular-stemmed Nightshade. Fl. June, Aug. Clt. 1800. Pl. 1½ to 2 feet.

74 S. bractea'tum (Thunb. in act. gorensk. 1812. fl. cap. 2. p. 57.) stem unarmed, shrubby, tetragonal; leaves ovate, serrated; racemes leafy. ♄. G. Native of the Cape of Good Hope. Stem stiff, glabrous; angles curled. Leaves glabrous. Bracteas similar to the leaves, convolute, serrulated. Calyxes acute. Berries black. It differs from *S. quadrangulàre* in the calyx, inflorescence, and leaves.

Bracteate Nightshade. Shrub.

75 S. hu'mile (Bernh. ex Willd. enum. p. 236. Dun. sol. p. 156.) stem herbaceous; branches rather angular, toothed, downy; leaves ovate, sub-repand: superior ones almost entire; flowers subumbellate. ⊙. H. Native of the South of Europe. S. officinàrum acinis e luteo-virescentibus, Tourn. inst. p. 148. Stems prostrate. Leaves rather downy, with a few teeth. Alternate pedicels drooping. Corolla small, white. Berry nearly globose, size of a pea, green, or yellowish green, smaller than in *S. nìgrum*.

Humble Nightshade. Fl. June, July. Clt. 1823. Pl. pros.

76 S. fla'vum (Kit. in Schultes, austr. ed. 2d. vol. 1. no. 871.) stem herbaceous; branches angular, toothed, clothed with strigose down; leaves ovate-oblong, angularly-sinuated, rather hairy; flowers subumbellate. ⊙. H. Native of the South of Hungary, and of France, about Andegaveny. S. ochroleùcum, Dun. syn. p. 14. Bast. in Desv. journ. bot. 3. 1814. p. 20. D. C. fl. fr. suppl. p. 418. Dun. sol. ed. 2d. ined. Nearly allied to *S. villòsum*, but the leaves are narrower, and more sinuately-toothed; the corollas are cream-coloured; the umbels fewer-flowered. Berries yellowish, at length dark brown.

Yellow-fruited Nightshade. Fl. June, July. Clt. 1817. Pl. 2 feet.

77 S. villòsum (Lam. ill. no. 2338. Dun. sol. 157. syn. p. 14.) stem herbaceous, villous; leaves ovate, angularly-toothed, villous; flowers subumbellate. ⊙. H. Native of Europe, in cultivated and waste places. Willd. enum. 1. p. 236. S. lùteum, Gmel. fl. bad. 1. p. 521. Mill. dict. no. 3. S. nìgrum, γ, villòsum, Lin. spec. 266. Willd. spec. 1. p. 1035. Bieb. fl. cauc. 1. p. 165. S. nìgrum villòsum moschàtum, Pers. ench. 1. p. 224. S. Ægyptìacum, Forsk. descr. p. 46.—Hall. helv. no. 576.—Sabb. hort. rom. 2. p. 12. t. 61.—Dill. elth. 366. t. 274. f. 353. S. officinàrum acinis luteis, Tourn. inst. p. 148. The whole plant is canescent from soft hairs. Berries at first green, but of a dirty copper colour, or almost red at maturity, nearly globose. Corollas white, larger than those of *S. nìgrum*, to which it is nearly allied.

Villous Nightshade. Fl. June, Sept. Clt. 1820. Pl. 1 to 3 feet.

78 S. hirsu'tum (Dun. sol. p. 158. syn. p. 14.) stem and branches terete, hairy; leaves quite entire, hairy; flowers subumbellate. ⊙. H. Native of Egypt, in gardens. S. nìgrum, δ, hirsùtum, Vahl. symb. 2. p. 40. S. Ægyptìacum, b. Forsk. fl. ægypt. p. 46. S. Memphíticum, Gmel. syst. p. 385. S. nìgrum hirsùtum, Forsk. descr. p. 46. Enab eddib. i. e. Fox grape in Arabic. Umbels nutant. Berries edible. This species differs from *S. villòsum* in the berries being black, and the leaves quite entire.

Hairy Nightshade. Fl. June, Sept. Clt. 1817. Pl. 1 to 2 feet.

79 S. Kitaibe'li (Schultes, fl. austr. ed. 2d. vol. 1. p. 395.) stem herbaceous, and is, as well as the leaves, clothed with tomentose pubescence; corymbs few-flowered. ⊙. H. Native of Hungary, Kitaibel. S. incànum, Kit. mss. This species differs from *S. hirsùtum*, in the leaves being hardly an inch long, and sinuated only at the base. Berries fuscescent, 4-5 together.

Kitaibel's Nightshade. Fl. June, Sept. Clt. 1822. Pl. 1 foot.

80 S. Besse'ri (Weinm. ex Rœm. et Schultes, syst. 4. p. 593.) stem herbaceous, rather angular; leaves ovate, acuminated, quite entire, downy; racemes subumbellate, extra-foliaceous, pendulous. ⊙. H. Native of America. Leaves 5-6 inches long. Calyx 5-toothed. Corolla white or bluish, with reflexed segments. Berries size and colour of those of *S. nìgrum*.

Besser's Nightshade. Fl. June, Aug. Clt. 1820. Pl. 1 foot.

Subsect. III. Holophy'lla (from ὁλος, *holos*, entire; and φυλλον, *phyllon*, a leaf; in reference to the entire leaves.) *Leaves quite entire, solitary. Calyx 5-parted. Stamens equal.*

§ 1. *Racemes terminal.*

81 S. se'ssile (Ruiz. et Pav. fl. per. 2. p. 35. t. 167. f. a. Dun. sol. p. 159. syn. p. 14.) stems shrubby, glabrous; leaves oblong-spatulate, acuminated, sessile, quite glabrous; racemes recurved. ♄. S. Native of Peru, in waste places about Munna. Shrub glabrous. Leaves a foot long. Corolla white. Anthers dark purple. Berry white, size of a cherry. Peduncles terminal, solitary, a span long.

Sessile-leaved Nightshade. Shrub 10 to 12 feet.

82 S. allogònum (Bernh. mss. ex Schlecht, in Linnæa, 8. p. 252.) corolla greenish, physaloid, furnished with a large spreading calyx, remaining under the berry; and is, as well as the stem, angularly winged. ⊙.? H. Native of Mexico, at Jalapa and Hacienda de La Laguna. Perhaps a proper genus.

Diverse-angled Nightshade. Pl.

83 S. anonæfòlium (Dun. syn. p. 15. sol. ed. 2d. t. 95. H. B. et Kunth, nov. gen. amer. 3. p. 27.) arboreous, glabrous; leaves oblong, acuminated, acute at the base, quite entire, glabrous, blistered above, and pilose in the axils of the veins beneath; corymbs terminal, branched. ♄. S. Native of New Granada, on the banks of the river Magdalena, between Teneriffe and Monpox. Branches terete. Leaves 5 inches long. Corollas white? with ovate-oblong, obtuse segments.

Anona-leaved Nightshade. Tree.

84 S. pa'tulum (Pers. ench. 1. p. 223. Dun. sol. 162. syn. p. 15.) stem shrubby; branches powdery; leaves oblong-lanceolate, acute, powdery on both surfaces, and particularly on the under side; racemes loose, spreading; pedicels twin. ♄. S. Native of Peru, in groves at Munna and Tambo-nuevo, S. lanceolàtum, Ruiz. et Pav. 2. p. 33. t. 164. f. a. but not of Cav. Leaves subpetiolate, about 5 inches long. Calyx powdery. Corolla large, violaceous, glabrous, powdery outside. Berry black, size of a cherry.

Spreading Nightshade. Fl. June, Sept. Clt. 1818. Shrub 4 to 5 feet.

85 S. pulverule'ntum (Pers. ench. 1. p. 223.) stem shrubby; branches powdery; leaves lanceolate-linear, nerved beneath, undulated; racemes rameal, powdery; pedicels twin. ♄. S. Native of Peru, in groves of Huanuco, at Acamago. Dun. sol. p. 163. syn. p. 15. S. angustifòlium, Ruiz. et Pav. fl. per. 2. p. 33. t. 163. f. b. but not of Lam. Stem much branched. Leaves powdery. Corolla whitish-violet, powdery outside. Berry black, subovate, size of a *chick-pea*.

Powdery Nightshade. Shrub.

86 S. longiflòrum (Vahl, eclog. 1. p. 20.) stem shrubby; leaves oblong or elliptic, attenuated, rather tomentose on both surfaces; racemes bifid, cymose; corolla 5-parted. ♄. S. Native of Guiana. S. longifòlium, Dun. sol. p. 163. t. 9. syn. p. 15. S. salvifòlium, Lam. ill. no. 2308.? S. subenérme, Jacq.? Branches terete, rather tomentose from minute starry hairs at top, as well as the peduncles, pedicels, leaves, and calyxes. Leaves unequal, 2-9 inches long, reflexed, undulately repand, green above. Corolla bluish-violet, with narrow, blunt segments, tomentose outside. Teeth of calyx subulate. The young branches are said by Link, ex enum. 1. p. 184. to be furnished with soft prickles.

Long-flowered Nightshade. Fl. June, Aug. Clt. 1823. Shrub 4 to 6 feet.

87 S. ni'tidum (Ruiz. et Pav. fl. per. 2. p. 33. t. 163.) stem shrubby; branches glabrous, shining; leaves ovate-lanceolate, acute; racemes subcymose, clothed with powdery tomentum. ♄. S. Native of Peru, in groves of Tarma, where it is called *Rapace* by the natives. Leaves entire or repand. Corolla whitish-violet, powdery outside. Berry black, size of a chick-pea.

Shining-branched Nightshade. Shrub.

88 S. angustifòlium (Lam. ill. no. 2343. Dun. syn. p. 15.) stem shrubby; branches subherbaceous; leaves narrow-lanceolate, quite glabrous, bluntish; flowers corymbose. ♄. G. Native of Buenos Ayres, in fields. Dun. sol. ed. 2d. ined. t. 32. Branches smooth. Leaves petiolate, similar to those of the *Laurel*. Peduncles long, branched. Corolla white? with ovate, blunt segments. Anthers large, yellow.

Narrow-leaved Nightshade. Shrub.

89 S. stenophy'llum (Dun. syn. p. 15. H. B. et Kunth, nov. gen. amer. 3. p. 27.) stem sub-herbaceous, clothed with powdery tomentum; leaves narrow, oblong-linear, almost sessile, quite glabrous above, but clothed with powdery tomentum beneath; racemes coarctate. 2. ? S. Native of Peru, on the Andes, near Olleros and Yanto. Dun. sol. ed. 2d. t. 97.

Narrow-leaved Nightshade. Pl. 2 feet?

90 S. Loxe'nse (Dun. syn. p. 16. H. B. et Kunth, nov. gen. 3. p. 28.) stem tomentose, scandent; leaves subcordate, ovate-lanceolate, hairy, and woolly beneath; racemes terminal, divaricate. 2. ᔓ. S. Native of Quito, frequent between Loxa, Gonzanama, and the banks of the river Catamayo, at the altitude of 1060 hexapods. Dun. sol. ed. 2d. ined. t. 98. Stem angular, a little winged, downy at base. Tomentum stellate, whitish-yellow. Leaves on short petioles, unequal at the base. Panicles terminal. Calycine segments truncate, mucronate. Corolla small, with oblong, acute segments.

Loxa Nightshade. Pl. climbing.

91 S. cri'spum (Ruiz. et Pav. fl. per. 2. p. 31. t. 158. f. a. Dun. sol. 159. syn. p. 16.) stem shrubby; leaves ovate and subcordate, undulately curled, acuminated, quite entire; flowers corymbose, terminal. ♄. G. Native of Chili, in waste places. Plant very bitter, and called by the natives *Natre*. Stem glabrous. Calyx 5-toothed. Corolla pale blue, slightly puberulous. Berry pale yellow, globose, size of a pea.

Curled-leaved Nightshade. Fl. June, July. Clt. 1824. Shrub 12 to 15 feet.

92 S. au'reum (Dun. syn. p. 16. H. B. et Kunth, nov. gen. 3. p. 28.) stem shrubby, twining; leaves petiolate, ovate, shining above, and rather pilose beneath; racemes dichotomous, clothed with brownish-yellow tomentum. ♄. ᔓ. G. Native of America, in frigid places at the bottom of Mount Chimborazo, near Calpi and Yanaurcu, at the altitude of 1620 hexapods. Stem clothed with powdery, brownish-yellow tomentum, as well as the pedicels, racemes, calyxes, &c. Racemes paniculately corymbose. Corolla violaceous; segments lanceolate, with revolute edges.

Golden-haired Nightshade. Shrub twining.

93 S. pyrifòlium (Lam. ill. p. 2345. Dun. sol. p. 160. syn. p. 16.) stem sub-herbaceous; leaves ovate, entire, acute, naked on both surfaces, on long petioles; racemes panicled, terminal; calycine segments obtuse, mucronate. ♄.? S. Native of Martinico. Dun. sol. ed. 2d. ined. t. 34. Allied to *S. quercifòlium*; but differs in the leaves being entire, and the flowers larger. Corolla white; with oval, obtuse segments. Calyx glabrous; segments blunt.

Pear-leaved Nightshade. Shrub 2 to 3 feet?

94 S. macranthe'rum (Moc. et Sesse. pl. mex. icon. ined. Dun. syn. p. 16. sol. ed. 2d. ined. t. 100. H. B. et Kunth, nov. gen. 3. p. 28. t. 195.) shrubby, scandent; leaves on long petioles, ovate, acuminated, acute at the base, quite entire, hairy or downy; panicles terminal, branched; flowers subcorymbose.

ħ . ⏑. G. Native of Mexico, near Cuernavaca. S. dulcamaroìdes, Poir. suppl. 3. p. 750. Branches rather angular, downy. Leaves 3 or 3½ inches long. Panicles downy. Calyx downy, sinuately 5-lobed. Corolla violaceous, size of those of *S. tuberòsum*, glabrous; with ovate, acute segments. Berry globose, red, an inch in diameter. Nearly allied to *S. pyrifòlium*. Anthers large, sessile, approximate.

Large-anthered Nightshade. Shrub climbing.

95 S. Bombe'nse (Jacq. p. 49. eclog. t. 24. H. B. et Kunth, nov. gen. 3. p. 29. Dun. sol. p. 160. ed. 2d. ind. t. 101. syn. p. 16.) shrubby; leaves petiolate, lanceolate-oblong, attenuated at both ends, acute, subundulated, glabrous; corymbs extra-axillary, trifid. ħ . S. Native of the Island of Tierra Bomba, about Carthagena; and of Mexico, near Moran, Regla, and Omitla. Plant glabrous. Leaves about 3 inches long. Peduncles opposite the leaves, an inch long, racemosely umbellate, ex Dun. Corollas white, size of those of *S. nìgrum*, green outside; segments ovate-oblong, acute, downy towards the margins. Calyx 5-toothed, a little ciliated.

Tierra-Bomba Nightshade. Fl. June, July. Clt. 1822. Tree 12 feet.

96 S. pubi'gerum (Dun. sol. 160. t. 6. syn. p. 16.) stem erect, shrubby; leaves ovate-lanceolate, attenuated at both ends, downy; racemes di-trichotomous. ħ . G. Native of Mexico. Moc. et Sesse, icon. mex. ined. Poir. suppl. 3. p. 751. S. microcárpum, Cerv. elench. hort. matr. 1803. Brouss. cat. hort. monsp. 1804. S. Cervantèsii, Lag. gen. et spec. nov. p. 10. no. 145. Stem marked with small tubercles. Young branches green, downy, rather angular. Leaves undulately repand. Racemes corymbose, downy. Flowers small, white, drooping. Calyx 5-toothed. Segments of corolla ovate, reflexed. Berry black, size of a pea. This species differs from *S. Bombénse* in being clothed with silky tomentum; and from *S. terminàle*, in the stems being erect, not decumbent; and in the flowers being cymose, not umbellate.

Down-bearing Nightshade. Fl. May, June. Clt. 1818. Shrub 3 to 5 feet.

97 S. termina'le (Forsk. ægypt. p. 45. Vahl, symb. 2. p. 40.) stem shrubby, decumbent; leaves ovate-lanceolate, almost quite entire, pilose; umbels terminal, villous. ħ . F. Native of Arabia Felix, on the higher mountains of Yemen, and shady places at Mocha. Dun. sol. 161. syn. p. 17. Stems warted, downy at top. Leaves villous beneath, acute at both ends, with undulately denticulated, ciliated edges. Calyx 5-toothed; segments lanceolate, obtuse. Corolla white. Berries taste of those of *S. Dulcamàra*. Anthers yellow.

Terminal-flowered Nightshade. Shrub decumbent.

98 S. a'sperum (Vahl, eclog. 2. p. 17. Dun. sol. p. 164. t. 7. syn. p. 17.) stem shrubby; leaves ovate-lanceolate or elliptic, rough; cymes on long peduncles. ħ . S. Native of South America, Vahl; Cayenne, Rich; Guadaloupe, D. C. herb. Branches scabrous from stellate hairs. Leaves 6 inches long, approximate towards the tops of the branches, attenuated at both ends, scabrous from minute, stellate hairs. Peduncles dichotomous, clothed with yellowish-white, stellate pili, as well as the peduncles, calyxes, and corollas. Segments of corolla oblong, acute. Berry almost globose.

Rough Nightshade. Shrub.

99 S. ra'dula (Vahl, eclog. 2. p. 16.) stem shrubby; leaves oblong-elliptic, acuminated at both ends, quite entire, very scabrous above, but clothed with canescent down beneath; corymbs terminal, dichotomous, hairy, ex Kunth; tomentose, ex Vahl. ħ . S. Native of Cayenne; and on the banks of the river Magdalena, near Badilla. Dun. sol. p. 164. ed. 2. ined. t. 35. syn. p. 17. H. B. et Kunth, nov. gen. amer. 3. p. 29. S. salvifòlium, Lam. ill. no. 2308. S. ásperum, Rich. in act. soc. p. 19. Branches clothed with stellate pili, as well as the leaves, &c. Leaves 2-4 inches long, scabrous and green above. Cymes clothed with starry down, twice or thrice bifid. Corollas small, white; with ovate segments.

Rasp-leaved Nightshade. Shrub.

100 S. lepidòtum (Dun. syn. p. 17. sol. ed. 2d. t. 102. H. B. et Kunth, nov. gen. 3. p. 30.) stem arboreous, terete; leaves ovate-lanceolate, falcate, rather scabrous above, and clothed with scaly tomentum beneath, shining on both surfaces; racemes subdichotomous. ħ . S. Native of New Granada. Branches, peduncles, pedicels, calyxes, and corollas, rubiginose from minute, scale-like, stellate hairs, as well as the under sides of leaves. Berry globose.

Scale-dotted Nightshade. Tree.

101 S. laurifòlium (Lin. suppl. p. 148. Dun. sol. p. 165. t. 8. syn. p. 17.) stem arboreous; leaves ovate-oblong, acute, glabrous above, and tomentose beneath; panicles dichotomous; pedicels cymose. ħ . S. Native of South America, in woods. Branches tomentose. Leaves on short petioles, quite entire, yellowish-brown beneath. Panicles tomentose. Calycine segments mucronulate. Corolline segments ovate.

Laurel-leaved Nightshade. Fl. June, July. Cult. 1820. Tree.

102 S. ripa'rium (Pers. ench. 1. p. 221.) stem shrubby; leaves oblong-acuminated, hoary from powdery, white tomentum; corymbs terminal, dichotomous, many-flowered, pedunculate. ħ . S. Native of Peru, in the province of Huanuco, on the edges of waterfalls. Dun. sol. p. 163. syn. p. 17. S. dichótomum, Ruiz. et Pav. fl. per. 2. p. 34. t. 166. f. b. but not of Lour. Almost all parts of the plant are canescent from powdery tomentum. Flowers small. Corolla violaceous. Berry yellow, size of a filbert.

River-side Nightshade. Shrub.

103 S. verbascifòlium (Lin. spec. 184. Mill. dict. no. 22.) shrubby; leaves ovate-oblong, acuminated, quite entire, tomentose, white beneath, without any leaves in the axils; corymbs nearly terminal, dichotomous; calyx semiquinquefid. ħ . S. Native of Asia, America, tropical parts of New Holland, &c. R. Br. prod. p. 444. Dun. sol. 165. syn. 17. Jacq. hort. vind. 1. t. 13. Willem. herb. maur. p. 17. S. pubéscens, Roxb. fl. ind. 2. p. 244. Blum. bijdr. 698. S. eriánthum, D. Don, prod. fl. nep. p. 96. S. adulterìnum, Hamilt. herb. S. bícolor, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 661.—Burm. amer. p. 241. t. 245. f. 2.—Plukn. alm. 351. t. 316. f. 1. Every part of the plant is clothed with powdery, white tomentum. Leaves broad, greenish-yellow above, and of a whitish-yellow colour beneath. Corollas small, white. Berries size of small cherries.

Var. β, adulterìnum (Hamilt. herb.) leaves a little broader, more ovate, and less tomentose. ħ . S. India.

Mullein-leaved Nightshade. Fl. June, July. Clt. 1749. Shrub 6 to 7 feet.

104 S. auricula'tum (Ait. hort. kew. 1. p. 246.) shrubby; leaves ovate-oblong, acuminated, quite entire, tomentose, of the same colour on both surfaces: axils furnished with oblique small leaves; corymbs subterminal, dichotomous, pedunculate; calyx semiquinquefid. ħ . S. Native of the Islands of Madagascar, Mauritius, and Bourbon. Dun. sol. p. 166. syn. p. 17. Vahl, symb. 3. p. 38. Wall. in Roxb. fl. ind. 2. p. 245. S. Mauritiànum, Scop. del. 3. p. 16. t. 8. Lam. ill. no. 2307. Leaves 6-7 inches long. All parts of the plant are clothed with yellowish tomentum. Corolla villous outside, violaceous inside. Berry globose, yellowish. Nearly allied to *S. verbascifòlium*.

Auricled-leaved Nightshade. Fl.? Clt. 1773. Shrub 6 to 7 feet.

105 S. umbellíferum (Eschscholtz, in mem. acad. st. pe-

tersb. 10. p. 286. Hook. et Arn. p. 152.) plant clothed with hoary down; stem suffruticose; leaves petiolate, ovate, acutish, quite entire; racemes umbellate, terminal, few-flowered; calyx urceolate, 5-cleft: with acute segments; corolla 5-cleft, 3 times longer than the calyx. ♄. H. Native of California. Corolla at first campanulate. Anthers biporose at the apex, with a tendency to split.

Umbelliferous Nightshade. Shrub.

106 S. Bahame'nse (Mill. dict. no. 24.) shrubby; leaves lanceolate, sinuately toothed, glabrous; umbels erect. ♄. F. Native of the Bahama Islands, Catesby. Dill. elth. t. 363. Bark brown. Leaves $3\frac{1}{2}$ inches long, and $1\frac{1}{2}$ broad, acuminated, pale green. Umbels small, lateral. Flowers large, white; segments acuminated.

Bahama Nightshade. Shrub 4 to 6 feet.

§ 2. *Racemes, cymes, or corymbs, lateral, rameal, not axillary nor opposite the leaves.*

107 S. va'gum (Heyne, ex Wall. cat. no. 2624. Nees, in Lin. trans. 17. p. 48.) shrubby; leaves ovate-oblong, repandly sinuated, clothed with powdery tomentum beneath while young, as well as the young branches; cymes lateral, bifid; calycine segments long-acuminated; berries small, globose. ♄. S. Native of the East Indies. S. corymbòsum, Wight, herb. This is a very distinct species, nearly allied to *S. longifòlium*, and *S. Bombénse*, or *pubigerum*, Dun.; but differs in the leaves being repandly angular; from the first it differs in the flowers being smaller, and white; and from the last in the calycine segments being long-acuminated.

Common Nightshade. Shrub.

108 S. lu'teo-a'lbum (Pers. ench. 1. p. 221. Dun. sol. 168. syn. p. 18.) stem shrubby; leaves ovate, acute, downy on both surfaces; racemes cymose, lateral; flowers secund. ♄. S. Native of Peru, in groves at Cuchero. S. pubéscens, Ruiz. et Pav. fl. per. 2. p. 36. t. 169. f. b. Corolla pale yellow. Berry globose, shining, orange-coloured, size of a cherry. Habit of *S. pubéscens;* but differs in the flowers being cymosely branched, less umbellate, and not opposite the leaves. Calycine segments deflexed, acute.

Yellow-white-flowered Nightshade. Shrub.

109 S. chlora'nthum (Spreng. syst. 1. p. 682.) leaves oblong, attenuated at the base, shining above, and quite glabrous, but clothed with stellate tomentum beneath; peduncles sub-umbellate; corollas minute, green; calyx 5-parted. ♄. S. Native of Brazil.

Green-flowered Nightshade. Shrub.

110 S. la'xum (Spreng. syst. 1. p. 682.) leaves ovate, acute, glabrous, veiny; branches cirrhiferous, scandent; peduncles racemose, loose; calyx 5-parted. ♄. ◡. S. Native of Monte Video, Sello.

Loose Nightshade. Shrub climbing.

111 S. dichótomum (Lour. coch. 1. p. 160.) stem suffruticose, pilose; leaves cordate-lanceolate, quite entire, tomentose; peduncles dichotomous. ♄. G. Native of China. Dun. sol. p. 167. syn. p. 18. Stem diffuse, branched. Berry small, globose, red.

Forked-peduncled Nightshade. Shrub.

112 S. filifórme (Ruiz. et Pav. fl. per. 2. p. 31. t. 159.) stem suffruticose; leaves ovate and cordate, obtuse, pubescent; peduncles filiform, bifid, subumbellate. ♄. S. Native of Peru, on hills at Lomas de Atiquipa. Dun. sol. 171. syn. p. 18. Habit of *Sálvia*. Stem granular. Flowers drooping. Corolla pale blue, thrice as large as the calyx.

Filiform-peduncled Nightshade. Shrub.

113 S. vi'ride (R. Br. prod. p. 445.) suffruticose; leaves ovate-oblong, acute, entire, flat, membranous, glabrous; racemes corymbose, simple or bipartite; calyx and corolla 5-cleft. ♄. G. Native of New Holland, within the tropic, on the sea shore. Perhaps the same as *S. víride*. Forst. pl. escul. p. 42. Spreng. mant. 1. p. 37.

Green Nightshade. Shrub.

114 S. seri'ceum (Ruiz. et Pav. fl. per. 2. p. 33. t. 161. f. b. Dun. sol. p. 181. syn. p. 19.) stem shrubby; branches slender; leaves small, ovate-lanceolate, silky, quite entire; peduncles 2-flowered, or few-flowered, cymose. ♄. S. Native of Peru, at Huassen-huassi, in woods. Branches silky. Leaves hoary. Corolla bluish-violet, silky outside. Berry red. Ruiz. et Pav. say that this species agrees with *S. eleagnifòlium*, and probably, like it, prickly at the base.

Silky Nightshade. Shrub $4\frac{1}{2}$ feet.

115 S. Linkia'num (Rœm. et Schultes, syst. 4. p. 601.) stem shrubby, much branched; branches twiggy, thickish, strigose; leaves ovate-lanceolate, strigose on both surfaces, somewhat repand; peduncles 2-flowered. ♄. S. Native of Brazil. S. diffùsum, Link, herb. Leaves $1\frac{1}{2}$ inch long, and $\frac{1}{2}$ an inch broad. Peduncles extra-foliaceous, nearly an inch long, deflexed. Calyx 5-parted, hairy, with lanceolate segments. Berry glabrous, size of a pea.

Link's Nightshade. Shrub.

§ 3. *Racemes opposite the leaves, or almost so, tomentose, downy, or clothed with leprous-like silvery, powdery down.*

116 S. nu'tans (Ruiz. et Pav. fl. per. 2. p. 34. t. 166. f. a.) shrubby; leaves oblong-ovate, acuminated, woolly beneath; racemes very short, opposite the leaves, cymose, recurved, many-flowered; flowers secund, drooping. ♄. S. Native of Peru, in waste places on the road to Pillao, where it is called *Chuculate* by the natives. Dun. sol. p. 167. syn. p. 19. Shrub rusty; branches granular. Leaves quite entire, granular above, and nearly glabrous. Corollas small, white. Calyx woolly. Berry yellow, globose.

Drooping-flowered Nightshade. Shrub.

117 S. venòsum (Dun. syn. p. 19. sol. ed. 2d. t. 105. H. B. et Kunth, nov. gen. amer. 3. p. 32.) arborescent; branches floccosely pilose; leaves lanceolate-oblong, acuminated, acute at the base, quite entire, rather pilose above, and hairy beneath; corymbs opposite the leaves. ♄. S. Native of New Granada, on the Andes of Quindiu. Leaves floccose on the midrib beneath, 5 or $5\frac{1}{2}$ inches long; petioles floccose. Calyx small, with roundish segments. Berry nearly globose, size of a sloe.

Veiny-leaved Nightshade. Shrub or Tree.

118 S. Swartzia'num (Rœm. et Schultes, syst. 4. p. 602.) shrubby; leaves petiolate, ovate-lanceolate, quite entire, coriaceous, glabrous, clothed with stellate hairs, beset with orbicular, golden-yellow scales beneath; racemes solitary, terminal. ♄. S. Native of Brazil, near Villa Ricca. S. aúreum, Swartz, in litt. Branches terete, beset with rusty scales. Racemes 5-flowered; pedicels deflexed, scaly. Calyx pentagonal, scaly outside. Corolla beset with scales outside, dark purple inside, with acuminated segments. Anthers purple.

Swartz's Nightshade. Shrub.

119 S. gnaphalioi'des (Pers. ench. 1. p. 223.) stem shrubby; leaves lanceolate, repand, glabrous, shining; umbels opposite the leaves, tomentose; berries drooping. ♄. S. Native of Peru, in shady places at Tarma; and in hedges about Acabamba, where it is called *Nununya* by the natives. Dun. sol. p. 178. syn. p. 19. S. calygnaphàlium, Ruiz. et Pav. fl. per. 2. p. 31. The calyxes being clothed with tomentum, the plant has much the appearance of a species of *Gnaphàlium*. Corollas violaceous. Berries dark red, saponaceous, size of a filbert.

Gnaphalium-like Nightshade. Shrub 10 to 12 feet.

120 S. Vellozia'num (Dun. sol. 236. ed. 2d. ined. t. 37. syn. p. 19.) branches leprosely tomentose, rufescent; leaves large, oblong-lanceolate, leprously tomentose beneath, but quite glabrous above; racemes short, almost opposite the leaves, multifid, cymose. ♄. S. Native of Brazil. Vand. spec. fl. bras. p. 13. and in Rœm. script. hisp. p. 86. Poir. suppl. 3. p. 754. Leaves petiolate, a foot long, dark green above, and rufescent beneath, like the racemes. Calyx deeply 5-cleft, with obtuse segments. Corolla small, deeply 5-cleft. Style villous.

Vellozi's Nightshade. Shrub.

121 S. arge'nteum (Dun. syn. p. 19. sol. ed. 2d. t. 39.) branches leprously silvery; leaves ovate-oblong, shining on both surfaces, leprously silvery beneath, but green and glabrous above: they are twin on the primary branches, and solitary on the secondary ones. ♄. S. Native about Rio Janeiro. Poir. suppl. 3. p. 755. Peduncles twin or tern, very short, 1-flowered, silvery, like the calyxes and outside of the corolla. Flowers small. Calyx 5-toothed. Segments of corolla oblong, acute.

Silvery Nightshade. Fl. June, July. Clt. 1824. Shrub 3 to 4 feet.

§ 4. *Glabrous trees or shrubs. Leaves glabrous, rarely pilose in the axils of the nerves. Racemes simple, cymose, cymosely umbellate, opposite the leaves. Corolla somewhat 5-cleft.*

122 S. urceola'tum (Pers. ench. 1. p. 223. Dun. sol. p. 171. syn. p. 20.) stem shrubby; leaves oblong, acuminated, undulately repand; peduncles opposite the leaves, few-flowered, very short. ♄. S. Native of Peru, in woods at Vitoc. S. oppositifòlium, Ruiz. et Pav. fl. per. 2. p. 35. t. 168. f. a. Shrub glabrous. Leaves shining above. Peduncles 2-4-flowered. Calyx 5-toothed, in the floriferous state small, but large in the fructiferous state. Corolla 5-cleft, with hooked segments.

Urceolate-calyxed Nightshade. Shrub 6 feet.

123 S. læviga'tum (Dun. syn. p. 20. sol. ed. 2d. ined. t. 106. H. B. et Kunth, nov. gen. 3. p. 32.) shrubby; branches and leaves glabrous, but pilose in the axils of the veins beneath; leaves on short petioles, elliptic-oblong, acuminated, cuneated at the base, quite entire; umbels opposite the leaves; pedunculate, few-flowered. ♄. S. Native of New Granada, near Fusagasuga. Leaves 4½ inches long, and 2 broad. Calyx 5-cleft, puberulous, with short, ovate, acutish segments. Allied to *S. tríste*, ex Kunth.

Smooth Nightshade. Shrub 4 to 6 feet?

124 S. obova'tum (Dun. syn. p. 21. sol. ed. 2d. ined. t. 112. H. B. et Kunth, nov. gen. 3. p. 35.) arboreous; branchlets angular, clothed with fuscous tomentum; leaves elliptic-oblong, acuminated, somewhat cuneated at the base, quite entire, glabrous, but pilose in the axils of the veins beneath; flowers opposite the leaves, umbellate, polygamous. ♄. S. Native of Peru, on the Andes of Quito, near Cuenca. Branches terete, glabrous. Leaves petiolate, 3 or 3½ inches long. Umbels sessile, many-flowered; and in each umbel there are 3-4 fertile flowers, which stand on long pedicels; the rest are small and abortive, and stand on short pedicels. Pedicels and calyxes clothed with fuscous tomentum. Calyx 5-lobed: lobes bluntish, unequal. Corolla smoothish, white? segments of the limb linear-oblong, acute, equal, mucronately tubercled under the apex.

Obovate-leaved Nightshade. Tree.

§ 5. *Racemes or cymes axillary, solitary or twin.*

125 S. incu'rvum (Ruiz. et Pav. fl. per. 2. p. 34. t. 164. f. b. Dun. sol. p. 171. syn. p. 21.) pubescent; stem angular, herbaceous; leaves ovate, acuminated; racemes twin, one shorter than the other; pedicels incurved, secund. ♃. ? S. Native of Peru, in woods at Munna. S. recúrvum, Poir. suppl. 3. p. 755. Stem thickened at the nodi, glabrous; the rest downy. Pedicels cymose, violaceous. Calyx campanulate, deeply 5-toothed. Corolla whitish-violet, 5-parted.

Incurved-pedicelled Nightshade. Pl. 2 feet.

126 S. a'nceps (Ruiz. et Pav. fl. per. 2. p. 36. t. 169. f. a. Dun. sol. 171. syn. p. 21.) stem herbaceous; leaves oblong-lanceolate; peduncles axillary, very short, 2 or 3 together; berries conical, 2-edged. ♃. ? S. Native of Peru, in woods at Cuchero. Leaves quite entire, downy. Calyx and corolla 5-parted. Peduncles cymose. Flowers secund, small, green. Berry whitish, many-angled towards the top.

Two-edged-berried Nightshade. Pl. 3 feet.

127 S. Bassòvia (Rich. herb. ined. Dun. syn. p. 22.) stem shrubby; leaves ovate-oblong, attenuated at both ends, glabrous; cymes small, axillary, solitary. ♄. S. Native of Guiana, in woods, Richard. Poir. suppl. 3. p. 754. no. 132. S. rugòsum, Rich. herb. Bassòvia sylvática, Aubl. guian. p. 217. t. 85. Lam. ill. t. 102. Willd. spec. 1. p. 1065. Leaves large, petiolate, shining; nerves rough above. Cymes shorter than the leaves. Calyx 5-toothed; teeth obtuse. Corolla pubescent, greenish; anthers yellow. Berry conical, somewhat compressed, wrinkled, greenish-white. This differs from its nearest ally, *S. ánceps*, in the stem being shrubby, and the cymes being solitary.

Bassovia Nightshade. Shrub 3 to 4 feet.

§ 6. *Peduncles axillary, 1-flowered, solitary, twin, or many together.*

128 S. brevifòlium (Dun. syn. p. 22. sol. ed. 2d. ined. t. 113. H. B. et Kunth, nov. gen. 3. p. 36.) suffruticose, scandent; branches and leaves glabrous; leaves ovate, obtuse, obsoletely cordate; peduncles almost opposite the leaves, 1-flowered, solitary. ♄. ◡. S. Native of Quito, near the town of Ibarra, climbing on trees. Stems radicant; branches rather angular. Leaves 9-10 lines long, furnished with a small twin or solitary leaf in the axils. Calyx 5-toothed. Corolla pale violet; segments lanceolate. Berries globose, red, size of those of *S. nìgrum*; Fructiferous calyx 5-cleft. Perhaps a species of *Witheríngia*.

Short-leaved Nightshade. Shrub climbing.

129 S. Havane'nse (Jacq. amer. p. 49. t. 35. ed. pict. t. 48. Dun. sol. 147. syn. p. 22.) shrubby; branches angular, and are, as well as the leaves, glabrous; leaves oblong-lanceolate, acute, shining, quite entire, narrowed at the base, rather coriaceous; peduncles sub-axillary, 1-flowered, solitary; berries oval. ♄. S. Native of Martinico, Jamaica, Peru, in shady parts of woods by the sea side; and of Cuba, near Havana, Regla, and Guanavacoa. H. B. et Kunth, nov. gen. 3. p. 36. Swartz, obs. 82. Ruiz. et Pav. fl. per. 2. p. 39. Leaves sometimes twin, but very seldom, 2½ inches long. Corollas blue, an inch in diameter; segments broad, short, emarginate. Berry ovate, deep blue, shining, ex Jacq.; globose, red, ex Kunth. Peduncles 2-3-flowered, ex Jacq.; 1-flowered, ex Kunth. Calyx 5-parted.

Havana Nightshade. Fl. July, Aug. Clt. 1793. Shrub 5 to 8 feet.

130 S. Montevide'nse (Spreng. syst. 1. p. 684.) leaves oblong, attenuated at the base, sub-repand, scabrous on both surfaces; branches powdery; peduncles erect, 1-flowered. ♄. S. Native of Monte Video.

Monte Video Nightshade. Shrub.

131 S. coria'ceum (Hook. bot. mag. 2703.) shrubby, glabrous; leaves petiolate, oblong, coriaceous, shining, entire, rather veiny; peduncles terminal and axillary, generally 1-flowered; corolla 5-lobed: lobes blunt, and plicæ mucronate, and longer than the lobes; calyx 4-5-parted. ♄. G. Native of Mexico. Corollas bluish-purple; anthers yellow beyond the throat.

Coriaceous-leaved Nightshade. Fl. July, Aug. Clt. 1820. Shrub 2 to 4 feet.

Subsect. IV. Gemina'ta (from *geminus*, twin; in reference to the leaves being twin.) *Leaves quite entire, twin, and sometimes solitary on the same branch, rarely aggregate. Calyx 5-parted. Stamens equal.*

§ 1. *Peduncles axillary, 1-flowered, solitary, twin, or aggregate.*

132 S. conoca'rpum (Rich. herb. Dun. syn. p. 22. sol. ed. 2d. ined. t. 30.) stem shrubby; leaves twin or tern, unequal, entire, obtuse, nearly sessile; peduncles solitary or twin, 1-flowered; berries oval, very acute. ♄. S. Native of the Island of St. John, Richard. Poir. suppl. 3. p. 748. Habit of a species of *Céstrum*. Branches wrinkled, yellowish. Leaves coriaceous, obovate or elliptic. Calycine segments ovate. Corolla blue, deeply 5-parted. Berry twice the size of a cherry, edible. Very nearly allied to *S. Havanénse*; and perhaps only differs in the colour of the berry, which is blue in *S. Havanénse*.

Cone-fruited Nightshade. Shrub.

133 S. membrana'ceum (Wall. cat. no. 2625, A. B. Nees, in Lin. trans. 17. p. 41.) stem herbaceous, dichotomous; leaves twin, ovate and oblong, acuminated at both ends, oblique at the base, unequal, hairy above; flowers usually twin, axillary; calyx 5-toothed: teeth subulate. ♃.? ⊙. S. Native of the Neelgherry Mountains, Noton, along with *S. bigeminàtum*.

Membranous-leaved Nightshade. Pl.

134 S. læ've (Dun. syn. p. 22. sol. ed. 2d. t. 36.) plant herbaceous, glabrous; leaves twin, one much smaller than the other, ovate, acute at both ends, acuminated, entire; peduncles usually twin, axillary; calyx 5-toothed: teeth subulate. ♃. S. Native of the East Indies. S. membranàceum, Wall. cat. no. 2625. B. Peduncles short. Calyx coriaceous, with 5 linear teeth. Berry globose. Seeds subtriangular, dotted.

Sleek Nightshade. Shrub.

135 S. aggrega'tum (Jacq. coll. 4. p. 124. icon. rar. t. 323.) stem shrubby; leaves somewhat ovate, obtuse, aggregate; peduncles 1-flowered, slender, many from the same bud, interfoliaceous; corollas campanulate. ♄. S. Native of Africa, on the sea shore; in Guinea; and at the Cape of Good Hope. Dun. sol. p. 146. syn. p. 22. Lam. ill. no. 2320. S. Guinee'nse, Lin. spec. p. 263. S. sempervírens, Mill. dict. no. 25. Lin. spec. ed. 1. p. 185. Sáracha Guinee'nsis, Pers. ench. 1. p. 219. A'tropa solanàcea, Lin. mant. 205. Willd. spec. 1. p. 1018. Vogel. icon. rar. t. 16. ex Lam. l. c.—Commel. hort. 2. p. 191. t. 96. Shrub glabrous. Leaves many from the same bud, quite entire, petiolate, shining, an inch long. Fructiferous pedicels drooping; all length of leaves. Corolla pale purplish-violet, an inch in diameter, with lanceolate segments. Berries globose, yellow, shining, 2-celled, size of peas.

Aggregate-leaved Nightshade. Fl. June, July. Clt. 1821. Shrub 4 to 6 feet.

136 S. hygro'philum (Schlecht, in Linnæa, 8. p. 254.) shrubby; branches villous; leaves twin, on short petioles, lanceolate, yellowish-green, acute at both ends, pilose above, and rather villous beneath; flowers forming umbels, on very short peduncles, opposite the leaves, few-flowered; teeth of calyx broad-ovate, acute; corollas white, 5-cleft, at length reflexed, pilose outside; berries globose, glabrous. ♄. G. Native of Mexico, in humid woods about Jalapa. Corolla white. Stamens regular. Leaves unequal in size, larger one 3½ inches long, and 1¼ broad.

Water-loving Nightshade. Shrub.

§ 2. *Glabrous trees or shrubs. Leaves glabrous, but sometimes pilose in the axils of the veins beneath. Racemes simple, cymose, or cymosely umbellate, opposite the leaves. Corollas 5-parted.*

137 S. nu'dum (Dun. syn. p. 20. sol. ed. 2d. ined. t. 107. H. B. et Kunth, nov. gen. amer. 3. p. 33.) shrubby; branches and leaves glabrous; leaves twin, one much smaller than the other, elliptic oblong, acuminated at both ends, quite entire; umbels nearly opposite the leaves, on short peduncles, few-flowered; pedicels at length reflexed. ♄. G. Native of Mexico, near Jalapa, in humid places. Leaves 3 or 3½ inches long, and about 1½ broad. Corolla white, size of those of *S. nìgrum*. Berry globose, glabrous, size of a large pea. Very like *S. diphýllum*; and hardly differs from it, unless in the leaves being all acute, deeper green: and in the pedicels being deflexed.

Naked Nightshade. Shrub.

138 S. diphy'llum (Lin. spec. 264. Aubl. guian. 1. p. 215.) stem shrubby; leaves twin: the larger one oblong, attenuated at both ends, obtuse; the smaller one obovate-elliptic, sometimes emarginate; cymes small; umbels short, opposite the leaves; floriferous pedicels drooping, fructiferous ones erect. ♄. S. Native of tropical America. Jacq. coll. 2. p. 231. icon. rar. 2. t. 322. Dun. sol. p. 172. syn. p. 20.—Pluck. alm. p. 349. phyt. t. 111. f. 4. An evergreen, fetid shrub. Stem blackish, terete. Leaves nearly sessile. The larger leaf 2 to 4 inches long. Corolla white, with lanceolate, acute segments. Berries globose, succulent, pale orange-coloured, size of a chick pea.

Two-leaved Nightshade. Fl. June, July. Clt. 1696. Shrub 2 to 4 feet.

139 S. arbòreum (Dun. syn. p. 20. sol. ed. 2d. ined. t. 198.) arboreous; branches flexuous, and are, as well as the leaves, glabrous; leaves twin, oblong, acuminated, cuneated at the base, quite entire, one of which is very small, and nearly sessile; cymes small, opposite the leaves. ♄. S. Native of the province of New Andalusia, near Cumanacoa. Branches angular, glabrous, or a little downy. Leaves shining above, 7-8 inches long, and 3 broad: upper ones twin, the smaller one roundish, ovate, an inch long. Cymes very minute, simple. Calyx 5-toothed; teeth ovate, acute. Corolla white, with oblong, acute segments, 6 times as long as the calyx.

Tree Nightshade. Fl. June, July. Clt. 1819. Tree 40 feet.

140 S. acumina'tum (Ruiz. et Pav. fl. per. 2. p. 34. t. 159. f. a. Dun. sol. 172. syn. p. 20.) shrubby; leaves twin, ovate-oblong, and elliptic, acuminated: the point straight or twisted; racemes cymose, opposite the leaves, many-flowered; flowers secund. ♄. S. Native of Peru, in woods at Chincao. Plant glabrous. Leaves on short petioles, quite entire, shining above. Racemes recurved at apex; pedicels slender, but thickened

at top. Corollas small, white. Berry black, globose, size of a chick pea.

Acuminated-leaved Nightshade. Shrub.

141 S. fœ́tidum (Ruiz. et Pav. fl. per. 2. p. 34. t. 165. f. b. Dun. sol. p. 173. syn. p. 20.) stem shrubby; leaves usually twin, ovate, dependent; cymes short, umbellate, drooping, opposite the leaves. ♄. S. Native of Peru, about Tarma, in the fissures of rocks, and in waste places. Plant glabrous, very fetid when bruised. Leaves veiny beneath. Corolla whitish blue, or pale blue; anthers declinate. Berry golden yellow, size of a small walnut. The leaves mixed with the flowers of *Sambùcus* are used for bathing ulcers in Peru.

Fetid Nightshade. Shrub 6 feet.

142 S. tríste (Jacq. amer. p. 50. t. 40. ed. pict. t. 49.) stem shrubby; leaves twin, lanceolate-oblong, somewhat repand, acuminated; cymes short: flowers secund. ♄. S. Native of Martinico, among bushes on the banks of rivers; and of Peru, in woods at Pillao. Vahl. symb. 3. p. 38. Willd. spec. 1. p. 1031. Dun. sol. p. 170. syn. p. 21. S. oblóngum, Ruiz. et Pav. fl. per. 2. p. 34. t. 165. f. 6. Dun. sol. p. 172. Leaves petiolate, a hand long, dark green. Peduncles lateral, an inch long, many-flowered. Corollas small, white, ex Jacq., whitish violet, ex Ruiz et Pav. with lanceolate segments. Berry globose, dusky yellow, size of a chick pea. Calyx 5-toothed, ex Ruiz. et Pav. Calycine segments roundish, ex Jacq.

Sorrowful Nightshade. Fl. June, July. Clt. 1820. Shrub 8 feet.

143 S. spira'le (Roxb. fl. ind. 2. p. 247. Wall. cat. no. 2619.) stem shrubby; branches compressedly angular, glabrous; leaves twin, the one 2 or 3 times smaller than the other, oblong-lanceolate, attenuated at the base, glabrous, quite entire; racemes sub-cymose, almost opposite the leaves, secund, revolute at apex; calyx beset with glandular dots. ♄. S. Native of Silhet, and Gualpara. S. Naratìda, Hamilt. herb. This species is nearly related to *S. tríste*, Jacq. but differs from it in the branches being angular; in the leaves being cuneated a long way at the base, acute, not acuminated, always entire; in the flowers being larger and white; and in the calyxes being glandular. Though rather fetid this species is still ornamental, on account of its smooth deep green foliage, spiral racemes of pretty white flowers, and numerous small round yellow berries.

Spiral Nightshade. Shrub.

144 S. cornifòlium (Dun. syn. p. 21. sol. ed. 2d. ined. t. 110. H. B. et Kunth, nov. gen. amer. 3. p. 34.) shrubby; branches and leaves glabrous; leaves elliptic-oblong, acuminated, acute at the base, quite entire, somewhat parallelly veined, twin, one of which is very minute; umbels opposite the leaves, on short peduncles. ♄. S. Native of New Granada, in the valley of the river Cauca, betwixt Palace and Popayan. Branches angular. Larger leaves about 3 inches long, downy when young: the smaller ones obovate, almost sessile. Calycine segments obtuse. Corollas white, size of those of *Lysimàchia vulgàris*, with ovate, acuminated segments. Ovarium villous.

Dogwood-leaved Nightshade. Shrub.

145 S. leucoca'rpum (Rich. herb. Dun. syn. p. 21. sol. ed. 2d. ined. t. 38.) branches twiggy; leaves twin, one 3 times smaller than the other, nearly orbicular, the other elliptic-lanceolate; cymes unilateral, few-flowered, opposite the leaves. ♄. S. Native of the Island of St. Martha, Richard. Nearly allied to *S. tríste*, but differs particularly in the leaves, in the unilateral cymes, and colour of the berries. Shrub glabrous. Branches terete. Leaves shining on both surfaces. Calyx coriaceous, small, 5-crenate. Corolla white, rather large, with acute segments. Berry spherical, shining, white.

White-fruited Nightshade. Shrub.

146 S. psychotrioìdes (Dun. syn. p. 21. sol. ed. 2d. ined. t. 111. H. B. et Kunth, nov. gen. amer. 3. p. 35.) arboreous; branches glabrous, suberosely warted, angular; leaves twin, lanceolate-oblong, or obovate-oblong, acuminated, acute at the base, quite entire, glabrous, but pilose in the axils of the veins beneath; umbels opposite the leaves, nearly sessile. ♄. S. Native of New Granada, on the banks of the river Magdalena near Mompox, and Teneriffe. Larger leaves 3-4 inches long. One of the leaves smaller than the other. Umbels 3-4-flowered. Flowers size and structure of those of *S. cornifòlium*. Fructiferous pedicels thickened at top, suberose.

Psychotria-like Nightshade. Shrub or tree.

§ 3. *Racemes lateral, rameal, not axillary, nor opposite the leaves.*

147 S. crotonifòlium (Dun. syn. p. 18. sol. ed. 2d. ined. t. 103. f. b. H. B. et Kunth, nov. gen. 3. p. 30.) shrubby; branches tomentose; leaves twin, oblong, narrow-acuminated, rounded and unequal at the base, somewhat repand, clothed with canescent down above, and soft white tomentum beneath; racemes supra-axillary, bifid; flowers unilateral. ♄. S. Native of New Granada, near the port of Carthagena, in hot places. Hairs stellate. One of the leaves is twice the size of the other, the largest 4-5 inches long. Calyx and corolla tomentose outside; segments of the latter linear-lanceolate. Berry globose, smoothish, size of a pea.

Croton-leaved Nightshade. Shrub.

148 S. Nare'nse (Dun. syn. p. 18. sol. ed. 2d. ined. t. 103. f. 8. H. B. et Kunth, nov. gen. 3. p. 31.) shrubby; branches tomentose; leaves twin, ovate, acute, cordate at the base, and unequal, clothed with canescent down above, and with white soft tomentum beneath; lower leaves sinuately angular; racemes lateral, bifid; flowers unilateral. ♄. S. Native of New Granada, in shady places on the banks of the river Magdalena, between Nares and Honda. Tomentum and down stellate. One of the leaves smaller than the other, petiolate. Larger leaves 7-8 inches long, and 5-6 broad. Flowers size of those of the preceding, pale yellow, ex Bonpl. Very like the preceding species, and only differs in the tomentum being more dense, in the leaves being broader and cordate, and in the lower ones being sinuately angular.

Nares Nightshade. Fl. June. Shrub 6 to 12 feet.

149 S. trachyphy'llum (Dun. syn. p. 18. sol. ed. 2d. ined. t. 104.) shrubby; branches tomentose; leaves twin, oblong, acuminated, rounded at the base and unequal, quite entire, roughish above, but clothed with soft hoary tomentum beneath; racemes lateral, dichotomous; flowers unilateral. ♄. S. Native of the province of Popayan, between Buga and Carthage. Branches terete. One of the leaves smaller than the other. Tomentum and down stellate. Larger leaves 5-6 inches long, and 2 or 2½ broad. Flowers like those of *S. crotonifòlium*, but a little smaller. Very nearly allied to *S. crotonifòlium*, but the tomentum is more dense; the leaves green and roughish above, and the flowers a little smaller.

Rough-leaved Nightshade. Shrub 6 to 10 feet?

150 S. tetra'ndrum (R. Br. prod. p. 445.) suffruticose, erect; leaves generally twin, oblong-ovate, entire, membranous, beset with a few scattered hairs; racemes corymbose, simple; flowers quadrifid. ♄. S. Native of New Holland, within the tropic, on the sea-shore. Dun. syn. p. 18. no. 98.

Tetrandrous-flowered Nightshade. Shrub.

151 S. geminifòlium (Schlecht, et Cham. in Linnæa, 5. p. 112.) shrubby; branches, inflorescence, and under sides of

leaves clothed with cream-coloured tomentum; upper surfaces of leaves green, but beset with stellate hairs; leaves twin, unequal in size, obovate, obtuse: the larger one ovate, acuminated, rounded at the base, $2\frac{1}{2}$ inches long; cymes terminal and lateral, pedunculate, many-flowered; calyx suburceolate, 5-toothed: teeth rounded; berry globose. ♄. G. Native of Mexico, at Jalapa. Flowers hardly larger than those of *S. nìgrum*.

Twin-leaved Nightshade. Shrub.

§ 4. *Racemes terminal.*

152 S. pterópodum (Dun. syn. p. 14. sol. ed. 2d. ined. t. 94. H. B. et Kunth, nov. gen. amer. 3. p. 26.) stem herbaceous, winged; leaves twin, sessile, decurrent, elliptic-oblong, sub-acuminated, very narrow at the base, undulately repand, smoothish above, but clothed with fine powdery down beneath; corymbs opposite the leaves, dichotomous; peduncles winged. ♃. ? S. Native of South America, near the city of Quito, at the altitude of 1500 hexapods. Leaves 8-10 inches long, and $3\frac{1}{2}$ broad. Peduncles many-flowered, one-half shorter than the leaves; branches and pedicels clothed with powdery down. Calycine lobes truncate, mucronate. Corolla white, with oblong acute segments. Ovarium glabrous, nearly globose. Said to be nearly allied to *S. séssile*.

Wing-peduncled Nightshade. Pl. 2 to 3 feet?

153 S. oblongifòlium (Dun. syn. p. 14. sol. ed. 2d. t. 95. H. B. et Kunth, nov. gen. amer. 3. p. 27.) herbaceous; leaves twin, elliptic-oblong, acute, narrowed at the base, almost quite entire, glabrous, downy on the veins beneath; racemes nearly terminal, bifid. ♃. S. Native of New Granada, on the Andes of Quindiu. Branches terete, glabrous. One of the leaves one-half smaller than the other, green above; larger ones 6-7 inches long, and $2\frac{1}{2}$ to 3 inches broad: the smaller ones nearly orbicular. Pedicels thickened under the top, and are, as well as the branches, villous. Calycine segments obtuse. Corolla white, glabrous; with ovate, obtuse segments.

Oblong-leaved Nightshade. Pl.?

154 S. pu'lchrum (Dun. syn. p. 15. sol. ed. 2. ined. t. 35.) stem shrubby; branches rugose; leaves oblong-ovate, ending in the petioles; racemes large, terminal, sub-dichotomous. ♄. S. Native of Brazil. Poir. suppl. 3. p. 750. Branches terete, glabrous. Leaves usually twin, acute, or obtuse, rather downy beneath. Pedicels cymose. Segments of corolla lanceolate, acute. Berry globose. Nearly allied to *S. crìspum*, but the leaves are less cordate, and the racemes are larger.

Fair Nightshade. Shrub.

Subsect. 4. *Branches spinescent. Leaves solitary, entire. Peduncles axillary, filiform, 1-flowered, solitary, or aggregate. Calyx 5-toothed, or 5-cleft. Stamens unequal. Seeds bony.*

155 S. lycioi'des (Lin. mant. 45. Jacq. icon. rar. 1. t. 46.) shrubby; branches spinescent, numerous; leaves elliptic, or oblong, obtuse, cuneated at the base, or acute at both ends, glabrous, or hairy; peduncles extra-axillary, solitary, 1-flowered. ♄. S. Native of Peru. Dun. sol. p. 172. syn. p. 22. Branches terete, glabrous; branchlets angular, hairy. Leaves 7-8 lines long. Pedicels solitary. Calyx urceolate, truncate, 5-toothed; teeth linear, subulate, remote. Corolla pale violet; limb angularly 5-lobed; throat yellow. Anthers yellow, a little arched. Berry globose, glabrous, red, size of a pea.

Var. β; leaves hairy. ♄. S. S. lycioides, var. β, Dun. syn. p. 23. H. B. et Kunth, l. c.

Lycium-like Nightshade. Fl. May, June. Clt. 1791. Shrub 3 to 4 feet.

156 S. candi'cans (Dun. syn. p. 23.) shrubby; branches spinescent; leaves obovate-cuneiform, obtuse, clothed with white tomentum beneath, but scabrous above; peduncles filiform, 1-flowered, solitary. ? ♄. S. Native of Peru, on argillaceous rocks of Huanuco and Tarma. S. lycioìdes, Ruiz. et Pav. fl. per. 2. p. 41. t. 177. f. 6, exclusive of the synonymes, but not of Lin. S. lycioìdes * tomentòsum, Dun. sol. p. 174. Stem much branched; branches ending in floriferous leafy spines. Calycine segments appendiculate. Corolla blue, with a yellowish bottom. Anthers free. Berry globose, of a reddish copper colour.

Whitish-leaved Nightshade. Shrub 3 to 5 feet.

Subsect. V. Holocla'ina (from ὁλος, *holos*, entire; and χλαινα, *chlaina*, an outer cloak; in reference to the entire calyx.) *Leaves quite entire, solitary, or twin. Calyx truncate, entire. Flowers twin, or fascicled at the sides of the leaves.*

157 S. bigemina'tum (Nees in Lin. trans. 17. p. 42.) stem suffruticose; lower leaves solitary: superior ones twin, densely clothed with bristles above, elliptic-oblong, acuminated at both ends, unequal in size; flowers usually twin at the sides of the leaves; calyx quite entire, smooth; peduncles erect while bearing the fruit. ♄. S. Native of Travancore. S. flexuòsum, and S. angulòsum, Herb. madr. Fruit size of a pea, seated on an erect, thick peduncle.

Twice-twin-flowered Nightshade. Shrub.

158 S. Neesia'num (Wall. cat. suppl. 248. Nees in Lin. trans. 17. p. 42.) stem suffruticose; branches tetragonal, roughish towards the summit; lower leaves solitary; superior ones twin, scabrous above from rough dots, oblong-lanceolate, acuminated at both ends, unequal in size; flowers fascicled at the sides of the leaves; calyx quite entire, smooth; peduncles spreading in the fruit-bearing state. ♄. S. Native of the mountains of Silhet. Corolla white, glabrous; segments lanceolate. Berry round, smaller than a pea.

Nees's Nightshade. Shrub.

159 S. Blu'mii (Nees in Blum. bijdr. 696, in Lin. trans. 17. p. 45.) leaves twin, of two forms, smaller one ovate, clothed with dense bristles on the upper surface; stem violaceous; flowers many in a fascicle. ♄. S. Native of Java. Calyx quite entire.

Blume's Nightshade. Shrub.

160 S. parasi'ticum (Blum. bijdr. p. 697.) stem nodose; leaves all solitary, glabrous; calyx entire. ♄. S. Native of Java.

Parasitical Nightshade. Shrub.

Subsect. VI. Poly'meris (from πολυς, *polys*, many; and μερις, *meris*, a part; the divisions of the calyx are numerous.) *Leaves quite entire, solitary, or twin. Calyx 10-toothed, or 10-cleft. Peduncles 1-flowered, axillary, or interfoliaceous.*

§ 1. *Leaves twin. Corolla plicate, 5-angled. Stamens sometimes unequal.*

161 S. uniflòrum (Dun. syn. p. 33. sol. ed. 2d. ined. t. 42.) stem dichotomous; branches glabrous, rough from dots; leaves usually twin, ovate, bluntish, glabrous, and shining above, but clothed with leprous tomentum beneath; peduncles solitary. ♄. S. Native of St. Domingo. Poir. suppl. 3. p. 757. S. dichótomum, Richard. Shrub elegant; branches brown, angu-

lar. Peduncles glabrous. Calyx glabrous, 10-cleft; the alternate segments smaller. Corolla with a 5-rayed star. Stamens equal. Berry globose, mucronate, size of a small cherry.

One-flowered Nightshade. Fl. May, July. Clt. 1820. Shrub 2 to 3 feet.

162 S. MONA'NTHUM (Rœm. et Schultes, syst. 4. p. 608.) leaves usually twin, almost sessile, elliptic; peduncles axillary, 1-flowered; calyx 10-cleft. ♃. S. Native of New Spain. S. uniflòrum, Lag. gen. et. spec. nov. p. 10. no. 142. Herbaceous, roughish from scattered, short, stellate hairs. Corolla dark purple, or blue, 3 times as long as the calyx. Calycine segments oblique, short. Berry ovate, quite smooth, size of a small hen's egg.

One-flowered Nightshade. Fl. June, July. Clt. 1818. Pl. 2 to 3 feet?

163 S. SPECIÒSUM (Dun. sol. p. 179. syn. p. 23.) arboreous; branches flexuous; leaves oblong, acuminated, solitary, or twin; peduncles solitary, axillary; margins of corolla crenulated. ♄. S. Native of the Caribbee Islands.—Burm. amer. p. 242. t. 245. f. 5.—Plum. cat. p. 4. Tourn. inst. p. 150. Leaves veiny: superior ones twin. Flowers showy. Corolla large, expanded, semiquinquefid, rather pentagonal. Berry spherical, erect, drooping at maturity.

Showy Nightshade. Tree.

164 S. NEGLE'CTUM (Dun. sol. p. 177. syn. p. 23.) stem shrubby; leaves ovate, undulated; peduncles solitary and twin; calycine segments reflexed. ♄. S. Native of the West India Islands.—Burm. amer. p. 242. t. 245. f. 4.—Plum. mss. vol. 4. f. 34. ex Aubl. guian. 1. p. 217.—Tourn. inst. p. 150. Much branched. Leaves quite entire. Lower peduncles solitary: upper ones twin, or tern. Calyx denticulated, according to the figure 10-16-toothed. Berry roundish, scarlet. This species is nearly allied to *S. geminàtum*, but differs in the stem not climbing, and in the more numerous retroflexed calycine teeth.

Neglected Nightshade. Fl. June, July. Clt. 1824. Shrub 4 to 5 feet?

165 S. TRÍCOLOR (Moc. et Sesse. pl. mex. icon. ined. Dun. syn. p. 24. sol. ed. 2d. ined. t. 41. Poir. suppl. 3. p. 756.) stem terete, dichotomous; leaves twin, one of them smaller than the other, ovate, acutish, clothed with shining tomentum; peduncles 4, together; anthers 5, one of which is twice as long as the others. ♄. S. Native of Mexico. Nearly allied to *S. léntum*, but differs in there being 3 green spots at the base of each segment of the corolla, and in the anthers being unequal, &c. Stem woolly. Peduncles villous. Calyx 10-toothed. Corolla white, somewhat reflexed, with a violaceous star in the middle. Berry globose, red.

Three-coloured-flowered Nightshade. Shrub.

166 S. PAUCIFLÒRUM (Vahl. eclog. 1. p. 21. Dun. sol. p. 176. syn. 24.) branches villous, tomentose above; leaves ovate, quite entire, glabrous above, tomentose beneath: rameal ones twin, unequal; peduncles twin, unequal. ♄. S. Native of Martinico. Branches herbaceous, clothed with rusty tomentum, as well as the under sides of the young leaves. Leaves 2-3 inches long. Flowers drooping, clothed with rusty tomentum. Calyx short, truncate, 10-toothed; teeth linear. Corolla glabrous, length of peduncles.

Few-flowered Nightshade. Pl.?

167 S. SYLVA'TICUM (Dun. syn. p. 24. sol. ed. 2d. ined. t. 114. H. B. et Kunth, nov. gen. amer. 3. p. 37.) shrubby, scandent; leaves ovate, acuminated, rounded at the base, subrepand, glabrous, but hairy on the veins beneath: superior ones twin, unequal; flowers extra-axillary, usually by threes; calyx 10-toothed: teeth subulate. ♄. ◡. S. Native near Cumana and Bordones, in woods. Branchlets hairy. Leaves about 2 inches long. Corolla large, pentagonal, marked by a 5-rayed star. Stamens 5, one longer than the others. Berry globose, glabrous, size of a sloe.

Wood Nightshade. Shrub climbing.

168 S. LYSIMACHIOI'DES (Wall. in Roxb. fl. ind. 2. p. 257. cat. no. 2609. Nees in Lin. trans. 17. p. 44.) herbaceous; stem creeping at the base, but ascending at the top, as well as the branches; leaves usually twin, nearly equal, ovate, acute at both ends, quite entire, pubescent; flowers solitary, smoothish, placed between the leaves; calyxes 8-10-toothed: teeth subulate, equal in length to the fruit. ♃. G. Native of Sheopore, Chundragiri, and Chitlong. Corollas white. Berries globular, size of a gooseberry, scarlet, or red.

Loostrife-like Nightshade. Pl. creeping, 1 foot long.

169 S. RETROFRA'CTUM (Vahl. eclog. 1. p. 21. Dun. sol. 176. t. 5. syn. p. 24.) stem shrubby, flexuous; axillary branches retrofracted; leaves ovate, glabrous: upper ones twin, unequal; peduncles filiform, many together, umbellate, axillary and terminal; calyx truncate, toothless, glabrous. ♄. S. Native of tropical America. Shrub twining.? Leaves petiolate, quite entire, 1½ inch long. Calyx 10-cleft; segments linear, subulate, unequal, joined by a pellucid membrane, whence it appears toothless. Corolla as in *S. virgàtum*, but smaller, 3 times longer than the calyx. Stamens equal.

Retrofracted Nightshade. Shrub twining?

170 S. GLANDULÒSUM (Ruiz. et Pav. fl. per. 2. p. 35. t. 167. f. b. Dun. sol. p. 180. syn. p. 25.) stem suffruticose, scandent; leaves twin, ovate-cordate; peduncles 3-5 together, interfoliaceous; calycine teeth gland-formed. ♄. ◡. S. Native of Peru, in groves at Vitoc, in the province of Tarma. Leaves on short petioles, very veiny, unequal at the base. Calyx turbinate, angularly striated, usually 10, rarely 12-14-toothed. Corolla white, spreading; limb plicate. Berry globose, pale red.

Glandular-toothed-calyxed Nightshade. Shrub climbing.

171 S. CUTACE'NSE (H. B. et Kunth, nov. gen. amer. 3. p. 38.) shrubby, scandent?; branches clothed with downy tomentum; leaves twin, ovate, sub-acuminated, quite entire, clothed with silky hairs on both surfaces, canescent beneath; flowers extra-axillary, twin, or terminal, by threes; calyx 10-toothed. ♄. ◡. S. Native of Peru, in woods near Ayavaca and Rio Cutaco. Branchlets angular. Leaves petiolate, one a little smaller than the other. Corolla sinuately 5-lobed, white, with a violaceous star, downy outside. Hairs simple, not stellate.

Cutaco Nightshade. Shrub climbing.

172 S. MA'CRODON (Wall. cat. no. 2621.) shrubby, erect; lower leaves solitary: superior ones twin, the one 2 or 3 times smaller than the other, oblong-lanceolate, acuminated at both ends, quite entire, hairy above, as well as the branchlets; flowers solitary, or in fascicles placed between the leaves; calyx furrowed, 10-toothed: teeth subulate, longer than the fruit. ♄. S. Native of the Pundua mountains. Similar to *S. denticulàtum* in habit, but differs in the teeth of the calyx being very long.

Long-toothed-calyxed Nightshade. Shrub.

173 S. DECEMDENTA'TUM (Roxb. fl. ind. 2. p. 247. Wall. cat. no. 2614.) herbaceous, erect, perennial; lower leaves solitary: superior ones twin, ovate, acute at both ends, hairy, the one smaller than the other; flowers fasciculately aggregate at the sides of the leaves; calyx 10-toothed, and is, as well as the pedicels, glabrous: teeth linear-subulate, equal. ⊙. G. Native of China and Singapore. Berries the size of a pea, smooth, bright red when ripe.

Ten-toothed Nightshade. Pl. 2 to 3 feet.

174 S. crassipe'talum (Wall. in Roxb. fl. ind. 2. p. 256. cat. no. 2618. Nees in Lin. trans. 17. p. 42.) shrubby; lower leaves solitary: superior ones twin, ovate-oblong, acuminated at both ends, ciliated, hairy above, one smaller than the other; flowers fasciculately aggregate at the sides of the leaves; calyx somewhat 10-toothed; teeth subulate: alternate ones shorter. ♄. G. Native of Nipaul. S. denticulàtum, var. α, Blum. bijdr. p. 697. S. biflòrum, D. Don, prod. fl. nep. p. 96, exclusive of many synonymes, and probably of Lour. coch. 1. p. 159.? Corolla purple, or white. Berry globular, scarlet, ½ an inch in diameter.

Thick-petalled Nightshade. Shrub 2 to 3 feet.

175 S. mollíssimum (Blum. bijdr. p. 698.) flowers fascicled at the sides of the leaves; teeth of calyx equal in length to the tube; leaves of two forms, tomentose beneath, the one ovate, and the other oblong. ♄. S. Native of Java.

Very-soft Nightshade. Shrub.

§ 2. *Leaves solitary. Corolla plicate, 5-angled. Stamens sometimes unequal.*

176 S Mocinia'num (Dun. syn. p. 23. sol. ed. 2d. ined. t. 43.) stem herbaceous, pilose; leaves almost sessile, ovate-lanceolate, acute, pilose; peduncles solitary; calyx 10-cleft. ⊙.? H. Native of Mexico. Poir. suppl. 3. p. 757.—Moc. et Sesse, pl. mex. icon. ined. Nearly allied to *S. viridiflòrum*. Peduncles axillary, longer than the leaves. Corolla violaceous, with acute angles. Anthers nearly sessile. Berry ovate-oblong, yellowish green.

Mocino's Nightshade. Pl.

177 S. fu'gax (Jacq. coll. 4. p. 123. icon. rar. t. 324. Dun. sol. 178. syn. p. 23.) stem shrubby, dichotomous, divaricate; leaves lanceolate, smoothish; peduncles solitary; calyx 10-toothed. ♄. S. Native of Caraccas. Lam. dict. 4. p. 282. Bark blackish, roughish with dots. Peduncles from the divarication of the branches, or opposite the leaves. Calyx small, truncate, 10-striped. Corolla large, white, with a yellow 5-rayed star, as in *S. stellàtum*, expanding about 5 in the morning, but closes in a short time afterwards, hence the specific name.

Fugacious-flowered Nightshade. Fl. May, July. Clt. 1816. Shrub 5 to 6 feet.

178 S. stella'tum (Jacq. coll. 3. p. 254. and 5. t. 5. f. 2. icon. rar. t. 325. Dun. sol. p. 178. syn. p. 24.) stem shrubby, scandent, flexuous; leaves ovate-lanceolate, glabrous, acuminated; peduncles generally twin; calyx unequally toothed. ♄. ◡. S. Native country unknown. Shrub evergreen, glabrous, green. Peduncles sometimes solitary, and by threes. Corollas elegant, large, blue, marked by a 5-rayed star, which is greenish and protuberant beneath, stretched out beyond the limb of the corolla into acute points, as in *S. fùgax*, *S. virgàtum*, and others. Berry globose, orange-coloured. Nearly allied to *S. geminàtum*, and *S. retrofráctum*, but differs in the larger flowers and unequally-toothed calyx.

Starry-flowered Nightshade. Fl. June, July. Clt. 1805. Shrub climbing.

179 S. gemina'tum (Vahl. eclog. 1. p. 21. Dun. sol. 177. syn. p. 24.) stem scandent; leaves ovate, quite entire, glabrous, as well as the calyxes and pedicels; peduncles axillary, usually twin; calyx 10-toothed: teeth linear-subulate. ♄. ◡. S. Native of Cayenne. Branches terete, powdery, when examined by a lens. One of the peduncles is longer than the other. Corolla glabrous.

Twin-flowered Nightshade. Shrub climbing.

180 S. biflòrum (Lour. coch. 159.) stem shrubby; leaves ovate, villous; peduncles twin; calyx 10-cleft. ♄. G. Native of China and Cochinchina, where it is called *Thien-phao*. Dun. sol. p. 177. syn. p. 24. Leaves quite entire. Calycine segments subulate. Berry small, roundish, red.

Two-flowered Nightshade. Shrub 3 to 4 feet.

181 S. phillyreoi'des (Dun. syn. p. 24. sol. ed. 2d. ined. t. 115. H. B. et Kunth, nov. gen. 3. p. 37.) stem shrubby, erect, dichotomous; leaves oblong, or lanceolate-oblong, tapering to both ends, acuminated, quite entire, glabrous above, and downy beneath; flowers alar, and lateral, 2 to 4 together; calyx somewhat 10-toothed. ♄. S. Native of New Granada, in the valley of the river Magdalena, near Teneriffe and Badilla. Branchlets angular, downy. Leaves glabrous, and green above, but pale and downy beneath. Corollas size of those of *S. lycioìdes*. Teeth of calyx linear-subulate, remote: the alternate ones very small, and placed in the middle of the tube. Corolla sinuately 5-angled, marked by a violaceous star. Berry globose.

Phillyrea-like Nightshade. Shrub.

182 S. virga'tum (Lam. ill. no. 2310. Dun. sol. p. 174. t. 4. syn. p. 25.) stem shrubby; branches twiggy; leaves ovate-oblong, acute, tomentose beneath, as well as the peduncles and calyxes; peduncles numerous, filiform, axillary, and in the forks of the branches; filaments unequal. ♄. G. Native of the Canary Islands. Tomentum stellate. Leaves quite entire. Calyx 10-cleft; segments joined by a pellucid membrane: alternate ones short. Corolla violaceous, marked by a 5-rayed star, tomentose outside. Stamens 5, one of which is longer than the others.

Twiggy Nightshade. Fl. June, Sept. Clt. 1820. Shrub 4 feet?

183 S. le'ntum (Cav. icon. 4. p. 4. t. 308.) shrubby, scandent; branches and under sides of the leaves clothed with starry hoary tomentum, but clothed with stellate down above; leaves ovate, acute, quite entire; extra-axillary flowers twin, and the terminal ones numerous; calyx 10-toothed: teeth linear-filiform. ♄. ◡. S. Native of New Spain, Cav.; in the province of Caraccas, near Cura, in the valley of Aragua. Dun. sol. 175. syn. p. 25. H. B. et Kunth, nov. gen. amer. 3. p. 38. Solànum scándens, foliis tomentosis, Plum. cat. p. 4.? Tourn. inst. p. 150.?—Plum. ed. Burm. p. 242. t. 245. f. 3.? Superior leaves twin.? Corolla sinuately 5-lobed, violaceous, with a white star, downy outside. One of the stamens is twice as long as the other 4.

Pliant Nightshade. Fl. June, Sept. Clt. 1823. Shrub cl.

§ 3. *Leaves twin. Calyx slightly* 10-*toothed. Flowers fascicled, or twin at the sides of the leaves.*

184 S. denticula'tum (Blum. bijdr. p. 697. Nees in Lin. trans. 17. p. 41.) stem suffruticose; lower leaves solitary: superior ones twin, smoothish, the larger one oblong, acuminated at both ends, the smaller one subovate; flowers fasciculately aggregate at the sides of the leaves; calyx minutely 10-toothed, furrowed. ♄. S. Native of Silhet; Java, in shady places on the higher mountains of Gede and Burangrang. There is a var. of this plant described by Blum. having the leaves, peduncles, and calyxes hairy; and another variety having the peduncles solitary, and the flowers tetrandrous from abortion.

Denticulated-calyxed Nightshade. Shrub.

§ 4. *Leaves solitary, rarely twin. Corollas 5-parted. Stamens equal.*

185 S. sca'ndens (Lin. suppl. 147. amœn. acad. 8. p. 253.) stem herbaceous, twining; leaves cordate, ovate, dependent,

very soft beneath; flowers sub-umbellate, terminal. ♄. ◠. S. Native of Surinam. Dun. sol. p. 179. syn. p. 25. Racemes compound. Corolla rotate, with lanceolate, recurved segments. Berry globose, size of a cherry.

Climbing Nightshade. Fl. July, Aug. Clt. 1820. Shrub twining.

186 S. sideroxyloi'des (Schlecht. in Linnæa, 8. p. 253.) shrubby; branches flexuous, tomentose; leaves ovate, or oblong-ovate, entire, acute, or sub-acuminated, bluntish at the base, roughish above, and clothed with rough tomentum beneath; tomentum stellate, of a rusty yellow colour; calyx hemispherical, 10-toothed: teeth short, obtuse; corollas white, downy outside; berries globose, glabrous. ♄. G. Native of Mexico, near Hacienda de La Laguna. Umbels sessile, axillary. Anthers regular. Pedicels and calyxes tomentose. Leaves very similar to those of the pear tree. There is an unnamed species very like this from Hayti. in Willd. herb. no. 4410.

Iron-wood-like Nightshade. Shrub.

187 S. lanuginòsum (Dun. syn. p. 25. sol. ed. 2d. ined. t. 116. H. B. et Kunth, nov. gen. amer. 3 p. 36.) shrubby; branchlets tomentose; leaves ovate, acutish, subcordate, quite entire, beset with stellate hair above, but clothed with hoary, villous tomentum beneath; peduncles tomentose, opposite the leaves, twin, or 3 together; calyx 10-toothed, tomentose. ♄. S. Native of Quito, near Mulalo, at the altitude of 1690 hexapods. Tomentum stellate. Berry size of a sloe, globose.

Woolly Nightshade. Shrub.

188 S. chrysophy'llum (Dun. syn. p. 25. sol. ed. 2d. ined. t. 117. H. B. et Kunth, nov. gen. 3. p. 39.) shrubby, scandent; branches tomentose; leaves elliptic, acute, quite entire, clothed with stellate pubescence above, and fuscescent tomentum beneath, of a golden rusty colour when young, as well as the branchlets; peduncles subaxillary, solitary; calyx 5-toothed. ♄. ◡. S. Native of the kingdom of Quito. Tomentum stellate. Leaves 2 inches long: superior ones twin, unequal in size. Corolla 5-parted, with ovate, oblong segments.

Golden-leaved Nightshade. Shrub climbing.

189 S. lasiophy'llum (Dun. syn. p. 25. sol. ed. 2d. t. 118. H. B. et Kunth, nov. gen. 3. p. 39.) shrubby; branches somewhat dichotomous, hispid from pili; leaves twin, oblong, subacuminated at both ends, quite entire, hispid above, but yellowish and softer beneath; peduncles alar and subaxillary, solitary or twin; calyx 10-toothed. ♄. S. Native of New Granada, on the Andes of Pasto, between Menezes and Zeindala, at the altitude of 1400 hexapods. Hairs simple. Calyx hispid; teeth linear, filiform; alternate ones a little shorter. Corolla whitish-violet, pilose outside; with oblong-lanceolate segments.

Woolly-leaved Nightshade. Shrub 2 to 3 feet.

190 S. linea'tum (Ruiz. et Pav. fl. per. 2. p. 31. t. 158. f. b.) stem shrubby; leaves twin, ovate, acuminated, lined, villous beneath; berries inclosed within the segments of the corolla, peduncled, interfoliaceous; calyx 10-toothed. ♄. S. Native of Peru, in groves at Munna. Dun. sol. p. 180. Peduncles hairy. Calyx 10-cleft, hairy; segments linear. Corolla white, length of calyx. Berry fuscous, size of a chick-pea.

Lined-leaved Nightshade. Shrub.

191 S. biformifòlium (Ruiz. et Pav. fl. per. 2. p. 32. t. 161. f. a.) stem suffruticose, flexuous; leaves twin, oblong-lanceolate: the smaller ones orbicular; peduncles interfoliaceous; calyx 10-toothed; berry inclosed within the segments of the calyx. ♄. S. Native of Peru, in groves at Chincao. Dun. sol. p. 180. syn. p. 26. Peduncles usually twin, but sometimes 3-4-5 together. Calyx hispid; teeth long-linear. Corolla purplish-violet. Berry yellowish-red, size of a pea.

Two-formed-leaved Nightshade. Shrub.

192 S. acutifòlium (Ruiz. et Pav. fl. per. 2. p. 33. t. 162. f. b. Dun. sol. p. 180. syn. p. 26.) stem suffruticose, flexuous; leaves twin, or 3 together, lanceolate; peduncles interfoliaceous; calyx 10-toothed. ♄. S. Native of Peru, in groves at Munna. Plant hairy. Leaves rather hispid on both surfaces, deflexed. Corolla white, 5-parted. Berry roundish, orange-coloured.

Acute-leaved Nightshade. Shrub.

Section II. Aculea'ta. Prickly shrubs and plants.

Subsect. I. *Leaves entire, repand, or sinuately angular. Peduncles or racemes simple, or nearly so.*

§ 1. Lepróphora (from λεπρος, *lepros*, rough; and φορεω, *phoreo*, to bear.) Dun. sol. p. 181. *Stems and leaves white from leprous, powdery tomentum. Racemes lateral, seldom axillary or opposite the leaves, few-flowered. Prickles straight, acerose.*

193 S. eleagnifòlium (Cav. icon. 3. p. 22. t. 243.) stem shrubby; leaves discoloured: lower ones sinuated and prickly: superior ones entire, unarmed; peduncles few-flowered. ♄. G. Native of Chili. Dun. sol. p. 181. syn. p. 26. Old stems prickly: young ones unarmed. Prickles short. Leaves white beneath, and greenish-yellow above. Calyx 5-cleft. Corolla blue, large, clothed with powdery tomentum outside, like the rest of the plant. Berry globose, yellow, glabrous, size of a chick-pea. Leaves very like those of *Eleágnus angustifòlius*.

Eleagnus-leaved Nightshade. Fl. June, July. Clt. 1823. Shrub 4 to 6 feet.

194 S. dealba'tum (Lindl. hort. trans. 7. p. 52.) suffruticose, hoary from stellate, leprous tomentum all over; leaves oblong-lanceolate, obtuse, having the petioles and midrib prickly beneath; lower leaves subsinuated: superior ones entire; racemes axillary, few-flowered; calyxes prickly. ♄. G. Native of Chili. Corolla pale lilac. Allied to *S. eleagnifòlium*, and *S. lepròsum*.

Whitened Nightshade. Fl. June. Clt. 1824. Shrub 2 to 3 feet.

195 S. lepròsum (Ortega, dec. 9. p. 115. Dun. sol. 182. syn. p. 26.) stem shrubby; leaves discoloured, all sinuated, and prickly on both surfaces, hoary beneath; peduncles few-flowered; calyx prickly. ♃. G. Native of Chili. The whole plant is canescent from short tomentum. Stem prickly. Prickles small, reddish-yellow; those on the calyx sometimes stellately pilose at top. Corolla large, pale blue, clothed with powdery down outside. Berry yellowish, size of a cherry. This species differs from *S. eleagnifòlium* in the leaves being all sinuated and prickly; and in the branchlets, peduncles, and calyxes being also prickly.

Leprous Nightshade. Pl. 2 feet.

196 S. obtusifòlium (Dun. syn. p. 26. sol. ed. 2d. t. 119. H. B. et Kunth, nov. gen. amer. 3. p. 40.) stem shrubby; branches prickly, and are, as well as the leaves, clothed with silvery tomentum; leaves oblong, obtuse, sinuately repand, prickly along the middle nerve beneath; peduncles lateral, solitary, few-flowered, and are, as well as the calyxes, prickly. ♄. G. Native of Mexico, near Regla; and Totonilco el Grande, at the altitude of 1200 hexapods. Tomentum stellate. Prickles yellow, short. Calyx 5-6-cleft. Corolla clothed with white tomentum outside, and blue inside, size of those of the potatoe; segments oblong, acutish. Stamens 5-6. Fruit unknown.

Obtuse-leaved Nightshade. Shrub.

197 S. fla'vidum (Torrey, in ann. lyc. 2. p. 227.) suffruti-

cose, densely clothed with yellowish tomentum all over; branches and calyxes prickly; leaves solitary, oblong, bluntish, sinuately repand: superior ones obsoletely sinuated; racemes opposite the leaves, usually 3-flowered. ♄. G. Native of North America, but the exact locality is unknown. Stem armed with simple, scattered prickles. Racemes at the extremities of the branches. Calycine segments subulate. Corolla large; lobes triangularly-lanceolate.

Yellowish Nightshade. Shrub.

§ 2. Lepróphoris affìnia. *The plants contained in this division are very like those of the last.*

198 S. furfura'ceum (R. Br. prod. p. 446.) stem shrubby; prickles acerose; leaves narrow-lanceolate, quite entire, furnished with a few prickles above, or unarmed, glabrous, smooth, but clothed with cinereous tomentum beneath; umbels lateral, 2-4-flowered, sessile; calyx unarmed. ♄. S. Native of New Holland, within the tropic. Dun. sol. 182. syn. p. 26.

Furfuraceous Nightshade. Shrub.

199 S. parvifòlium (R. Br. l. c.) stem shrubby; prickles acerose; leaves narrow-lanceolate, quite entire, flat, glabrous above, and furnished with a few prickles, but tomentose beneath, and unarmed, as well as the calyxes; umbels lateral, 2-4-flowered, sessile. ♄. S. Native of New Holland, on the sea shore, within the tropic.

Small-leaved Nightshade. Shrub.

200 S. orbicula'tum (Dun. syn. p. 27. sol. ed. 2d. ined. t. 44. Poir. suppl. 3. p. 762.) stem prickly; prickles acerose, red; leaves nearly orbicular, clothed with leprous tomentum on both surfaces, small; flowers twin or solitary, on short peduncles. ♄. G. Native of New Holland. Branches greyish-yellow. Prickles long, tomentose at the base, one to each petiole. Leaves somewhat petiolate, unarmed, cream-coloured below, and greenish-grey above. Peduncles and calyxes clothed with rusty tomentum.

Orbicular-leaved Nightshade. Shrub.

201 S. stelli'gerum (R. Br. prod. p. 445.) stem shrubby; prickles few, acerose; leaves entire, almost unarmed, lanceolate, glabrous above, smooth, grey and tomentose beneath; corymbs lateral, subumbellate, simple, nearly sessile; calyx unarmed. ♄. G. Native of New South Wales, about Port Jackson. Dun. sol. p. 201. syn. p. 27. Flowers pale blue. Fruit red. Tomentum stellate.

Var. α; prickles of the stem much curved. ♄. G. Stem and branches tomentose. Corolla pale purple. Stamens equal. Berry globose, scarlet. S. stellígerum, Smith, exot. bot. 2. p. 57. t. 88.

Var. β; prickles of the stem straight. ♄. S. Native of New Holland, within the tropic, on the sea shore. Dun. sol. ed. 2d. ined. t. 57. Tomentum on the under sides of the leaves rusty. Corolla villous outside, pale blue. Berry small, scarlet.

Star-bearing Nightshade. Fl. June, Aug. Clt. 1823. Shrub 3 feet.

202 S. discólor (R. Br. prod. p. 445.) stem shrubby; prickles setaceous, straight; leaves elliptic, subrepand, glabrous above, and tomentose beneath, cinereous, and are, as well as the calyxes, unarmed; racemes lateral, many-flowered, undivided. ♄. S. Native of New Holland, on the sea shore, within the tropic. Dun. sol. 183. syn. p. 27.

Two-coloured leaved-Nightshade. Shrub.

203 S. dianthóphorum (R. Br. l. c. but not of Lour.) nearly unarmed; stem furnished with a very few acerose prickles, and sometimes there are no prickles; leaves oblong-ovate, entire, tomentose, unarmed; peduncles lateral, 2-flowered or twin; calyx 5-cleft, acuminated. ♄. S. Native of New Holland, within the tropic, on the sea shore. Dun. sol. 183. syn. p. 27. Branches clothed with rusty-yellow, stellate tomentum, as well as the under sides of leaves. Leaves often twin, dark green above. Calyx woolly, longer than the corolla; anthers violaceous.

Pink-bearing Nightshade. Shrub.

204 S. elli'pticum (R. Br. l. c.) stem shrubby; prickles straight, tomentose at the base; leaves oblong-oval, obtuse, entire, tomentose on both surfaces, and are, as well as the calyxes, prickly; peduncles usually 3-flowered. ♄. S. Native of New Holland, within the tropic, on the sea shore.

Elliptic-leaved Nightshade. Shrub.

205 S. hórridum (Dun. syn. p. 28. sol. ed. 2d. ined. t. 46.) stem terete, pilose, prickly; leaves on long petioles, ovate-oblong, entire, villous on both surfaces, and prickly, as well as the peduncles, which are 1-flowered. ♄. G. Native of New Holland. Poir. suppl. 3. p. 763. The whole plant is clothed with stellate hairs. Leaves greyish-green above, and cream-coloured beneath. Segments of corolla acute. Berry globose, size of a large cherry.

Horrid Nightshade. Shrub.

206 S. echina'tum (R. Br. prod. p. 447.) stem erect; prickles setaceous, straight, acerose; leaves ovate-oblong, entire, unarmed, tomentose on both surfaces; racemes opposite the leaves, simple; berry somewhat 4-celled, inclosed in the echinated calyx. ♄. S. Native of New Holland, on the sea shore, within the tropic.

Echinated-calyxed Nightshade. Shrub.

207 S. Rodschìedii (Meyer. prim. esseq. p. 111.) stem shrubby; leaves oblong, sinuated or entire, subcordate at the base, or attenuated, tomentose beneath, and prickly; racemes lateral; calyxes mutic. ♄. S. Native about the Essequibo, on the American continent. The whole plant, except the adult branches and genitals, is beset with elegant stellate hairs. Branches, petioles, and leaves prickly; prickles solitary, compressed, yellow: rameal ones curved, the rest straight. Calycine segments short, bluntish. Corolla like that of *S. mammòsum*, violaceous, clothed with tomentum outside, as well as the calyx. Berry size of a cherry.

Rodschiede's Nightshade. Shrub.

§ 3. Persica'riæ (so named from the leaves of most of the species resembling those of *Persica*, or the peach.) Dun. sol. 183. Leaves entire or repand, narrow, oblong-lanceolate. Racemes simple, elongated, extra-foliaceous; pedicels secund, erect in the flowering state, but drooping in the fruit-bearing state. Corollas 5-parted.

208 S. racemòsum (Jacq. amer. p. 50. t. 36. ed. pict. t. 50. Lin. mant. 47.) stem unarmed, shrubby; leaves lanceolate, repand, undulated, acute; corollas 5-parted. ♄. S. Native of Martinico, on the declivities of mountains, Jacquin; Surinam, Lin. Leaves shining, petiolate. Racemes length of leaves. Corolla white; segments deep, oblong-lanceolate. Berry red, size of a small pea.

Racemose-flowered Nightshade. Fl. July, Aug. Clt. 1781. Shrub 3 to 4 feet.

209 S. i'gneum (Lin. spec. p. 270.) stem shrubby; leaves lanceolate, acuminated, revolute on both sides at the base; corollas 5-parted. ♄. S. Native of the Caribbee Islands, and Guiana. Jacq. hort. vind. t. 14. Aubl. guian. 1. p. 207. exclu-

sive of the syn. of Plum.—Burm. amer. 241. t. 245. f. 1.—Sloane, jam. 1. p. 38. t. 11. f. 3.—Plukn. alm. 350. phyt. t. 225. f. 5. Solànum fruticòsum, lauri foliis, aculeàtum, Plum. cat. p. 4. Tourn. inst. p. 149. Shrub sometimes prickly, and sometimes unarmed. Leaves clothed with stellate villi on both surfaces, but most so beneath. Prickles long, of a reddish, fiery colour, subulate, straight. Corolla white or purplish; with long, narrow, reflexed segments. Berry red, size of a cherry, ex Poir; yellowish, size of a pea, ex Jacq.

Var. β, parvifòlium (Vahl. eclog. 1. p. 23.) ♄. S. Native of the Island of Santa Cruz. This differs from the species in habit; in the stem and branches being more slender; in the leaves being much smaller, less acuminated; and in the prickles being 2 or 3 times longer.

Fiery-spined Nightshade. Fl. March, Nov. Clt. 1714. Shrub 5 to 6 feet.

210 S. subarma'tum (Willd. enum. p. 240.) stem shrubby, rather prickly; leaves lanceolate, downy beneath, quite entire, having the margins revolute at the base; racemes simple. ♄. S. Native country unknown. Dun. sol. p. 185. syn. p. 28. Down stellate. Leaves glabrous above, having the midrib sometimes furnished with one prickle beneath. Corolla white, with lanceolate segments. This plant is sometimes to be found in the gardens under the name of *S. Bahaménse*. According to Poiret it is perhaps a mere variety of *S. ígneum*.

Half-armed Nightshade. Fl. May, June. Clt. 1820. Shrub 5 to 7 feet.

211 S. persicæfòlium (Dun. sol. p. 185. syn. p. 28.) stem shrubby; leaves oblong-lanceolate, narrow; racemes simple; corollas 5-cleft. ♄. S. Native of the Caribbee Islands.—Burm. amer. p. 240. t. 244.—Plum. cat. 4. Stem scabrous, unarmed. Leaves prickly on the middle nerve beneath. Calyx unarmed. Berry globose, drooping. This species differs from *S. ígneum* in the leaves being narrower.

Peach-leaved Nightshade. Shrub 4 to 6 feet.

212 S. Bahame'nse (Lin. spec. ed. 1st. p. 188. ed. 2d. p. 270.) stem shrubby; leaves lanceolate, repand or sinuated, obtuse, with reflexed margins; corollas 5-parted. ♄. G. Native of Providence, one of the Bahamas. Dun. sol. p. 186. syn. p. 28. S. fruticòsum, Mill. dict. no. 18.—Sloan. hist. p. 236. t. 145.—Dill. elth. 263. t. 271. f. 250. Stem and leaves prickly. Leaves villous. Prickles brownish, straight. Corolla bluish-purple, with narrow, reflexed segments. Berry size of a pea, yellowish. Said to be nearly allied to *S. polyacánthum;* but the leaves are broader, and the flowers racemose, not solitary, &c.

Bahama Nightshade. Fl. June, July. Clt. 1732. Shrub 5 to 6 feet.

213 S. graciliflòrum (Dun. syn. p. 29. sol. ed. 2d. ined. t. 47.) branches smoothish, prickly; prickles straightish; leaves ovate-oblong, unequal at the base, sinuated, prickly on both surfaces, rather pilose; pili very minute, stellate, distant; racemes short, cymosely umbellate. ♄. S. Native of Java. Prickles yellowish, rather villous at top. Pedicels and flowers slender. Calyx small, 5-toothed.

Slender-flowered Nightshade. Shrub.

214 S. Dunalia'num (Gaud. in Freyc. voy. pt. bot. p. 448. t. 58.) shrubby; leaves elliptic, acute, running into the petioles at the base, quite entire, glabrous, spiny on the middle nerve beneath, as well as on the branches and petioles; flowers corymbose, tetrandrous; calyx glabrous, with ovate, acute lobes; corolla clothed with powdery tomentum outside, with ovate-lanceolate segments; berries globose. ♄. S. Native of the Moluccas.

Dunal's Nightshade. Shrub.

215 S. mólle (Dun. syn. p. 28. sol. ed. 2d. ined. t. 120. H. B. et Kunth, nov. gen. amer. 3. p. 40.) stem suffruticose, prickly; branches unarmed, clothed with hoary tomentum, as well as the under surfaces of the leaves, but the upper surfaces of the leaves are clothed with canescent down, they are oblong, acuminated, sinuated, prickly on the nerve beneath; racemes almost opposite the leaves, subdichotomous, and are, as well as the calyxes, unarmed. ♄. S. Native of the province of Caraccas, near St. Geronimo del Pyrital, on the banks of the river Guarico. Prickles straight, yellowish. Down stellate. Corolla white, clothed with hoary tomentum outside. Berry round, variegated with white and green, ex Bonpl.

Soft Nightshade. Fl. June, Sept. Clt. 1818. Shrub 4 to 5 feet.

§ 4. Poly'gama (from πολυς, *polys*, many; and γαμος, *gamos*, a marriage; in reference to the greater number of male flowers than of hermaphrodite ones.) *Flowers small: hermaphrodite ones solitary, on short peduncles: male ones racemose. Leaves entire, or repand.*

216 S. polyaca'nthum (Lam. ill. no. 2377. Poir. dict. 4. p. 304.) very prickly; prickles acicular; leaves linear-lanceolate, nearly sessile, obtuse, villous on both surfaces; peduncles axillary, 1-flowered. ♄. S. Native of the Island of Dominica. Vahl, eclog. 1. p. 24. Dun. sol. p. 186. syn. p. 29. S. parviflòrum, Cav. icon. 3. p. 19. t. 236.—Burm. amer. p. 218. t. 224. f. 1. exclusive of the syn. of Lin. and Dill.—Plum. mss. 5. p. 51. ex Burm. l. c. Villi stellate, yellowish. Prickles straight, yellowish-brown at top. Corollas small, white; segments linear, villous outside. Berry globose, glabrous, shining, size of a coriander seed.

Many-spined Nightshade. Fl. June, Sept. Clt. 1821. Shrub 3 to 4 feet.

217 S. microphy'llum (Dun. sol. p. 187. syn. p. 29.) stem branched; leaves small, ovate, entire, rather tomentose; flowers quadrifid, tetrandrous. ♄. S. Native of the Caribbee Islands. Aquártia microphýlla, Lam. ill. no. 1604. t. 82. f. 2. Poir. suppl. 1. p. 410. Habit of *S. lycioìdes*. Prickles acicular, sometimes solitary, and sometimes twin at the base of the branches, or infrafoliaceous. Leaves size of those of wild thyme, or hardly larger, acute or obtuse. Peduncles extrafoliaceous, very short, solitary or twin. Segments of corolla linear.

Small-leaved Nightshade. Shrub.

218 S. Aqua'rtia (Dun. sol. 187. syn. p. 29.) stem branched, prickly; leaves subovate, obtuse, entire, tomentose; flowers 4-cleft, tetrandrous. ♄. S. Native of St. Domingo, at Bayaba, on rocks by the sea side. Aquártia tomentòsa, Lam. ill. no. 1603. t. 62. f. 1. Poir. dict. 1. p. 217. Aquártia aculeàta, Jacq. amer. t. 15. Branches armed with short, subulate prickles, but almost unarmed in the young state. Peduncles lateral, 1-flowered, very short. Calyx tomentose; segments unequal. Corolla white, tomentose outside; segments linear, bluntish. Berry globose, yellow, shining, size of a small pea.

Aquart's Nightshade. Fl.? Clt. 1819. Shrub 4 feet.

219 S. crotonoìdes (Lam. ill. no. 2383. Poir. dict. 4. p. 306.) stem shrubby; leaves discoloured, elliptic-lanceolate, glabrous above, and tomentose beneath, unarmed; racemes short; flowers quadrifid, tetrandrous. ♄. S. Native of the Caribbee Islands. Dun. sol. p. 188. t. 13. syn. p. 29. Branches tomentose, rusty at top. Prickles acicular, few, straight. Peduncles lateral, clothed with rusty tomentum, forked and cymose at top. Segments of corolla linear.

Croton-like Nightshade. Shrub 3 to 4 feet.

220 S. reticula'tum (Dun. syn. p. 29. sol. ed. 2d. ined. t. 48.) branches tomentose at top, powdery; leaves ovate-lanceolate, unequal, quite glabrous and reticulated above, nerved be-

neath, and clothed with leprous tomentum; peduncles 1-flowered; flowers quadrifid? ♄. S. Native of St. Domingo. Poir. suppl. 3. p. 764. Habit of *S. crotonoìdes*, prickly or unarmed. Berries globose, mucronate.

Reticulated-leaved Nightshade. Fl. June, July. Clt. 1820. Shrub 3 to 4 feet.

221 S. poly'gamum (Vahl, symb. 3. p. 39. t. 55. Dun. sol. 188. ed. 2d. ined. t. 49. syn. p. 39.) stem shrubby; leaves ovate-oblong, nearly entire, rather scabrous above, but tomentose beneath. ♄. S. Native of the Island of Santa Cruz. Branches, and under surfaces of leaves, and peduncles, clothed with rusty tomentum. Prickles straight, reddish-yellow. Leaves subcordate at the base, unequal, 2-3 inches long. Flowers small, cymose. Calyx and corolla tomentose outside, 4-5-parted. Stamens 4-5. Some of the flowers are male, and some hermaphrodite, as has been observed by D. West, ex Vahl.

Polygamous-flowered Nightshade. Shrub.

222 S. integrifòlium (Poir. dict. 4. p. 301. Dun. sol. p. 189.) stem shrubby; leaves ovate, subrepand, rather tomentose beneath; umbels axillary. ♄. S. Native of the Mauritius. Stem prickly, as well as pilose. Leaves sometimes twin, sometimes aggregate, smoothish above, but furnished with distant, minute pili, and prickles; prickles few, small. Calyx villous, 5-toothed. Corolla small, whitish. Berry globose, yellowish, size of a grape, ex Poir.

Entire-leaved Nightshade. Shrub.

§ 5. Eriophy'lla (from *εριον*, *erion*, wool; and *φυλλον*, *phyllon*, a leaf; leaves woolly.) Dun. sol. p. 189. *Leaves repand, angular or sinuated, woolly on both surfaces. Peduncles solitary, many-flowered; or aggregate, 1-flowered, short. Flowers small.*

223 S. hi'rtum (Vahl, symb. 2. p. 40. icon. 3. t. 21.) stem shrubby; leaves cordate, angular, tomentose, prickly; peduncles lateral, aggregate, and are, as well as the calyxes, hairy. ♄. S. Native of Trinidad. Dun. sol. p. 189. syn. p. 30. Prickles small, straight, acicular. Stem tomentose at top. Leaves a hand long, whitish beneath. Peduncles supra-foliaceous, 1-flowered. Calyx and corolla hairy outside; three of the segments of the corolla are longer than the other two.

Hairy Nightshade. Fl. June, July. Clt. 1821. Shrub.

224 S. cordifòlium (Dun. syn. p. 30. sol. ed. 2d. ined. t. 135.) stem hairy, prickly; leaves on long petioles, cordate, angularly repand, villous on both surfaces, unarmed; racemes simple, lateral. ♄. S. Native of Brazil, at Rio Janeiro. Poir. suppl. 3. p. 764. The whole plant is clothed with stellate and simple, soft, rust-coloured hairs. Leaves unequal at the base. Segments of corolla equal. This species differs from *S. hirtum*, in the leaves being unarmed; in the flowers being racemose; and in the corolla being regular.

Heart-leaved Nightshade. Shrub.

225 S. eriophy'llum (Dun. syn. p. 30. sol. ed. 2d. ined. t. 50.) branches clothed with white tomentum, prickly; leaves clothed with white tomentum on both surfaces, ovate, sinuated, obtuse, on short petioles; calyxes woolly, subcampanulate. ♄. G. Native of New Holland. S. lasiophýllum, Poir. suppl. 3. p. 764. Prickles small, slender. Segments of calyx obtuse, rarely prickly. Corolla blue, pentagonal, the star villous outside. Berry globose.

Woolly-leaved Nightshade. Shrub.

226 S. tomentòsum (Lin. spec. ed. 1st. p. 188. ed. 2d. p. 269.) stem shrubby, prickly; prickles acerose; leaves cordate, subrepand, undulated, densely tomentose on both surfaces; tender parts clothed with purplish powder. ♄. S. Native of North America, ex Lin. spec. ed. 1st.; Æthiopia, ex Lin. spec. ed. 2d.; Guiana, ex Aubl.; Peru, where it is called *Hormis*, ex Ruiz. et Pav.; Cape of Good Hope, ex Thunb. prod. p. 36. Aubl. guian. 1. p. 216. Ruiz. et Pav. fl. per. 2. p. 41. Dun. sol. p. 190. syn. p. 30.—Sabb. hort. rom. 2. t. 58.—Triumf. præl. 46. t. 6.—Bocc. sic. 8. t. 5.—Plukn. alm. 351. t. 316. f. 2.? The whole plant is densely clothed with greenish-yellow tomentum. Leaves usually 3 inches long, and about 1 inch broad, sometimes unarmed, sometimes prickly beneath. Prickles straight, yellowish-green. Racemes shorter than the petioles, at length drooping. Corolla bluish-violet. Berry subglobose, rather tomentose while young; but glabrous, and of a dirty orange colour, and about the size of a gooseberry when mature.

Tomentose Nightshade. Fl. June, July. Clt. 1662. Shrub 2 to 3 feet.

227 S. hy'bridum (Jacq. vind. 2. t. 113. Dun. sol. 191. syn. p. 30.) stem shrubby, prickly; leaves ovate, almost unarmed, acute, repand; the tender parts clothed with violet powder on the back and margins. ♄. S. Native of Guinea. Leaves repandly angular, pale green, undulated, unequal at the base. Peduncles clothed with violet tomentum: some umbellate, and others 1-flowered. Corolla pale blue; segments 5-10. Some of the flowers are sterile. Berry roundish, depressed, orange-coloured, pendulous. Prickles strong, straight or recurved, sometimes wanting on the leaves. Perhaps only a variety of *S. tomentòsum*.

Hybrid Nightshade. Fl. June, July. Clt. 1815. Shrub 2 to 3 feet.

228 S. cocci'neum (Jacq. misc. 2. p. 239. icon. rar. 1. t. 43.) stem shrubby, prickly; leaves ovate, somewhat cordate, repand, tomentose; berries scarlet. ♄. S. Native country unknown, and probably of garden origin. Dun. sol. 191. syn. p. 31. S. tomentòsum, var. coccíneum, Willd. spec. 1. p. 1045. Pers. ench. 1. p. 228. Prickles straight, subulate, brown. Leaves green, sometimes prickly on the middle nerve and petioles. Racemes opposite the leaves, simple, tomentose. Corolla white or purplish. Calycine segments ovate-lanceolate, acute. Berry pea-shaped, red at first, but at length dirty white, ex Jacq. It is very like *S. tomentòsum*, but smaller in all its parts, and less tomentose.

Scarlet-berried Nightshade. Fl. June, July. Clt. 1810. Shrub 2 to 3 feet.

229 S. brevi'pilum (Dun. sol. p. 191. t. 21. syn. p. 31.) stem shrubby; leaves twin, sessile, obtuse-angled, tomentose on both surfaces; calyx 5-parted. ♄. S. Native of the West Indies; as of St. Thomas and Porto Rico. This species differs from *S. Jamaicénse* in the peduncles, pedicels, and calyxes being unarmed; and in the calyx being 5-parted, not 5-toothed. Every part of the plant is clothed with stellate tomentum. Leaves of a rusty yellow colour on both surfaces, often unarmed.

Short-haired Nightshade. Shrub 4 to 6 feet.

230 S. Jamaice'nse (Swartz, fl. ind. occ. 1. p. 454.) stem shrubby; leaves twin, cuneated, broadest in the middle, and obtuse-angled, tomentose on both surfaces, as well as the rachi and calyxes; calyx 5-toothed; prickles reflexed. ♄. S. Native of Jamaica and Hispaniola, among rubbish. Dun. sol. 191. syn. p. 31. Stem and midrib of leaves beneath furnished with strong prickles. Racemes lateral, much shorter than the leaves, simple, many-flowered; flowers pedicellate, subcymose. Corolla small, pale blue or white, with reflexed segments, tomentose beneath. Berry round, black when ripe, size of a red currant.

Jamaica Nightshade. Fl. June, July. Clt. 1818. Shrub 6 feet.

231 S. toxica'rium (Lam. dict. 3. p. 309. Dun. sol. 193. ed. 2d. ined. t. 50. syn. p. 31.) stem shrubby, prickly; leaves lobately angular, tomentose, oblique at the base, emarginate,

furnished with scattered prickles on both surfaces; racemes sessile, cymose; segments of corolla sub-lanceolate. ♄. S. Native of Guiana. Richard. act. soc. par. ex Poir. suppl. 3. p. 764. S. Juripèba postèrior, Pis. bras. book 4. chapt. 41.? Prickles of the stem large, recurved. Leaves usually twin. Peduncles, pedicels, calyxes, and outside of corollas clothed with stellate tomentum, like the under surfaces of the leaves. Root poisonous.

Poisonous Nightshade. Shrub.

232 S. cuneifòlium (Dun. sol. p. 193. t. 22. syn. p. 31.) stem shrubby; leaves twin, long-cuneated, sinuately angular above; angles acute, but sometimes the leaves are nearly entire, with obtuse angles; racemes short. ♄. S. Native of Cayenne. S. cròceum, Dun. sol. 241. S. dùbium, Dun. sol. p. 240. S. Jamaicénse, Mill. dict. no. 71.—Sloan. hist. p. 236. t. 144. f. 3. —Plukn. phyt. t. 226. The whole plant clothed with rusty stellate tomentum. Branches and base of midrib of leaves prickly; prickles strong, reflexed, tomentose at the base. Leaves unequal: largest ones 4-5 inches long, and the smaller ones 2-3 inches long. Pedicels longer than the peduncle, slender. Flowers small. Calycine segments long, subulate, prickly. Corolla white, 5-cleft. Berry globose, reddish yellow.

Wedge-leaved Nightshade. Fl. June, July. Clt. 1818. Shrub 3 to 4 feet.

233 S. heterótrichum (Dun. sol. p. 192. t. 20. syn. p. 31.) stem tomentose; leaves twin, sessile, ovate, rather angular, tomentose from stellate pili; nerves bullate, beset with simple hairs. ♄. S. Native of tropical America. Branches clothed with long yellowish hairs, which are stellate at top. Prickles slender, recurved. Leaves yellowish beneath, and rather rusty above; nerves furnished with a few small prickles beneath. Racemes short, simple, many-flowered, beset with stellate tomentum, as well as the outside of the corollas and calyxes. Calycine segments linear-lanceolate, long. Corolla 5-parted, with almost linear segments. Berry globose.

Variable-haired Nightshade. Fl. June, July. Clt. 1824. Shrub 3 to 4 feet.

234 S. Willdenovia'num; tomentose; stem shrubby, prickly; leaves twin, angular, cuneated; umbels extra-foliaceous, sessile; peduncles and calyxes hispid. ♄. S. Native of Porto Rico, Desf. S. cuneifòlium, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 623, but not of Dun.

Willdenow's Nightshade. Shrub.

§ 6. Micraca'ntha (from *μικρος, micros*, small; and *ακανθα, akantha*, a spine; in reference to the small, short, recurved prickles.) Dun. sol. p. 193. *Stem shrubby, prickly; prickles small, short, recurved. Leaves lanceolate, entire, or sinuately angular; the middle nerve prickly beneath. Racemes simple, cymose, extra-axillary.*

235 S. sca'brum (Vahl. eclog. 1. p. 22.) stem shrubby; branches flexuous, prickly, glabrous; leaves usually by threes, oblong, acute, sinuately angular, clothed with stellate down above, and stellate pili beneath, having the nerve prickly; racemes lateral, few-flowered, and are, as well as the calyxes, prickly. ♄. S. Native of Caraccas, near San Juan, and other parts of tropical America. Dun. sol. p. 193. ed. 2d. t. 121. syn. p. 31. H. B. et Kunth, nov. gen. 3. p. 41. S. adhæ'rens, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 669. Prickles scattered, recurved, yellowish. Calyx 5-cleft. Corolla white, tomentose outside; segments lanceolate-linear. Berry small, globose.

Scabrous Nightshade. Shrub.

236 S. heterophy'llum (Lam. ill. no. 2360. Poir. dict. 4. p. 301. no. 64.) leaves by threes, unequal, scabrous above, and rather tomentose beneath; racemes and calyxes unarmed. ♄. S. Native of Guiana. Dun. sol. p. 205. ed. 2d. t. 62. syn. p. 32. S. acanthifòlium, Hort. Prickles strong, sub-recurved. Leaves large, with blunt lobes, prickly on the midrib. Pedicels and calyxes villous. Calycine segments ovate, obtuse. Corolla large, divided to the base into lanceolate-linear, obtuse segments. Fruit-bearing peduncles reflexed. Berry round, size of a pea.

Variable-leaved Nightshade. Shrub.

237 S. Ature'nse (Dun. syn. p. 32. sol. ed. 2d. ined. t. 122. H. B. et Kunth, nov. gen. amer. 3. p. 41.) shrubby; branches prickly, and clothed with rusty tomentum; leaves twin, elliptic-oblong, acuminated, quite entire, beset with stellate hairs above, and stellate pili beneath; midrib of leaves, as well as the calyxes, prickly; racemes extra-axillary, simple, unarmed. ♄. S. Native on the banks of the Orinoco, near the cataract of Ature. Prickles compressedly conical, subulate, and recurved at top, shining. Leaves unequal in size, greenish above, and fuscescent beneath, 6 inches long. Racemes clothed with rusty tomentum, as well as the calyxes and outside of corolla. Calyx prickly.

Ature Nightshade. Shrub.

238 S. nemore'nse (Dun. sol. p. 194. syn. p. 32.) stem shrubby, scandent; leaves petiolate, twin, the larger one oblong, sinuately angular, and the smaller one ovate, lanceolate, quite entire; racemes filiform, very long. ♄. ◡. S. Native of Peru, in groves at Chincao and Cuchero, where it is called *Rocotito de Monte*. S. laciniàtum, Ruiz. et Pav. fl. per. 2. p. 40. t. 177. f. a. Pers. ench. 1. p. 228, but not of Ait. Branches angular, prickly; prickles small, recurved, yellowish. Leaves nearly sessile, prickly on the back. Peduncles prickly, hanging in the fruit-bearing state. Calyx small. Corolla blue. Berry ovate-globose, size of a small pear, golden yellow.

Grove Nightshade. Shrub climbing.

239 S. volu'bile (Swartz. fl. ind. occ. 1. p. 458. Pers. ench. 1. p. 226, exclusive of the syn. of Lam. and Jacq.) stem shrubby, scandent; leaves angular, with denticulated margins; racemes lateral; calyxes prickly. ♄. ◡. S. Native of Hispaniola, in woods. Dun. sol. p. 195. syn. p. 32. S. scándens, Swartz. prod. p. 47, but not of Lin. Plum. mss. t. 4. f. 32. ex Aubl. guian. 1. p. 217.? Stem prickly; branches terete. Leaves 3-4 inches long, or a span, ovate-lanceolate, rough above, and hispid from rusty hairs beneath; petioles and midrib prickly; prickles small, recurved. Calyx 5-toothed, clothed with rusty down, prickly, reflexed. Corolla large, bluish, 5-parted, tomentose outside, with long segments. Berry umbilicate.

Twining Nightshade. Fl. June, July. Clt. 1823. Shrub climbing.

240 S. lanceæfòlium (Jacq. icon. rar. 2. t. 329. coll. 2. p. 286.) stem shrubby, scandent; leaves twin, lanceolate-oblong, attenuated at both ends, rather roughish, prickly on the midrib and petioles beneath; racemes short, unarmed. ♄. S. Native of tropical America. Dun. sol. p. 195. syn. p. 32. S. sarmentòsum, Lam. ill. no. 2385. Poir. dict. 4. p. 307, exclusive of the syn. of Swartz. Branches sarmentose, green and shining, rather villous, as well as the stem and both sides of the leaves; hairs obsolete, starry. Leaves unequal in size, 4-8 inches long, sometimes entire, and sometimes sinuately angular, shining above, but paler beneath. Prickles solitary, or by pairs, yellowish, small, recurved. Racemes rather villous, as well as the outside of the calyxes and corollas. Pedicels cymose, approximate. Calyx 4-5-parted, with subulate segments. Corolla white, 4-5-parted, with lanceolate, acute segments. Anthers 4-5, yellow.

Var. β, tetrándrum; flowers tetramerous, tetrandrous. ♄. ◡. S. Native of Cayenne. S. flexuòsum, Vahl. eclog. 1. p. 22.

Lance-leaved Nightshade. Fl. July, Aug. Clt. 1816. Shrub climbing.

241 S. ambíguum (Dun. syn. p. 32. sol. ed. 2d. ined. t. 123.) branches scandent, pilose; lower leaves solitary: superior ones twin, ovate-elliptic, angular, a little sinuated, rather scabrous from pili on both surfaces, having the midrib prickly; racemes simple, unarmed. ♄. ◡. S. Native country unknown.

Ambiguous Nightshade. Shrub climbing.

242 S. micracánthum (Lam. ill. no. 2382. Poir. dict. 4. p. 306.) stem shrubby; leaves ovate-lanceolate, acuminated, rather tomentose beneath; prickles small, few, recurved; racemes short. ♄. S. Native of Guadaloupe, Brazil, and Cayenne. Dun. sol. p. 196, exclusive of the syn. of Vahl, symb. p. 32. Branches rather villous, or tomentose at top. Down stellate. Leaves green above, but rough from minute stellate hairs, but tomentose beneath, as well as the petioles, peduncles, and outside of the corollas and calyxes. Branches, petioles, and midrib of leaves beneath prickly; prickles sometimes twin. Racemes lateral; pedicels cymose. Calyx 5-toothed. Corolla deeply 5-cleft. Berry size of a chick pea.

Small-spined Nightshade. Shrub.

243 S. brachyánthum (Dun. syn. p. 32. sol. ed. 2d. ined. t. 124. H. B. et Kunth, nov. gen. amer. 3. p. 42.) arboreous; branches prickly; branchlets tomentose; leaves twin, elliptic, acute at both ends, quite entire, puberulous above, but clothed with hoary fuscescent tomentum beneath, and prickly on the midrib; racemes lateral, simple; pedicels and calyxes prickly. ♄. S. Native of New Andalusia, on the declivity of Mount Cocollar, at the altitude of 480 hexapods. Down and tomentum stellate. Prickles short, recurved. Pedicels long, unilateral, and are, as well as the calyxes, prickly. Racemes, outside of corollas, and calyxes clothed with hoary tomentum. Calyx 5-parted; segments obovate, cuspidate, cohering. Corolla 5-parted, with linear-oblong, acute segments, about the size of those of *Ornithógalum lùteum*. This species differs from *S. micracánthum*, Lam. in the leaves being tomentose beneath, and in the pedicels and calyxes being prickly.

Short-flowered Nightshade. Tree 30 feet.

244 S. Jussiæ'i (Dun. syn. p. 33. sol. ed. 2d. ined. t. 52.) leaves solitary, ovate-lanceolate, smoothish above, but rather tomentose and prickly on the midrib beneath; racemes simple, cymose longer than the petioles. ♄. S. Native of Rio Janeiro, Commerson. Poir. suppl. 3. p. 767. Prickles short, recurved. Down and tomentum stellate. Peduncles, pedicels, and calyxes woolly. Calyx 5-toothed. Corolla deeply 5-cleft; segments ovate-lanceolate. Ovarium tomentose, powdery.

Jussieu's Nightshade. Shrub.

245 S. Javite'nse (H. B. et Kunth, nov. gen. amer. 3. p, 42.) shrubby; branches prickly; branchlets clothed with fine hoary tomentum; leaves solitary, oblong, acute, quite entire, clothed with stellate down on both surfaces, rather prickly on the midrib beneath; racemes lateral, simple; pedicels and calyxes unarmed. ♄. S. Native on the banks of the Orinoco, and the Tuamino, near Carichana and Javita. S. monachophýllum, Dun. syn. p. 33. sol. ed. 2d. ined. t. 125. Hairs and tomentum stellate. Prickles conical, recurved at top, shining, yellowish. Pedicels unilateral, clothed with stellate down, as well as the calyxes. Calyx 5-parted; segments subobovate, cuspidate. Corolla and stamens like those of *S. brachyánthum*. It differs from *S. Jussiæ'i* in the leaves being on short petioles, entire, oblong, downy on both surfaces, often unarmed, with the middle nerve rather prickly; the prickly racemes and flowers smaller.

Javita Nightshade. Shrub.

246 S. umbròsum (Dun. syn. p. 33. sol. ed. 2d. ined. t. 126. H. B. et Kunth, nov. gen. amer. 3. p. 43.) shrubby, scandent; branches prickly, and are, as well as the under surfaces of the leaves, clothed with hoary villous tomentum: upper surfaces villous; leaves solitary, or twin, oblong, acuminated, quite entire; racemes extra-axillary, bifid; peduncles and midribs of leaves beneath prickly; pedicels and calyxes unarmed. ♄. ◡. S. Native of New Andalusia, in bushy places near Cumanacoa. Hairs and down stellate, simple. Prickles scattered, small, subulate, yellowish, recurvedly reflexed. Pedicels unilateral. Calyx villous, 5-parted; segments obovate, cuspidate, cohering. Corolla hispid from stellate pili outside, with linear, acutish segments.

Shaded Nightshade. Fl. June, July. Clt. 1825. Shrub cl.

247 S. Juripe'ba (Rich. act. soc. par. p. 107. Dun. sol. p. 196. t. 15. syn. p. 33.) shrubby; branches prickly, rather pilose; leaves solitary, elliptic-oblong, acute, almost quite entire, clothed with stellate pili on both surfaces, prickly on the midrib beneath: superior leaves twin; racemes lateral and terminal, almost sessile, and are, as well as the calyxes, unarmed. ♄. S. Native of Cayenne; and of the Island Pararumo, in the Orinoco, and near the cataract of Ature, on the banks of the Orinoco. S. obscùrum, Vahl, symb. p. 41. Willd. spec. 1. p. 1046. Juripèba prior, Pis. bras. lib. 4. cap. 41. S. styracifòlium, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 663.—Plum. mss. t. 4. f. 32, ex Dunal. Hairs or down stellate. Leaves canescent beneath. Flowers unilateral. Corolla violaceous, ex Bonpl. white inside, and purple outside, ex Plum. Prickles on the branches recurved, on the midribs of leaves straight. Calyx 5-cleft, with broad, mucronulate segments. Corolla 5-parted, with long, linear segments.

Juripeba Nightshade. Shrub.

248 S. rubiginòsum (Vahl. eclog. 2. p. 17. icon. t. 13.) shrubby, clothed with rusty stellate tomentum all over; prickles recurved; leaves elliptic, acute, quite entire, glabrous above, and tomentose beneath; cymes terminal. ♄. S. Native of Cayenne. Dun. sol. p. 197. syn. p. 33. Branches, petioles, and midribs of leaves beneath prickly. Leaves 3-4 inches long, obscure green above. Peduncles bifid; pedicels reflexed at first. Calyx 5-cleft, with linear-lanceolate segments. Corolla 5-cleft, with sublinear segments.

Rusty Nightshade. Fl. June, July. Clt. 1821. Shrub.

249 S. velutìnum (Dun. syn. p. 33. sol. ed. 2d. ined. t. 53.) stem scandent, ? tomentose; leaves ovate-oblong, unequal at the base, acute, clothed with silky tomentum, furnished with a few prickles beneath; racemes terminal, few-flowered. ♄. ◡. ? S. Native of Cayenne. This species differs from *S. rubiginòsum* in the leaves being silky on both surfaces, in the hairs being simple, but yellowish. Prickles short, recurved. Leaves yellowish green above, but whiter beneath. Racemes villous. Calycine segments oblong, acute, and are, as well as the corolla, villous outside.

Velvety Nightshade. Shrub climbing.

250 S. coria'ceum (Dun. sol. p. 197. t. 14. syn. p. 33.) shrubby, scandent; leaves glabrous, lanceolate-elliptic, acute; racemes lateral, simple, equal in length to the leaves. ♄. ◡. S. Native of Cayenne. Branches terete, powdery, as well as the young leaves, peduncles, and pedicels. Leaves sometimes twin, on short petioles 4 inches long, coriaceous, sometimes prickly on the midrib. Prickles short, recurved. Peduncles sometimes bifid; pedicels secund. Corolla large, blue. Calyx coriaceous, 5-toothed; teeth roundish, mucronate. Stigma 2-lobed.

Coriaceous-leaved Nightshade. Shrub climbing.

Subsect. II. Subine'rmia. *Stem prickly at the base. Leaves sinuately angular, or entire. Racemes many-parted; pedicels cymose. Flowers numerous, many of which are abortive; in the fertile flowers the style is longer than the anthers; in the*

sterile flowers the style is the length of the filaments. Corollas 4-5-6-cleft. Berries 4-celled. a. Anthers unequal.

251 S. Bonarie'nse (Lin. spec. 264, exclusive of the syn. of Plum.) shrubby, almost unarmed; leaves ovate-oblong, sinuately repand, smoothish; racemes corymbose, lateral, or extrafoliaceous. ♄. H. Native of Buenos Ayres. Dun. sol. 198. syn. p. 34.—Dill. elth. p. 364. t. 272. f. 351. Stem green, prickly at the base: adult ones unarmed. Leaves sometimes entire, rarely prickly. Corymbs large. Calyx 4-5-cleft; segments subulate. Corolla large, white, downy outside. Berry globose, yellow? 4-celled, size of a chick pea. Root creeping.

Buenos-Ayrean Nightshade. Fl. June, Sept. Clt. 1727. Shrub 6 to 10 feet.

252 S. fastigia'tum (Willd. enum. p. 235.) shrubby, almost unarmed; leaves ovate-oblong, entire, or sinuately repand, downy; racemes corymbose, terminal. ♄. G. Native country unknown. Dun. sol. p. 198. t. 16. t. 2. p. D. syn. p. 34. Poir. suppl. 3. p. 770. Jacq. eclog. t. 6. Stem usually unarmed, but sometimes prickly. Branches green. Leaves rarely prickly, sometimes entire, scabrous from short stellate pili. Flowers large, some fertile, and some sterile. Calyx 4-5-6-cleft; segments acute. Corolla large, 4-5-6-cleft, pale blue, marked by a yellow star inside. Anthers 4-5-6, yellow. Berry globose, 4-celled, orange yellow at maturity, size of a chick pea.

Fastigiate-flowered Nightshade. Fl. June, July. Clt. 1818. Shrub 4 to 5 feet.

253 S. Pòka (Dun. syn. p. 34. ed. 2d. ined. t. 56.) branches nearly glabrous, prickly; leaves ovate-lanceolate, almost entire, or sinuately angular, scabrous on both surfaces, rather tomentose beneath, unarmed; racemes short, lateral, few-flowered. ♄. S. Native of Java, Leschenault. Branches prickly towards the top; prickles short, straight, slender, rarely recurved. Racemes bifid, unarmed, beset with rusty hairs. Calyx 5-cleft. Corolla woolly outside, 5-cleft; with lanceolate, acute segments. Down and hairs stellate.

Poka Nightshade. Shrub.

254 S. opórinum (Willd. enum. 1. p. 238. Poir. suppl. 3. p. 768.) stem shrubby, prickly at bottom; leaves oblong-lanceolate, repandly angular, or entire; racemes cymose, lateral, and terminal. ♄. G. Native of Mexico. ? S. macrophýllum, Hort. monsp. Dun. sol. p. 199. t. 16. syn. p. 34. S. grandiflòrum, Desf. arb. 1. p. 169, but not of Ruiz. et Pav. S. cymòsum, Ort. dec. 1. p. 12.—Zucc. cent. 1. p. 47. Tops of branches beset with powdery tomentum; hairs short, stellate, cinereous. Prickles somewhat recurved at apex. Leaves large, a foot long, unequal, somewhat cordate at the base, having the midrib and petioles sparingly prickly: upper leaves nearly entire: young ones canescent beneath, with convolute edges. Peduncles 2-3-parted, green, scabrous from short stellate hairs, as well as the pedicels, and calyxes, and outside of corollas. Calyx 5-parted; segments broad at the base, and subulate at the apex. Corolla large, blue, marked with a yellow star inside, 4-5-cleft, plicate, spreading, afterwards reflexed. Stigma somewhat 2-lobed. Berry globose, 4-celled, yellowish when ripe, size of a chick pea. This species differs from *S. fastigiàtum* in all its parts being larger and more pilose; corollas deep blue; racemes leafy.

Autumnal Nightshade. Fl. July, Sept. Clt. 1820. Shrub 5 to 6 feet.

255 S. subine'rme (Jacq. amer. p. 50. t. 40. f. 3, a leaf only.) stem shrubby, nearly unarmed; leaves lanceolate, elliptic, quite entire, glabrous above, but rather tomentose beneath; cymes mealy; calycine segments obtuse. ♄. S. Native of the West Indies, among bushes; Mexico, &c. Dun. sol. p. 200. syn. p. 34. Swartz. prod. 1. p. 453. Lin. mant. 8. p. 253. S. laurifòlium, Mill. dict. no. 20. Leaves 3-4 inches, glabrous above, and more or less tomentose beneath. Racemes cymose. Calyx 5-cleft, with obtuse segments. Corolla blue, with lanceolate segments. Berry globose. This species differs from *S. lanceolàtum* in the racemes being smaller, and in the calycine segments being obtuse.

Nearly-unarmed Nightshade. Fl. July, Aug. Clt. 1752. Shrub 4 to 6 feet.

256 S. ela'tum (Link. enum. 1. p. 186.) stem furnished with reflexed prickles, which are tomentose at the base; leaves lanceolate, rather tomentose, unarmed, when young hoary beneath; peduncles lateral, bifid; calycine segments linear. ♄. S. Native country unknown. Prickles numerous, short. Leaves acute, repand. Tomentum stellate. Pedicels crowded, tomentose, as well as the calyxes. Corolla blue, tomentose outside.

Tall Nightshade. Fl. June, July. Clt. 1820. Shrub 6 to 8 feet.

257 S. ochroneu'rum (Link. l. c.) stem furnished with recurved prickles; branches clothed with rusty tomentum; nerves of leaves prickly; cymes terminal; calycine segments short; corolla 5-parted. ♄. S. Native of Brazil. Leaves tomentose, not hoary. Tomentum stellate. Corolla blue. Anthers distant.

Var. β; stem furnished with more numerous, larger prickles. Leaves smaller, and more finely tomentose, and the nerves more prickly on both sides. ♄. S. Native of Brazil.

Yellow-nerved-leaved Nightshade. Clt.? Shrub.

258 S. astroìtes (Jacq. eclog. t. 65. Link. enum. 1. p. 186.) stem almost unarmed; or the branches are furnished with a few short, recurved prickles; leaves ovate-oblong, sinuated or repand, beset with stellate hairs on both surfaces; corymbs intrafoliaceous, dichotomous; calyxes acuminated, clothed with stellate pili. ♄. G. Native of Chili or Peru. Leaves 9 inches long. Corollas 5-lobed, of a violaceous blue colour. Petioles furnished with 1 or 2 short, recurved prickles. Berry globose, orange-coloured, 2-celled. This species comes very near to *S. Bonariénsis* and *S. fastigiàtum*.

Star-like Nightshade. Fl. June, July. Clt. 1818. Shrub 3 to 4 feet.

259 S. Mexica'num (Moc. et Sesse, fl. mex. icon. ined. Dun. syn. p. 34. sol. ed. 2d. ined. t. 56.) stem shrubby, tomentose, unarmed, or nearly so; leaves ovate-oblong, tomentose, canescent beneath; racemes subcymose; calycine segments subulate; corolla 5-cleft, with acute segments. ♄. S. Native of Mexico. Stem prickly at the base. Racemes lateral and terminal. Corolla violaceous. Berry globose, orange-coloured, size of a pea.

Mexican Nightshade. Fl. June, July. Clt. 1825. Shrub 3 to 4 feet.

260 S. lanceola'tum (Cav. icon. 3. p. 23. t. 245.) stem shrubby, tomentose, prickly at the base; branches clothed with hoary tomentum; leaves lanceolate-oblong, quite entire, clothed with canescent down on both surfaces, unarmed: lower ones sinuate; racemes cymose, lateral, almost terminal; calycine segments subulate; corolla semiquinquefid, angularly plicate. ♄. G. Native of Mexico. Dun. sol. p. 200. syn. p. 34. Pseudocápsicum lancifòlium, Mœnch. meth. suppl. p. 180. Down and hairs stellate. Leaves greenish above. Corolla pale blue. Berry globose, 4-celled, size of a chick pea, orange-yellow.

Lanceolate-leaved Nightshade. Fl. June, July. Clt. 1800. Shrub 5 to 6 feet.

261 S. glutinòsum (Dun. syn. p. 35. sol. ed. 2d. ined. t. 54.) stem shrubby, erect, sparingly prickly; leaves oblong-lanceolate, cordate at the base, acute, tomentose, clammy and soft on both surfaces; racemes cymose, lateral, clammy. ♄. S. Na-

tive country unknown. Prickles straight, acerose; hairs stellate and glandular at apex; the leaves, peduncles, and calyxes clothed with similar hairs; the upper parts of the branches clammy. Leaves undulated, quite entire, or sinuated, yellowish on both surfaces, prickly on the midrib beneath. The hairs on the petioles, peduncles, nerves of leaves, and calyxes, are clammy, and of a rusty-yellow colour. Flowers pentamerous. Calycine segments oblong, acute. Corolla blue, with the star in the centre villous; lobes mucronate. Berry globose, size of a cherry, 4-celled, yellow.

Clammy Nightshade. Fl. June, July. Clt. 1810. Shrub 3 to 5 feet.

262 S. formòsum (Dun. syn. p. 35. sol. ed. 2d. ined. t. 127. H. B. et Kunth, nov. gen. amer. 3. p. 44.) stem shrubby, very prickly, hairy; leaves rather cordate, ovate-lanceolate, acuminated, clothed with woolly tomentum, almost unarmed; racemes lateral, many-flowered, very hairy. ♄. S. Native on the banks of the Orinoco, in woods near Maypures. Branches very hairy. Prickles straight, acerose. Hairs rufescent, stellate and simple, intermixed. Leaves sinuately-repand, undulated, unarmed, of a pale rufescent colour beneath, and greenish-yellow above. Calyx 5-parted, clothed with pale rusty hairs. Corolla large, plicate, 5-angled, violaceous, with a star in the centre, which is woolly outside. Stigma capitate.

Showy Nightshade. Shrub.

263 S. Brównii (Dun. sol. p. 201. syn. p. 35.) stem shrubby; prickles straight, subacerose; leaves entire or repand, long-lanceolate, almost unarmed, rather scabrous above, but clothed with grey tomentum beneath; corymbs lateral, subumbellate, on short peduncles, simple; corolla 3 times as long as the calyx. ♄. G. Native of New South Wales, within the tropic. S. violàceum, R. Br. prod. p. 446. Leaves often twin. Calyx of a greyish-purple colour, with long subulate segments. Corolla violaceous.

Brown's Nightshade. Fl. June, Aug. Clt. 1820. Shrub 2 to 4 feet.

264 S. e'legans (Dun. syn. p. 35. sol. ed. 2d. ined. t. 58.) stem tomentose, prickly; leaves oblong, acuminated, tomentose on both surfaces, prickly, sinuately repand, whitish-yellow beneath; racemes simple, tomentose, prickly. ♄. G. Native of New Holland. This species differs from *S. Brównii* in the stem, leaves, racemes, and calyxes, being prickly. Prickly, small, acute, straight, yellow at the base, and brown at top, tomentose, like the rest of the plant. Leaves often twin, prickly on the middle nerve beneath. Calyx 5-parted; with subulate segments, greyish-brown, afterwards bluish. Corolla violaceous. Style incurved.

Elegant Nightshade. Shrub.

Subsect. III. Tórvum (from *torvus*, grim or stern; in allusion to the shrubs bearing prickles.) *Prickly shrubs. Leaves entire, sinuated, or lobed. Flowers corymbose, or panicled. Anthers equal.*

265 S. gigante'um (Jacq. coll. 4. p. 125. icon. rar. 2. t. 328.) stem shrubby; prickles tomentose at the base; leaves elliptic-lanceolate, acute, unarmed, entire, glabrous above, but clothed with hoary tomentum beneath; racemes dichotomous, cymose, lateral, many-flowered, clothed with white tomentum. ♄. G. Native of the Cape of Good Hope. Dun. sol. p. 202. syn. p. 36. Sims, bot. mag. 1921. S. níveum, Vahl, symb. 2. p. 41. Thunb. prod. p. 36. S. papilionàceum, Dumont de Courset. bot. cult. suppl. p. 153.? S. farinòsum, Wall. in Roxb. fl. ind. 2. p. 255. S. argénteum, Heyne, herb. The whole plant is clothed with mealy tomentum, except the upper surfaces of the leaves. In the axils of the leaves, which are large, rise other small ones. Pedicels pendulous when bearing the flowers. Calyx small, at first 5-toothed, but afterwards 5-cleft. Corolla purplish-violet, small, deeply 5-cleft. Berry roundish, red, shining, size of a pea.

Var. β? stem unarmed? leaves thinner, and on longer petioles; tomentum finer, and more hoary; calyx deeply divided. ♄. S. Native of Dindygul, in the East Indies. Nees, in Lin. trans. 17. p. 47. S. farinòsum, Wall. cat. no. 2610. b.

Var. γ? leaves nearly a foot long, and 4 inches broad, form of those of the var. β, as well as the tomentum. ♄. G. Native of the Neelgherry mountains. Nees, l. c. S. farinòsum, Wall. cat. no. 2510. c.

Giant Nightshade. Fl. June, July. Clt. 1792. Tree 10 to 15 feet.

266 S. tórvum (Swartz, prod. p. 47. fl. ind. occ. 1. p. 456.) stem shrubby; prickles recurved, tomentose at the base; leaves twin, subcordate, ovate, sinuated and lobed, or angular, tomentose, having the midrib prickly; peduncles extra-foliaceous, corymbose, many-flowered, and are, as well as the calyxes, unarmed; segments ovate, acuminated. ♄. S. Native of Jamaica; Hispaniola; Cuba; Bermudas; and in many parts of the East Indies, in hedges. In Cuba it is called *Pendejera*. Dun. sol. p. 203. t. 23. syn. p. 36. exclusive of the syn. of Jacq. S. I'ndicum, Lin. spec. ed. 1st. p. 187. S. stramonifòlium, Ait. hort. kew. 1. p. 252.? Lam. ill. no. 2365. exclusive of the syn. of Jacq. Poir. dict. 4. p. 300. exclusive of the syn. of Jacq. S. ficifòlium, Ort. dec. 9. p. 116. S. acanthifòlium, Desf. hort. par. ex Lam. S. scàbrum, Ruiz. et Pav. fl. per. 2. p. 39. t. 175. f. a. S. pseùdosaponàceum, Blum. bijdr. p. 702.—Plukn. alm. p. 350. t. 225. f. 6.? Stem tomentose, branched, armed with a few prickles. Tomentum or down stellate, pale yellow or rusty. Leaves often twin. Prickles tomentose at the base. Racemes lateral, bifid or trifid, many-flowered; pedicels cymose. Calyx 5-cleft. Corolla white, 5-cleft, marked with a yellow, shining star in the centre; segments lanceolate, acute, with undulated edges. Anthers yellow. Style in the sterile flowers length of filaments; in the fertile flowers longer than the anthers. Berry globose, green, 4-celled, size of a chick-pea. This species is nearly allied to *S. I'ndicum*; but differs from it in the leaves being hardly prickly; in the racemes being multifid; and in the peduncles, pedicels, and calyxes, being unarmed.

Var. β; unarmed; leaves repand. ♄. S. Native of the East Indies. Nees in Lin. trans. 17. p. 54. S. Silànum, Ham. herb. ex Wall. cat. no. 2627. D. S. multiflòrum, Roth, nov. spec. p. 130.

Grim Nightshade. Fl. June, July. Clt. 1816. Shrub 6 feet.

267 S. ferrugíneum (Jacq. hort. schœnbr. 3. p. 46. t. 334.) stem shrubby; prickles glabrous; leaves ovate, lobed or sinuated, prickly on the midrib and petioles beneath, acute, tomentose; racemes corymbose. ♄. S. Native country unknown. Willd. enum. 1. p. 239. Dun. syn. p. 36. sol. ed. 2d. ined. Young leaves and branches clothed with rusty tomentum. Corolla pale blue or white. Nearly allied to *S. tórvum*, but differs in the racemes being shorter and fewer-flowered. Tomentum rusty, stellate. Prickles of the stem glabrous, rarely recurved. Said by Nees, Lin. trans. 17. p. 53. to be the same as *S. tórvum*.

Rusty Nightshade. Fl. July, Aug. Clt. 1816. Shrub 4 to 6 feet.

268 S. Hernande'sii (Moc. et Sesse, fl. mex. icon. ined. Dun. syn. p. 36. sol. ed. 2d. ined. t. 59.) stem shrubby, prickly, tomentose; leaves twin, deeply sinuated, acute, tomentose; racemes lateral; pedicels umbellate; berry 6-celled. ♄. G. Native of Mexico. Prickles few, recurved. Leaves ovate-oblong, subcordate. Petioles and peduncles prickly. Calyx villous,

with deep, acute segments. Corolla white, with ovate-oblong, bluntish segments. Berry globose.

Hernandez's Nightshade. Shrub.

269 S. TRICUSPIDA'TUM (Rich. herb. ex Dun. syn. p. 36. sol. ed. 2d. ined. t. 60.) stem shrubby, sometimes prickly; leaves sinuately angular at top, acute, scabrous above, and tomentose beneath, and rather prickly on the midrib beneath; cymes simple, tomentose. ♄. S. Native of Guiana. Poir. suppl. 3. p. 771. Branches tomentose, rusty at top. Leaves large, ovate-oblong, on long petioles, subcordate. Hairs and tomentum stellate. Calycine segments 5, acute. Corolla large, deeply 5-cleft. It differs from *S. tórvum* in the form of the leaves, and simple racemes.

Tricuspidate-leaved Nightshade. Shrub 4 to 6 feet.

270 S. Macca'i (Rich. herb. ex Dun. syn. p. 37. sol. ed. 2d. t. 61.) stem shrubby, hardly prickly; leaves subcordate at the base, sinuately lobed, canescent beneath: sinuses rounded; lobes sinuately angular; cymes simple. ♄. S. Native of Cayenne. Poir. suppl. 3. p. 771. Maccài, Merian, surin. t. 6. Branches white, powdery. Prickles straight. Leaves on long petioles, broad, furnished with a few prickles on the midrib beneath, beset with distant, stellate pili above. Peduncles, pedicels, calyxes, and under surfaces of leaves tomentose. Inflorescence and flowers similar to those of *S. tricuspidàtum*. Berry red, globose, edible.

Maccai Nightshade. Shrub 4 to 6 feet?

271 S. OVALIFÒLIUM (Dun. syn. p. 37. sol. ed. 2d. ined. t. 128.) stem shrubby, prickly; branches villously tomentose, unarmed; leaves obovate-elliptic, acute, rounded at the base, and almost unarmed, clothed with stellate tomentum beneath; racemes lateral, subdichotomous, short, and are, as well as the calyxes, unarmed. ♄. S. Native of New Granada, in the valley of the Magdalena, near Honda. Leaves repand, and somewhat undulated, furnished with 1 or 2 straight prickles on the midrib beneath, 3-4 inches long. Racemes, outside of calyxes and corollas clothed with white, stellate tomentum. Calyx 5-parted; segments obovate, acute. Segments of corolla oblong, linear, acute.

Oval-leaved Nightshade. Shrub.

272 S. HI'SPIDUM (Pers. ench. 1. p. 228. Dun. sol. p. 204. syn. p. 37.) stem shrubby, prickly, very hairy; leaves lobed, acuminated; racemes lateral, dichotomous, unarmed. ♄. S. Native of Peru, among rubbish at Pillao and Panao, where it is called *Campucasa* and *Huircacasa*. Plant beset with stellate, rusty hairs all over. Some of the superior leaves are ovate, and quite entire, acute, and a few are repand; the rest are cordate, 7-11-lobed: lobes acutish, a span long, very hairy. Racemes axillary and terminal, many-flowered. Calyx 5-cleft. Corolla white, clothed with rusty, stellate tomentum outside, somewhat 5-parted. Berry globose, yellowish.

Hispid Nightshade. Shrub 10 to 12 feet.

273 S. LANA'TUM (Dun. sol. p. 305. syn. p. 37.) stem prickly, arboreous; leaves oblong, solitary or twin; corymbs rameal, subdichotomous. ♄. S. Native of Peru, at Huassanassi. S. ásperum, Pers. ench. 1. p. 229. but not of Vahl. S. asperolanàtum, Ruiz. et Pav. fl. per. 2. p. 39. t. 174. f. b. Shrub clothed with rough, stellate, rusty wool. Leaves oblong-lanceolate, angular, shining. Calyx 5-cleft. Corolla white, woolly outside. Berry yellow, about the size of a filbert.

Woolly Nightshade. Shrub 5 to 6 feet.

274 S. PANICULA'TUM (Lin. spec. 267.) stem and petioles prickly; leaves sinuately angular, glabrous above; flowers panicled, terminal. ♄. S. Native of Brazil, and the West India Islands, where it is called *Croc de Chien* by the French. Aubl. guian. 1. p. 216. Dun. sol. p. 203. syn. p. 37. Stems and petioles clothed with white tomentum. Prickles few, straight, naked. Leaves tomentose, broad, cordate, unarmed, glabrous above. Panicles terminal, compound, tomentose, and are, as well as the calyxes, unarmed.

Panicled-flowered Nightshade. Shrub.

275 S. ACUTI'LOBUM (Dun. syn. p. 37. sol. ed. 2d. ined. t. 63.) branches almost unarmed, clothed with powdery tomentum; leaves on long petioles, cordate, sinuately angular, clothed with powdery tomentum on both surfaces; racemes cymose, almost terminal. ♄. S. Native of Para, in Brazil. Poir. suppl. 3. p. 772. Nearly allied to *S. paniculàtum;* but differs from it in the leaves being clothed with powdery tomentum. Branches almost unarmed; prickles few, small, and acute. Tomentum yellowish, stellate. Leaves greenish-yellow above, and whitish beneath. Racemes multifid, tomentose, as well as the calyxes. Corollas large.

Acute-lobed-leaved Nightshade. Shrub.

276 S. A'LBIDUM (Dun. sol. p. 206. syn. p. 37.) stem arboreous, prickly; leaves sinuated: lower ones lobed, hoary beneath; racemes axillary, many-flowered, subcorymbose. ♄. S. Native of Peru, among broken rocks on the edges of torrents; at Huanuco, Acomayo, Chulquillo, and Camuha, where it is called by the inhabitants *Yurahuacta* and *Yurahusa*. S. incànum, Ruiz. et Pav. fl. per. 2. p. 40. t. 175. f. b. but not of Lin. spec. ed. 1st. Young leaves 7-9-lobed: adult ones sinuated, glabrous above. Racemes tomentose. Calyx small. Corolla white. Berry globose, small, yellow, sometimes black.

Whitish Nightshade. Shrub 20 feet.

277 S. SAPONA'CEUM (Dun. sol. p. 206. syn. p. 37.) stem shrubby, prickly; leaves sinuately angular, scabrous; corymbs lateral, dichotomous; flowers secund. ♄. G. Native of Peru and Chili, in waste places. S. scàbrum, Ruiz. et Pav. fl. per. 2. p. 39. t. 175. f. a. but not of Vahl. In Peru the plant is called *Casiamuru*. Prickles few, remote, straight, fulvescent. Leaves solitary, but sometimes twin, beset with small stellate hairs on both surfaces. Calyx deeply 5-cleft. Corolla bluish-violet, with acute segments. Berry orange-yellow, size of a chick pea. Said by Nees in Lin. trans. 17. p. 54. to be the same as *S. tórvum*, Swartz. The *S. saponàceum*, Hook. bot. mag. t. 2697. is *S. dealbàtum*, Lindl.

Soapy Nightshade. Fl. July. Clt. 1825. Shrub 4 to 6 feet.

278 S. PLATYPHY'LLUM (Dun. syn. p. 38. sol. ed. 2d. ined. t. 130.) suffruticose; branches prickly? leaves broad-oblong, sinuately lobed, rounded at the base, beset with stellate pili on both surfaces, prickly on the midrib beneath; flowers racemose; pedicels and calyxes unarmed, and are, as well as the corollas, clothed with fuscous tomentum. ♄. S. Native in woods on the banks of the Orinoco, between the confluence of the Meta and the Cataract of Maypures. S. undecimangulàre, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 669. Leaves purplish beneath, ex Bonpl., 7-8 inches long, and 5-6 broad. Flowers unilateral. Calyx 5-cleft; lobes acute. Corolla violaceous, white inside; segments ovate-lanceolate, acuminated. Perhaps only a var. of *S. saponàceum*.

Broad-leaved Nightshade. Shrub.

279 S. Vailla'ntii (Dun. syn. p. 38. sol. ed. 2d. ined. t. 64.) stem glabrous, prickly; prickles reversed; leaves ovate, acuminated, sinuately-lobed, pilose above, scabrous beneath; racemes bifid, cymose. ♄. S. Native country unknown. Poir. suppl. 3. p. 772. This species differs from *S. saponàceum* in the characters indicated above; and in the leaves being beset with simple hairs on the upper surface, instead of stellate ones; and in the flowers being fewer.

Vaillant's Nightshade. Shrub.

280 S. PROCU'MBENS (Lour. coch. ed. Willd. 1. p. 163.) stem shrubby, procumbent, prickly; prickles recurved; leaves small, twin, on short petioles, ovate, obtuse, repandly lobed, clothed with stellate tomentum on both surfaces, glaucous,

prickly on the midrib; peduncles lateral and terminal, few-flowered; flowers reflexed, quadrifid, tetrandrous. ♄. S. Native of Cochinchina, in fields and hedges. Dun. sol. p. 207. syn. p. 38. Nees, in Lin. trans. 17. p. 58. Habit of *S. trilobàtum*. Corolla small, pale violet, with lanceolate, obtuse segments. Berry red, size of a pea, smooth, globose.

Procumbent Nightshade. Shrub procumbent.

281 S. Lichtenste'inii (Willd. enum. 1. p. 239. Dun. sol. p. 207. syn. p. 38.) stem prickly, shrubby, scandent; leaves oblong-cordate, sinuately angular, tomentose, white beneath, prickly on the middle nerve on both surfaces. ♄. ◡. G. Native of the Cape of Good Hope. Fruit size and colour of those of *Cápsicum ánnuum*. Leaves in the young plants 4 inches long, green above. Perhaps belonging to a different section.

Lichtenstein's Nightshade. Shrub climbing.

Subsect. IV. Melongena (altered from the Arabic name of the Egg-plant, bydendjan, ex Forsk. p. 63.) Tourn. inst. p. 152. *Peduncles shorter than the leaves, sometimes solitary and 1-flowered, but usually bifid below; the lower pedicel rising from the stem, and bearing a fertile flower, drooping after florescence; the other part of the peduncle bearing many usually sterile flowers; in the fertile flower the calyx is prickly, and increasing after florescence; and the style is longer than the anthers; in the sterile flower the calyx is unarmed, or hardly at all prickly, and the style is as long as the filaments. Corollas quinquefid, undulately plicate. Berry 2-3-celled; placentas 2-3, convexo-concave, fixed to the axis on both sides of dissepiment of the intermediate longitudinal lamina. Leaves sinuated, angular, or lobed.*

282 S. Melonge'na (Lin. syst. 1. p. 188. Wall. cat. no. 2628. Nees, in Lin. trans. 17. p. 48.) herbaceous, woody at the base, perennial, clothed with stellate tomentum; leaves ovate, unequal at the base, angularly sinuated; flowering peduncles reflexed; fertile peduncle solitary: sterile one racemose; calyx campanulate, with linear-lanceolate segments; corolla angular. ⊙. S. Native of the East Indies, and Arabia? Leaves canescent from stellate tomentum, but most so beneath. Calyx 6-9-cleft. Corolla large, violaceous, 6-9-cleft, marked by a yellow star inside, tomentose outside; segments broad, acute. Stigma 4-5-cleft. Berry large, smooth, shining, shape of an egg, blunt and umbilicate at apex, white; cells vanished; placentas fleshy, white, as well as the seeds, which are small and compressed.

Var. α, ovígerum; stem, leaves, and calyxes unarmed, or almost so. ⊙. S. S. ovígerum, Dun. sol. 210. Blum. bijdr. p. 698. S. melongèna, Lin. syst. 1. p. 188. Murr. syst. 1. p. 183. Melanzàna nìgra, Rauw. itin. ex C. Bauh. l. c. et Mor. hist. l. c. 5. Berries round. Melongèna fructu rotundo, Tourn. inst. l. c. The egg-plant, *Melongène* in French, *Tollapfel* in German, and *Malanzana* in Italian. The berries are large, oval, and generally white in colour, much resembling a hen's egg, and in large specimens that of a swan. In French and Italian cookery it is used in stews and soups, and for the general purposes of the Love-apple or Tomato. The following varieties are cultivated for culinary purposes. 1. The oval-shaped white. 2. The globular-shaped white, and the purple or violet-coloured of both forms. In cultivating the plants for use, they should be reared on a hot-bed in light rich earth. After they have grown two or three proper leaves, they may either be pricked out into another hot-bed, or planted in small pots, to be shifted in rotation till in size no. 16. in which they will produce their fruit. If the plants instead of being shifted into fruiting pots are planted against a wall, or in a warm border in June, they will fruit in the open air, if the season is not unusually wet and cold.

Melongene Egg-plant, Mad-apple, and Jews'-apple. Fl. June, July. Clt. 1597. Pl. 2 to 3 feet.

283 S. inca'num (Lin. spec. ed. 1. p. 188. Dun. sol. p. 213. but not of Ruiz. et Pav.) all as in *S. melongèna*, except that the fertile peduncles are racemosely corymbose, 3-4-flowered; stem, leaves, and calyxes prickly; fruit smaller, ovate or subglobose, and more inclosed in the calyx. ⊙. S. Native of the East Indies, everywhere; Mauritius, &c. S. incànum, Roxb. fl. ind. 2. p. 249. exclusive of the syn. of Rumph. S. undàtum, Lam. dict. 4. p. 301. Blum. bijdr. p. 700. S. Zeylánicum, Scop. del. 1. t. 1. S. I'ndicum, Wall. cat. no. 2626. S. incànum Zeylánicum, Pers. ench. 1. p. 226. ?—Boerh. lugdb. 2. p. 69. Plant clothed with canescent tomentum. Corolla bluish-violet. Berry roundish, yellow or white, egg-shaped.

Var. β; flowers 6-7-cleft. ⊙. S. Native of the Mauritius. S. argyracántha, Dum. Courset. bot. cult. ed. 2d. vol. 3. p. 162. S. marginàtum argyracántha, Pers. ench. 1. p. 228.

Hoary Egg-plant. Fl. July, Aug. Clt. 1820. Pl. 2 to 3 feet.

284 S. heteraca'nthum (Dun. syn. p. 39. sol. ed. 2d. ined. t. 65. Nees in Lin. trans. 17. p. 51.) herbaceous, woody at the base, perennial, clothed with stellate hairs; prickles of the

stem, which is angular, thick and hooked; leaves oval, sinuated, hoary beneath, furnished with strong straight prickles on both surfaces; segments of the leaves angular; peduncles corymbose, many-flowered, with one fertile flower at the base; calyx a little increased after florescence; corolla quinquefid: with oblong-lanceolate segments. ⊙. S. Native of the East Indies, and Africa.? This species differs from *S. Melongèna*, which it is very like, in the strong, recurved, more crowded prickles of the stem, and in the leaves being more deeply sinuated, having the lobes angular on both sides, and in the corolla being 5-cleft to the middle.

Variable-spined Egg-plant. Pl. 2 to 3 feet.

285 S. melanóxylum (Link, enum. 1. p. 188.) leaves cordate-oblong, rather unequal at the base, sinuated, prickly, tomentose, green above, and canescent beneath. ⊙. H. Native country unknown. Prickles fuscescent. Peduncles axillary, solitary. Calyx tomentose, prickly, with obtuse segments. Corolla violaceous, 6-parted. Anthers separate.

Black-wooded Egg-plant. Fl. June, July. Clt. 1821. Pl. 2 to 3 feet.

286 S. fusca'tum (Lin. spec. 268.) stem shrubby; leaves ovate-oblong, sinuately lobed, obtuse, rather tomentose; peduncles lateral, bifid at the base; berries globose. ♄. S. Native of tropical America. Dun. sol. p. 212. syn. p. 39. S. Campechiénse, β, fuscàtum, Lin. mant. 340. Branches prickly, fuscescent on the side towards the sun, beset with short, scattered, stellate hairs. Leaves prickly on both surfaces, rather roughish above, but tomentose beneath. Prickles recurved. Calyx prickly in the fertile flowers, but unarmed in the sterile flowers, 5-cleft. Corolla pale violet. Berry variegated with white and green, sometimes yellow.

Var. α, violàceum; prickles violaceous. Tourn. inst. p. 149.

Var. β, lùteum; prickles yellow, or greenish white. ⊙. S. fuscàtum, Jacq. coll. 1. p. 51. icon. rar. t. 42. Melongèna fructu rotundo, cum spinis ex albo virentibus, Tourn. inst. p. 152.?

Fuscous Egg-plant. Fl. June, July. Clt. 1817. Shrub 3 to 4 feet.

287 S. Sodo'meum (Lin. spec. 268.) stem shrubby, diffuse; prickles straight, dilated at the base; leaves oblong, sinuately-pinnatifid, shining above, and rather scabrous and prickly on both surfaces, as well as the calyxes; lobes of leaves obtuse, angular, or sinuated; peduncles bifid. ⊙.? ♄.? G. Native of the North of Africa, and South of Europe, from which it has been probably introduced to New Holland, Cape of Good Hope, and Brazil. Lam. ill. no. 2358. t. 115. f. 1. R. Br. prod. p. 446. Sibth. et Smith, fl. græc. t. 235. Thunb. prod. 1. p. 37. S. Hermánni, Dun. sol. p. 212. t. 2. β.—Munt. phyt. cur. f. 212. good.—Mor. hist. 3. sect. 13. t. 1. f. 15.—Herm. lugdb. p. 573. t. 575.—Pluk. alm. 351. phyt. t. 226. f. 5.—Sabb. hort. rom. 2. p. 12. t. 57. Solanástrum, Heist. Fabr. Helmst. p. 348, ex Willd.—Tourn. inst. 249. Stem and branches usually fuscous, or purplish; branches beset with minute stellate hairs at top. Leaves deep green. Prickles yellow, subulate, brown at the base. Calyx prickly in the fertile flowers, and unarmed in the sterile ones. Corolla purple, 5-cleft. Berry size of a walnut, globose, variegated with white and green, at length yellow.

Sodom Egg-plant, or Apple of Sodom. Fl. June, July. Clt. 1688. Shrub 3 to 4 feet.

288 S. I'ndicum (Lin. spec. 268.) shrubby, prickly; prickles of the stem compressed, recurved; leaves solitary, or twin, oblong, or ovate, tomentose, discoloured, sinuately lobed, or pinnatifid, unequal at the base; racemes interfoliaceous, subcymose; calyx prickly, with straight, linear, reflexed segments; berries globose; corolla quinquefid. ♄. S. Native of Barbadoes. Dun. sol. p. 228. syn. p. 40.—Dill. elth. 362. t. 270. f. 349.—Rob. t. 28. Tourn. inst. p. 149. exclusive of the syn. of Mor.—Plukn. alm. 350. phyt. t. 225. f. 9.—Rumph. amb. 5. p. 240. t. 86. f. 1.? Leaves prickly on both surfaces, green above, and paler beneath. Down stellate. Prickles straight; those of the stem shorter, and brown; and those of the leaves pale green. Peduncles lateral, simple, 5-6-flowered. Corolla large, bluish-purple, undulated, semi-5-cleft, somewhat pentagonal. Berry pear-shaped.? This species is said to differ from *S. Caroliniénse* in the leaves being more deeply sinuated, in the segments being sinuately-toothed, in the racemes being shorter, and in the calycine segments being reflexed, and in the corollas being larger.

Var. α; leaves cuneiform, or truncate at the base, sinuately lobed. ♄. S. Native of Silhet and Sirinagur, Penang, &c. S. I'ndicum, Lin. Roxb. fl. ind. 2. p. 252. ex Nees in Lin. trans. 17. p. 55. S. violàceum, Jacq. fragm. p. 82. t. 133. f. 1. Dun. sol. p. 128. S. canéscens, Blum. bijdr. p. 701. S. Sodòmeum, Russel, herb. Cheru-chunda, Rheed. mal. 2. t. 36.

Var. β; leaves truncate at the base, or cuneate, erosely pinnatifid. ♄. S. Native of Penang and Bengal. Nees, l. c. S. pinnatífidum, Roth, nov. spec. 129. S. Hèynei, Rœm. et Schultes, syst. 4. p. 669. S. I'ndicum, Wall. cat. no. 2626. D. E.

Var. γ; leaves smaller, cordate at the base, sinuately lobed. ♄. S. Native of the East Indies. Nees, l. c. S. agréste, Roth. nov. spec. 130. Rœm. et Schultes, syst. 4. p. 55. S. I'ndicum, Wall. cat. no. 2626. G. suppl. no. 240.

Var. δ; leaves smaller, truncate, or subcordate at the base, repandly angular; stem sparingly prickly; racemes usually 1-4-flowered. ♄. S. Native of the East Indies. Nees, l. c. S. pubéscens, Heyne, herb. Wall. cat. no. 2629. hort.

Indian Egg-plant. Fl. July. Clt. 1732. Shrub 3 to 4 feet.

289 S. coa'gulans (Forsk. fl. ægypt. arab. p. 47. Vahl. symb. 2. p. 41.) stem shrubby; leaves ovate-oblong, sinuately repand, rather tomentose, whitish beneath, prickly on the middle nerve beneath; prickles smoothish. ♄. G. Native of Arabia, Felix, where it is called *Beikaman*. Jacq. hort. schœnbr. 4. p. 35. t. 469. Delile, descr. p. 63. t. 23. f. 1. Dun. sol. p. 214. t. 2. Stem sparingly prickly, clothed with white tomentum at top. Leaves clothed with short stellate tomentum, greenish above: lobes obtuse. Prickles straight, or a little recurved, subulate at first, rather tomentose, but at length smoothish. Peduncles bifid, tomentose. Flowers as in *S. Sodòmeum*. Berry roundish, ovate, yellow at maturity.

Curdling Egg-plant. Fl. July. Clt. 1802. Shrub 3 to 4 feet.

290 S. Sa'nctum (Lin. spec. 269.) stem shrubby, tomentose; leaves ovate, repand, oblique at the base, clothed with hoary tomentum on both surfaces; prickles rather tomentose; berries nearly globose. ♄. S. Native of Palestine. Vahl, symb. 2. p. 49. Dun. sol. p. 215. syn. p. 40. S. incànum, Forsk. fl. ægypt. arab. p. 46, but not of Lin. S. coccíneum, Hort. par. Melongèna spinòsa, fructu rotundo croceo, Tourn. inst. p. 152. Pomum de Hiericho melongènis congener, Bauh. hist. 3. p. 619. with a bad figure. Pòma Hierachúntica, Imp. p. 878, with a bad figure. Every part of the plant is clothed with white, short, stellate tomentum, the prickles also. Leaves sinuately repand, obtuse, or acute, obliquely cordate at the base. Prickles compressed, broad at the base, subulate at apex, at length glabrous. Petioles prickly beneath. Racemes and flowers as in *S. coágulans*.

Holy Egg-plant. Fl. June, July. Clt. 1818. Shrub 3 feet.

291 S. du'bium (Fres. pl. ægypt. p. 166.) prickly, and

clothed with stellate tomentum; stem shrubby; leaves ovate-oblong, unequally cordate at the base, sinuately repand, prickly; prickles acicular, very straight; peduncles 3-5-flowered; calyx almost unarmed, clothed with stellate tomentum. ♄. G. Native of Egypt. Very nearly allied to *S. sánctum*, and *S. incànum*.

Doubtful Nightshade. Shrub.

292 S. Conge'nse (Link. enum. 1. p. 137.) stem tomentose, furnished with straight prickles; leaves ovate, sinuated, prickly, tomentose; peduncles lateral, very short, many-flowered; calyx tomentose, with oval, obtuse segments; corolla deeply 5-parted. ♄. S. Native of Africa, on the banks of the Congo, or Zaire river. Prickles broad at the base, those on the nerves of the leaves long, and straight. Corolla blue, downy outside. Anthers separated, equal.

Congo Egg-plant. Fl. June, July. Clt. 1821. Shrub 2 to 3 feet.

293 S. Ve'lleum (Swartz. in litt. ex Rœm. et Schultes, syst. 4. p. 643.) stem shrubby, prickly; leaves ovate, acute, quite entire, unarmed on both surfaces, clothed with woolly tomentum, reticulated beneath; racemes dichotomous, flexuous. ♄. S. Native of tropical America. Prickles straight, scattered. Branchlets tomentose. Leaves opposite, one smaller than the other, rusty, 2-3 inches long. Racemes terminal from the divisions of the branches, very long, tomentose, many-flowered. Flowers crowded, nearly sessile. Calyx tomentose. Corolla blue, tomentose outside, with obtuse segments. Stigma obtuse.

Woolly Egg-plant. Shrub.

294 S. margina'tum (Lin. suppl. p. 147. Murr. comm. gœtt. 1783. p. 11. t. 4. Jacq. coll. 1. p. 50. icon. rar. 1. t. 45.) stem shrubby; leaves subcordate, sinuately lobed, clothed with hoary powdery tomentum beneath, margined with white above; berry 3-celled, globose. ♄. G. Native of Palestine. Dun. sol. p. 215. t. 3. A. syn. p. 40. Sims. bot. mag. 1928. S. níveum, Allioni, auct. misc. and S. Abyssínicum, Jacq. hort. vind. ex Vittm. summ. p. 492. Stem prickly, tomentose at top, as well as the branches; tomentum powdery. Leaves sinuately repand, obtuse, prickly on both sides, when young white on both surfaces, but green above in the adult state. Prickles straight, subulate, yellow, fuscous at the base. Petioles, peduncles, pedicels, outsides of calyxes, and corollas clothed with white tomentum. Calyx 5-6-cleft. Corolla 5-6-cleft, large, white, marked by a purple star in the centre. Berry large, 3-celled, globose, yellow, drooping, ex Poir.

White-edged-leaved Egg-plant. Fl. June, Sept. Clt. 1775. Shrub 3 to 4 feet.

295 S. Campechie'nse (Lin. spec. 267.) stem herbaceous, very prickly, hairy; leaves cordate-oblong, lobed: lobes toothed; calyxes of the fertile flowers very prickly; berries cherry shaped. ⊙. H. Native of the Bay of Campeachy, Willd. spec. 1. p. 1059, exclusive of the syn. Lin. mant. Dun. sol. p. 216. S. acanthifòlium, Mill. dict. no 14.—Dill. elth. p. 316. t. 268. f. 347. Stem brown on the side next the sun, hairy like the leaves; hairs all stellate. Leaves prickly beneath, somewhat 5-lobed, green above, and greenish white beneath. Prickles straight, whitish, yellowish, or brown. Peduncles, pedicels, and fertile calyxes hairy, and very prickly. Corolla hairy outside, pale violet, 5-cleft. Berry form and size of a cherry, whitish when ripe.

Campeachy Egg-plant. Fl. July. Clt. 1732. Pl. 1 to 2 feet.

296 S. tróngum (Poir. dict. 4. p. 308. Dun. sol. p. 217. syn. 40.) stem suffruticose, prickly; leaves angularly sinuated, prickly on both surfaces; flowers solitary, extra-foliaceous; berries globose. ⊙.? S. Native of the Moluccas. Trongum agréste spinòsum, Rumph. amb. 5. p. 240. t. 86. f. 1. Root hard, long. Prickles recurved. Leaves obscure green. Calyx prickly. Corolla purple. Berry globose, size of a cherry. Perhaps only a var. of *S. Melongèna*, ex Nees.

Trongum Egg-plant. Fl. June, July. Clt. 1818. Shrub ½ to 1 foot.

297 S. pre'ssum (Dun. sol. p. 217. syn. p. 41.) stem almost unarmed; leaves ovate, attenuated at both ends, prickly; berries glabrous, nearly globose, flat on the top. ⊙.? S. Native of the Moluccas. Tróngum prá rùbrum, Rumph. amb. 5. cap. 48. p. 241. t. 86. f. 2. Stem usually dwarf; branches sparingly prickly. Leaves twin, acute, obscure, green, with brown nerves. Prickles short. Calyx prickly. Corolla white, or pale red. Berries size of a pigeon's egg, green, marked with white spots. Perhaps a var. of *S. Melongèna*, ex Nees.

Pressed-fruited Egg-plant. Pl.

298 S. a'lbum (Lour. coch. 1. p. 129.) stem suffruticose, almost unarmed; branches prostrate; leaves oblong, angular, sparingly prickly; peduncles many-flowered; berries globose. ♄. G. Native of Cochinchina, where it is called *Ca-Co* by the natives; and of Amboyna. Dun. sol. p. 217. syn. p. 41.—Rumph. amb. 5. p. 241. cap. 48. Root extended, with the smell of a turnip. Leaves 9-10 inches long, on long petioles, powdery, like the branches, petioles, and fruit; the powder yellow. Prickles small, short. Peduncles many-flowered, 6-7. Calyx bearded. Corolla white. Anthers yellow. Berry globose, green, marked with white spots. Perhaps a var. of *S. Melongèna*, ex Nees.

White-flowered Egg-plant. Pl. 3 to 4 feet.

Subsect. V. Acanthóphora (from *ακανθος*, *acanthos*, a spine; and *φορεω*, *phoreo*, to bear; the species contained in this section bear spines.) Dun. sol. p. 218. *Stem prickly. Leaves sinuately angular, toothed or pinnatifid, almost glabrous, or villous from simple, silky hairs, or tomentose from stellate hairs. Racemes short, few-flowered. Corollas 5-parted.*

§ 1. *Berries glabrous. Leaves smooth, or villous from usually simple silky hairs.*

299 S. acerifòlium (Dun. syn. p. 41. sol. ed. 2d. ined. t. 131. H. B. et Kunth, nov. gen. amer. 3. p. 46.) suffruticose; branches and both sides of leaves prickly, and hispid from pili; leaves hastately 3-lobed, cordate, on long petioles; peduncles few-flowered; calyx unarmed. ♄. S. Native of New Andalusia, at the monastery of Caripe. Prickles subulate, straight, elongated, yellow. Leaves about 4 inches long; lobes acuminated: lateral ones diverging, obsoletely angled outside at the base: middle one large. Peduncles prickly. Corolla violaceous. Calyx 5-lobed.

Maple-leaved Nightshade. Shrub 8 feet.

300 S. myriaca'nthum (Dun. sol. p. 218. t. 19. syn. p. 41.) stem very prickly, hairy; prickles soft, acicular; leaves cordate, sinuately angular, acute, very villous and prickly on both surfaces. ♄. S. Native country unknown. Hairs cinereous. Prickles straight. Peduncles slender, 2-3-flowered, nearly opposite the leaves, almost unarmed. Calycine segments oblong-subulate, villous outside, with ciliated margins. Corolla pilose outside, with linear-lanceolate, acute segments. This species differs from *S. aculeatíssimum*, in the leaves being very villous and sinuately angular, not lobed, and in the prickles being smaller and more slender.

Many-spined Nightshade. Fl. July, Aug. Clt. 1822. Shrub.

301 S. aculeati'ssimum (Jacq. coll. 1. p. 100. icon. rar. t. 41.) stem shrubby, very prickly; leaves subcordate, lobed, villous and prickly on both surfaces; lobes acute, toothed. ♄.

S. Native of tropical America, and Ceylon. Dun. sol. 219. syn. p. 41.—Lin. fl. zeyl. p. 38. exclusive of the syn. of Dill. and Plukn.—Ray. 3. p. 353. Prickles subulate, unequal, mixed with villi. Peduncles almost unarmed, very short, few-flowered. Flowers usually abortive. Corolla white, with acute segments. Berry globose, size of a small cherry, at first spotted with green and white, but at length pale yellow.

Very prickly Nightshade. Fl. April, July. Clt. 1816. Shrub 2 to 4 feet.

302 S. platanifòlium (Hook. in bot. mag. t. 2618.) stem hairy, sparingly prickly; prickles straight; leaves 5-lobed: lobes deeply toothed, acute; peduncles lateral, aggregate, generally 1-flowered, drooping; berry variegated. ♄. S. Native of South America. Corolla deeply 5-cleft, revolute, pale violet, with hairy margins. Stem hairy. Leaves downy. Berry large, almost globular, beautifully variegated with green and white. The plant is said to have considerable affinity with *S. Campechiénse* and *S. aculeatíssimum*, but differs from both in being less prickly.

Plane-leaved Nightshade. Fl. July. Clt. 1823. Shrub 2 to 4 feet.

303 S. incarcera`tum (Ruiz. et Pav. fl. per. 2. p. 40. t. 176. f. a.) stem prickly, villous, suffruticose; leaves usually twin, cordate, sinuately-angular, acuminated, prickly; flowers secund; berry clasped by the segments of the calyx. ♄. S. Native of Peru, in groves at Chincao. Dun. sol. p. 219. syn. p. 41. Prickles unequal, broad at the base, and subulate at the apex, and others filiform, minute. Leaves unequal in size, clothed with white hairs. Peduncles villous, nearly unarmed; pedicels cymosely umbellate. Calyx villous, with linear, reflexed segments. Corolla pale violet. Berry white, oblong, size of a cherry.

Incarcerated-fruited Nightshade. Shrub 3 to 4 feet.

304 S. mammòsum (Lin. spec. p. 267. Aubl. guian. 1. p. 216.) herbaceous; stem villous, sparingly prickly; leaves subcordate, lobed, villous, prickly on both surfaces; berry large, teated at the base. ⊙. S. Native of Virginia, Guiana, and the West India Islands, Cape of Good Hope, ex Thunb. prod. 1. p. 36. fl. cap. 2. p. 58. Dun. sol. p. 220. syn. p. 41. Pursh. fl. amer. sept. 1. p. 156. S. villosíssimum, Zuccag. cent. 1. no. 48. Pòmum Sodòmæ Merian, sur. 27. t. 27, ex Sloane. S. Americanum molle, foliorum nervis et aculeis flavescentibus, fructu mammoso, Tourn. inst. p. 149.—Sloan, hist. p. 38. t. 12. f. 1.—Plum. mss. t. 4. f. 37.—Plukn. alm. p. 350. phyt. t. 226. f. 1. The plant is called by the French *Pomme à chauve-souris*, *Pomme teton*, and *Poire de Bachelier*. Prickles compressed, yellow, broad at the base, subulate at the apex, straight, or incurved. Leaves large, the breadth almost equal to the length; lobes acute, sinuately-toothed. Peduncles unarmed, 3-4-flowered, short. Calyx very villous. Corolla violaceous, or blue, with almost linear segments. Anthers corniculate. Berry large, yellow, teated, or mammose round the base, conical.

Teated-fruited Nightshade. Fl. June, Aug. Clt. 1699. Pl. 2 to 4 feet.

305 S. acicula`re (Swartz. in litt. ex Rœm. et Schultes, syst. 4. p. 647.) stem prickly, shrubby; prickles subulately acerose; leaves roundish-cordate, repandly acute-angled, prickly on both surfaces, clothed with stellate hairs above, and tomentum beneath; peduncles axillary, terminal, very long, many-flowered. ♄. S. Native of Brazil. Prickles straight. Peduncles solitary, length of leaves, pilose, bifid at apex. Flowers large, blue. Calyx beset with bristly hairs.

Acicular-spined Nightshade. Shrub.

306 S. cilia`tum (Lam. ill. no. 2360.) stem herbaceous; leaves subcordate, sinuately lobed, ciliated: lobes obtuse; peduncles short, few-flowered; corollas 5-parted; berries globose, almost dry. ⊙. H. Native country unknown. Dun. sol. p. 221. t. 18. syn. p. 41. S. ciliàre, Willd. enum. 1. p. 237. S. capsicoìdes, Hort. par. ex Lam. This species differs from *S. Campechiénse* in the leaves not being toothed, in the hairs being simple, in the stem being prickly, not hispid. Corymbs 2-3, rarely 5-flowered. Flowers white, nutant. Berry smaller than a walnut, globose, brick coloured. It is distinguished from *S. Sodòmeum* in the racemes being small, and always 2-3-flowered.

Ciliated-leaved Nightshade. Fl. June, July. Clt. 1820. Pl. 1½ to 2 feet.

307 S. lí'vidum (Willd. herb. ex Link, enum. 1. p. 188.) leaves subcordate, sinuately-pinnatifid, rather tomentose above, but green: tomentose, and canescent beneath; prickles dilated at the base. ♄. S. Native country unknown. Branches and petioles tomentose. Leaves equal, or unequal at the base, furnished with prickles on the nerves. Peduncles 4-5-flowered, tomentose. Calyx tomentose, and furnished with long prickles. Corolla white.

Livid Nightshade. Fl. June, July. Clt. 1819. Shrub.

308 S. barbise`tum (Nees, in Lin. trans. 17. p. 51.) fasciculately hairy; stem herbaceous, prickly; prickles straight; leaves twin, elliptic, sinuated, rather hairy on both surfaces, and prickly, having the segments angular; racemes lateral, simple, many-flowered, secund, prickly; berry glabrous, covered by a bristly calyx. ⊙.? H. Native of Silhet; on the banks of the river Atran, in Martaban, and Tavoy. S. Melongèna, Wall. cat. no. 2628. e. part. Habit of *S. aculeatíssimum*, but is easily distinguished from that species in the racemose inflorescence, and in the berry being covered by the calyx.

Bristly-bearded Nightshade. Pl.?

§ 2. *Leaves villous, or tomentose from usually stellate hairs. Berries hairy.*

309 S. stramonifòlium (Jacq. misc. 2. p. 298. icon. rar. 1. t. 44.) stem shrubby, prickly; leaves cordate, sinuated, or acutely lobed, villous, and prickly on both surfaces; peduncles and calyxes unarmed. ♄. S. Native of the East Indies. Dun. sol. p. 222. syn. p. 42. Willd. spec. 1. p. 1044. exclusive of the syn. of Ait. but not of Lam. nor Poir. S. mammòsum, Lour. coch. 1. p. 162. exclusive of the syn. of Burm. Leaves a foot long, on long petioles, soft, beset with large, straight, and recurved prickles. Pedicels cymose. Calycine segments small, roundish. Corolla white, or purplish, with lanceolate segments. Stigma subcapitate.

Stramonium-leaved Nightshade. Fl. June, Sept. Clt. 1778. Shrub 6 feet.

310 S. flave'scens (Dun. syn. p. 42. sol. ed. 2d. ined. t. 67. f. 2.) stem shrubby, prickly, canescent; leaves cordate, sinuated, obtuse, prickly, and tomentose on both surfaces, yellowish beneath; peduncles, calyxes, and bracteas very hairy. ♄. S. Native of Trinidad. S. fèrox, β, flavéscens, Nees in Lin. trans. 17. p. 52. Stem very prickly. Prickles on the leaves long and strong, and the pili stellate; but the pili on the pedicels, calyxes, and berries are simple. Berry yellowish-brown. Segments of the calyx ovate, acute. Nearly allied to *S. lasiocárpum*, but differs in the leaves being sinuated, and in the recesses and lobes being very blunt.

Yellowish-fruited Nightshade. Fl. June, July. Clt. 1826. Shrub 4 to 6 feet.

311 S. fe`rox (Lin. spec. 267. Nees in Lin. trans. 17. p. 52.) stem perennial, prickly, herbaceous, woody at the base, clothed with woolly tomentum; leaves cordate, sinuately-angular, clothed with woolly tomentum, and prickly; peduncles intrafoliaceous, and are, as well as the pedicels, short; berry hairy, covered by the hairy calyx. ♃. S. Native of the East

Indies. Dun. sol. 223. ed. 2d. ined. t. 68. syn. p. 42. S. involucràtum, Blum. bijdr. p. 701. S. lasiocárpum, Dun. sol. p. 222. syn. p. 42. Blum. bijdr. p. 701. Wall. in Roxb. fl. ind. 2. p. 255. S. hirsùtum, Roxb. fl. ind. 2. p. 253. S. mammòsum, Lour. coch. 1. p. 131.—Burm. zeyl. p. 218.—Mor. hist. 3. p. 525. no. 12. sect. 13. t. 2. f. 12. Anachundri, Rheed. mal. 2. p. 65. t. 35. There are varieties of this plant having the calyxes and peduncles more or less prickly; prickles small, subulate, sometimes lying under the hairs. Stature of *S. Melongèna*. Leaves large, villous above, but tomentose beneath, as well as the racemes and calyxes, which are also prickly. Peduncles axillary, simple, short. Corolla white. Berry yellow when ripe.

Fierce Nightshade. Fl. Aug. Sept. Clt. 1795. Pl. 2 to 3 feet.

312 S. Orinoce'nse (Dun. sol. p. 42. sol. ed. 2d. ined. t. 132. H. B. et Kunth, nov. gen. p. 46.) stem herbaceous, very prickly; leaves cordate, sinuately angular, tomentose and prickly on both surfaces; calyx unarmed; berries hispid, almost covered by the calyx. ♃.? S. Native on the banks of the rivers Orinoco and Atabapo, very frequent. Stem and leaves clothed with pale yellow, stellate tomentum. Prickles long, subulate, rather compressed, straight, brown, and rather woolly at the base, and rusty, or yellow at top. Racemes lateral. This species differs from *S. fèrox*, in the stem being very prickly, in the leaves being tomentose on both surfaces, and in the racemes being unarmed.

Orinoco Nightshade. Pl. 2 to 3 feet.

313 S. Wi'ghtii (Nees in Lin. trans. 17. p. 51.) clothed with fascicled or stellate hairs; stem suffruticose, terete, armed with acicular prickles; leaves solitary, subcordately-ovate, or elliptic, sinuated, acute, rather prickly; fascicles few-flowered; peduncles elongated in the fruit-bearing state; berry glabrous, globose, covered by the unarmed, hairy calyx. ♄. S. Native of the East Indies.? This species differs from *S. barbisètum*, and *S. fèrox*, in the fruit-bearing pedicels and calycine segments being more elongated.

Wight's Nightshade. Shrub 2 to 3 feet.

† *Acanthóphoris affìnia?*

314 S. campanula'tum (R. Br. prod. p. 446. Dun. sol. p. 223.) stem herbaceous; prickles crowded, straight, subulate; leaves ovate, angularly-lobed, hairy, very prickly on both surfaces, as well as the calyxes; racemes simple, armed; corollas campanulate. ⊙. H. Native of New South Wales, about Port Jackson.

Campanulate-flowered Nightshade. Fl. June, Sept. Clt. 1819. Pl. 1 to 2 feet.

315 S. arma'tum (R. Br. prod. p. 446. Dun. sol. p. 224. ed. 2d. ined. t. 69.) stem herbaceous, diffuse; prickles much crowded, setaceously subulate; leaves oblong, sinuately pinnatifid, glabrous on both surfaces: lobes angular, or sinuated, prickly, as well as the calyxes; racemes 2-3-flowered; peduncles solitary. ⊙.? H. Native of New South Wales, about Port Jackson. Prickles orange-coloured. Leaves often twin. Down stellate. Berry globose.

Armed Nightshade. Fl. Aug. Sept. Clt. 1819. Pl. 2 feet.

316 S. punge'tium (R. Br. l. c.) stem herbaceous; prickles straight, acerose; leaves ovate-oblong, pinnatifid, or repandly sinuated, membranous, pilose on both surfaces, and the same colour, and are, as well as the calyxes, prickly; peduncles lateral, solitary, or twin, 1-flowered. ⊙. H. Native of New South Wales, about Port Jackson. Dun. sol. ed. 2d. ined. t 70. Corolla bluish violet. Down stellate.

Pungent Nightshade. Fl. Aug. Sept. Clt. 1823. Pl. 1 to 2 feet.

317 S. cine'reum (R. Br. l. c. Dun. sol. l. c.) stem herbaceous; prickles straight, subulately-setaceous; leaves oblong, pinnatifidly-sinuated, glabrous above, smooth, but clothed with cinereous tomentum beneath, and prickly on both surfaces, as well as on the calyx: peduncles 2-3-flowered. ⊙. H. Native of New South Wales, about Port Jackson.

Cinereous Nightshade. Fl. Aug. Sept. Clt. 1823. Pl. 1 to 2 feet.

318 S. latifòlium (Poir. dict. 4. p. 303. Dun. sol. p. 231. ed. 2d. ined. t. 66. syn. p. 43.) stem suffruticose, prickly; leaves petiolate, cuneated, ovate, very large, sinuately pinnatifid, pilose and prickly on both surfaces: lobes acute, and the recesses obtuse; racemes lateral, few-flowered. ♄. S. Native of tropical America. Nearly allied to *S. rígidum*, but less rigid, the stem taller, the leaves larger, and the flowers less terminal. Stem green, smooth; branches villous at top. Leaves green, soft. Prickles stiff, rather villous. Flowers both fertile and sterile. Calyx villous, sometimes prickly, usually unarmed in the sterile flowers. Corolla white; segments ovate, obtuse, hardly mucronate.

Broad-leaved Nightshade. Shrub.

319 S. crini'tum (Lam. ill. no. 2356. Poir. dict. 4. p. 297.) stem shrubby, prickly; leaves ovate, sinuately angular, tomentose, prickly on the midrib; petioles, peduncles, and calyxes beset with capillary prickles; berries villous. ♄. S. Native of Cayenne. Dun. sol. p. 224. ed. 2d. ined. t. 71. syn. p. 43. Stem very villous, and very prickly, some of the prickles are strong, and others are more numerous and capillary, usually ending in a 5-6-rayed star. Leaves large, cream-coloured, whitish beneath, and furnished with strong prickles, but almost unarmed above. Flowers disposed almost in a spicate panicle. Calyx inclosing the fruit. Corolla large, white, villous beneath, divided even to the middle into ovate, obtuse segments. Berry ovate.

Long-haired Nightshade. Shrub.

320 S. macra'nthum (Dun. syn. p. 43. sol. ed. 2d. ined. t. 72.) stem prickly, woolly; leaves large, subcordate, acuminated, angularly-lobed, woolly on both surfaces, prickly beneath; racemes cymose, woolly. ♄. S. Native of Brazil. Down or wool stellate, greyish brown. Prickles yellowish brown, straight. Leaves sometimes twin, greyish green above, rufescent beneath, with red nerves. Racemes simple, or bifid, unarmed, or furnished with a few prickles. Corolla large, with a large star in the centre, which is silky outside.

Large-flowered Nightshade. Shrub.

321 S. sessiliflòrum (Dun. syn. p. 43. sol. ed. 2d. ined. t. 73.) branches tomentose, almost unarmed; leaves subcordate, large, sinuately angular, clothed with silky tomentum on both surfaces; flowers sessile. ♄. S. Native of Para, in Brazil. Poir. suppl. 3. p. 775. Tomentum rusty. Leaves ciliated, when young rusty. Flowers 3-4 together. Calyx tomentose outside. Corolla tomentose outside. Berries eaten in Para, where they are called *Cubios*.

Sessile-flowered Nightshade. Shrub.

Subsect. VI. Lathyroca'rpum (from λαθυρος, *lathyros*, chick-pea; and καρπος, *karpos*, a fruit; in reference to the size and shape of the berries.) *Stem prickly. Leaves sinuated, or lobed. Racemes simple, or almost so. Corollas quinquefid. Berries small, globose.*

322 S. Mille'ri (Jacq. coll. 4. p. 209. icon. rar. 2. t. 330.) stem suffruticose, prickly; leaves nearly glabrous, lobed, bluntish, prickly; peduncles generally twin. ♄. G. Native of the Cape of Good Hope, ex Jacquin; on the higher mountains of Caramania, ex Ortega. Dun. sol. 225. syn. p. 43. Lam. ill. no. 2376. Poir. dict. 4. p. 304. exclusive of the

synonymes. S. trilobàtum, Lin. spec. ed. 1st. p. 188. S. trilobàtum, floribus parvis albis, Lin. spec. 270. S. subbiflòrum, Orteg. dec. 9. p. 118. S. Schiru Schuna, Mill. dict. no. 32. This species differs from *S. trilobàtum* in the leaves being pinnatifidly 5-lobed; in the flowers being much smaller, and white. Stem shining, glabrous. Cauline prickles a little recurved. Peduncles 1-flowered, solitary, twin, or tern. Lobes of leaves repand, obtuse. Berry roundish, glabrous, reddish-yellow, drooping, size of a pea, ex Jacq.; but the plant of Miller is annual, and the berries are red, and size of a pea.

Miller's Nightshade. Fl. July, Aug. Clt. 1762. Shrub 2 to 3 feet.

323 S. TRILOBA'TUM (Lin. spec. 270.) stem frutescent, scandent, prickly; prickles hooked; leaves panduriformly 3-lobed, or 3-lobed, obtuse, glabrous, and are, as well as the petioles and peduncles, prickly; racemes subumbellate, terminal and lateral; corollas deeply 5-cleft. ♄. ب. S. Native of the East Indies; as of Coromandel, Java, &c.; and of Jamaica, ex Plukn. Dun. sol. p. 225. Burm. ind. p. 57. t. 22. f. 2. Roxb. fl. ind. 2. p. 253. Nees, in Lin. trans. 17. p. 59. S. acetosæfòlium, Lam. ill. no. 2341. Poir. dict. 4. p. 306. Dun. sol. p. 226. S. fúscum, Heyn. herb. ex Wall. cat. no. 2622. B.—Plukn. alm. p. 351. phyt. t. 316. f. 5. Corollas large, white. Berries small, globose, red, drooping.

Three-lobed-leaved Nightshade. Fl. Aug. Clt. 1759. Shrub climbing.

324 S. SARMENTÒSUM (Nees, in Lin. trans. 17. p. 58.) herbaceous; stem procumbent, sarmentose, prickly; leaves geminately sub-opposite, oblong, repandly sublobed, rather prickly, clothed with stellate hairs; peduncles extra-foliaceous, usually 1-flowered, prickly, as well as the calyxes; calyx turbinate, 5-cleft, with subulate segments. ⊙.? S. Native of Penang. S. Melongèna, Wall. cat. no. 2628.? F. Leaves a little cut, and nearly opposite. It differs from *Melongèna* in the inflorescence and leaves.

Sarmentose Nightshade. Pl. sarmentose.

325 S. RIGE'SCENS (Jacq. schœnbr. 1. p. 19. t. 42.) stem prickly, suffruticose; leaves sinuately-lobed, rough from fascicles of stellate pili, prickly; prickles straight; racemes few-flowered. ♄. G. Native of the Cape of Good Hope. Dun. sol. p. 226. exclusive of the syn. of Lam. and Poir. suppl. p. 44. S. hùmile, Lam. ill. no. 2374. Branches rather villous. Leaves green; lobes obtuse. Prickles straight, long, subulate, shining, yellow. Racemes lateral, simple. Pedicels drooping. Peduncles, pedicels, and calyxes, rather tomentose, sometimes unarmed, and sometimes prickly. Corollas violaceous. Berry globose, size of a pea, glabrous.

Stiffish Nightshade. Fl. June, July. Clt. 1823. Shrub 2 feet.

326 S. ANGUI'VI (Lam. ill. no. 2375. Poir. dict. 4. p. 304.) stem shrubby, prickly; leaves ovate, sinuately angular, tomentose beneath; racemes short; calyx unarmed. ♄. S. Native of Madagascar. Dun. sol. p. 227. syn. p. 44. sol. ed. 2d. ined. t. 74. Berries small, glabrous, red, esculent.

Anguivi Nightshade, or Madagascar Potatoe. Fl. May, Sept. Clt. 1818. Shrub 2 to 3 feet.

327 S. CAROLINE'NSE (Lin. spec. 268.) stem prickly, herbaceous; leaves ovate-oblong, tomentose, sinuately lobed, acuminated; racemes simple, loose. ↯. H. Native of Carolina; and on the banks of the Missouri, along the Platte to the mountains. Jacq. coll. 2. p. 287. icon. rar. t. 331. Michx. fl. bor. amer. 1. p. 150. Dun. sol. p. 227. syn. p. 44. but not of Mill. which is *S. Dillènii*.—Dill. elth. p. 362. t. 269. f. 348. Root creeping. Stem pale green, beset with stellate pili. Segments of leaves acutish. Leaves prickly on the midrib above, and on the principal veins beneath. Prickles straight, subulate, yellow. Racemes simple, lateral and terminal, elongated. Corolla white or pale blue. Berry globose, larger than a chick-pea, yellow at maturity. Calycine segments lanceolate, acuminated.

Carolina Nightshade. Fl. July, Sept. Clt. 1732. Pl. 1 to 2 feet.

328 S. VIOLA'CEUM (Jacq. fragm. p. 82. t. 132. f. 1.) stem shrubby, prickly; leaves lobately sinuated, tomentose, unequal at the base: superior ones twin; racemes nearly simple; calyxes prickly. ♄. S. Native of Ceylon, Malabar, China, New South Wales. Ortega, dec. 5. p. 56. Dun. sol. p. 228. syn. p. 44. Poir. suppl. 3. p. 743. S. cuneàtum, Mœnch. meth. p. 476. S. I'ndicum, Lam. ill. no. 2366. Poir. dict. 4. p. 300. exclusive of the syn. of Plukn. Willd. spec. 1. p. 1042. exclusive of the syn. of Roxb., Dill., and Lin. fl. zeyl. Lour. coch. 1. p. 163.—Burm. thes. zeyl. 220. t. 102. S. fruticòsum I'ndicum, fructu rubro, Tourn. inst. p. 149. Scheru-Schunda, Rheed. mal. 2. t. 36. This species differs from *S. I'ndicum* in the leaves; in the sinuses being obtuse, larger, and less numerous; lobes entire, not dentately angular; cauline prickles compressed, recurved; calycine segments not reflexed; corollas smaller; berries globose. Leaves green above, and canescent beneath. Down stellate. Prickles brown at the base, and yellow at top; those of the leaves straight, unequal. Racemes few-flowered, tomentose, prickly, sometimes forked at the base; the other division 1-flowered. Corolla pale violet; segments lanceolate, acute, spreading. Berry copper-coloured, size of a chick-pea.

Violaceous-flowered Nightshade. Fl. June, July. Clt. 1817. Shrub 3 to 4 feet.

329 S. PYRACA'NTHUM (Lam. ill. no. 2364. Poir. dict. 4. p. 299.) stem shrubby, prickly; leaves oblong, narrow, acute, sinuately pinnatifid, tomentose, prickly; prickles straight, red. ♄. S. Native of Madagascar. Cav. descr. p. 114. Willd. enum. 1. p. 238. Dun. sol. p. 229. syn. p. 44. S. pyracántha, Smith, exot. bot. 2. p. 9. t. 64. S. runcinàtum, Wendl. obs. p. 43. ex Willd. l. c. S. pyracánthon, Jacq. schœnbr. 4. p. 36. t. 470. S. spinosíssimum, Lodd. cat.? Young branches tomentose. Down all stellate. Leaves having the middle nerve red above; lobes almost entire, acutish; recesses obtuse. Prickles straight, subulate, red. Petioles, peduncles, pedicels, and calyxes, dotted with white tomentum, prickly. Racemes simple, many-flowered. Calyx rusty, with ovate-subulate segments. Corolla bluish-violet, marked by a paler star inside in the centre, and by a pale green star outside. Berry globose, yellowish-green, at length fuscous, twice the size of a pea. A specimen received from Agardh by Schultes, under the name of *S. undàtum*, does not differ from *S. pyracánthum*, unless in the prickles being yellow, not red.

Var. β, inérmis (Sims, bot. mag. 2547.) peduncles and calyxes unarmed. ♄. S. Native of Madagascar.

Fire-spined Nightshade. Fl. Aug. Oct. Clt. 1789. Shrub 3 to 4 feet.

330 S. VIRGINIA'NUM (Lin. spec. 267.) stem annual, erect, prickly; leaves pinnatifidly sinuated, prickly on both surfaces, glabrous, with ciliated margins: lobes sinuated, obtuse; racemes prickly, simple. ⊙. H. Native of North America, from Virginia to Carolina. Dun. sol. p. 230. syn. p. 45. but not of Jacq. Pursh, fl. amer. sept. p. 156.—Dill. elth. p. 350. t. 267. f. 346.—Plukn. alm. p. 351. phyt. t. 62. f. 3. Tourn. inst. p. 149. Stem rather angular. Leaves green. Prickles strong, subulate, straight, whitish. Racemes 6-7-flowered. Calyx prickly. Corolla large, violaceous. Berry small, roundish-oblong, variegated with white and green before maturity.

Virginian Nightshade. Fl. May, Aug. Clt. 1662. Pl. 1 to 2 feet.

331 S. JACQUI'NI (Willd. spec. 1. p. 1041.) stem decumbent,

diffuse, prickly; leaves sinuately pinnatifid, prickly on both surfaces, glabrous, with naked margins; racemes simple, and are, as well as the calyxes, prickly. ⊙. H. Native of the East Indies. Dun. sol. 231. syn. p. 45. S. Virginiànum, Jacq. icon. rar. t. 332. coll. 2. p. 235. exclusive of the syn. of Dill. S. diffùsum, Wall. cat. no. 2613. S. Jacquìni, β, Nees, in Lin. trans. 17. p. 57. Kandung Kattiri of the Tamuls. This species differs from *S. Virginiànum* in the stem being decumbent, not erect; and in the margins of the leaves being naked, not ciliated. Prickles subulate, straight, long, white; lobes of leaves acutish, sinuated; recesses obtuse. Corolla bluish-purple.

Jacquin's Nightshade. Fl. Sept. Nov. Clt. 1804. Pl. procumbent.

332 S. xanthoca'rpum (Schrad. et Wendl. sert. hannov. 1. p. 8. t. 2.) stem herbaceous, prickly; lower branches procumbent, divaricate; leaves pinnatifidly ciliated, prickly on both surfaces, and clothed with stellate down: segments sinuated, acute, with naked margins; racemes few-flowered, drooping. ⊙. H. Native of the Cape of Good Hope, East Indies, and Mauritius. Dun. sol. p. 231. exclusive of the syn. of Lam. syn. p. 45. S. diffùsum, Roxb. fl. ind. 2. p. 250. S. Jacquìni, var. α, Nees, l. c. Very like *S. Jacquìni;* but differs in the cauline prickles being fewer; in the young branches and leaves being clothed with stellate down. Prickles long, yellow. Peduncles 3-4-flowered, lateral and terminal. Corolla large, blue, flat, marked with a purple star in the centre, which is downy outside. Berry globose, size of a cherry, yellow, shining, 1-celled.

Yellow-fruited Nightshade. Fl. June, July. Clt. 1824. Pl. ½ foot.

333 S. Richa'rdi (Dun. syn. p. 45. sol. ed. 2d. ined. t. 67. f. 1.) stem prickly, and scabrous from tomentum, as well as the leaves, on both surfaces, cinereous beneath; flowers panicled. ♄. S. Native country unknown. Leaves ovate-oblong, beset with stellate pili on both surfaces; the prickles on the upper surface straight, and those on the under surface recurved. Racemes simple, beset with stellate hairs, and prickly as well as the calyxes and pedicels. Corolla large, with a 5-rayed star in the centre, villous outside.

Richard's Nightshade. Shrub.

334 S. hy'strix (R. Br. prod. p. 446. Dun. sol. 232. syn. p. 45.) stem herbaceous, diffuse; prickles much crowded, subulate, straight; leaves oblong, pinnatifidly sinuated, glabrous, and are, as well as the calyxes, very prickly; corolla armed. ⊙. S. Native of New Holland, on the south coast.

Porcupine Nightshade. Pl. ?

Subsect. VII. Cryptoca'rpum (κρυπτω, *krypto*, to hide; and καρπος, *karpos*, a fruit; fruit hidden by the calyx.) Dun. sol. 232. syn. p. 45. Nyctèrium species of authors. *Leaves pinnatifid, bipinnatifid, and pinnate. Corollas 5-cleft. Berry covered by the increased prickly calyx.*

§ 1. *Anthers equal.*

335 S. Balbi'sii (Dun. sol. 232. t. 3. D. syn. 45. Ker. bot. reg. 140.) stem shrubby, villous, prickly; leaves pinnatifid, pilose, prickly: segments acute, sinuately toothed; racemes cymose, lateral and terminal, and are, as well as the calyxes, prickly; anthers nearly equal. ♄. G. Native of Peru, on the Andes, near Ayavaca; and on the banks of the river Cutaco, at the altitude of 900 to 1400 hexapods. S. decúrrens, Balb. icon. et descript. fasc. 1. p. 17. t. 1. S. viscòsum, Lag. gen. et spec. nov. p. 10. no. 145. D. C. hort. monsp. S. sisymbrifòlium, Lam. ill. no. 2386. Poir. dict. 4. p. 307. S. inflàtum, Horn. hort. hafn. 1. p. 221. S. brasicæfòlium, Jacq. eclog. p. 14. t. 7. S. formòsum, cat. hort. Dorp. S. Mauritànum velins du gard. de paris, p. 21. t. 66. Roth, nov. spec. S. víscidum, Schweigg. enum. p. 67. Mart. enum. hort. erl. p. 64. S. Thouíni, Gmel. cat. carlsr. p. 254. The whole plant is clothed with simple pili, which are tipped by glands. Leaves soft, clammy, prickly. Petioles prickly. Calyx sometimes unarmed, and sometimes prickly. Prickles straight, subulate, slender, yellow, or reddish-yellow. Corollas large, white, semiquinquefid. Berry ovate, size of a cherry, copper-coloured. This is a beautiful plant when in blossom.

Var. β, *purpùreum* (Hook. bot. mag. t. 2828.) flowers purple. ♄. S. Native of Brazil. S. Balbísii, Ker. bot. reg. t. 140. Berry large, yellow, covered by the calyx. There is also another variety with pale blue flowers.

Balbis's Nightshade. Fl. April, Sept. Clt. 1816. Shrub 3 to 4 feet.

336 S. te'ctum (Pers. ench. 1. p. 228. Dun. sol. p. 233. syn. p. 46.) stem shrubby, terete, prickly; leaves bipinnatifidly sinuated, villous, prickly on both surfaces; berry covered by the villous calyx. ♄. G. Native of Mexico. S. sinuàtum, Willd. spec. 1. p. 1043. Pers. ench. 1. p. 227. S. frúctu técto, Cav. icon. 4. p. 5. t. 309. S. villòsum, Dietr. gart. lex. 9. p. 341. Plant villous. Leaves bipinnatifid; lobes obtuse, curled. Prickles thick, whitish: the slenderer ones brown. Corolla yellow, tomentose outside. Stamens alternating with the crenæ in the throat. Berry globose, glabrous. Racemes cymose, extrafoliaceous. Peduncles and calyxes very prickly.

Covered-berried Nightshade. Fl. April, Sept. Clt. 1824. Shrub 2 to 3 feet.

§ 2. *Anthers unequal.*

337 S. cornu'tum (Lam. ill. 2. p. 25. no. 2387. Poir. dict. 4. p. 308.) stem prickly, glabrous, subherbaceous; leaves pinnate, prickly: segments pinnatifid, obtuse; prickles strong; anthers declinate, horn-formed: the lower one large, and much drawn out. ♄. G. Native of Mexico; also of Brazil. Juss. ann. mus. 3. p. 120. t. 9. Dún. sol. p. 234. syn. p. 46. S. heterándrum, Juss. Nyctèrium cardaminifòlium, Vent. jard. malm. no. 85. Nyctèrium cornùtum, Link, enum. 1. p. 189. Leaves large, glabrous. Peduncles and calyxes villous and prickly at the base. Prickles subulate, yellow, fuscescent at the base; those of the calyx setaceous. Racemes simple, lateral. Corollas large, yellow, irregular, semiquinquefid, with reflexed segments.

Horned-anthered Nightshade. Fl. June, Aug. Clt. 1823. Shrub 2 to 4 feet.

338 S. hetera'ndrum (Pursh, fl. amer. sept. 2. p. 731. t. 7.) annual; stem and leaves prickly and hairy; leaves ovate, obtuse, pinnatifid, hairy on both surfaces: segments obsoletely crenated and undulated; anthers declinate, distant: lower one horn-formed, and drawn out; berry inclosed in the echinated calyx. ⊙. H. Native on the banks of the Missouri, Arkansas, &c. Pursh, l. c. 1. p. 156. Androcèra lobàta, Nutt. gen. amer. 1. p. 129. Nyctèrium lobàtum, Sweet. N. lùteum, Donn. Corollas yellow. Peduncles lateral, many-flowered.

Variable-anthered Nightshade. Fl. June, July. Clt. 1813. Pl. 1 to 2 feet.

339 S. rostra'tum (Dun. sol. p. 234. t. 24. syn. p. 46.) stem prickly, pilose; pili stellate at apex; leaves pinnatifid: segments obtuse; corollas irregular; anthers declinate, horn-formed: lower one large, and much drawn out. ⊙. H. Native of Mexico. Leaves beset with cinereous, stellate, and simple hairs, and very prickly on both surfaces. Prickles unequal, straight, subulate, yellowish. Racemes lateral, simple.

Calyx villous, prickly. Corollas large, yellow, pilose outside, semiquinquefid. Berry globose, size of a pea.

Beaked-anthered Nightshade. Fl. June, Aug. Clt. 1823. Pl. 2 to 3 feet.

340 S. Fontanesia'num (Dun. syn. p. 46. sol. ed. 2d. ined. t. 76.) stem rather woody, annual, prickly, pilose; leaves deeply pinnatifid: segments sinuated; corollas almost regular; anthers small: lower one a little curved at apex, brown. ⊙. H. Native of Brazil? Poir. suppl. 3. p. 777. Ker. bot. reg. t. 177. Nyctèrium Fontanesiànum, G. Don, in Loud. hort. brit. p. 74.—An intermediate plant between *S. rostràtum* and *S. heterodóxum*; but differs from both in the prickles being recurved, and more robust; in the leaves being more deeply pinnatifid; in the segments being more deeply sinuated and curled; in the flowers being smaller, and more regular, although also yellow.

Desfontaine's Nightshade. Fl. July, Sept. Clt. 1813. Pl. 2 to 3 feet.

341 S. heterodóxum (D. C. hort. monsp. mss. with a drawing, ex Dun. sol. p. 235. t. 25. syn. p. 46.) herbaceous; branches and leaves pilose and prickly; leaves bipinnatifid; segments sinuately 3-lobed, or runcinate; peduncles lateral, few-flowered, and are, as well as the calyxes, prickly; anthers declinate: lower one large, and much drawn out. ⊙. H. Native of Mexico, near Zelaya and Molino de Sarąbia, at the altitude of 940 hexapods. Nyctèrium heterodóxum, Link, enum. 1. p. 189. Segments of leaves acute. Hairs simple, clammy, glanduliferous at top. Prickles subulate, yellow. Corollas small, blue, downy outside. Berry globose, size of a sloe.

Variable Nightshade. Fl. June, Aug. Clt. 1820. Pl. 2 to 3 feet.

Subsect. VIII. Nycte'rium (from νυκτερις, *nycteris*, a bat; form of leaves?) Dun. sol. p. 202. *Leaves cordate, entire; or oblong, sinuated. Corolla rather irregular, quinquefid; segments acute, reflexed. Anthers unequal. Berry globose, propped by the calyx, but not covered by it.*

342 S. pube'scens (Willd. phyt. p. 5. no. 17. t. 3. spec. 1. p. 1026.) shrubby, unarmed, clothed with hairy down all over; leaves ovate, acute, quite entire, or subrepand; racemes corymbose at the sides of the leaves; lower anthers drawn out. ♄. S. Native of the East Indies. Dun. sol. p. 167. syn. p. 19. Nees, in Lin. trans. 17. p. 60. Corollas large, purplish. Very nearly allied to *S. vespertílio* of Ait; but the stem in that species is prickly, and the leaves cordate, and the flowers are often quadrifid.

Downy Nightshade. Fl. June, July. Clt. 1820. Shrub 5 to 6 feet.

343 S. calyci'num (Nees, in Lin. trans. 17. p. 60.) shrubby? unarmed, clothed with hairy stellate pubescence; leaves ovate, quite entire, or a little repand; racemes terminal; calyx and corolla funnel-shaped; one of the anthers drawn out. ♄.? S. Native of the East Indies. S. pubéscens, var. Herb. madr. Wall. cat. suppl. no. 237. This is a singular species.

Large-calyxed Nightshade. Shrub.

344 S. vespertí'lio (Ait. hort. kew. 1. p. 252.) stem shrubby; leaves cordate, entire; corollas rather irregular, usually quadrifid; lower anther elongated. ♄. G. Native of the Canary Islands, where it is called *Realgera* and *Permenton*. Dun. sol. p. 202. syn. p. 35. Wendl. hort. harr. p. 5. t. 21. Nyctèrium cordifòlium, Vent. malm. p. 85. t. 85.—Pluk. phyt. t. 316. f. 3. alm. 351. mant. 173. Stem prickly. Leaves scabrous above, and tomentose beneath; petioles and midrib prickly. Hairs and tomentum stellate. Racemes extra-axillary, prickly, tomentose. Flowers tetramerous or pentamerous. Corolla blue, tomentose outside. Anthers 4-5, one of which is long and arched. Berry glabrous, size and form of a cherry.

Bat-winged-leaved Nightshade. Fl. April, July. Clt. 1779. Shrub 2 to 3 feet.

345 S. tridyna'mum (Moc. et Sesse, fl. mex. icon. ined. Dun. syn. p. 35. sol. ed. 2d. ined. t. 75.) stem herbaceous? prickly, rather tomentose, leaves sinuated, bluntish, tomentose; racemes simple; calyxes prickly on the ribs; corollas irregular; 3 of the anthers are recurved, and longer than the other two. ⊙.? G. Native of Mexico. Stem of a rusty-yellow colour. Racemes terminal and axillary. Calycine segments 5, acute; and the corolla large and violaceous, as well as the tops of the anthers. Berry globose.

Three-powered Nightshade. Pl. 2 feet.

346 S. Amazònium (Ker, in bot. reg. t. 71. Dun. syn. p. 36. sol. ed. 2d. ined.) stem shrubby, tomentose, unarmed; leaves oblong-ovate, repand, or sinuately-lobed; racemes cymose, scorpioid; flowers polygamous, monoecious; calyxes of the fertile flowers prickly at the base: the segments unarmed; corollas irregular; 3 of the anthers longer than the other 2. ♄. 1. Native of Mexico. Nyctèrium Amazònium, Link, enum. 1. p. 189. G. Don, in Loud. hort. brit. p. 74. N. Lambérti, Sweet. The whole plant is clothed with hoary down. Flowers large, beautiful blue, corymbose.

Amazonian Nightshade. Fl. June, Aug. Clt. 1800. Shrub 2 to 3 feet.

† *Species not sufficiently known.*

§ 1. *Unarmed species.*

* *Leaves entire or repand.*

347 S. Cajunume'nse (H. B. et Kunth, nov. gen. amer. 3. p. 47.) stem shrubby; branches hairy; leaves solitary, roundish-ovate, short-acuminated, cordate, quite entire, hairy; racemes supra-axillary, trifid; flowers unilateral. ♄. S. Native of New Granada, in the woods of Cajunuma and Untusinga, near Loxa, at the altitude of 1040 hexapods. Corolla subrotate, violaceous, glabrous; segments ovate-oblong, acute, with inflexed margins. Berry 2 inches long, ovate, acute, 1-celled, many-seeded, ex Bonpl. Perhaps this species belongs to section *S. crotonoìdes*, or is, and perhaps with more correctness, a species of *Cápsicum*.

Cajanuma Nightshade. Shrub 10 to 12 feet.

348 S. adenótrichum (Dun. sol. 236. syn. p. 46.) stem unarmed, shrubby; leaves cordate, acuminated, clothed with glanduliferous hairs on both surfaces, quite entire; flowers racemose. ♄. S. Native of Brazil. Vandelli. spec. fl. bras. in Rœm. script. de pl. hisp. p. 86.

Gland-haired Nightshade. Shrub.

349 S. di'dymum (Dun. sol. p. 236. syn. p. 47.) stem frutescent, flexuous; leaves ovate; calyxes, stem, and leaves, beset with branched hairs; the upper surfaces of the leaves tubercled; flowers cymose. ♄. S. Native of Brazil. Vand. spec. fl. bras. in Rœm. script. pl. hisp. p. 86.

Didymous Nightshade. Shrub.

350 S. cladótrichum (Dun. l. c.) stem unarmed, frutescent, flexuous; leaves ovate; calyxes, stem, and leaves, beset with branched hairs; upper surface of the leaves tubercled; flowers cymose. ♄. S. Native of Brazil. Vand. spec. fl. bras. in Rœm. script. de pl. hisp. p. 85.

Branch-haired Nightshade. Shrub.

351 S. intege'rrimum (Dun. sol. p. 236. syn. 47.) stem unarmed, shrubby; leaves broad-lanceolate, quite entire; lower

surfaces of the leaves tomentose; racemes terminal. ♄. S. Native of Brazil. Vand. spec. fl. bras. in Rœm. script. pl. hisp. p. 85.

Quite-entire-leaved Nightshade. Shrub.

352 S. Forska'lii (Dun. sol. p. 237. syn. p. 47.) leaves villous, oval, oblique at the base, with repand margins.—Native of Arabia. S. villòsum, Forsk. fl. arab. p. 47. but not of Lam. Bockœme is the Arabic name of the tree.

Forskæl's Nightshade. Shrub?

353 S. repa'ndum (Forst. prod. p. 105. Willd. spec. 1. p. 1032. Dun. l. c.) stem unarmed, sub-herbaceous, flexuous, smooth; leaves ovate, repand, tomentose; pedunclés axillary, cymose. ⊙.? H. Native of the Society Islands.

Repand-leaved Nightshade. Pl.

354 S. Plukene'tii (Dun. l. c.)—Native of? Solànum I'ndicum, lauriniis angustioribus foliis maximum. Plukn. phyt. t. 227. f. 2.

Plukenet's Nightshade. Shrub?

355 S. erioca'lyx (Dun. l. c.) stem unarmed, shrubby; leaves ovate, quite entire, tomentose beneath; umbels erect, terminal; calyxes obtuse, woolly. ♄. S. Native of America, about Carthagena. S. racemòsum, Mill. dict. no. 28. ex Houst. mss. but not of Lin. Umbels large. Corollas large, white. Berry globose, yellow, size of a small cherry. Leaves 4 inches long, and 1½ broad.

Woolly-calyxed Nightshade. Shrub.

356 S. umbella'tum (Mill. dict. no. 17. ex Houst. mss. Dun. l. c.) stem frutescent, unarmed; leaves lanceolate, quite entire, pilose beneath; umbels erect, terminal. ♄. S. Native of Mexico, about Campeachy. Leaves 5 inches long, and 1½ broad. Flowers small. Corolla white. Anthers purple. Berry yellow, size of a pea.

Umbellate-flowered Nightshade. Shrub 10 to 12 feet.

357 S. America'num (Mill. dict. no. 5.) stem unarmed, herbaceous; leaves ovate, acuminated, glabrous; umbels erect. ⊙. H. Native of Virginia. S. Americànum vulgàri simile, flore parvo purpurascente, acinis nigricantibus minoribus, Rand. ex Mill. Stem angular; branches slender, spreading. Leaves dark green, a little toothed. Flowers few, small. Calycine segments narrow, acuminated, white, purplish outside. Berries small, black.

American Nightshade. Pl. 2 to 3 feet.

358 S. axiliflòrum (Dun. sol. p. 238. syn. p. 47.) stem unarmed, frutescent, flexuous; leaves ovate, tomentose beneath; flowers solitary, alar. ♄. ◡. S. S. scándens, Mill. dict. no. 19. ex Houst. mss. Leaves 2 inches long, and 1½ broad. Corolla large, pentagonal, blue; angles mucronate. Berry size of a pea, red. Perhaps belonging to section *Polymeris*.

Axillary-flowered Nightshade. Shrub 10 to 12 feet.

359 S. Willdenòwii (Rœm. et Schultes, syst. 4. p. 661.) unarmed, herbaceous, quite glabrous; leaves ovate-elliptic, obtuse, quite entire; peduncles solitary or twin. ⊙. H. Native country unknown. S. obtusifòlium, Willd. enum. suppl. p. 11.

Willdenow's Nightshade. Pl. 1 to 2 feet.

360 S. Memphi'ticum (Mart. enum. hort. erlang. p. 63.) stem herbaceous, unarmed, erect, denticulately angular; leaves ovate; peduncles erect, many-flowered: fructiferous ones drooping. ⊙. H. Native country unknown. Leaves petiolate, rather downy, purplish, having the veins violaceous on the under side. Peduncles corymbose, 5-7-flowered. Calycine segments obtuse. Corollas size of those of *S. nigrum*, violaceous; the segments cut even to the calyx, with a yellowish claw; anthers brown. Berry black. Aspect of the plant lurid, from the stem being purplish, and the veins of the leaves dark purple.

Memphitic Nightshade. Pl. 1 to 1½ foot.

361 S. dictyóticum (Rœm. et Schultes, syst. 4. p. 661.) stem shrubby, tomentose; leaves ovate, truncately cordate at the base, unequal, angular towards the base, toothed, densely tomentose beneath; cymes axillary. ♄. S. Native country unknown. S. reticulàtum, Willd. herb. mss.

Netted Nightshade. Shrub.

362 S. citrifòlium (Willd. herb. ex Rœm. et Schultes, syst. 4. p. 662.) stem shrubby; leaves oblong, acuminated, shining, clothed with white tomentum beneath; spikes terminal, dichotomously corymbose. ♄. S. Native of South America, on the banks of the river Magdalena.

Citron-leaved Nightshade. Shrub.

363 S. stipula'ceum (Willd. l. c.) stem shrubby; leaves lanceolate, quite entire, tomentose; cymes pedunculate, alar; stipulas semilunate. ♄. S. Native of Brazil, Hoffmannsegge.

Stipulaceous Nightshade. Shrub.

364 S. Cumane'nse (Rœm. et Schultes, syst. 4. p. 662.) stem shrubby; leaves roundish-ovate, acute, glabrous, a little toothed; umbels terminal. ♄. S. Native of Cumana, Humb. et Bonpl. S. umbellàtum, Willd. herb. l. c.

Cumana Nightshade. Shrub.

365 S. dumetòrum (Willd. herb. l. c.) stem shrubby, branched; leaves ovate, downy above, but pilosely tomentose beneath; peduncles axillary, 1-flowered. ♄. S. Native country unknown.

Bush Nightshade. Shrub.

366 S. campanifórme (Rœm. et Schultes, syst. 4. p. 662.) shrubby; leaves lanceolate, acuminated, glabrous; racemes axillary, on long peduncles. ♄. S. Native of Brazil. S. campanulàtum, Willd. herb. l. c. Racemes axillary and extra-foliaceous, longer than the leaves, erect. Corolla deeply 5-parted, campanulate.

Bell-formed-flowered Nightshade. Shrub.

367 S. pedunicula'tum (Willd. herb. l. c.) shrubby; leaves lanceolate, petiolate, bluntish, pilosely strigose; umbels pilose, pedunculate. ♄. S. Native country unknown.

Pedunculate-flowered Nightshade. Shrub.

368 S. prunifòlium (Willd. l. c.) shrubby; leaves elliptic, acuminated, serrated, on long petioles; panicle terminal. ♄. S. Native of Caraccas, Bredemeyer. Leaves 1½ inch long, acuminated at both ends, erosely-toothed. Panicle divaricate.

Plum-leaved Nightshade. Shrub.

369 S. flexuòsum (Willd. herb. l. c.) stem shrubby, flexuous, retrofracted; leaves ovate, tomentose beneath; peduncles solitary, axillary, filiform, elongated. ♄. S. Native of St. Domingo, Desfontaines.

Flexuous Nightshade. Shrub.

370 S. micra'nthum (Willd. herb. l. c.) stem shrubby; leaves oblong, attenuated at both ends, scabrous and green beneath; corymbs shorter than the petioles. ♄. S. Native of South America. Humb. et Bonpl.

Small-flowered Nightshade. Shrub.

371 S. mode'stum (Rœm. et Schultes, syst. 4. p. 665.) stem frutescent, unarmed, glabrous; leaves lanceolate, attenuated at the base, veiny, with subundulated margins, glabrous; flowers terminal, corymbose. ♄. S. Native of Mexico. S. Mexicànum, Willd. herb. l. c.

Modest Nightshade. Shrub.

* * *Leaves toothed, sinuated, lobed, and pinnate.*

372 S. Africa'num (Tourn. inst. p. 149. Dun. sol. p. 238. syn. p. 48.)—Native of Africa. S. bacciferum vulgari simile Africanum; foliis frequentius et profundius crenatis, Tourn. l. c.

African Nightshade. Pl. ?

373 S. Lusita'nicum (Dun. sol. p. 238. syn. p. 48.) ♃. H. S. Lusitánicum perenne; foliis amplis profunde crenatis; fructu rubro, Tourn. inst. p. 149.

Portugal Nightshade. Pl.

374 S. viscòsum (Mœnch. meth. suppl. p. 79. Dun. sol. p. 238. syn. p. 48.) stem shrubby, clammy; leaves large, cordate, sinuated, clammy; sinuses elevated. ♄. S. Native country unknown. Stem terete, branched at top. Leaves petiolate; lobes roundish, pubescent. Peduncles lateral, shorter than the petioles, bearing each 3-4 pedicels, which are reflexed in the fruit-bearing state. Corolla white. Berry roundish, yellow, striated.

Clammy Nightshade. Shrub 4 feet.

375 S. avicula're (Forst. prod. no. 107. pl. esc. no. 12.) stem unarmed, shrubby; leaves sinuately pinnatifid; corymbs terminal. ♄. G. Native of New Zealand.

Knot-Grass Nightshade. Shrub.

376 S. re'pens (Dun. sol. p. 239. syn. p. 48.) stems herbaceous, pilose, tetragonal, membranous, creeping; leaves pinnate or decurrent, quite entire, pilose; racemes simple. ♃. H. Native of Brazil. Vand. spec. fl. bras. in Rœm. script. pl. hisp. p. 86.

Creeping Nightshade. Pl. creeping.

377 S. Valenzue'læ (Palacio, mem. mus. 2. p. 340. Dun. syn. p. 48.) root bearing tubers; leaves unequally pinnate; racemes few-flowered; pedicels articulated; berries glabrous, oblong, compressed. ♃. H. Native of New Granada, at the river Malave, Eloy Valenzuela. Stolons bearing white, nearly round, flattened, sapid tubers. Stems procumbent, much branched. Corolla with revolute segments. A variety of *S. tuberòsum*.

Valenzuela's Potatoe. Pl. procumbent.

378 S. Ca'ri (Mol. chil. p. 109.) stem herbaceous; leaves pinnate, entire; nectarium campanulate, exceeding the petal. ♃. ? H. Native of Chili. This is certainly no *Solànum*, and perhaps even does not belong to the order.

Cari Nightshade. Pl. ?

379 S. subloba'tum (Willd. herb. l. c.) stem suffruticose, branched; leaves lanceolate, sublobed, naked, obtuse; peduncles opposite the leaves, sub-trilobed. ♄. G. Native of Buenos Ayres.

Sublobate-leaved Nightshade. Shrub.

380 S. Caraccasa'num (Rœm. et Schultes, syst. 4. p. 664.) stem shrubby; leaves pinnate, ternate and simple, quite entire; flowers racemose. ♄. S. Native of Caraccas, Bredemeyer. S. heterophýllum, Willd. herb. l. c. Shrub 10 feet high. Branches dichotomous, divaricate. Peduncles from the axils of the branches, elongated into twin, pendulous racemes. Corolla and anthers violaceous.

Caraccas Nightshade. Shrub.

381 S. fusca'tum (Rœm. et Schultes, l. c.) shrubby; leaves interruptedly pinnate, tomentose beneath; stipulas falcate; flowers corymbose, panicled. ♄. S. Native of South America. Humb. et Bonpl. S. pinnàtum, Willd. herb. l. c.

Fuscous Nightshade. Shrub.

382 S. thymifòlium (Willd. herb. l. c.) stem frutescent; leaves pubescent, auricled at the base, almost sessile; peduncles axillary, 1-flowered. ♄. G. Native of Buenos Ayres.

Thyme-leaved Nightshade. Shrub.

§ 2. *Prickly plants.*

* *Leaves entire.*

383 S. Bote'lho (Vand. fasc. p. 10. Rœm. script. pl. hisp. p. 85.) stem shrubby, tomentose, rather prickly; leaves ovate-oblong, quite entire, tomentose beneath; racemes lateral, drooping. ♄. S. Native of Brazil. S. Botelhiànum, Dun. sol. p. 239. Prickles few, very short. Calyxes, peduncles, and petioles tomentose. Leaves unequal at the base, glabrous above. Berry glabrous.

Botelho's Nightshade. Shrub.

384 S. Brasilia'num (Dun. sol. p. 665. syn. p. 48.) ♄. S. Native of Brazil. Solànum Brasiliànum, folio integro mucronato, glabro, Papas Americani, floribus in summitate caulis, Plukn. amalth. append. t. 454. f. 4. Leaves ovate, acuminated, unarmed. Flowers corymbose. Corolla pentagonal; anthers divaricate.

Brasilian Nightshade. Fl. Clt. Shrub ?

385 S. corda'tum (Forsk. fl. arab. p. 47. no. 56.) stem shrubby, rather prickly; leaves roundish-cordate, entire, unarmed. ♄. S. Native of Arabia, where it is called *Hadak*. Leaves half an inch long, glabrous. Corolla violaceous, deflexed. Berry pulpy, red, size of a pea.

Cordate-leaved Nightshade. Shrub.

386 S. nicotianæfòlium (Lag. gen. et spec. nov. p. 10. no. 144.) stem prickly, shrubby; leaves obliquely cordate-oblong, and oblong, acute, unarmed, subundulated, very clammy. ♄. S. Native country unknown.

Tobacco-leaved Nightshade. Shrub.

387 S. trifolia'tum (Burm. ind. t. 22. f. 3. Gmel. syst. p. 386. Vittm. summ. 1. p. 493.) stem shrubby; leaves ternate, ovate, quite entire. ♄. S. Native of Coromandel. Stem quite glabrous. Prickles few, incurved. Leaves alternate, petiolate, glabrous.

Trifoliate Nightshade. Shrub.

388 S. Dominge'nse (Willd. herb. ex Rœm. et Schultes, syst. 4. p. 665.) stem shrubby, rather prickly, flexuous; leaves elliptic, petiolate, quite entire, tomentose beneath; flowers axillary, aggregate. ♄. S. Native of St. Domingo.

St. Domingo Nightshade. Shrub.

* * *Leaves sinuated, lobed, and pinnatifid.*

389 S. Chine'nse (Dun. sol. p. 240. syn. p. 49.) ♄. G. Native of China. Solànum incànum Chinénse minus spinosum, floribus parvis fere umbellatis, fructu majore aureo, Plukn. phyt. t. 62. f. 1. Tourn. inst. p. 149. In the figure the leaves are represented as twin; the one smaller than the other, sinuated, having the midrib prickly; the peduncles are numerous, aggregate, almost opposite the leaves, and hardly longer than the petioles; and the flowers are small. Said to be nearly allied to *S. violàceum*.

China Nightshade. Shrub.

390 S. glabra'tum (Dun. l. c.) stem prickly, shrubby; leaves prickly, oblong, dentately-sinuated, glabrous; calyx glabrous; corolla violaceous, reflexed; berry globose. ♄. G. Native of Arabia, at Surdud. S. Bahaménse, Forsk. egypt. p. 46. no. 53.

Glabrous Nightshade. Shrub.

391 S. Ara'bicum (Dun. l. c.) stems procumbent, annual, very prickly; prickles straight; peduncles opposite; the leaves racemose. ☉. H. Native of Arabia, where it is called *Bocheme*, or *Bokom*. S. armàtum, Forsk. fl. arab. p. 47. no. 54, but not of R. Br. Perhaps only a variety of *S. glabràtum*, with which it agrees in the leaves, and form and figure of the corolla. Prickles numerous, white, straight, spreading. Stems, petioles, nerves of leaves, calyxes, and peduncles very prickly. Fruit fleshy, obscure green, veined with white.

Arabian Nightshade. Pl. procumbent.

392 S. strigòsum (Vand. fasc. p. 10. Rœm. script. pl. hisp. p. 55.) stem shrubby, strigose; leaves ovate, sinuated, rather

prickly on the midrib, tomentose; calyxes strigose; berry tomentose. ♄. S. Native of Brazil. Dun. sol. p. 241. syn. p. 49. Stem, petioles, and calyxes beset with long, yellowish strigæ. Leaves cordate at the base; prickles yellowish. Panicles lateral, branched. Corolla tomentose outside. Berries small.

Strigose Nightshade. Shrub.

393 S. Vandellia'num (Dun. sol. p. 241. syn. p. 49.) stem flexuous, dichotomous, shrubby, prickly, tomentose; prickles incurved; leaves sinuately-angular, rather tomentose, spiny on the midrib; spikes solitary. ♄. S. Native of Brazil. S. dichótomum, Vand. fasc. p. 9. Rœm. script. p. 54, but not of Lour. Stem greenish yellow. Tomentum stellate. Prickles few, yellow at top. Leaves sub-petiolate. Spikes revolute, as in *Heliotròpium*. Calyx tomentose. Corolla white.

Vandelli's Nightshade. Shrub.

394 S. Mœ'nchii (Dun. sol. p. 242. syn. p. 49.) stem herbaceous, pilose, prickly, scabrous; pili white, stellate; leaves ovate, sinuated, acute, rather pilose, the midrib prickly on both sides; peduncles erect, terminal, 4-5-flowered, longer than the petioles. ♃. S. Native country unknown. S. stellàtum, Mœnch. meth. p. 475, but not Jacq. Stems simple. Prickles yellow, distant. Peduncles and calyxes pilose, and furnished with a very few prickles. Corolla white, large. Anthers distant. Style white; stigma green. Berry smooth, yellow.

Mœnch's Nightshade. Pl. 2 feet.

395 S. Belfortia'num (Dun. sol. p. 242. syn. p. 49.) stem shrubby, tomentose, prickly; leaves deeply and sinuately angular, tomentose, rather prickly; flowers corymbose. ♄. S. Native of Brazil. S. Belfort, Vand. fasc. p. 10. Rœm. script. p. 56. Prickles few, very short, straight. Leaves petiolate, unequal at the base. Prickles slender. Corymbs lateral. Calyx pilose.

Belfort's Nightshade. Shrub.

396 S. Banksia'num (Vand. fasc. p. 10. Rœm. script. p. 55. Dun. sol. p. 242.) stem prickly, pilose, herbaceous; lower leaves cordate, ovate: superior ones pinnatifidly-sinuated, acute, pilose; prickles straightish on both surfaces. ♃. S. Native of Brazil, where it is called *Rebentabois*. Prickles thick, reversed, yellow at top. Berry yellow, nearly dry, size of a cherry.

Banks's Nightshade. Pl.?

397 S. atrovírens (Dun. sol. p. 243. syn. p. 50.) ♄. S. Native of India. Solànum I'ndicum spinosum atrovírens et undique glabrum, foliis branchæ ursinæ divisuris. Pluckn. phyt. t. 62. f. 2. S. pomíferum spinosum I'ndicum, fructu echinato, foliis cardui seu acanthi spinosi, Breyn. prod. p. 1.?

Dark-green Nightshade. Shrub.

398 S. Cape'nse (Thunb. prod. 37. Lin. suppl. 147.) stem prickly, shrubby, erect; leaves sinuately-pinnatifid, prickly, naked: alternate segments entire, obtuse. ♄. G. Native of the Cape of Good Hope. Dun. sol. p. 243. syn. p. 50. Plant armed with copious yellow, recurved prickles. Leaves ovate, obtuse, glabrous. Peduncles solitary, 1-2-flowered, drooping. Calyx prickly. Corolla blue. Berry glabrous.

Cape Nightshade. Shrub 1 foot.

399 S. Houstòni (Dun. sol. p. 243. syn. p. 50.) stem shrubby, prickly; leaves oblong, sinuately pinnate, prickly; umbels sessile. ♄. S. Native of Vera Cruz. S. quercifòlium, Mill. dict. no. 16. ex Houst. mss. Prickles recurved. Flowers small, white. Berries red, size of juniper berries.

Houston's Nightshade. Shrub 5 to 6 feet.

400 S. angu'rium (Dun. l. c.) stem shrubby, prickly; leaves pinnatifidly-jagged, tomentose, prickly on both surfaces; peduncles axillary, few-flowered. ♄. S. Native of Vera Cruz. S. angustifòlium, Mill. dict. no. 15. ex Houst. mss. Stem procumbent, tomentose. Prickles long, yellow. Leaves almost 4 inches long, and 2 broad. Peduncles 2-3 inches long. Calyx very prickly. Corollas large, yellow. Berry globose, size of a pea, variegated with green and white.

Anguria-leaved Nightshade. Shrub prostrate.

401 S. Valada'res (Vand. in Rœm. script. p. 55.) stem suffruticose, prickly, rather pilose; leaves pinnate, cut, prickly on both surfaces; racemes lateral, compound. ♄. S. Native of Brazil. Dun. sol. p. 243. syn. p. 50. Stem green. Prickles long, straight, red, very sharp. Leaves rather pilose. Petioles, peduncles, and calyxes prickly and pilose.

Valadares Nightshade. Shrub.

402 S. Rottbœllia'num (Rœm. et Schultes, syst. 4. p. 668.) ♄. S. Native of Surinam. S. fœ'tidum, Rottb. act. hafn. 1778. p. 287. J. Puihn. mat. med. ven. regn. veg. 1785. Dun. sol. p. 244. syn. p. 50. The berry on being wounded, or bruised, exhales an intolerable smell, which excites nausea and cephalalgia.

Rottbœll's Nightshade. Shrub.

403 S. rígidum (Lam. ill. no. 2373. Poir. dict. 4. p. 303. Pers. ench. 1. p. 228.) a dwarf prickly shrub; leaves ovate, sinuately angular, prickly, almost naked, beset with white prickles on both surfaces. ♄. S. Native country unknown. Stem very stiff, hardly a foot long, erect, a little branched, rather villous; prickles short, straight. Leaves acute, undulated; lobes acute, sub-mucronate, rather ciliated, pale or yellowish green. Prickles numerous, naked, subulate, stiff, purplish at the base. Racemes terminal. Peduncles short, a little branched, tomentose. Calyx villous; with lanceolate, very acute segments, sometimes prickly, and sometimes unarmed.

Stiff Nightshade. Shrub 1 foot.

404 S. aqua'ticum (Hort. par. Dum. Courset, bot. cult. ed. 2d. suppl. p. 152.) stem shrubby, prickly, thick, villous; leaves cordate, deeply and sinuately lobed, prickly on both surfaces, as well as the petioles, villous, soft. ♄. S. Native country unknown. Stem straight, simple, or branched, dark purple. Prickles strong, a little recurved. Leaves large, 8-9 inches long, pale green.

Aquatic Nightshade. Shrub.

405 S. quinquangula're (Willd. herb. ex Rœm. et Schultes, syst. 4. p. 669.) stem shrubby; leaves 5-angled, hairy, and are, as well as the petioles, beset with subulate prickles; peduncles generally 2-flowered. ♄. S. Native of Caraccas, Bredemeyer.

Five-angled-leaved Nightshade. Shrub.

406 S. juba'tum (Willd. l. c.) stem shrubby, and is, as well as the peduncles, prickly; leaves roundish-ovate, angularly-toothed, downy and prickly on both surfaces; calyxes covered; prickles bristly. ♄. S. Native on the banks of the Orinoco, Humb. et Bonpl.

Bearded Nightshade. Shrub.

N.B. In Salt's abyss. append. p. 475, there are 2 species mentioned, but without any diagnosis of either, viz. *S. cinèreum*, R. Br. and *S. uncinàtum*, R. Br.

What are the following species. 1. *S. æthiopioìdes*, Cav. 2. *S. agréste*, Brouss. 3. *S. aracátscha*, Bess. Krzem. 4. *S. stipulàceum*, Brouss. 5. *S. cestrifòlium*, Fisch.

Cult. All the species of *Solànum* thrive best in a rich, light soil, and are readily increased by seed; or cuttings planted in sand under a hand-glass root readily. A great number of the species are very handsome, and therefore worth cultivating for ornament. They are treated like other stove greenhouse and hardy plants. The seeds of annual species, natives of tropical countries, require to be raised on a hot-bed, and the plants to be set out in the open ground about the end of May in a sheltered, dry situation.

II. LYCOPE'RSICUM (from λυκος, *lykos*, a wolf; and περσικον, *persicon*, a peach; Wolf-peach.) Tourn. inst. p. 150. t. 63. Adams, fam. 2. p. 218. Mill. dict. Mœnch. meth. p. 515. Dun. sol. p. 109. H. B. et Kunth, nov. gen. amer. 3. p. 17.—Lycopérsicum and Psolànum, Neck. elem. bot. 2. p. 60. —Solànum species. Lin. gen. no. 251. Juss. gen. p. 126. &c.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-6-parted. Corolla rotate, with a very short tube, and a 5-6-cleft limb. Stamens 5. Anthers conical, joined by a membrane, which is elongated at apex, dehiscing lengthwise inside. Stigma sub-bifid. Berry 2-3-celled. Seeds villous.—Herbaceous, unarmed, procumbent herbs. Leaves impari-pinnate. Peduncles solitary, extra-axillary, many-flowered, sometimes leafy; pedicels articulated under the flowers, reflexed when bearing the fruit. Corollas yellow. Fruit of various shapes and sizes, usually red and glossy. In most of the species the hairs are glandular at the base.

1 L. PIMPINELLIFÒLIUM (Mill. dict. no. 4. Dun. sol. p. 111.) stem herbaceous, glabrous; leaves pinnate; leaflets entire, glabrous; racemes simple. ⊙. H. Native of Peru, and Brazil. Solànum pimpinellifòlium, Lin. amœn. 4. p. 268. spec. p. 265. Vellozo. spec. fl. bras. in Rœm. script. p. 85. L. inodòrum, Juss. Leaflets cordate, not cut or toothed in any way. There are no hairs on this species.

Burnet-leaved Love Apple, or Tomato. Fl. May, July. Clt.? Pl. proc.

2 L. PERUVIA'NUM (Mill. dict. no. 5. Dun. sol. p. 111.) stem sub-herbaceous, tomentose; leaves unequally pinnate, tomentose, canescent, stipulate; leaflets cut; peduncles and pedicels bracteate. ♃. S. Native of Peru, in arid and waste places, very common in the provinces of Lima and Chancay, ex Ruiz. et Pav.; cultivated in Cochinchina, ex Lour. Solànum Peruviànum, Lin. spec. ed. 1st. 186. ed. 2d. p. 267. Jacq. icon. rar. 2. t. 327. Ruiz. et Pav. fl. per. 2. p. 37. Lour. coch. 1. p. 162.—Feuill. per. 3. p. 37. t. 25. In Peru the plant is called *Tomatte Cimarron*, i. e. *Wild Golden Apple*, and in China it is called *Ca' tau Vang*. Root permanent. Stems woody at the base; branches villous. Leaflets bluntish. Racemes villous, sometimes simple, sometimes bipartite, lateral, and terminal. Calyx 5-parted. Corolla the largest of the genus. Berry size of a pea, rather villous. Plant with a pleasant smell.

Peruvian Love Apple, or Tomato. Fl. May, June. Clt. 1823. Pl. proc.

3 L. PYRIFÓRME (Dun. sol. p. 112. t. 26.) stem herbaceous, pilose; leaves unequally-pinnate, pilose; leaflets cut, glaucescent beneath; racemes often leafy; calycine segments about equal in length to the corolla; berries obconical. ⊙. H. Native country unknown. Solànum pomíferum, Cav. descr. p. 112. Pers. syn. 1. p. 226. Racemes large: superior ones rarely leafy: lower ones usually terminated by a leafy branch. Berry pear-shaped, 2-celled, as in the 4 following species. Hairs simple, unequal. This and all the following species exhale a heavy smell.

Pear-formed-fruited Love Apple, or Tomato. Fl. July, Sept. Clt. 1823. Pl.

4 L. HUMBÓLDTII (Dun. sol. p. 112.) pilose; pili diverse; stem herbaceous; leaves unequally pinnate, pilose; leaflets cut, glaucescent beneath; peduncles and pedicels bractless; calycine segments about half as long as the corolla. ⊙. H. Native of South America, on the banks of the Rio Negro. L. lycopérsicum, Wall. cat. no. 2611. Roxb. fl. ind. 2. p. 245. Solànum Humbóldtii, Willd. hort. berol. 1. p. 27. t. 27. enum. p. 235. This is very like *L. cerasifórme*, but differs in the racemes of flowers being smaller, the calycine segments being never the length of the corolla; and the berries being one-half smaller, size of a cherry, and red. Berry 2-3-celled, smoothish, and, when cultivated, not less angular than those of *L. esculéntum*, ex Nees.

Humboldt's Love Apple, or Tomato. Fl. July, Sept. Clt. 1822. Pl. 2 to 3 feet.

5 L. REGULA'RE (Dun. syn. p. 3. sol. ed. 2d. ined. t. 81.) plant rather villous; stem almost herbaceous; leaves regularly pinnate, canescent; segments or leaflets almost entire; peduncles and pedicels often bractless. ⊙. H. Native country unknown.

Regular-leaved Love Apple, or Tomato. Fl. May, July. Clt.? Pl. 2 to 3 feet.

6 L. DENTA'TUM (Dun. syn. p. 4. sol. ed. 2d. ined. t. 82.) plant rather villous; stem herbaceous; leaves stipulate, unequally pinnate; leaflets oblong-acuminated, toothed; peduncles and pedicels often bracteate; segments of the calyx shorter than the corolla. ⊙. H. Native country unknown.

Toothed-leaved Love Apple, or Tomato. Pl. 2 to 3 feet.

7 L. HIRSU'TUM (Dun. syn. p. 4. sol. ed. 2d. ined. t. 83. H. B. et Kunth, nov. gen. amer. 3. p. 18.) hairy; stem sub-herbaceous; leaves stipulate, unequally pinnate; leaflets dentately crenated; pedicels sometimes bracteate; calycine segments about equal in length to the corolla. ⊙. H. Native of New Granada, near Loxa. Peduncles unibracteate in the middle. Corollas yellow like the other species. Fruit unknown.

Hairy Love Apple, or Tomato. Pl. 2 to 3 feet.

8 L. CERASIFÓRME (Dun. sol. 113. syn. p. 4.) pilose; hairs diverse; leaves unequally pinnate; leaflets cut, glaucescent beneath; calycine segments rather shorter than the corolla; berries spherical. ⊙. H. Native of Peru, by the sea-side, and in gardens. Solànum lycopérsicum, var. β, Lin. spec. ed. 1st. p. 185. Solànum pseùdo-lycopérsicum, Murr. syst. 183. Jacq. vind. 1. t. 11. Ruiz. et Pav. fl. per. 2. p. 37. Solànum spùrium, Gmel. syst. 384. Lycopérsicum Galèni, Mill. dict. no. 2.—Rumph. amb. 5. p. 416. cap. 49. Very like *L. esculéntum*, and *L. pyrifórme*, but differs in the berries being cherry-formed, 2-celled, size of a plum, but not furrowed lengthwise, rather villous. *Tamatta Bontal* is the Malay name of this species, and *Tomate redondo* the Peruvian name.

Var. α; berries red. ⊙. H. Lycop. fructu cerasi rubro, Tourn. inst. p. 150. Cerasa amoris racemosa, rubra, Bauh. prod. p. 90.

Var. β; berries yellow. ⊙. H. Lycop. fructu cerasi luteo, Tourn. inst. p. 150. Solànum racemosum, cerasorum forma, fructu luteo, Tourn. l. c.

Cherry-formed-fruited Love Apple, or Tomato. Fl. July, Sept. Clt. 1800. Pl. 2 to 3 feet.

9 L. ESCULE'NTUM (Mill. dict. no. 2. Dun. sol. p. 113. t. 3. f. 3. syn. p. 4.) herbaceous, pilose; pili diverse; leaves unequally pinnate; leaflets cut, attenuated at the apex, glaucescent beneath; flowers many, joined; berries torulose. ⊙. H. Native of South America. Solànum Lycopérsicum, Lin. spec. p. 150. Lam. ill. t. 115. f. 2. Lour. coch. 1. p. 162.—Plenck, off. t. 122.—L. pomum amoris, Mœnch. meth. p. 515. L. Galeni, Tourn. inst. p. 150. t. 63.—Sabb. hort. rom. p. 12. t. 62. Pomum amoris, Blackw. t. 133. Rumph. amb. 5. p. 416. t. 154. f. 1.—Mor. hist. sect. 13. t. 1. Màla áurea, Chabr. icon. 525. La Pomme d' amour, Regn. bot. p. 54. Many flowers are joined in one, which makes them appear of many parts, having from 2 to 5 joined pistils, and as many bundles of stamens. Calyx longer than the corolla.

The Love Apple, or Tomato, is called *La Pomme d' amour*, and *La Tomatte* in France, *Liebes Apfel* in Germany, and *Pomo d' oro* in Italy; it is a tender annual. The stem, if supported, will rise to 6 or 8 feet, and exhales, like the leaves, when handled, a

disagreeable smell. The flowers appear in bunches in July and August. The fruit is smooth, depressed at both ends, and furrowed on the sides; it varies in size, but seldom exceeds that of an ordinary golden-pippin apple.

Use.—When ripe, the fruit, which has an acid flavour, is put in soups and sauces, and the juice is preserved for winter use, like ketchup; it is also used in confectionary, as a preserve, and when green as a pickle. Though a good deal used in England in soups, and as a principal ingredient in a well-known sauce for mutton, yet our estimation and uses of the fruit are nothing to those of the French and Italians, and especially the latter. Near Rome and Naples whole fields are covered with it, and scarcely a dinner is served up in which it does not in some way or other form a part.

Varieties.—Those in general cultivation are called, the large, and small, cherry and pear-shaped red, and the large and small, or cherry-shaped yellow. The first sort is in most estimation for domestic purposes, and should be cultivated accordingly, while a few plants of the other kinds may be raised for variety of the fruit.

Propagation and Culture.—The plants must be raised and forwarded in a hot-bed, under glass from about the vernal equinox till May. Sow in any general hot-bed about the end of March, or beginning or middle of April, and as to quantity of seed one ounce will produce 60 plants. As soon as the plants are about 2 inches high, if they are immediately pricked out into another hot-bed, or into that where raised, or singly into small pots placed in the hot-bed, they will grow more stocky, and can be more successfully transplanted. About the middle or end of May transplant them each with a ball of earth into a south border, to have the full sun, that the fruit may ripen to perfection. Some may be planted close to a south wall, if vacant spaces can be had; but as they draw the ground exceedingly, do not set them near choice fruit trees. Give water. During the first week, or fortnight, if the nights be cold, defend them with hand-glasses, or by inverting a large garden pot over each plant, or transplant upon holes filled with hot dung, earthed to 6 inches depth, and cover with hand-glasses. When they begin to run train them to stakes, or, where planted near a wall or pales, nail up the branches. J. Wilmot plants at the foot of a bed sloping steeply to the south, and trains the stems and branches on it by pegging them down; they frequently strike root at the joints; he tops them as soon as their branches meet, clears off all the lateral shoots, and thins the leaves, by which the fruit is exposed, and well ripened. In the fine season of 1818 each plant so treated produced on an average twenty pounds weight of fruit. The fruit begins to ripen in August; gathered in October, and hung up in bunches in any dry apartment it will continue good for use in November.

To save Seed.—"Gather some of the best ripe fruit in autumn, clear out the seed, wash and cleanse it from the pulp, and dry it thoroughly, then put it up in papers or bags for use next spring." Abercrombie.

Var. β; berries pale red. ⊙. H. L. fructu e rubro pallescente, Tourn. inst. p. 150.

Var. γ; berries yellow. ⊙. H. L. fructu luteo, Tourn. l. c.

Var. δ; berries white. ⊙. H. L. fructu albo, Tourn. l. c.

Esculent, or Common Love Apple, or Tomato. Fl. July, Sept. Clt. 1596. Pl. 2 to 3 feet.

† *Species not sufficiently known.*

10 L. procu'mbens (Mill. dict. no. 6.) stem herbaceous, procumbent; leaves pinnatifid, glabrous; segments cut; flowers solitary, axillary. ⊙. H. Native country unknown. Dun. sol. p. 115. syn. p. 5. Flowers lateral. Calyx large, deeply multifid. Flowers cream-coloured. Berries small, sub-compressed.

Procumbent Love Apple, or Tomato. Fl. July, Sept. Clt. 1770. Pl. proc.

11 L. commuta'tum (Rœm. et Schultes, syst. 4. p. 569.) leaves interruptedly pinnate; leaflets oblique, ovate, obtuse, downy on both surfaces, sub-repandly crenated; racemes bifid, longer than the leaves, the branches diverging. ♃. S. Native of South America, Solànum commutàtum, Spreng. pug. 1. p. 18. Corolla yellow, form of those of the other species. Calyx 5-cleft.

Changed Love Apple, or Tomato. Fl. July, Sept. Clt. 1818. Pl. 2 to 3 feet.

Cult. For culture and propagation see *L. esculéntum*, no. 9

III. PELTANTHE'RA (from πελτη, *pelte*, a buckler; and ανθηρα, *anthera*, an anther; in reference to the form of the anthers.) Roth. nov. spec. p. 126. Rœm. et Schultes, syst. 4. p. liv. and 670.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla rotate, plicate, 5-cleft. Stamens inserted in the throat of the corolla, short, broad. Anthers sagittate at the base, conniving into an oblong, attenuated, obsoletely pentagonal cone. Stigma clavate. Berry unknown. This genus differs from *Solànum* in the anthers being 1-celled, hamately sagittate at the base, and furnished with a sessile, peltate body on the back, and not dehiscing by 2 pores at top as in that genus.

1. P. solana'cea (Roth, l. c. Rœm. et Schultes, syst. 4. p. 670.) ♄. S. Native of the East Indies, Vallàris, Heyne mss. Leaves opposite, elliptic, quite entire. Racemes axillary, subcorymbose. Corolla size and colour of that of *Solànum pseùdocápsicum.* Ovarium 1-celled?

Solanaceous Peltanthera. Shrub.

Cult. For culture and propagation see *Solànum*, p. 442.

IV. CA'PSICUM (from καπτω, *kapto*, to bite; on account of the biting heat of the seeds and pericarp; some derive it from *capsa*, a chest.) Tourn. inst. 66. Lin. gen. no. 252. Schreb. gen. no. 338. Juss. gen. p. 126. ed. Usteri. p. 141. Gærtn. fruct. 2. p. 1241. t. 132. Lam. ill. t. 116. f. 1, 2. H. B. et Kunth, nov. gen. 3. p. 48. Fingerhuth diss. cap. Nees in Lin. trans. 17. p. 62.

Lin. syst. *Pentándria, Monogýnia.* Calyx permanent, 5-toothed. Corolla rotate; limb plicate, 5-cleft. Anthers connivent, 2-celled, dehiscing lengthwise. Stigma obtuse. Berry dry, inflated, and hollow, of a papery consistence, 2-4-celled, many-seeded, naked. Placentas adnate to the dissepiment.—Shrubs, or sub-shrubs, rarely herbs. Leaves scattered, solitary, or twin, and quite entire. Peduncles extra-axillary, and alar, 1-flowered. Flowers greenish white, or violaceous.

§ 1. *Peduncles solitary. Fruit erect, or pendulous.*

* *Annual. Berries pendulous.*

1 C. a'nnuum (Lin. spec. p. 270.) fruit oblong, pendulous, and erect; petioles glabrous; stem herbaceous; calyx obsoletely 5-toothed. ⊙. H. Native of South America. Woodv. med. bot. 391. t. 144. Stev. and Church. med. bot. 1. t. 44. Plenck. off. t. 107.—Knor, del. 2 t. l. 6.—Rheed. mal. 2. t. 35. Corollas white. Fruit red, yellow, variegated with red and yellow, and dark green, variable in shape.

Capsicum is called *Piment* in French, *Spanischr Pfeffer* in German, *Peberone* in Italian, *Chilli* in Mexico, and *Tschili* in Hindostan. There are 3 species in cultivation. 1. *C. ánnuum*, the Guinea pepper, though a native of India, endures our

climate in summer. The fruit varies much in shape and colour, either long-podded, red, or yellow, or short-podded, red and yellow, or heart-shaped, red and yellow. 2. *C. cerasifórme*, the cherry-pepper, is also an annual standing our climate in summer; is known by its small, cherry-shaped fruit, which is sometimes heart-shaped or angular, in colour red or yellow. 3. *C. gróssum*, the bell-pepper, a stove biennial; the berries of this kind are large, red or yellow. It will endure the open air in summer, but will require a place in the stove in winter and spring months. The well known preparation called Cayenne-pepper is the pods of the smaller kinds of capsicum dried in the sun, pounded, and mixed with salt; it is then kept stopped in bottles. When used in moderation it is not unwholesome, especially to those of cold leucophlegmatic habits. In such temperaments, as well as in paralytic cases, it is used medicinally in small quantities, as one of the highest stimulants. A mixture of sliced cucumbers, shalots, or onions, cut very small, a little lime juice and Madeira wine, with a few pods of bird-pepper, well mashed and mixed with the liquor, seldom fails to provoke the most languid appetite in the West Indies. It is there called Man-dram. Gathered fresh from the plant, the pods of all the species are liberally used in all tropical countries to assist digestion and correct flatulencies.

Var. α, *longicárpum*; fruit long, pendant. Tourn. inst. 152.

Var. β, *olivæfórme* (Mill. dict. no. 6.) fruit ovate. Ait. hort. kew. ed. 2d. vol. 1. p. 405.

Var. γ, *abbreviàtum* (Fing. diss. t. 2. f. 1.) Miller has raised from the seed of one individual plant the following varieties of Tournefort. 1. Capsicum fructu surrecto oblongo, Tourn. inst. 152. 2. Capsicum fructu bifido, Tourn. l. c. 3. Capsicum siliquis surrectis et oblongis brevibus, Tourn. l. c. 4. Capsicum tereti spithamæo, Tourn.

Annual Capsicum, or Chilli, or Guinea Pepper. Fl. June, July. Clt. 1548. Pl. 1 to 2 feet.

2 C. lóngum (D. C. hort. monsp. 1813. p. 86.) fruit oblong, acuminated, a little incurved; petioles glabrous; stem herbaceous. ⊙. H. Native country unknown. C. ánnuum, Hort. —Mor. hist. sect. 13. t. 2. f. 2. no. 6.—Clus. cur. post. p. 101. f. 9—10.—Dod. pempt. 716. f. 3.—Bauh. hist. 2. p. 943. f. 1. —Fuchs. icon. 733. Capsicum fructu tereti spithamæo, Tourn. inst. p. 152.? C. ánnuum, var. α, Ait. hort. kew. 2. p. 405.

Long-fruited Capsicum, or Chilli Pepper. Fl. June, July. Clt. 1548. Pl. 1 to 2 feet.

3 C. cordifórme (Mill. dict. no. 2.) fruit heart-shaped; stem herbaceous. ⊙. H. Native of India. Capsicum siliqua propendente oblonga et cordiformi, Tourn. inst. p. 152. Fruit yellow and red, variable in shape. The following varieties of this species are mentioned: 1. Fruit pendent, round or heart-shaped, Tourn. 2. Fruit broader and rounder, Tourn. 3. Fruit large, round, Tourn. 4. Fruit erect, round, Tourn. 5. Fruit erect, heart-shaped. In all these varieties the fruit varies from yellow to red.

Var. β, *màjus*, Fing. diss. t. 9. f. c. C. ánnuum, Wall. cat. suppl. no. 222.

Heart-shaped-fruited Capsicum, or Chilli pepper. Fl. June, July. Clt.? Pl. 2 feet.

4 C. angulòsum (Mill. dict. no. 4.) fruit heart-shaped, angular; stem herbaceous. ⊙. H. Native of India? Capsicum siliquis surrectis cordiformibus angulàtis, Tourn. inst. p. 153. Fruit large, pendulous, of 2 forms, obtuse, angular, rather compressed, usually retuse and bifid at apex. Besser, cat. krzem. 1811. p. 27. Leaves wrinkled. Fruit red or scarlet, sometimes formed like a mitre at top, and sometimes campanulate. More tender than the other annual kinds.

Angular-fruited Capsicum, or Chilli Pepper. Fl. June, July. Clt.? Pl. 1 to 2 feet.

5 C. Mille'ri (Rœm. et Schultes, syst. 4. p. 563.) stem herbaceous; fruit round, glabrous. ⊙.? H. Native of New Spain, Miller. C. cerasifórme, Mill. dict. no. 5. Capsicum siliquis surrectis cerasiformis, Tourn. inst. 153. Leaves fascicled, pale green, on long petioles. Fruit red, size and shape of a pea. Perhaps only a variety of *C. ánnuum*.

Miller's Capsicum, or Chilli Pepper. Fl. June, July. Clt.? Pl. 1 foot.

6 C. cónicum (Meyer, esseq. p. 112.) herbaceous; branchlets downy, terete; fructiferous calyx almost quite entire; peduncles twin; fruit oblong-conical, erect; leaves solitary, rarely twin, ovate, acuminated, on short petioles, roughish on both surfaces, downy on the veins beneath, as well as the petioles. ⊙. H. Native about the Essequibo, in plantations. C. frutéscens, Rodschied, obs. p. 38. but not of Lin. Peduncles alar and axillary. Flowers drooping. Fruit croceous, shining.

Conical-fruited Capsicum, or Chilli Pepper. Pl.?

7 C. tetragònum (Mill. dict. no. 3.) herbaceous; fruit large, angular, obtuse. ⊙. H. Native of both Indies. Fing. diss. t. 10. f. d. Wall. cat. no. 224. Capsicum fructu longo ventre tumido, per summum, tetragono, Tourn. inst. p. 153. C. cydonifórme, Hort. Berries always red, crowded, 1-2 inches long, subtetragonal at top, usually pendulous, rarely erect.

Tetragonal-fruited Capsicum, or Chilli Pepper. Fl. June, July. Clt.? Pl. 1 to 2 feet.

* * *Shrubby. Berries pendulous.*

8 C. sphæ'ricum (Willd. enum. 1. p. 241.) fruit globose; petioles glabrous; stem shrubby. ♄. S. Native of India? Fing. diss. t. 9. f. a. C. cerasifórme, Wall. cat. no. 221. Shrub middle-sized; branches dichotomous. Leaves ovate, acuminated, glabrous. Fruit size of a cherry. Said to differ from *C. cerasifórme* in the fruit being pendulous.

Spherical-fruited Capsicum, or Chilli Pepper. Fl. April, July. Clt. 1807. Shrub 2 feet.

9 C. ova'tum (D. C. cat. hort. monsp. 1813. p. 86.) fruit ovate, acuminated; petioles and leaves glabrous; stem shrubby. ♄. S. Native country unknown. Peduncles shorter than the petioles. Calyx bluntly 5-toothed. Berry colour and size of a cherry, but ovate, pendulous. It differs from *C. sphæ'ricum* only in the shape of the fruit.

Ovate-fruited Capsicum, or Chilli Pepper. Fl. June, Sept. Clt. 1824. Shrub 2 to 3 feet.

10 C. pe'ndulum (Willd. enum. 1. p. 242.) fruit oblong; petioles downy; stem shrubby. ♄. S. Native country unknown. C. gróssum, β, Schultes, obs. no. 299. Fruit an inch long, red.

Pendulous-fruited Capsicum, or Chilli Pepper. Fl. April, July. Clt. 1804. Shrub 2 to 3 feet.

11 C. lu'teum (Lam. ill. 2. no. 2392.) fruit ovate, 3-celled; branches and petioles hairy; stem shrubby, flexuous. ♄. S. Native of the East Indies. Stem subtetragonal. Leaves glabrous, twin, or 4-5 in a fascicle. Flowers solitary or fascicled, supra-axillary. Corolla small, white, with short acute segments. Fruit yellow, oblong, middle-sized, on hardly recurved peduncles, downy.

Yellow-fruited Capsicum. Fl. June, Aug. Clt. 1820. Shrub 2 to 3 feet.

12 C. gróssum (Lin. syst. 226.) fructiferous calyx bowl-shaped, spreading, sinuately toothed; fructiferous peduncles solitary, erect, or reflexed; berry oblong or ovate, torose; leaves ovate, acuminated; branches downy. ♄. S. Native of India. Nees, in Lin. trans. 17. p. 62. Roxb. fl. ind. 2. p. 260. Wall. cat. no. 2643.A.—Besl. hort. eyst. 2. t. 2. f. 1. Fruit large, pale red.

Var. β; branches smoothish; fruit pendulous; leaves broader, very unequal at the base, subrepand, or cut a little. ♄. S. Native of India. C. gróssum, Wall. cat. no. 2643. B.

Var. γ, *cordàtum* (Fing. diss. t. 6. f. a.) fruit cordate.

Var. δ ? *pomíferum* (Martius, hort. erl. p. 65.) stem downy; fruit large, globose.

Var. ε, *globòsum* (Besser. cat. Krzem. 1811. p. 27.) fruit globosely depressed, erect.

Var. ζ, *lùteum* (Bess. l. c.) fruit ovate-conical, yellow, erect or drooping. Schultes, obs. p. 45. no. 299.

Var. η, *bífidum;* fruit bifid. Capsicum fructu bifido, Tourn. inst. mant. p. 152.

Large-fruited Capsicum, or Bell Pepper. Fl. July. Clt. 1759. Shrub 1 to 3 feet.

13 C. Havane'nse (H. B. et Kunth, nov. gen. 3. p. 49.) frutescent, dichotomous, divaricate; stem glabrous, striated, terete; branches angular; leaves ovate-oblong, glabrous; peduncles solitary, fructiferous ones reflexed; berries oblong. ♄. S. Native of Cuba, on the sea beach, among sand about the Havana. Leaves solitary, rounded at the base, running into the petioles, which are smoothish. Berry red, half an inch long, girded by the calyx.

Havana Capsicum, or Chilli Pepper. Shrub.

* * * *Shrubby. Fruit erect.*

14 C. conoi'des (Mill. dict. no. 8.) stem suffrutescent; fruit ovate-conical, erect. ♄. S. Native of both Indies. C. cónicum, Lam. ill. no. 2390. C. eréctum, var. ánnuum, Mart. enum. hort. erl. p. 65. C. cerasifórme, δ, macrocárpum, Besser. cat. hort. Krzem. 1811. p. 27.—Lob. icon. 317.? Shrub glabrous. Leaves lanceolate, acute. Flowers extra-axillary. Calyx campanulate, with 5 short teeth. Corolla cream-coloured.

Conoid-fruited Capsicum, or Chilli Pepper. Fl. June, July. Clt. 1750. Shrub 1 to 2 feet.

15 C. pyramida'le (Mill. dict. no. 1. Fing. diss. t. 3. f. 1.) stem shrubby; leaves linear-lanceolate; fruit pyramidal, erect, yellow. ♄. S. Native of Egypt. Perhaps *C. torulòsum* of Jacq. hort. vind.

Pyramidal-fruited Capsicum, or Chilli Pepper. Fl. April, July. Clt. 1750. Shrub 2 to 3 feet.

16 C. cerasifórme (Willd. spec. 1. p. 1651. exclusive of the syn. of Mill. enum. 1. p. 242.) fruit globose; petioles glabrous; stem shrubby. ♄. S. Native country unknown. Very like *C. frutéscens;* but is distinguished from that species in the fruit being globose, and the size of a cherry, red or yellow.

Cherry-formed-fruited Capsicum, or Cherry Pepper. Fl. June, Sept. Clt. 1739. Shrub 1 to 2 feet.

17 C. cerasiflòrum (Link, enum. 1. p. 190.) young petioles ciliated; berries erect, globose, solitary. ♄. S. Native country unknown. Very nearly allied to *C. cerasifórme*, but differs in the petioles being ciliated.

Cherry-flowered Capsicum, or Chilli Pepper. Fl. June, Sept. Clt. 1823. Shrub.

18 C. frute'scens (Lin. hort. cliff. p. 59. spec. 271.) fructiferous calyx cylindrical, subtruncate; fructiferous peduncles solitary; berry conically attenuated, incurved; leaves oval, acuminated at both ends; petioles and branches, which are angular, downy. ♄. S. Native of India. Willd. spec. 1. p. 1051. Roxb. fl. ind. 2. p. 201. Blum. bijdr. 704. H. B. et Kunth, nov. gen. 3. p. 48. Nees, in Lin. trans. 17. p. 63. Cápsicum minus rubrum et flavum, Rumph. amb. 5. p. 248. t. 88. f. 1—3. Capo Molago, Rheed. mal. 2. p. 109. t. 56. Corolla white. Fruit size of an olive, red or copper-coloured, or reddish-yellow. The red-fruited kind is called Tschili-cuning, and the yellow-fruited sort Tschili-mera. This species also furnishes the Cayenne-pepper of the shops. The ripe pods are dried in the sun, and then in an oven, after bread is baked, in an earthen or stone pot, with flour between the strata of pods. When quite dry they are cleaned from the flour, and beaten or ground to fine powder. To every ounce of this a pound of wheat flour is added, and it is made into small cakes with leaven; these are baked again, that they may be as dry and hard as biscuit, and then are beaten into powder and sifted. It is then fit for use as a pepper, or for being packed in a compressed state, and so as to exclude air, for exportation.

Var. β, *torulòsum* (Jacq. hort. vind.) fruit twice as large as the species.

Frutescent Capsicum, or Chilli Pepper. Fl. June, Sept. Clt. 1756. Shrub 2 to 3 feet.

19 C. bi'color (Jacq. fragm. t. 99. f. 1.) fruit oblong, mucronate; petioles glabrous; stem shrubby. ♄. S. Native of the West Indies. Sims. bot. mag. 1835. C. nìgrum, Willd. enum. 1. p. 242. C. violàceum, Brouss. elench. monsp. 1804. Desf. tabl. de l'ecole, p. 83. D. C. cat. hort. monsp. 1813. p. 87. Flowers large, subviolaceous. Fruit black or dark purple. Calyx campanulate, obsoletely 5-toothed.

Two-coloured Capsicum, or Chilli Pepper. Fl. June, Sept. Clt. 1804. Shrub 3 to 4 feet.

20 C. purpu'reum (Vahl, herb. ex Horn. hort. hafn. 1. p. 224.) peduncles generally solitary; fruit oblong, erect, mucronate; petioles glabrous; stem shrubby; branches divaricate. ♄. S. Native country unknown. Stem dark purple; branches striped with dark purple; and the leaves spotted with the same colour.

Purple Capsicum, or Chilli Pepper. Fl. June, Sept. Clt.? Shrub 2 to 3 feet.

21 C. chamæce'rasus (Nees, in. Lin. trans. 17. p. 65.) frutescent; branches subtetragonal, contracted, glabrous; fructiferous calyx loose, large, cup-shaped, quite entire; peduncles solitary, erect; berry globose; leaves lanceolate, glabrous. ♄. S. Native of India. C. cerasifórme, Poir. suppl. 5. p. 325. but not of Willd. C. purpùreum, Wall. cat. suppl. no. 206. This species differs from *C. cerasifórme* in the large, cup-shaped, entire calyx.

False-cherry-fruited Capsicum, or Chilli Pepper. Shrub.

§ 2. *Peduncles generally twin. Fruit erect or pendulous.*

* *Shrubby. Berries erect.*

22 C. fastigia'tum (Blum. bijdr. 705.) frutescent; branches tetragonal, fastigiate, diverging, pubescently scabrous; fructiferous calyx subcylindrically truncate; fructiferous peduncles generally twin, erect; berry oblong-cylindrical, straight; leaves oval or lanceolate, acuminated at both ends, minutely and serrulately ciliated. ♄. S. Native of India. C. frutéscens, Lin. spec. 1. p. 271. but not of hort. cliff. Burm. fl. ind. p. 58. Fing. diss. exclusive of many of the synonymes. C. minimum, Roxb. fl. ind. 2. p. 201. but not of Mill.

Fastigiate-branched Capsicum, or Chilli Pepper. Fl. June, Sept. Shrub 1 to 2 feet.

23 C. globi'ferum (Meyer. esseq. p. 113.) frutescent; branches terete, tubercular; fructiferous calyx nearly entire; peduncles twin; fruit globose, erect; leaves twin or solitary, ovate, acuminated at both ends, subciliated. ♄. S. Native in plantations about the Essequibo. C. baccàtum, Rodschied, obs. p. 38. Branches glabrous. Leaves rather scabrous on both surfaces, downy while young. Flowers minute, drooping. Berry size of a small cherry, pale yellow.

Globe-bearing Capsicum, or Chilli Pepper. Fl. June, July. Clt. 1824. Shrub 2 feet.

24 C. microca'rpum (Brouss. elench. 1804. p. 12. D. C. cat. hort. monsp. 1813. p. 86.) frutescent; petioles and leaves downy; calyx with 5 subulate spreading teeth; peduncles twin; fruit ovate, erect. ♄. S. Native country unknown. Horn. hort. hafn. 2. p. 958. C. ciliàre, Willd. enum. 1. p. 243.? Flowers small, white, furnished with 10 green spots on the lower part of the limb. Pedicels striated, downy, ex D. C.

Petioles ciliated on the margins; peduncles longer than in *C. baccàtum*, ex Willd. Fruit a little smaller than in *C. baccàtum*.

Small-fruited Capsicum, or Chilli Pepper. Fl. April, July. Clt. 1820. Shrub 2 feet.

25 C. mi'nimum (Mill. dict. no. 10.) stem shrubby; fruit small, ovate, erect. ♄. S. Native country unknown. C. baccàtum, var. *β*, Poir. suppl. 5. p. 326.

Smallest-fruited Capsicum, or Chilli Pepper. Fl. April, July. Clt.? Shrub 1 to 2 feet.

26 C. bacca'tum (Lin. syst. p. 226. Mill. dict. no. 9.) frutescent; branches angular, striated; leaves oblong, glabrous, as well as the petioles; calyx urceolate, obsoletely 5-toothed; peduncles twin; fruit erect, almost globose. ♄. S. Native of tropical America, and now cultivated in India and Guinea. Willd. spec. 1. p. 1050. H. B. et Kunth, nov. gen. 3. p. 49. Afz. rem. guin. coll. 2. p. 12. C. frutéscens, *β*, Lin. spec. 271. —Sloane, hist. 1. p. 240. t. 146. f. 2.—Rumph. amb. 5. p. 147. t. 88. f. 2. Flowers greenish. Fruit small, ovate. The calyx is said to have 5 subulate teeth according to Lin.; but according to H. B. et Kunth it is obsoletely 5-toothed; there are, therefore, probably two distinct species, confounded under the name of *C. baccàtum*.

Berried Capsicum, or Bird Pepper. Fl. June, Sept. Clt. 1731. Shrub 2 to 4 feet.

27 C. micra'nthum (Link, enum. 1. p. 190.) calyxes very blunt; leaves ovate, acuminated; petioles ciliated. ♄. S. Native of Brazil. Leaves as in *C. microcárpum*, and with the calyx always entire, and the fruit cylindrical, 6 lines long. Peduncles twin.

Small-flowered Capsicum, or Chilli Pepper. Fl. May, June. Clt. 1824. Shrub 2 to 3 feet.

* * *Shrubby. Berries pendulous.*

28 C. Sine'nse (Jacq. hort. vind. 3. t. 67.) frutescent; branches flexuous, divaricate, angular; leaves large, ovate, acuminated, on slender, filiform, downy pedicels; calyx entire; fruit ovate, pendulous, twin. ♄. G. Native of China. Willd. spec. 1. p. 1051. Lam. ill. 2394. Flowers 4-5 in a fascicle in the spontaneous plant, supra-axillary, but twin or solitary in the cultivated plant. Corolla dirty white. Berry yellow, glabrous, mucronate by the style.

China Capsicum, or Chilli Pepper. Fl. June, Sept. Clt. 1807. Shrub 2 to 3 feet.

† *Species hardly known.*

29 C. viola'ceum (H. B. et Kunth, nov. gen. 3. p. 49.) suffruticose; branchlets angular, rather scabrous, downy while young; but the branches are terete; leaves ovate-oblong, acuminated, puberulous; flowers solitary or twin, drooping; calyx urceolate, hairy, with 7 acute teeth; berries oblong. ♄. S. Native near the city of Quito, in cultivated places, at the altitude of 1500 hexapods, where it is called *Aji* by the natives. C. Quiténse, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 809. Shrub much branched. Leaves solitary? twin, ex Bonpl., running into the petioles at the base; petioles puberulous. Flowers extra-axillary. Corolla violaceous, hairy outside; throat white; limb 7-cleft; segments ovate, acuminated, equal. Stamens 7, inserted in the upper part of the tube. Stigma somewhat 2-lobed. Berry dry, oblong, red, 3-6 inches long.

Violaceous-flowered Capsicum, or Chilli Pepper. Shrub.

30 C. Hamiltònii; stem shrubby, biennial, about 3 feet high, erectish, violaceous; leaves dark violet; immature berries red, of a dark violet colour when mature, short, bluntly conical. ♂. S. Native of the Island of Nevis, in gardens. C. violàceum, Desf. cat. hort. par. Hamilt. prod. p. 25, but not of H. B. et Kunth.

Hamilton's Capsicum, or Chilli Pepper. Fl. Year. Shrub 3 feet.

31 C. cærule'scens (Bess. cat. hort. Krzem. p. 27.) Said to be nearly allied to *C. bicolor*; but differs in the stem and leaves being green; in the fruit being one half shorter, and difformed, bluntly angular, retuse, and at length orange-coloured.

Bluish Capsicum, or Chilli Pepper. Shrub?

32 C. aggrega'tum (Willd. rel. ex Rœm. et Schultes, syst. 4. p. 809.) peduncles aggregate, pubescent; leaves downy above, but clothed with hoary tomentum beneath. ♄. S. Native country unknown.

Aggregate Capsicum, or Chilli Pepper. Shrub.

33 C. Wildenòwii; peduncles twin; fruit globose, small; branches and petioles downy; stem shrubby. ♄. S. Native of South America. Humb. et Bonpl. C. microcárpum, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 808.

Willdenow's Capsicum, or Chili Pepper. Shrub.

Use.—The green pods, or inflated berries, of all the species and their varieties, are used for pickling. They are sometimes also used in their ripe state, when they form a spice of the hottest quality, known by the name of Cayenne-pepper. The fruit of *C. gróssum* are deemed better for pickling than the others, the skin being thick, pulpy, and tender.

Culture.—All the species, with their varieties, are raised from seed: a small parcel, or the produce of two pods, will be a sufficient quantity of each, or of any one variety, for ordinary supply. Sow all the annual sorts at the end of March, or beginning or middle of April, in a moderate hot-bed, under a frame. Cover the seed a quarter of an inch deep. When the plants are 2 or 3 inches in growth, prick some into a new, moderate hot-bed, to forward them for final transplanting; or, in default of this, prick them into a bed of natural earth, at the beginning of May, if fine, settled, warm weather: defend them with a frame or awning of mats at night, or in cold weather. Give water lightly at planting, and occasionally afterwards in moderate supplies, to assist their fresh rooting and subsequent growth. At the beginning of June, when the weather is settled warm, transplant them into the open garden, in beds of light rich earth, from 12 to 18 inches apart, giving water. They will thus advance freely, flower in July or August, and produce plenty of pods from August till the end of September. Under the deficiency of a hot-bed or stove, or for succession, annual capsicums may be raised in a bed of light rich earth, under a hand-glass; but the sowing must be deferred to fine warm weather in May. Give the plants air in the day, but cover them close at night, till danger from frost is over. At the close of June transplant as above. The perennial and shrubby species may be wintered in the stove.

To save seed.—Leave one or two of the largest and handsomest shaped pods to ripen in autumn; after gathering them, the best way is to hang them up in a dry place, and not take out the seeds till wanted for sowing in spring.

V. PHY'SALIS (from *φυσα*, *physa*, a bladder; in reference to the inflated calyx.) Lin. gen. no. 250. Schreb. gen. no. 336. Gærtn. fruct. 2. p. 238. t. 131. Juss. gen. p. 126. ed. Usteri, p. 140. H. B. et Kunth, nov. gen. amer. 3. p. 12. Nees, in Linnæa, 6. p. 449. and Lin. trans. 17. p. 66.—Alkekéngi, Tourn. inst. p. 151. t. 64.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-toothed. Corolla campanulately rotate, plicate, 5-lobed. Anthers connivent, dehiscing lengthwise. Stigma capitate. Berry 2-celled, many-seeded, covered by the unarmed, membranous, angular, inflated calyx; placentas adnate.—Annual or perennial herbs, rarely shrubs. Stems angular. Leaves scattered, sometimes twin,

entire or lobed. Flowers lateral or extra-alar, solitary or aggregate. Corollas greenish, white, yellow, or blue.

Sect. I. Physalodendron (from φυσαλις, *physalis*, winter cherry; and δενδρον, *dendron*, a tree; in allusion to the species being woody.) Shrubby. Flowers aggregate.

1 P. somnífera (Link, enum. hort. berol. 1. p. 180. Nees, in Linnæa, 6. p. 453.) shrubby; leaves quite entire; flowers crowded, nearly sessile, sub-verticillate. ♄. G. Native of the East Indies; and the South of Europe; in the Grecian Islands, Spain, &c. Corolla yellowish-green. Berry small, red.

Var. α, flexuòsa (Nees, in Linnæa, 6. p. 454. in Lin. trans. 17. p. 66.) stem more flexuous; leaves pubescent, or pubescently tomentose; flowers smaller; segments of the calyx about equal in length to the tube. ♄. G. Native of the East Indies, and the South of Europe. P. flexuòsa, Lin. spec. p. 261. Jacq. eclog. 1. t. 23. Roxb. fl. ind. 2. p. 240. Wall. cat. no. 2635. P. Suqúnda, Hamilt. herb. P. Alpìni, Jacq. eclog. 1. p. 39. Pavétti, Alp. exot. p. 71. t. 70.? Leaves smoothish or downy, canescent. Stem woolly or downy.

Var. β, somnífera (Nees, in Lin. trans. 17. p. 67.) stem less, flexuous; flowers one half larger; segments of the calyx sometimes shorter than the tube, and sometimes equal in length to it. ♄. G. Native of the Grecian Islands, Canaries, Mauritius, and the Cape of Good Hope. P. somnífera, Lin. hort. cliff. p. 62. spec. 261. Mill. dict. no. 6. Sibth. et Smith, fl. græc. t. 233. Cav. icon. 2. p. 2. t. 103. Jacq. eclog. 1. t. 22. Physaloìdes somnífera, Mœnch, meth. p. 473.—Mor. hist. 3. p. 526. sect. 13. t. 3. f. 20.—Tourn. inst. p. 151. Στρυχνος ὑπνοτικος, Diosc. mat. lib. 4. cap. 73. P. arboréscens, Thunb. prod. p. 37. fl. cap. 1. p. 191. P. tomentòsa, Sieb. fl. maur. 2. no. 226. Plant downy. Calyx greenish-yellow, or red. Corolla yellowish.

Somniferous Winter Cherry. Fl. July, Aug. Clt. 1759, β. 1796. Shrub 2 to 3 feet.

2 P. arbore'scens (Willd. herb. Lin. spec. p. 261.? Willd. spec. 1. p. 1020.?) stem arborescent; leaves repandly toothed; flowers aggregate, pendulous; corolla 5-parted. ♄. S. Native of Mexico, about Campeachy. Mill. dict. no. 8. t. 206. f. 2. Leaves canescent, tomentose. Corolla tomentose outside, fuscous. This is the species described by Nees, in Linnæa; but the plant is described by Linnæus as follows: "Stem fruticose; leaves ovate, pilose; flowers solitary or twin; corollas revolute." The leaves are also said to be dark green above, and woolly beneath: upper ones twin. Corolla is said to be yellow, marked with brown spots inside, and the berry round, red, and the calyx becoming dark purple in the fructiferous state. The plant of Nees, and that of Linnæus, are, however, probably the same, notwithstanding the apparent difference in the characters given to it by them.

Arborescent Winter Cherry. Fl. July, Aug. Clt. 1700. Shrub 4 to 12 feet.

Sect. II. Eurostorhìza (from εὔρωστος, *eurostus*, robust; and ῥιζα, *rhiza*, a root; in reference to the strong roots of the species.) Frutescent or herbaceous, with strong roots, and permanent bases of the stems. Flowers solitary. Alabastra while closed large for the size of the corolla, ventricose.

3 P. viscòsa (Lin. hort. cliff. p. 496. spec. p. 261.) herbaceous, scabrous from bi-trifurcate, short hairs; root perennial, creeping, scabrous; stem dichotomous; leaves ovate, or subcordate, entire, or toothed; flowers almost spotless; segments of calyx unequal, broad, ovate. ♃. H. Native of Brazil; and of Virginia, and from Pennsylvania to Carolina in North America. Pursh, fl. amer. sept. 1. p. 167. P. Pennsylvánica, Lin. spec. 1670. Pursh, l. c. p. 167.—Dill. hort. elth. p. 11. t. 10. f. 10. The whole plant is beset with short, 2-3-4-forked bristles, seated on minute tubercles: upper leaves twin, unequal. Corolla yellow, marked with a paler star in the centre. Berry ovate, or turbinate, umbilicate, smooth, viscid, orange-coloured, rather acid, and not disagreeable to the taste.

Var. β, Jacquìni; leaves ovate, repandly toothed, often acutish, smaller. ♃. H. Native from Pennsylvania to Carolina. P. viscòsa, Jacq. vind. 2. t. 136. P. Jacquìni, Link, enum. 1. p. 180. P. Pennsylvánica, Lin. spec. 1670. Mill. dict. no. 3. P. tomentòsa, Walt. fl. carol. p. 99. In *P. Pennsylvánica* the stems are said to be procumbent, the flowers twin, and the berries small, red, size of a pea.

Clammy-berried Winter Cherry. Fl. July, Aug. Clt. 1699, B. 1726. Pl. 1 to 3 feet.

4 P. lanceola'ta (Michx. fl. bor. amer. 1. p. 149. Pursh. fl. 1. p. 157.) plant dwarf, downy; leaves almost sessile, oval-lanceolate, almost entire, green on both surfaces, and rather downy; calyx villous; stem dichotomous. ♃.? H. Native of Lower Carolina. P. Virginiàna, Mill. dict. no. 4. t. 206. f. 1.? Leaves tapering gradually into the petioles at the base. Corolla sulphur-coloured, with a dark purple bottom. Berry yellow, ex Mill.

Lanceolate-leaved Winter Cherry. Pl. 1 to 2 feet.

5 P. Walte'ri (Nutt. in journ. acad. nat. sc. phil. 7. p. 112.) perennial, clothed with powdery tomentum, much branched, dichotomous; leaves twin, broad, ovate, obtuse, on long petioles, entire; peduncles solitary, nutant; fructiferous calyx smoothish. ♃. H. Native of South Carolina. P. lanceolàta, Elliott, but not of Michx. Leaves green above.

Walter's Winter Cherry. Pl. 1 foot?

6 P. angustifòlia (Nutt. l. c. p. 113.) perennial, quite glabrous, prostrate, dwarf; leaves very long, linear, fleshy, solitary; peduncles nutant, filiform. ♃. H. Native of West Florida. Leaves 3 inches long.

Narrow-leaved Winter Cherry. Pl. prostrate.

7 P. Curassa'vica (Lin. hort. cliff. p. 62. spec. 261.) shrubby, clothed with viscid down; down simple, articulated; stem erect; leaves ovate, repand; flowers solitary, spotless; calyx hairy, with subulate segments. ♃. S. Native of Curaçoa. Mill. dict. no. 5. P. origanifòlia, Lam. ill. gen. no. 2398.—Mor. hist. 3. p. 527.—Plukn. phyt. t. 111. f. 5. Calyx cylindrically campanulate, not angular, densely hairy. Corolla sinuately 5-angled, yellow. Berry greenish-yellow. This species differs from *P. viscòsa*, in the down being simple, not forked, in the calyx being densely hairy and smaller, and in its segments being short and subulate, and in the bottom of the corolla being pale.

Curaçoa Winter Cherry. Fl. June, Sept. Clt. 1699. Pl. 1½ foot.

8 P. Alkeke'ngi (Lin. spec. p. 262.) herbaceous, downy from simple hairs; root perennial, creeping; stem almost simple; leaves ovate-deltoid, acuminated, repand; flowers spotless; fructiferous calyx ovate, coloured: segments subulate. ♃. H. Native of Europe, on exposed parts of hills; and of Japan? Willd. spec. 1. p. 1022. Sibth et Smith, fl. græc. t. 234. Schkuhr, handb. t. 45. P. Halicácabum, Scop. fl. carn. ed. 2d. no. 286. Alkekéngi officinàrum, Tourn. inst. p. 151. Στρυχνος ἀλικακαβος, Diosc. lib. 4. chap. 72.—Plench, off. t. 124.—Blackw. t. 161. Corolla dirty white. Calyx reddish yellow, inclosing a scarlet berry. The berries of the *Alkekéngi*, or *Winter Cherry*, were well known to the ancients, and are described by Dioscorides. They have an acidulous, and not unpleasant flavour, followed by a slight bitterness, which they are said to derive from the investing calyx. Though esteemed detergent, and aperient, the fruit is chiefly recommended as a diuretic. From 6 to 12

berries, or an ounce of the expressed juice, is given as a dose. In some parts of Germany the country people eat the fruit by handfuls, and in Spain and Switzerland they frequently supply the place of other eatable fruits. Instances are related of their good effects in dropsical and calculous disorders, but at present they are wholly disregarded. In some parts they are esteemed as good as gooseberries for tarts.

Alkekengi, or Common Winter Cherry. Fl. July, Sept. Clt. 1548. Pl. 1 to 1½ foot.

9 P. CHENOPODIFÒLIA (Lam. ill. no. 2401. Poir. suppl. 2. p. 348.) herbaceous, perennial, tuberous at the base, clothed with hoary, simple tomentum; stem erect, dichotomous; leaves deltoid-ovate, angularly-toothed; corolla spotted; anthers violaceous; fructiferous calyx ovate, angular, pale. ♃. S. Native of Peru. P. tuberòsa, Willd. enum. 1. p. 232. P. incàna, Cat. hort. par. Root thick, branched. Leaves small for the size of the plant: superior ones twin, unequal. Flowers drooping. Calyx pubescently tomentose, bifid to the middle, with the segments unequal. Corolla downy outside, yellow, marked with 5 square, dark, violaceous spots at the bottom. Berry yellow, clammy. This species often occurs in gardens under the name of *P. viscòsa*.

Goosefoot-leaved Winter Cherry. Fl. July, Aug. Clt. 1798. Pl. 2 to 3 feet.

10 P. HETEROPHY'LLA (Nees, in Linnæa, 6. p. 463.) herbaceous, villous, with a perennial root; branches diffuse, angular, flexuous; leaves twin, very unequal in size, ovate, or cordate, acute, toothed; corollas spotted; anthers yellow; fructiferous calyx ovate, angular, pale. ♃. H. Native of North America, on argillaceous hills in Pennsylvania, Poeppig. P. Pennsylvánica, Willd. herb. P. tomentòsa, Walt. fl. car. p. 99.? P. nùtans, Walt. fl. car. p. 99.? Root creeping. Stems procumbent. Flowers nutant. Calyx hairy, 5-cleft, unequal. Corolla downy outside, with a repand margin, yellow, marked by 5 obscure, brownish-violet spots. Leaves almost orbicular, cordate, and ovate, and repand in various ways.

Variable-leaved Winter Cherry. Pl. procumbent.

11 P. PERUVIA'NA (Nees in Linnæa, 6. p. 464. and Lin. trans. 17. p. 67.) herbaceous, perennial, densely and pubescently villous from simple hairs; stem erect, branched a little; leaves cordate, acuminated, entire, or dentately sinuated, rather tomentose; corolla spotted; anthers violaceous; fructiferous calyx ovate, nearly equal, pale. ♃. G. Native of Peru, about Lima; East Indies; New Holland, at Port Jackson; Madeira. Plant grey from down. Leaves twin. Calyx downy. Corolla size of that of *P. Alkekéngi*, yellow, marked with 5 brown spots at the throat. Berry globose, viscid, yellow, sweet-scented; they are an excellent substitute for gooseberries in making tarts, for which they are used in many places.

Var. α, esculénta; leaves more or less toothed. ♃. G. P. esculénta, Willd. in act. nat. car. berol. 4. p. 197. P. tomentòsa, Medic. act. pal. 4. p. 184. t. 4. P. Peruviàna, Roxb. fl. ind. 2. p. 241. Wall. cat. no. 2644.

Var. α, edùlis; leaves almost quite entire. ♃. G. P. Peruviàna, Lin. spec. 1. p. 1670. Willd. spec. 1. p. 1022. enum. 1. p. 232. P. pubéscens, Lin. herb. R. Br. prod. p. 447. Ruiz. et. Pav. fl. per. 2. p. 41. Rœm. et Schultes, syst. 4. p. 675. P. tuberòsa, Zucc. obs. cent. no. 43. in Rœm. coll. p. 130. D. C. hort. monsp. 1813. p. 50. P. latifòlia, Lam. ill. no. 2407. Rœm. et Schultes, syst. 4. p. 676. P. Barbadénsis, Lam. dict. 2. p. 102. no. 12. P. edùlis, Sims, bot. mag. t. 1068. Balb. cat. hort. taur. 1813.—Mor. hist. 3. p. 526. sect. 13. t. 3. f. 17.—Feuill, per. 3. p. 5. t. 1.

Peruvian Winter Cherry. Fl. April, Oct. Clt. 1772. Pl. 2 to 3 feet.

SECT. II. EPETEIORHIZA (from επετειος, *epeteios*, annual; and ῥιζα, *rhiza*, a root; in reference to the annual roots.) Herbaceous, annual; root slender. Flowers solitary. Alabastrum ovate, while closed small in respect to the corolla.

§ I. *Fructiferous calyx bladdery, closed.*

12 P. PUBE'SCENS (Lin. hort. cliff. no. 62. spec. p. 262.) herbaceous, annual, much branched, clothed with pubescent tomentum; leaves unequal at the base, cordate, acuminated, toothed, but quite entire at the base; corollas spotted; anthers violaceous; fructiferous calyx ovate, acuminated, acutely angular, retuse at the base. ☉. H. Native of North America, as of Virginia, Carolina, and Pennsylvania; East Indies, but hardly indigenous; Island of Ascension, but probably introduced. Pursh. fl. sept. amer. 1. p. 157. P. ramòsa, Mill. dict. no. 9. P. Peruviàna, Roxb. fl. ind. 2. p. 241. Wall. cat. no. 2034. C. D. F. P. Rothiàna, Herb. hort. berol. Alkekéngi procúmbens, Mœnch. meth. 473.—Mor. hist. 3. p. 527. sect. 13. t. 3. f. 24. P. stamìnea, Muhl. in herb. Willd. P. edùlis, Cyr. Balb. cat. hort. taur. 1813. Mill. fig. t. 206. f. 1. The whole plant is densely clothed with minute soft down. Leaves generally distinctly cordate at the base. Corolla yellow, marked with 5 roundish, brownish-violet spots at the throat. Berries yellowish when ripe, size of cherries; they are called gooseberries in many parts, and are used in tarts as a substitute for them.

Var. β, pruinòsa; leaves also toothed at the base. ☉. H. Native of America. P. pubéscens, β, Lam. dict. 2. p. 101. no. 9. P. pruinòsa, Lin. spec. p. 263. Rœm. et Schultes, syst. 4. p. 678. P. Barbadénsis, Jacq. misc. 2. p. 359. icon. rar. 1. t. 39. Rœm. et Schultes, syst. 4. p. 676. Willd. enum. 1. p. 232. P. obscùra, β, pubéscens, Pursh, fl. amer. sept. 1. p. 157. Rœm. et Schultes, syst. 4. p. 677. no. 21. β.—Dill. elth. p. 12. t. 9. f. 9.

Downy Winter Cherry. Fl. July, Aug. Clt. 1640. Pl. 1 to 2 feet.

13 P. FŒ'TENS (Poir. suppl. 2. p. 348.) herbaceous, annual, clothed with clammy pubescence; branches dichotomously diffuse; leaves ovate-elliptic, unequal at the base, acute, coarsely toothed; corollas spotted; anthers violaceous; fructiferous calyx ovate, ventricose, equal. ☉. H. Native of tropical America. P. fœtidíssima, Lag. gen. et spec. nov. diagn. p. 10. no. 146. Rœm. et Schultes, syst. 4. p. 680. Link, enum. 1. p. 181. P. nodòsa, Lam. ill. p. 29.? The whole plant is clothed with capitate, soft, short hairs, of an ungrateful smell, green, and shining. Stems and branches thickened at the joints. Corolla rather downy outside, with ciliated edges, sulphur-coloured, marked with 5 large livid-violaceous spots at the bottom; angles acute. Berry nearly globose, yellowish.

Stinking Winter Cherry. Fl. July, Aug. Clt. 1816. Pl. 1½ to 2 feet.

14 P. ÆQUA'TA (Jacq. fil. eclog. 2. Nees in Linnæa, 6. p. 470.) herbaceous, annual; stem dichotomous, and clothed with hairy pubescence at the side, as well as the erect, strict branches; leaves ovate, or oblong, sinuately serrated, glabrous; corollas spotted; anthers violaceous; fructiferous calyx ovate-subglobose, smooth; pedicels short, hairy. ☉. S. Native country unknown. P. ixocárpa, Brot. ex D. C. hort. monsp. 1813. Horn. hort. hafn. suppl. p. 26. Upper leaves said to be twin. Leaves sometimes scabrous on the midrib and veins beneath; petioles hairy above. Calyx downy; segments triangular. Corolla small, downy outside, yellow, with a blackish violet bottom. Berry large, yellow, filling the bottom of the calyx.

Equal-calyxed Winter Cherry. Fl. June, July. Clt. 1826. Pl. 1½ to 2 feet.

15 P. LINKIA'NA (Nees, in Linnæa, 6. p. 471.) herbaceous, annual, glabrous; stem branched, rather diffuse; leaves ovate,

acuminated, sinuately serrated, glabrous: serratures mucronate; corolla spotless; anthers violaceous; fructiferous calyxes ovate, acuminated, equal; peduncles elongated, glabrous. ⊙. H. Native of Brazil. P. dùbia, Link, enum. 1. p. 181. P. ixocárpa, Brot. hort. bonn. P. angulàta, Hort. Vrat.—Mor. hist. 3. p. 526. sect. 13. t. 3. f. 22. Stems procumbent at length, but erect at first. Upper leaves twin. Calyx rather scabrous, with triangular, acuminated segments. Corolla sinuately 5-angled, yellow, with a more obscure, 5-lobed star in the bottom; angles acute. Berry globose, yellow. The variety having the calyx veined with purple is the *P. dùbia*, Link; and the one with pale, self-coloured calyx, is *P. arenària*, Hort. Vrat.

Link's Winter Cherry. Fl. July, Aug. Clt. 1821. Pl. 1 to 2 feet.

16 P. LANCEIFÒLIA (Nees, in Linnæa, 6. p. 473.) herbaceous, annual, smoothish; stem dichotomous; leaves lanceolate, attenuated at both ends, a little toothed; corolla spotless; anthers bluish; fructiferous calyx pendulous, ovate, equal?; peduncles very long, downy. ⊙. H. Native of Peru, Mexico, and North America?. P. angulàta, Ruiz. et Pav. fl. per. 2. p. 42. Stem thickened at the nodi, sulcately angular. Leaves sometimes twin, pale green: lower ones glabrous: upper ones minutely pubescent about the petioles and principal veins, as well as the calyx in the same way; midrib marked by a furrow on both sides. Corolla downy outside, cream-coloured. Berry globose, yellow.

Lance-leaved Winter Cherry. Pl. 1 to 2 feet.

17 P. ANGULA'TA (Lin. hort. cliff. p. 62. spec. p. 262.) herbaceous, annual, much-branched, glabrous; leaves ovate or oblong, acute, coarsely, unequally, and dentately serrated, but in var. β almost entire; corolla spotless; anthers pale blue; fructiferous calyx 5 angled, truncate at the base; the segments triangularly subulate under florescence, about equal in length to its tube. ⊙. H. Native of the East Indies. Willd. spec. 1. p. 1022. Rœm. et Schultes, syst. 4. p. 676, exclusive of var. β, and its synonymes. Nees in Linnæa, 6. p. 474, and in Lin. trans. 17. p. 70. P. obscùra, var. α, glàbra, Pursh, fl. 1. p. 157. P. Peruviàna, Wall. cat. no. 2634. A. E. G. H. P. mínima, Wall. cat. no. 2633. P. flexuòsa, and P. angulàta, Russel, herb. P. angulàta, Heyne, herb. P. flexuòsa, and P. Sugúnda, Hamilt. herb.—Dill. elth. p. 13. t. 12. f. 12.—Mor. hist. 3. p. 527. sect. 13. t. 3. f. 27. ?—Rheed. mal. 10. p. 139. t. 70. Corolla small, short, somewhat campanulate, yellow. Berry size of a cherry, globular, yellow?

Var. β, pátula; leaves oblong-lanceolate, acuminated at the base and apex; stem diffuse. ⊙. H. Native of Vera Cruz and Brazil. P. pátula, Mill. dict. no. 12.

Var. γ, Bonariénsis; leaves oblong, almost quite entire. ⊙. H. Native of Buenos Ayres. P. angulàta, β, foliis integérrimis, Lin. spec. 262. Rœm. et Schultes, syst. 4. p. 676.—Dill. elth. p. 12. t. 11. f. 11.

Angular-calyxed Winter Cherry. Fl. June, Sept. Clt. 1732. Pl. 1 to 2 feet.

18 P. I'NDICA (Lam. dict. 2. p. 102. no. 14.) herbaceous, annual; stem erect, divaricately dichotomous, and is, as well as the branches, flexuous, and the petioles clothed with fine viscid pubescence, roughish; leaves ovate, or oblong, a little toothed; corolla spotless; anthers yellow; fructiferous calyx ovate, rather angular; the segments triangular under florescence, and not half as long as its tube. ⊙. H. Native of the East Indies, and New Holland. Nees in Linnæa, 6. p. 476. P. parviflòra, R. Br. prod. p. 447. Rœm. et Schultes, syst. 4. p. 680. P. mínima, Roxb. fl. ind. 2. p. 242. The whole plant is covered with long, white, clammy hairs. Corolla tubularly campanulate, yellow.

Var. β, parviflòra; fruit smaller, ovate, almost globose; leaves almost entire. ⊙. H. P. parviflòra, Willd. herb. P. Abyssínica, et P. parviflòra, Willd. herb. Corolla yellow, hardly spotted at the throat.

Least Winter Cherry. Fl. July, Aug. Clt. 1759. Pl. ½ to 1 foot.

20 P. PROSTRA'TA (Lher. stirp. p. 43. t. 22.) herbaceous, annual; stem much branched, prostrate, villous, as well as the leaves; leaves cordate, or ovate-elliptic, repandly-toothed, on long petioles; corollas large, blue; fructiferous calyx globose, membranous, ribbed. ⊙. H. Native of Peru, Jacq. coll. 1. p. 99. icon. rar. 1. t. 38. Andr. bot. rep. t. 75. Ruiz. et Pav. fl. per. 2. p. 41. Lam. ill. t. 116. f. 2. P. Liménsis, Retz, obs. 5. p. 22. Physaloìdes prostràta, Mœnch. Corollas campanulately funnel-shaped, 1¼ inch in diameter, blue, painted with deeper purple veins. Berry small, yellowish.

Prostrate Winter Cherry. Fl. July, Aug. Clt. 1782. Pl. prostrate.

§ 2. *Fructiferous calyx open, and filled with the fruit.*

21 P. PHILADE'LPHICA (Lam. dict. 2. p. 101.) herbaceous, annual, smoothish; stem erect, dichotomous, and is, as well as the branches, strict; leaves obliquely ovate, acuminated, repandly angular; corollas spotted, and veiny; fructiferous calyx when mature open, girding the berry. ⊙. H. Native of North America, from New England to Virginia, in dry places on the banks of rivers, Pursh. Pursh, fl. amer. sept. 1. p. 157. Physàlis chenopodifòlia, Willd. spec. 1. p. 1023. enum. suppl. p. 11, but not of Lam. Physàlis ovàta, Poir. suppl. 2. p. 348. P. atriplicifòlia, Jacq. fragm. p. 58. t. 85. f. a. Poir. suppl. 2. p. 348. P. megistocárpos, Zucc. obs. cent. no. 56. in Rœm. coll. p. 130. Calyx 5-cleft to the middle, having the base and veins violaceous. Corolla yellow, marked with 5 violet spots at the bottom, which emit more obscure veins. Calyx not inflated, as in the other species, but like that of *Saràcha*, of which it is probably a species.

Philadelphian Water Cherry. Fl. July, Aug. Clt. 1800. Pl. 1 to 1½ foot.

SECT. III. ANÓMALÆ. Roots perennial. ? Stems herbaceous. Corolla campanulately funnel-shaped, not plicate as in the other sections. Perhaps a distinct genus.

22 P. ORINOCE'NSIS (H. B. et Kunth, nov. gen. amer. 3. p. 12.) stem angular, hairy; leaves quite entire, ovate, sub-acuminated, unequal at the base, hairy on the veins and nerves beneath; flowers twin?; teeth of calyx acute; corollas funnel-shaped. ♃.? S. Native on the banks of the Orinoco, near Arichuna, and the cataract of the Atures. Corolla 5 times longer than the calyx, pilose. Berry globose, size of a large pea, inclosed in the bladdery, reticulated calyx.

Orinoco Winter Cherry. Pl.

23 P. XALAPE'NSIS (H. B. et Kunth, l. c. 13.) stem angular? glabrous, or the branches are marked by a pilose line; leaves oblong, acuminated, entire, rather pilose, ciliated; flowers umbellate, pedunculate; corolla campanulately funnel-shaped. ♃.? S. Native of Mexico, between Perote and Xalapa, at the altitude of 700 hexapods. Flowers size of those of the preceding species; the fruit also resembling it.

Xalapa Winter Cherry. Pl.?

† *Species hardly known, or very imperfectly described.*

24 P. OBSCU'RA (Michx. fl. bor. amer. 1. p. 149.) leaves subcordate, almost orbicular, acuminated, unequally toothed; stem herbaceous, divaricate, much branched; branches angular. ⊙. H. Native of Lower Carolina, in sandy fields. P. obscùra, β, pubéscens, Pursh. fl. 1. p. 157. P. angulàta, Walt. fl. car. p. 99. Plant clothed with viscid down. Corolla yellow, with 5 brown spots, and bluish anthers. Nearly allied to *P. pruinòsa*.

Obscure Winter Cherry. Pl. 1 to 2 feet.

25 P. SUBTRIFLÒRA (Ruiz. et Pav. fl. per. 1. t. 178. f. b.) stem angular; leaves ovate, acute, quite entire, villous; peduncles 2-3-flowered; fruit drooping.—Native of Peru. Perhaps not belonging to the genus.

Subtriflowered Winter Cherry. Pl.

26 P. PA'TULA (Mill. dict. no. 12.) much branched, spreading; branches angular, glabrous; leaves lanceolate, pinnately-toothed. ⊙. H. Native of Vera Cruz, Houston. Humble. Leaves woolly. Flowers small, white. Berry small, yellowish.

Spreading Winter Cherry. Pl. humble.

27 P. VILLÒSA (Mill. dict. no. 13.) much branched; branches villous; leaves ovate, acuminated, serrately toothed. ⊙. H. Native of Vera Cruz, Houston. Flowers small, pale yellow. Berry globose, yellowish green, size of a cherry.

Villous Winter Cherry. Pl.?

28 P. CORDA'TA (Mill. dict. no. 14.) stem erect, branched; leaves ovate, serrate-toothed; petioles and peduncles very long. ⊙. H. Native of Vera Cruz, Houston. Leaves purple in autumn, like those of *Làmium*. Flowers small, white. Berry large, size of a cherry, greenish yellow, striped with purple.

Cordate-leaved Winter Cherry. Pl. 2 feet.

29 P. MA'XIMA (Mill. dict. no. 15.) stem erect, branched; leaves ovate-lanceolate, clammy; fruit large, cordate. ⊙. H. Native of Vera Cruz, Houston. Stem glabrous, almost 3 feet high. Leaves on long petioles. Flowers small, cream-coloured. Berry pale yellow.

Largest Winter Cherry. Pl. 3 feet.

30 P. LU'TEA (Medic. act. palat. 4. phys. p. 186.) fructiferous calyxes pear-formed, unopen, almost filled by the berry; corollas spotless. ♃. H. Native country unknown. Said to be allied to *P. viscòsa*, but differs in the fructiferous calyx being oblong, with 10 elevated angles.

Yellow Winter Cherry. Pl.?

31 P. RAMÒSA (Forsk. fl. arab. p. 204.) leaves solitary and twin, broadly ovate, acute, sinuately toothed, rather villous. ⊙. H. Native of Arabia, at Uahfad. Habit of *P. alkekéngi*, but the calyx is much inflated and pentagonal. Corolla yellow. Berry dry, red.

Branched Winter Cherry. Pl.?

32 P. NU'TANS (Walt. fl. carol. p. 99.) leaves alternate, ovate, and are, as well as the stem, which is rather angular, tomentose; flowers solitary, drooping. ⊙.? H. Native of Carolina.

Drooping Winter Cherry. Pl.?

33 P. MUCRONA'TA (Willd. enum. suppl. p. 11, without any diagnosis.) Nothing is known of this plant but the name.

Mucronate Winter Cherry. Pl. 1 foot.

34 P. MICRA'NTHA (Link, enum. 1. p. 181.) hairy; leaves cordate, acute, toothed; peduncles axillary, at length reflexed; calyx angular, with acute segments. ⊙. H. Native country unknown. P. parviflòra, Willd. enum. suppl. p. 11. Nearly allied to *P. pubéscens*, and probably only a variety of it. Corolla small, yellow.

Small-flowered Winter Cherry. Fl. July, Aug. Clt. 1826. Pl. 1 to 2 feet.

Cult. For culture and propagation see *Solànum*, p. 442.

VI. SARA'CHA (named by Ruiz. and Pavon, after Isodore Saracha, a Benedictine monk much attached to the study of botany, and who enriched the royal gardens at Madrid with many rare plants.) Ruiz. et Pav. fl. per. 2. p. 42. t. 178. prod. p. 349. Bellínia, Rœm. et Schultes, syst. 4. p. lvi. and p. 687.

LIN. SYST. *Pentándria, Monogýnia.* Calyx campanulate, 5-angled, 5-cleft; segments ovate, permanent. Corolla campanulately rotate: with 5 equal, reflexed lobes, and furnished with 5 nectariferous pits at the base. Anthers cordate, straight, dehiscing lengthwise. Stigma capitate. Berry globose, 1-2-celled, half inclosed in the hardly inflated calyx, almost to the middle; placenta fleshy. Seeds many, compressed, reniform.—Usually herbaceous, procumbent, or erect plants. Leaves alternate, petiolate, entire, usually twin, especially the upper ones. Peduncles from the forks of the stem, or axils of the leaves, 2 or many flowered, usually umbellate and drooping. *Saràcha* only differs from *Solànum* in the filaments being woolly at the base, and closing up the mouth of the tube of the corolla; and by its cordate anthers, with the cells opening lengthwise.

* *Annual Plants.*

1 S. PROCU'MBENS (Ruiz. et Pav. fl. per. 2. p. 43. t. 180. f. b.) herbaceous, procumbent; leaves twin, unequal, ovate, quite entire, glabrous in the adult state, but when young villous on the margins and back; flowers umbellate, drooping; filaments glabrous. ⊙. H. Native of Peru, in the valley of Canta. A'tropa procúmbens, Cav. icon. 1. p. 53. t. 72. Jacq. hort. schoenbr. t. 492. A'tropa plicàta, Roth, catalect. 2. p. 24. Physàlis solanàcea, Mentens ex Roth, l. c. Solànum procúmbens, D. C. fl. fr. 3. p. 611. Bellínia procúmbens, Rœm. et Schultes, syst. 4. p. 687. Stem dichotomous, furrowed, downy, angular. Leaves rarely solitary. Peduncles axillary, 2-3-4-flowered; pedicels and calyxes villous. Corolla cream-coloured, with a green centre, and downy margin. Berry shining, size of a pea.

Procumbent Saracha. Fl. June, July. Clt. 1822. Pl. proc.

2 S. UMBELLA'TA (D. C. cat. hort. monsp. 1813. p. 142.) herbaceous, erect, hairy, much branched; leaves ovate, wrinkled, entire, shining, acute, scabrous: floral ones twin; flow-

ers umbellate, drooping; filaments bearded at the base. ⊙. H. Native of Peru. Sweet, fl. gard. t. 85. A'tropa umbellàta, Roth, catal. 2. p. 26. Jacq. schoenbr. t. 493. A'tropa Ròthii, Poir. suppl. 1. p. 610. Bellínia umbellàta, Rœm. et Schultes, syst. 4. p. 688. Stem solitary, dichotomous. Leaves canescent beneath, green above, entire, and sometimes slightly angular. Umbels pedunculate, 7-10-flowered, axillary, solitary. Corolla plicate, cream-coloured, or greenish-white, smaller than those of *S. procúmbens*. Berry dark purple.

Umbellate-flowered Saracha. Fl. June, July. Clt. 1822. Pl. 2 to 4 feet.

3 S. contórta (Ruiz. et Pav. fl. per. 2. t. 180. f. a.) herbaceous, erect; leaves ovate, angularly toothed, downy, and quite entire: upper floral ones twin; flowers umbellate drooping, pedunculate; filaments villous at the base. ⊙. H. Native of Peru, from Canta to Obragillo. Bellínia contórta, Rœm. et Schultes, syst. 4. p. 689. A'tropa contórta, Spreng. syst. 1. p. 699. Stem furrowed, glabrous, branched, of a livid violaceous colour at bottom; branches dichotomous, downy. Peduncles and pedicels twisted. Umbels 6-10-flowered. Corolla cream-coloured, rather large. Berry black, globose, size of a pea.

Twisted-pedicelled Saracha. Pl. 3 to 4 feet.

* * *Shrubby Plants.*

4 S. puncta'ta (Ruiz. et Pav. fl. per. 2. p. 42. t. 178.) suffruticose, erect; leaves ovate-oblong, quite entire, glabrous above, and powdery beneath; pedicels 1-flowered, unequal, aggregate, axillary and terminal; corollas spotted. ♄. G. Native of Peru, in elevated places. Bellínia punctàta, Rœm. et Schultes, syst. 4. p. 688. A'tropa punctàta, Spreng. syst. 1. p. 698. Branches angular, downy while young. Pedicels a little longer than the corollas. Calyx glabrous. Corolla large, campanulate, powdery outside, yellowish, and marked with small purple spots.

Dotted-flowered Saracha. Shrub 2 to 3 feet.

5 S. Zuccagnia'na; frutescent, erect; stem villous, 4-5-angled; leaves solitary or twin, ovate-cordate, rather villous, entire; common peduncle villous, between the petioles of the twin leaves, bearing an umbel of pedicellate drooping flowers. ♄. G. Native of America? A'tropa erécta, Zucc. cent. in Rœm. coll. p. 129. no. 41. Angles of stem violaceous. Leaves glabrous above, but the margins and nerves beneath are villous. Umbels 2-3-4-flowered. Segments of calyx ciliated. Corolla greenish-yellow, rotate, marked by 10 twin green spots at bottom; limb pentagonal, ciliated, revolute. Filaments villous at the base. Berry globose, glabrous, 2-celled.

Zuccagni's Saracha. Shrub.

6 S. villòsa; stem frutescent; leaves cordate-ovate, acuminated, quite entire, very villous: rameal ones twin, unequal; umbels axillary, many-flowered, drooping; limb of corolla 5-cleft. ♄. G. Native of Peru? A'tropa villòsa, Zucc. in Rœm. coll. p. 130. no. 42. Rœm. et Schultes, syst. 4. p. 684. Stem pentagonal, violaceous at the base, furrowed, villous, as well as the branches, which are tetragonal. Common peduncle horizontal, solitary, between the petioles of the twin leaves; pedicels 8-9, papillose. Corolla greenish-yellow, rotate; limb pentagonal; segments ciliated. Evidently a species of *Saràcha*.

Villous Saracha. Shrub erect.

7 S. denta'ta (Ruiz. et Pav. fl. per. 2. p. 176. f. b.) herbaceous, procumbent, downy; leaves entire and toothed, ovate, twin; peduncles usually 4-flowered, subumbellate, lateral and terminal, inclinate. ♃. G. Native of Peru, along with *S. punctàta*. Bellínia dentàta, Rœm. et Schultes, syst. 4. p. 689. A'tropa dentàta, Spreng. syst. 1. p. 699. Pedicels unequal, short. Corolla whitish-violet, villous, campanulate, marked by 5 green spots. Berry copper-coloured, size of a pea.

Toothed-leaved Saracha. Pl. procumbent.

8 S. biflòra (Ruiz. et Pav. fl. per. 2. p. 42. t. 179.) herbaceous, erect, downy; leaves ovate, usually twin; peduncles axillary, 2, rarely 3-flowered; flowers pendulous. ♃. G. Native of Peru, in corn-fields. Bellínia biflòra, Rœm. et Schultes, syst. 2. p. 689. Branches angular. Corolla greenish-yellow. Stamens twice as long as the corolla. Berry white, size of a pea, a little compressed.

Two-flowered Saracha. Pl. 2 feet.

9 S. viscòsa (Schrad. cat. sem. hort. goett. 1832. D. Don, in Sweet, fl. gard. n. s. t. 323.) clothed in every part with glandular pubescence, and viscid; stem erect, suffruticose; leaves twin, cordate, acuminated, sinuately toothed, and sometimes entire; peduncles umbellate; throat of corolla woolly; fructiferous calyx coloured. ♄. G. Native of Mexico, Spangenberg. Umbels solitary, nearly sessile. Calyx 5-cleft, large. Corolla large, with acute lobes, valvate in æstivation, cream-coloured, and marked towards the base with numerous olive-coloured spots. Anthers cordate, violet. Berry globose, size of a cherry, scarlet.

Clammy Saracha. Fl. June, Sept. Clt. 1835. Pl. 1 to 2 feet.

10 S. pube'scens (Willd. rel. ex Rœm. et Schultes, syst. 4. p. 689.) shrubby, downy; leaves ovate, acute; umbels pedunculate, terminal. ♄. G. Native of Peru. Humb. et Bonpl. Bellínia pubéscens, Rœm. et Schultes, syst. 4. p. 689.

Downy Saracha. Shrub?

N.B. What are Saràcha micrántha, D. C. hort. monsp. 1813. and S. Peruviàna, Dietr. gart. lex. 8. p. 522. ?

Cult. The shrubby species of *Saràcha* require protection in a frame or greenhouse in winter; but they may be planted out in open ground in summer; they are increased by cuttings and seeds. The seeds of annual species only require to be sown in the open ground in spring.

VII. WITHERI'NGIA (named by L. Heritier, in honour of William Withering, M.D., author of "A Botanical Arrangement of the Vegetables of Great Britain." 2 vols. 8vo. Birmingham, 1776. First edition.) Lher. stirp. 1. p. 33. t. 1. Dun. sol. p. 107. H. B. et Kunth, nov. gen. 3. p. 13. Mart. bras. 3. p. 73.—Solànum species of Lin. and other authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx urceolately campanulate, 4-5-cleft. Corolla rotate; tube short; limb 4-5-cleft. Stamens 4-5; anthers conniving, dehiscing lengthwise. Stigma subcapitate. Berry 2-celled, propped by the permanent calyx, many-seeded; placentas adnate. Seeds lenticular.—Trees, shrubs, or herbs, with soft wood, and large medulla, having the habit of *Solànum*. Branches opposite or alternate, thickened at the nodi. Leaves alternate, usually twin, (one in each pair smaller than the others,) quite entire, or sinuately-toothed, rarely pinnatifid. Inflorescence umbellate, racemose, or panicled, rarely having the flowers solitary. Peduncles lateral or extra-axillary. Corollas whitish, rose-coloured, yellow, greenish, or bluish.

* *Stems shrubby.*

1 W. stramoniifòlia (H. B. et Kunth, nov. gen. 3. p. 13.) arboreous; branches angularly winged; branchlets downy; leaves ovate, acuminated, unequally cordate, dentately angular, hairy, twin; umbels extra-axillary, sessile; filaments bearded at top. ♄. S. Native of Mexico, near La Bandarilla; and the city of Xalapa, at the altitude of 750 hexapods, where it is called *Oja Peluda* by the natives. Leaves 4-5 inches long, and 2-3 broad. Umbels many-flowered. Flowers nutant, pentamerous and pentandrous. Corolla yellowish, hairy outside, size of those of *Cápsicum frutéscens*. Berry globose, red, size of a pea.

Stramonium-leaved Witheringia. Fl. May, Aug. Clt. 1823. Tree 10 to 20 feet.

2 W. CRASSIFÒLIA (Dun. sol. p. 108. syn. p. 2.) stem shrubby, hairy, rather sarmentose; leaves ovate, entire, or sinuately-angular, bluntish; panicles subdichotomous, reclinate. ♄. G. Native of the Cape of Good Hope. Solànum crassifòlium, Lam. ill. no. 2323. Sol. dulcamàra, var. β, Lin. spec. p. 264. Solànum Africànum, Mill. no. 26.—Dill. hort. elth. 365. t. 273. f. 352. Branches hispid, rather angular at top. Leaves pilose. Panicles subcymose, and nearly terminal. Flowers pentamerous and pentandrous. Corolla of a violaceous purple colour; segments ovate, subconnivent. Anthers copper-coloured.

Thick-leaved Witheringia. Fl. May, Aug. Clt. 1706. Pl. 1 to 2 feet.

3 W. PI'CTA (Mart. bras. 3. p. 74. t. 227.) arborescent; branches and branchlets spreading, viscid and pilose, as well as the leaves; leaves alternate and twin, broad-ovate, short-acuminated, acutish at the base; peduncles solitary, and some aggregate, axillary, shorter than the leaves. ♄. S. Native of Brazil, in the mine provinces on Serra do Mar; and near the town of Joao d'El Rey, &c., in dry exposed places. Flowers pentamerous and pentandrous. Calyx with lanceolate segments. Corolla white, spotted with violet in the throat; segments broad-lanceolate, acutish, exceeding the anthers, which are linear. Berry yellowish.

Painted-flowered Witheringia. Shrub 6 to 8 feet.

4 W. DIVARICA'TA (Mart. bras. 3. p. 72. t. 228.) suffruticose, the whole clothed with fine down; leaves ovate-lanceolate, or ovate, acuminated, rounded at the base; racemes simple, few-flowered, lateral, exceeding the leaves. ♄. S. Native along with the preceding, on Serra do Mar; and on the descent to the valley of the river Paraiba. Branches for the most part opposite. Flowers pentamerous and pentandrous. Segments of the calyx ovate, acute, ciliated, and often serrulated. Corolla white; segments lanceolate, acute, twice as long as the inflated lanceolate anthers.

Divaricate Witheringia. Shrub 4 to 5 feet.

5 W. DIPLÓCONOS (Mart. bras. 3. p. 76. t. 229.) suffruticose, glabrous; leaves ovate, acuminated, cordate at the base; racemes alar, longer than the leaves. ♄. S. Native of Brazil, in hedges and woods at Tejuca, and elsewhere; near Sebastinople; also on Serra do Mar. Leaves twin. Corollas semiquinquefid, of a testaceous rose-colour, with a violaceous middle nerve, or wholly violaceous, size of those of *Sol. tuberòsum;* segments triangular, twice as long as the ovate, ventricose anthers, which are glandular at apex. Pistil referrible to an inverted cone in a cone. Segments of the calyx ovate, acute, denticulated on the margins. Perhaps a species of *Dunàlia.*

Double-coned Witheringia. Shrub 3 to 4 feet.

6 W. MACROPHY'LLA (Dun. syn. p. 1. sol. ed. 2d. ined. t. 77. H. B. et Kunth, nov. gen. amer. 3. p. 14.) shrubby; branches rather angular, puberulous; leaves ovate-elliptic, subacuminated, rather repand, smoothish: superior ones twin; umbels sessile, twice as short as the petioles; filaments bearded. ♄. S. Native of New Granada, near Turbaco, at the altitude of 180 hexapods. Leaves about 8 inches long, and about 4 broad, rather downy on the primary veins beneath. Flowers size of those of *Solànum nìgrum*, tetramerous and tetrandrous. Calyx 4-toothed. Corolla 4-cleft, greenish, with oblong, acute segments. Anthers ovate-lanceolate. Berries globose, red, size of pepper berries. This species differs from *W. solanàcea*, which it is very like; in the shrubby stem; larger leaves, and smoother branches; in the umbels being shorter than the petioles; and in the smaller flowers.

Long-leaved Witheringia. Shrub.

7 W. CILIA'TA (H. B. et Kunth, nov. gen. amer. 3. p. 15.) shrubby; branches terete, glabrous; leaves oblong, acute, narrowed at the base, quite entire, ciliated, glabrous, twin; peduncles extra-axillary, solitary or twin, elongated. ♄. S. Native of New Granada, on the Andes of Pasto, near Tulcan, at the altitude of 1580 hexapods. Young branchlets downy. Flowers size of those of *Solànum nìgrum*, pentamerous and pentandrous. Calyx downy, 5-toothed. Corolla white; limb angularly 5-lobed; lobes acute. Filaments glabrous; anthers oblong, obtuse. This species has much the habit of *Solànum phillyreoìdes*, with which at first sight it might be readily confounded.

Ciliated-leaved Witheringia. Shrub.

8 W. MÓLLIS (H. B. et Kunth, l. c.) shrubby; branches terete, clothed with hoary tomentum; leaves ovate, acuminated at both ends, quite entire, downy above, clothed with soft tomentum beneath, and canescent, twin; peduncles 2-3-4 together, elongated. ♄. S. Native of Peru, near the town of Caxamarca, at the altitude of 1500 hexapods. Leaves $1\frac{1}{2}$ to 2 inches long. Flowers drooping, size of those of *Solànum nìgrum*, pentamerous and pentandrous. Calyx 5-toothed, hoary. Corolla hairy outside; limb angularly 5-toothed: teeth acute. Anthers oblong, obtuse, on glabrous filaments. Berry size of pepper, globose. Very like the two preceding, but differs in the form of the leaves.

Soft Witheringia. Shrub.

9 W. RHOMBOI'DEA (Dun. syn. p. 1. H. B. et Kunth, l. c.) shrubby; branches terete, tomentose; leaves ovate, acutish, rounded at the base, and unequal, quite entire, clothed with soft pubescence above, and hoary tomentum beneath, twin; umbels sessile, 4-6-flowered, longer than the petioles; filaments glabrous. ♄. S. Native on the Andes of Quindiu, on El Machin, at the altitude of 1030 hexapods. Leaves an inch long, green above. Flowers size of those of *Solànum nìgrum*, pentamerous and pentandrous. Calyx clothed with hoary tomentum, 5-toothed: teeth linear, remote. Corolla glabrous, 5-cleft, with oblong, acute segments, which are hairy at top. Anthers linear-oblong.

Rhomboid-leaved Witheringia. Shrub climbing.

10 W. DUMETÒRUM (Dun. sol. p. 1. sol. ed. 2d. ined. t. 79. H. B. et Kunth, l. c. p. 16.) shrubby; branches rather angular, tomentose while young; leaves ovate, subacuminated, cuneated at the base, hairy above, clothed with hairy tomentum beneath, and canescent: superior ones twin; peduncles twin or tern, 1-flowered, much longer than the petioles; filaments glabrous. ♄. S. Native of New Granada, among bushes in the province of Pasto, between Chumban and Tusa, at the altitude of 1500 hexapods. Leaves 12-16 inches long. Flowers size of the preceding, pentamerous and pentandrous. Calyx like that of the last species, from which it is principally distinguished in the form of the leaves.

Bush Witheringia. Shrub.

11 W. RIPA'RIA (H. B. et Kunth, l. c. p. 16.) shrubby; branches angular? hispid from pili; leaves somewhat obliquely obovate-oblong, acuminated, acute at the base, glabrous, pilose on the nerves beneath, twin; flowers extra-axillary, crowded, about equal in length to the petioles; filaments pilose at the base. ♄. S. Native of New Granada, on the Andes of Quindiu, near the river Toche, at the altitude of 1050 hexapods. Leaves $2\frac{1}{2}$ to $3\frac{1}{2}$ inches long. Flowers extra-axillary, size of those of *Lycium Bárbarum*. Calyx obsoletely 5-toothed, glabrous. Corolla greenish-white, glabrous; tube funnel-shaped; limb 5-parted.

River-side Witheringia. Shrub.

12 W. ANGUSTIFÒLIA (Dun. syn. p. 2. sol. ed. 2d. ined. t. 80. H. B. et Kunth, l. c. p. 17.) shrubby; branches flexuous,

terete; branchlets tomentose; leaves lanceolate, acuminated, acute at the base, glabrous; racemes few-flowered, twin; filaments glabrous. ♄. S. Native of New Granada, at the foot of Mount Catopaxo, in sandy places, at the altitude of 1600 hexapods. Leaves solitary, 2 to $2\frac{1}{2}$ inches long, clothed with canescent tomentum while young. Racemes extra-axillary, solitary or twin. Flowers size of the preceding. Calyx 5-cleft, clothed with hoary tomentum; with subovate acute segments. Corolla blue, clothed with hoary tomentum outside; limb 5-parted, with oblong segments. Anthers linear-oblong. Berry globose, size of those of *Solànum nìgrum*. Perhaps a distinct genus.

Narrow-leaved Witheringia. Shrub 4 to 6 feet.

13 W. pe'ndula (Rœm. et Schultes, syst. 3. p. 522.) frutescent; leaves ovate, entire, acuminated, glabrous above, but clothed with downy tomentum beneath; racemes terminal; peduncles long, reflexed. ♄. S. Native of Brazil. Solànum péndulum, Link. herb. Stems angular, and pubescently villous at top. Leaves 3 inches long, and $1\frac{1}{4}$ broad, thickish, subrepand, ciliated. Peduncles 3 inches long, downy. Calyx smoothish, hemispherical, obsoletely 4-5-cleft. Corolla 4-5-parted; segments linear-lanceolate, obtuse. Anthers 4-5, generally unequal.

Pendulous-flowered Witheringia. Shrub.

* * *Stems herbaceous.*

14 W. solana'cea (Lher. stirp. 1. p. 33. t. 1.) root composed of fusiform tubers; stem subherbaceous, pilose, rather angular; leaves ovate-oblong, or ovate-lanceolate, rather pilose: superior ones twin; umbels axillary, sessile, longer than the petioles. ♃. G. Native of South America. Lam. ill. t. 82. Leaves acute, entire, rather pilose. Calyx 4-toothed. Corolla pale yellow, 4-cleft. Stamens 4; filaments white, glabrous outside, and hairy inside. Tube of corolla suburceolate, with 4 gibbosities, bluntly tetragonal.

Solanaceous Witheringia. Fl. May, Sept. Clt. 1742. Pl. 1 foot.

15 W. umbella'ta (Dun. syn. p. 2. sol. ed. 2d. ined. t. 27.) stem herbaceous, winged, pilose; leaves ovate, attenuated at both ends, sinuately toothed, pilose; racemes axillary, usually solitary; pedicels umbellate. ♃. S. Native of St. Domingo. Poir. suppl. 5. p. 505. Calycine segments 5, acute. Nearly allied to *W. montàna*.

Umbellate-flowered Witheringia. Pl. 1 foot.

16 W. monta'na (Dun. syn. p. 2. Poir. suppl. 5. p. 505.) root tuberous; stems herbaceous, pilose; leaves pilose, ovate, entire, or dentately repand, or sinuated; peduncles 1-flowered. ♃. G. Native of Peru, on hills, where it is called Papa montàna. Solànum montànum, Lin. spec. 266. Dun. sol. p. 145.—Solànum tuberòsum minus, Atriplicis folio vulgò Papa montàna, Feuill. per. 3. p. 62. t. 46. Root ovate. Stem bifurcate. Leaves on long petioles, subcordate. Flowers in the fork of the stem. Corolla campanulate, 5-cleft, rose-coloured. Stamens purple.

Var. β, arenària (Dun. sol. p. 146.) peduncles many-flowered, bracteate; leaves lobed. ♃. G. Native of Peru, on sandy hills, and among rocks about Lima and Chancay, where it is called Papas de Loma. Solànum montànum, Ruiz. et Pav. fl. per. 2. t. 160. f. b. This variety is nearly allied to *W. phyllántha*. Stem larger than in var. *α*, hispid. Calyx 5-parted. Corolla flat, blue. Perhaps a distinct species.

Mountain Witheringia. Fl. May, Aug. Clt. 1822. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

17 W. phylla'ntha (Dun. syn. p. 2. Poir. suppl. 5. p. 505.) stem herbaceous, winged; leaves pilose, cuneiform, a little lobed at apex, decurrent; racemes rising with the leaves. ⊙.? ♃.? G. Native of Peru, in cultivated fields near the town of La Magdalena, Cav.; sandy places of Lima, Chancay, and Lurin, Ruiz. et Pav. Solànum phyllánthum, Cav. icon. 4. p. 35. t. 359. f. 1. Ruiz. et Pav. fl. per. 2. p. 32. Root fusiform. Leaves 5-lobed at top; lobes ovate, acute. Peduncles rising from the decurrent disk of the leaves. Calyx 5-cleft. Corolla pale blue, marked by a 5-rayed star, spreading, 5-angled. Berry round, red, size of a pea.

Leaf-flowered Witheringia. Fl. July, Aug. Clt. 1822. Pl. 1 foot.

18 W. pinnati'fida (Dun. syn. p. 2. Poir. suppl. 5. p. 506.) stem herbaceous, winged; leaves rather pilose, decurrent, pinnatifid: segments obtuse, sinuated; peduncles bractless; flowers panicled. ♃. G. Native of Peru: in sandy places in the provinces of Lima and Chancay; plentiful in Torre blanca and Jequan, on hills. Solànum pinnatífidum, Ruiz. et Pav. fl. per. 2. p. 37. t. 170. f. b. Dun. sol. 138. but not of Lam. Flowers drooping. Calyx 5-parted, with linear, obtuse segments. Corolla pale blue or white, flat. Berry yellow, size of a pea.

Pinnatifid-leaved Witheringia. Fl. June, Aug. Clt. 1822. Pl. 1 foot.

19 W. multi'fida (Dun. syn. p. 3. Poir. suppl. 5. p. 506.) stem herbaceous; leaves rather pilose, bipinnatifid, running into the petioles; petioles stem-clasping; peduncles long, panicled, leafy beneath the middle. ♃. G. Native of Peru, on hills at Pungo, in the province of Cumana. Solànum multífidum, Ruiz. et Pav. fl. per. 2. p. 37. t. 17. f. a. but not of Lam. Dun. sol. p. 138. Stem juicy, furnished with a few simple hairs, as well as the leaves. Segments of the leaves blunt, toothed. Peduncles multifid, terminal and lateral, very long, furnished each with an entire or trifid leaf, which is clasping beneath the middle. Corolla blue. Berry larger than the calyx.

Multifid Witheringia. Pl. 1 to 2 feet.?

Cult. For culture and propagation see *Solànum*, p. 442.

VIII. NETOU'XIA (named by Kunth, in honour of H. Netoux, author of "Dissertationes de Cassiis Egyptiacis.") H. B. et Kunth, nov. gen. amer. 3. p. 10. t. 193.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, regular, with linear segments. Corolla salver-shaped; limb 5-parted; throat furnished with a tubular, short, entire, or obsoletely-toothed corona. Stamens 5, inclosed; anthers dehiscing lengthwise. Stigma emarginate. Fruit baccate?.—A fetid erect herb. Leaves scattered: superior ones twin, cordate, quite entire. Peduncles extra-axillary, solitary, 1-flowered. Corolla yellow, becoming blackish on drying. This genus is more nearly allied to *A'tropa* and *Petùnia* than any other; but it differs from them, as well as all others of the order, in the corolla being furnished with a corona faucis.

1 N. formòsa (H. B. et Kunth, l. c.) ♃. G. Native of Mexico, in woods near Real del Monte. A'tropa arenària, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 686. Flowers size of those of *Vínca màjor*.

Beautiful Netouxia. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

Cult. This singular plant will grow in any light rich soil; and may be readily increased by cuttings or divisions.

IX. MANDRA'GORA (The English name Mandrake is a corruption of the Greek appellation Μανδραγορος, compounded of *μανδρα, mandra*, an ox-stall, something relating to cattle; and *αγαυρος, agauros*, cruel; from its effects on cattle when accidentally gathered with their fodder in the countries where the plants abound. It is a venomous plant, and was an important engine in the days of medical charlatanry, from the roots being supposed to bear a resemblance to the human form.)

Tourn. inst. p. 76. t. 12. Lin. hort. cliff p. 51. Blackw. t. 364. Sabb. hort. rom. 1. t. 1. Juss. gen. p. 125. Gærtn. fruct. 2. p. 237. t. 131. f. 1. D. C. syn. fl. gall. p. 236. A'tropa species, Lin. gen. and most other authors.

LIN. SYST. *Pentándria, Monogýnia.* Calyx turbinate, 5-angled, 5-cleft. Corolla campanulate, 5-cleft. Stamens 5. Filaments dilated at the base, and connivent, but filiform and divaricate at apex. Ovarium furnished with a circular gland round the base, which is drawn out into 2 horns. Stigma capitate, furrowed. Berry globose, apple-shaped, fleshy, solid, 1-celled, having the receptacles rather prominent inside. Seeds many, reniform, peripheric, disposed in a simple series.—Stemless, fetid plants, with broad radical leaves; large, fusiform, usually forked roots; and numerous single-flowered scapes, which are always shorter than the leaves.

1 M. OFFICINA'RUM (Lin. spec. ed. 1st. p. 181.) leaves oblong-lanceolate and ovate, acute, a foot long, undulated, quite entire, at first erect, then spreading; root and flowers white; segments of the calyx lanceolate, linear, acuminated; segments of corolla acute. ♃. H. Native of Spain, Switzerland, Italy, &c. Bertol. el. pl. hort. bon. 1824. p. 6. M. officinàlis, Mill. dict. no. 1. fig. t. 173. M. acaúlis, Gærtn. fruct. 2. p. 236. t. 131. f. 1. M. vernàlis, Spreng. A'tropa Mandrágora, Lin. spec. 259. Bull. herb. t. 145.—Plenk. off. t. 126. Corolla bluish. Fruit as large as a nutmeg, of a yellowish green colour when ripe. Root white, fleshy, usually bifid, 3-4 feet long. The roots are supposed to bear a resemblance to the human form, and are figured as such in old herbals, being distinguished into the male with a long beard, and the female with a prolix head of hair. It has been fabled to grow under a gallows, where the matter falling from the dead body gave the root the shape of a man; to utter a shriek or groans at digging up; and it was asserted that he who would take up a plant of Mandrake should in common prudence tie a dog to it for that purpose, for if a man should do it himself he would surely die soon after, ex Linnæus. The whole plant is reputed poisonous, though in small doses it was used medicinally, and particularly as an opiate.

Officinal or Common Mandrake. Fl. May, June. Clt. 1548. Pl. 1 foot.

2 M. PRÆ'COX (Sweet, fl. gard. t. 198.) leaves lanceolate-oblong, obtuse, undulated, bullately wrinkled, villously pubescent, rising at the same time with the flowers; calycine segments lanceolate, acute, keeled; segments of corolla spreadingly reflexed, acute; scapes aggregate. ♃. H. Native of Switzerland. A'tropa Mandrágora, β, Lam. dict. 1. p. 391. Pers. ench. 1. p. 218. A'tropa Mandrágora fœmina, Bull. herb. t. 146. M. officinàlis, β. D. C. fl. fr. no. 2689.—Hall. helv. no. 578. Corolla woolly, of a yellowish-brown, tinged with blue. This plant flowers two months earlier than *M. vernàlis*, Spreng., and is also much smaller.

Early Mandrake. Fl. March, April. Clt. 1819. Pl. ½ foot.

3 M. AUTUMNA'LIS (Bertol. el. pl. hort. bon. 1820. p. 6. D. Don, in Sweet, fl. gard. n. s. t. 325.) leaves oblong, pilose, wrinkled, undulated, beset with warty bristles on the upper surface, as well as the calyx; calycine segments lanceolate, acuminated, keeled from the midrib; corolla spreading, with elliptic, obtuse segments; berry oblong, mucronate. ♃. H. Native of the South of Italy; and Greece, about Athens and Elis, and is likewise found in some of the Islands of the Archipelago. A'tropa Mandrágora, Sibth. et Smith, fl. græc. 3. p. 26. t. 232. M. macrocárpa, Bertol. Scapes pale purple, shorter than the leaves. Corolla violet-coloured, not unlike those of a species of *Campánula*. This plant is chiefly distinguished from *M. vernàlis* in the blunt lobes of the corolla, and the oblong pointed berry. It is, moreover, altogether a larger plant. This is probably the Mandrake mentioned in the Scriptures, in the 30th chapter of Genesis.

Autumnal Mandrake. Fl. Dec. Clt. 1548. Pl. ½ foot.

Cult. The species of Mandrake thrive best in a deep light soil, in a shady situation. They are only to be increased by seed. The roots are extremely apt to rot during winter.

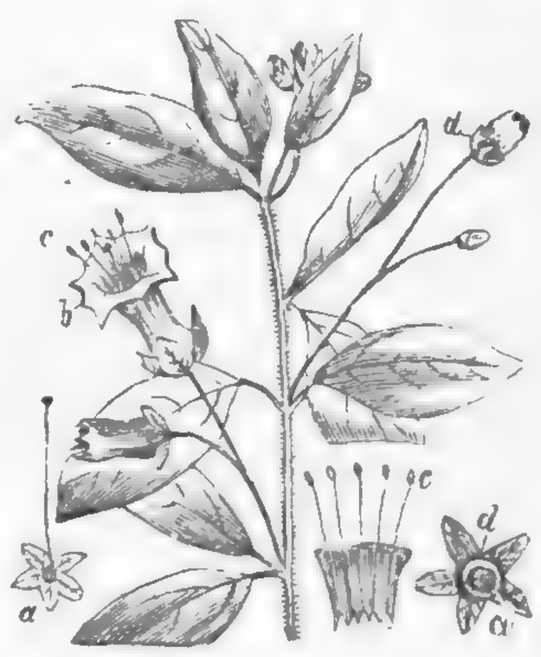
X. A'TROPA (from ατροπος, *atropos*, one of the destinies; derived from *a* priv.; and τρεπω, *trepo*, to turn; in reference to the poisonous effects of the species.) Lin. gen. no. 249. Schreb. gen. no. 335. Juss. gen. 125. ed. Usteri, p. 140. Gærtn. fruct. 2. p. 240. t. 131. Lam. ill. t. 114. f. 2. H. B. et Kunth, nov. gen. amer. 3. p. 11.—Belladónna, Tourn. inst. t. 13.

LIN. SYST. *Pentàndria, Monogýnia.* Calyx loose, 5-cleft, permanent. Corolla campanulate; limb usually 5-cleft, rarely 10-cleft, spreading. Stamens 5, generally exserted, conniving at the base; anthers dehiscing lengthwise. Stigma peltately depressed. Berry globose, propped by the permanent spreading calyx; placentas free, and distant from the dissepiment. Seeds numerous, reniform.—Caulescent shrubs or herbs. Leaves scattered, twin, entire. Peduncles extra-axillary, 1-2, or many-flowered. Corolla violaceous or greenish.

§ 1. *Limb of corolla* 10-*cleft or* 10-*toothed; the alternate lobes or teeth smaller.*

1 A. VIRIDIFLÒRA (H. B. et Kunth, nov. gen. amer. 3. p. 11. t. 196.) stem suffruticose, twining; leaves twin, elliptic-ovate, subacuminated, quite entire, hairy; peduncles 2-flowered; flowers, drooping; limb of corolla 10-cleft. ♄. ⌒. S. Native of New Granada, between the town of Pasto and Chilanquer, at the altitude of 850 hexapods. A'tropa flexuòsa, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 686. Corolla tubularly funnel-shaped, green, 3-4 times longer than the calyx, hairy, furnished with 5 tubercles on the outside at the base. Filaments glabrous, dilated at the base. This and *A. áspera* of Ruiz. et Pav. might probably form a distinct genus.

FIG. 39.



Green-flowered Deadly Nightshade. Shrub twining.

2 A. A'SPERA (Ruiz. et Pav. 2. p. 45.) stem herbaceous, angular, pilose; leaves twin, unequal, oval-oblong and lanceolate, quite entire or subsinuated, hairy; peduncles 1-flowered, drooping; limb of corolla 10-cleft. ♃. S. Native of Peru, on hills about Lima. Stem dichotomous, branched. Peduncles extra-axillary, or in the forks of the stem. Corolla yellowish-blue, violaceous in the centre, with 5 of the segments acute, and the alternating 5 emarginate. Filaments hairy, violaceous. Berry white, size of a pea. Seeds red.

Rough Deadly Nightshade. Pl. 2 feet.

3 A. HIRTE'LLA (Spreng. syst. 1. p. 699.) herbaceous; leaves ovate, acute, scabrous; branches rough; peduncles elongated, 1-flowered, filiform. ⊙. H. Native of Brazil.

Hairy Deadly Nightshade. Pl. ?

§ 2. *Limb of corolla* 5-*cleft. Stems frutescent.*

4 A. UMBELLA'TA (Ruiz. et Pav. fl. per. 2. p. 44. t. 181. f. a.)

stem frutescent; leaves ovate and cordate, quite entire and angular; peduncles many-flowered, umbellate, drooping; limb of corolla 5-cleft. ♄. S. Native of Peru, on hills about Lima. A. revolùta, Dietr. lex. 1. p. 422. Stem glabrous; branches dichotomous, downy. Leaves solitary or twin, downy. Peduncles short, axillary, downy, bearing 8-12 pedicellate flowers. Corolla yellow, melliferous; tube cylindrical, purple; limb reflexed, ciliated. Stamens inclosed. Style exserted. Berry whitish, globose, size of a pea.

Umbellate-flowered Deadly Nightshade. Shrub 4 feet.

5 A. biflòra (Ruiz. et Pav. fl. per. 2. p. 44. t. 181. f. b.) stem frutescent; leaves ovate, acute, quite entire: upper ones twin; peduncles 2-flowered, drooping?; limb of corolla 5-cleft. ♄. S. Native of Peru, in humid places. Shrub rather downy. Branches pendulous, rather angular. Corolla suburceolate, villous, striated; tube greenish, white, or purplish; limb greenish-yellow, erect. Anthers and stigma blue. Berry white, size of that of *Belladónna*, a little compressed.

Two-flowered Deadly Nightshade. Shrub 2 feet.

6 A. bícolor (Ruiz. et Pav. fl. per. 2. p. 45.) stem frutescent; leaves ovate, angular, glabrous; peduncles 3-4-flowered; limb of corolla 5-cleft. ♄. S Native of Peru, in shady places. Branches angular. Leaves acute, usually twin. Corolla tubular, reddish green; limb green.

Two-coloured-flowered Deadly Nightshade. Shrub 6 to 7 feet.

7 A. frute'scens (Lin. spec. p. 260. Lam. ill. t. 114. f. 2.) stem shrubby; leaves ovate-cordate, obtuse, downy; flowers 1-3 together, pedicellate, axillary; limb of corolla 5-cleft to the middle, reflexed. ♄. G. Native of Spain. Physàlis suberòsa, Cav. icon. 2. p. 1. t. 102. Physàlis frutéscens, D. C. fl. fr. 3. p. 611. Belladónna frutéscens, rotundifòlia, Hispánica, Tourn. inst. p. 77.—Barrel. icon. p. 1173. Habit of *Physàlis somnífera*, but differs from it in the calyx being 5-cleft, and in the flowers being 6 times larger, and campanulate, and in the leaves being smaller, and in the berry not being inclosed in the calyx. Leaves solitary. Corollas yellowish, divided into 5 reflexed segments beyond the middle. Anthers not exserted, ex Lam. Perhaps this will form a new genus.

Frutescent Deadly Nightshade. Fl. June, July. Clt. 1787. Shrub 4 to 6 feet.

8 A. arista'ta (Poir. suppl. 1. p. 609.) stem frutescent; leaves oblong, entire, almost glabrous; branches, petioles, and peduncles woolly; peduncles solitary, 1-flowered, hardly as long as the petioles; limb of corolla 5-cleft. ♄. G. Native of the Canaries. Physàlis aristàta, Ait. hort. Kew. 1. p. 244. Willd. spec. 1. p. 1020. Branches compressed, somewhat angular. Leaves solitary, or twin, ovate-lanceolate, acuminated. Corolla yellow, campanulate, with lanceolate, acuminated segments. Calycine teeth or segments awned. Berry globose.

Awned-calyxed Deadly Nightshade. Fl. June, Aug. Clt. 1779. Shrub 3 to 4 feet.

§ 3. Belladónna. Limb of corolla 5-cleft. Stems herbaceous.

9 A. Belladónna (Lin. spec. 260.) herbaceous, erect; leaves twin, ovate, quite entire, glabrous; peduncles solitary, 1-flowered. ♃. H. Native throughout Europe, frequent in woods; with us it is not very common. Smith, engl. bot. t. 592. Oed. fl. dan. t. 758. Curt. fl. loud. fasc. 5. t. 16. Jacq. fl. austr. 4. t. 309. Mill. icon. t. 62.—Plenck. icon. 125.—Bull. herb. t. 29.—Heyne, getr. darst. t. 43. Belladónna baccífera, Lam. fl. fr. 2. p. 255. Bell. trichótoma, Scop. carn. ed. 2d. no. 255. Solànum melanocérasus, Bauh. pin. p. 166. Belladónna, majoribus foliis et floribus, Tourn. inst. p. 77.—Blackw. t. 564.—Sabb. hort. 1. t. 3. Solànum lethàle, Clus. hist. 2. p. 86. Mor. hist. sect. 13. t. 3. f. 4. Root thick, branching. Stem trichotomous, tinged with purple; the branches dichotomous. Leaves rather large, soft to the touch, a little hairy on both surfaces. Corolla large, lurid, dusky purple within, and streaked, with a yellow variegated base, but greenish-red, or dusky brown outside. Berry size of a cherry, black when ripe, full of purple juice. The plant inhabits church-yards, dung-hills, and gloomy lanes, and uncultivated places in England, but in other countries it is said to be common in woods and hedges.

When this plant was found to differ from the genus *Solànum*, it assumed the Italian name of *Belladónna*, which was given to it, according to some, because it was used as a wash among the ladies, to take off pimples from the skin; or, according to others, from its quality of representing phantasms or beautiful women to the disturbed imagination. The qualities of the plant are malignant, and it is extremely poisonous in all its parts. Numerous instances have occurred of the berries proving fatal, after causing convulsions and dilirium. Buchanan relates the destruction of the army of Sweno, the Dane, when he invaded Scotland, by the berries of this plant, which were mixed with the drink which the Scots, according to truce, were to supply the Danes. The Danes became so inebriated that the Scottish army fell on them in their sleep, and slew such numbers, that there were scarcely men enough left to carry off their king. The case related by Ray is remarkable, that is, the dilatation of the pupil of the eye caused by a part of the leaf applied outwardly, and which took place successively on the repetition of the experiment. With respect to the berries, they have been frequently known to have been fatal to children, and also to adults, if a considerable number be eaten. The symptoms are said to occur in half an hour after taking them, and consist of vertigo, great thirst, dilirium, swelling, and redness of the face, difficulty of breathing. The general sensibility of the system is said to be weakened to a great degree, so that the stomach will bear a far larger dose of emetic medicines than it would otherwise have done. Vinegar liberally drank has been found efficacious in obviating the effects of the poison. A remarkable instance of the malignant powers of the young shoots occurred in the presence of Professor Martyn, in the botanic garden at Cambridge, which fully proved that they are not less deleterious than the berries.

The leaves are said to have been sometimes successfully applied to cancerous tumours. Belladonna, notwithstanding its deleterious nature, is not totally excluded from medicine; some diseases, and those of the most malignant kind, have been known to yield to the anodyne and anti-spasmodic virtues of the plant when administered with caution. Bergius relates, that he has often given relief in epilepsy and convulsions, by the internal use of the powder of the dried leaves, taken in doses of from one to four grains: and Gesner, in his medical epistles, recommends the expressed juice of the berries boiled with sugar into a syrup, and given by a teaspoonful at a time, as excellent in every case requiring an opiate, and as peculiarly efficacious in the cure of dysentery.

Belladonna has been best analyzed by Mr. Brandes, an apothecary at Salz Uffelm, who has discovered a new alkaloid upon which its narcotic virtues depend, which he calls atropia. He urges the necessity of caution in the examination of atropia and its salts. Even the vapour of their solutions causes dilatations and paralyses of the pupil; and during the whole time of the experiments Mr. Brandes experienced violent headach, vertigo, pain of back, and nausea, so that he could scarcely continue them. On tasting a small quantity of sulphate of atropia, which was rather salt than bitter, he had extreme confusion of head, trembling in all his limbs, pulse weak, and at last retching. But the most severe of these symptoms abated in half an hour.

Medical use of Deadly Nightshade.—Under proper manage-

ment this virulent poison may become an excellent remedy. Besides its narcotic power, it promotes all the secretions; but its exhibition requires the greatest caution, for it is apt, when continued for any length of time, even in small doses, to cause dryness and tension in the throat, vertigo, dimness of sight. When any of these symptoms occur its use must be suspended for some time, and afterwards resumed in smaller doses. Deadly Nightshade has been exhibited in several febrile diseases, in obstinate intermittents, in the plague, in inflammation, the gout, in palsy and loss of speech from apoplexy, in chorea, epilepsy, hydrophobia, melancholy, mania, dropsies, and obstinate jaundice; in amaurosis, ophthalmia, scirrhus, and cancer; and as an antidote to the contagion of scarlatina. Deadly Nightshade is best exhibited in substance, beginning with a very small dose of the leaves or root. In hydrophobia Munch gave the powdered root every second morning to the extent of from one to five grains to children, and from fourteen to fifteen grains to adults. The watery infusion is also a powerful remedy.

Belladonna, or Common Deadly Nightshade. Fl. June, July. Britain. Pl. 2 to 6 feet.

10 A. rhomboídea (Gill. et Hook, in bot. misc. 1. p. 135. t. 37.) plant herbaceous, downy; leaves rhomboidal-oval, obtuse; peduncles 1-flowered, drooping; corolla glabrous outside. ♃. F. Native of Chili. Stem somewhat quadrangular, branched. Stigma capitate, furrowed, green. Berry oblong, apiculated. Seeds large, marginate. Stamens placed much higher upon the corolla than in *A. Belladónna*, and the style and inside of the corolla are furnished with a belt of hairs. Corolla small, white.

Rhomboid-leaved Deadly Nightshade. Pl. 1 foot.

† *Species doubtful, or not sufficiently known.*

11 A. herba'cea (Mill. dict. no. 3.) stem herbaceous; leaves ovate, nerved, with undulated margins. ♃. S. Native about Campeachy, Houston. Stem sub-excavated, furnished with 2-3 small branches at top. Leaves 4 inches long, and 3 broad. Peduncles short, interfoliaceous. Corollas white, smaller than those of *A. Belladónna*.

Herbaceous Deadly Nightshade. Pl. 2 feet.

Cult. The species of *Atropa* are of an easy culture and propagation. They will grow in common earth. The shrubby kinds are increased by cuttings or seeds, and the herbaceous, perennial kinds by seeds, or dividing at the root.

XI. ANI'SODUS (from *ανισος, anisos*, unequal; and *οδους, odous*, a tooth; in reference to the inequality of the teeth of the calyx.) Link, et Otto. abbild. gart. berol. fasc. 6. p. 77. Spreng. gen. 1. p. 159. Nees in Lin. trans. 17. p. 72. Whitlèya, Sweet, fl. gard. t. 125. Nicándra species, Link, et Otto. l. c. t. 35.

Lin. syst. *Pentándria, Monogýnia.* Calyx campanulate, angular, 5-cleft; segments unequal. Corolla campanulate, 5-lobed; lobes rounded, gradually smaller. Stamens inclosed, inserted in the base of the corolla, straight. Berry 2-celled, many-seeded, operculate, inclosed in the erect, coriaceous, inflated, reticulated, 10-ribbed calyx; operculum 4-valved, mucronate. Placenta thick, ovate, scrobiculate. Seeds compressed, angular, dotted. Albumen fleshy. Embryo peripheric, semicircular, pale; with an obtuse, conical radicle, and semi-cylindrical cotyledons.—A large, robust, downy, branched, canescent plant, with broad leaves; and solitary, drooping flowers, which are of a yellowish green colour at first, but at length becoming purplish.

1 A. lu'ridus (Link, l. c. Spreng. syst. 1. p. 699. ♃. H. Native of the Himalaya, on Gosain-than. Nees in Lin. trans. 17. p. 72. Nicándra anómala, Link, et Otto, abbild. t. 35. Physàlis, stramonifòlia, Wall. in Roxb. fl. ind. 2. p. 242. Whitlèya stramonifòlia, Sweet, fl. gard. t. 125. Anísodus stramonifòlius, G. Don, in Loud. hort. brit. p. 61. Stems dichotomous. Leaves twin, ovate-elliptic, repandly lobed, attenuated at the base, villous beneath. All the tender parts are densely clothed with mealy, ferruginous, loose tomentum. Leaves smelling like those of tobacco when bruised.

Lurid Anisodus. Fl. Aug. Sept. Clt. 1823. Shrub 4 to 7 feet.

Cult. This is a strong, coarse growing plant, of the most easy culture. It will grow in almost any soil, but requires a dry situation. It is to be increased by division, and by seed.

XII. NICA'NDRA (so named after Nicander of Colophon, priest of Apollo, who lived about the time of Attalus. His Georgics are lost: his poems are commended by Cicero, and many fragments of them remain in Athenæus. There is a fine manuscript of Nicander at Vienna.—Haller.) Adans. fam. p. 219. Juss. gen. p. 125. ed. Usteri, p. 140. Gærtn. fruct. 1. p. 237. t. 131. f. 2.—A'tropa, spec. Lin.—Physàlis species, Lam.—Calydérmos, Ruiz. et Pav. fl. per. 2. p. 44.

Lin. syst. *Pentándria, Monogýnia.* Calyx pentagonal, 5-parted, inflated; angles compressed; segments sagittate. Corolla campanulate, slightly 5-lobed. Stamens 5, incurved, distant, dilated at the base, inclosed; anthers ovate, dehiscing lengthwise. Stigma capitate. Berry fleshy, almost dry, 3-5-celled, inclosed in the calyx; placentas prominent.—A strong, coarse, annual, much branched, glabrous plant. Leaves twin. Flowers extra-axillary, solitary, drooping.

1 N. physaloìdes (Gærtn. fruct. 2. p. 237. t. 131. Pers. ench. 1. p. 219.) ⊙. H. Native of Peru; and from Pennsylvania to Virginia, but is probably only indigenous to Peru. Pursh, fl. amer. sept. 1. p. 158. Sims, bot. mag. t. 2458. Calydérmos eròsus, Ruiz. et Pav. fl. per. 2. p. 44. A'tropa physaloìdes, Lin. spec. p. 260. Jacq. obs. 4. t. 98. Physàlis Peruviàna, Mill. dict. no. 16. Physàlis daturæfòlia, Lam. dict. 2. p. 102. no. 15. Thor. chlor. land. p. 74. Alkekéngi amplo flore violaceo, Feuill. per. p. 724. t. 16. Root fibrous. Leaves glabrous, sinuated, like those of *Datùra*. Corolla large, blue, rayed, with a white bottom, which is marked with 5 dark blue spots.

Winter-cherry-like Nicandra. Fl. July, Sept. Clt. 1759. Pl. 2 to 4 feet.

Cult. The seeds of this plant only require to be sown in the open border; and when the plants are up they must be planted separately; being large they require a good deal of space.

XIII. LY'CIUM (derived from Lycia in Asia Minor, hence *λυκιον, Lycion*, of Dioscorides, a name given by him to a thorny shrub, which was supposed by Dr. Sibthorp to have been the Rhámnus infectòrius, but which Mr. Royle, with greater probability, regards as identical with a species of Bérberis, which he has denominated *Bérberis Lýcium*. The name has been applied to the present genus, on account of its containing thorny shrubs.) Lin. gen. 262. Schreb. gen. no. 343. Gærtn. fruct. 2. p. 242. t. 132. Juss. gen. p. 126. ed. Usteri, p. 141. Lam. ill. t. 112. H. B. et Kunth, nov. gen. amer. 3. p. 50.—Jasminoìdes, Niss, in act. gall. 1711. Mich. gen. 224. t. 105.

Lin. syst. *Pentándria, Monogýnia.* Calyx urceolate, regularly 5-toothed, or irregularly 3-5-cleft, permanent. Corolla funnel-shaped, or tubular; limb 5 or 10 cleft, or toothed, imbricate in æstivation, sometimes plicate. Stamens 5, usually exserted; filaments bearded, and widened at the base; anthers cordate,

dehiscing lengthwise. Stigma peltately-depressed, or capitate, bisulcate, ex Juss. or 2-lobed. Berry roundish, 2-celled, propped by the permanent calyx; placentas adnate. Seeds numerous, reniform.—Trees or shrubs usually spinose. Leaves entire, or nearly entire, alternate, solitary, or in fascicles. Peduncles extra-axillary, or terminal, solitary, twin, or umbellate, rarely corymbose. Corollas white, yellow, rose-coloured, purple, blue, or scarlet.

Sect. I. Euly'cium (from *ευ, eu*, well or good; and *Lycium*; this section contains the true species of the genus.) Calyx urceolate, irregularly 3-6-cleft. Corolla tubularly funnel-shaped; with a 5-parted, spreading, or reflexed limb. Genitals exserted.—Shrubs or trees, usually spinose. Flowers extra-axillary, solitary, twin, or umbellate.

1 L. Europæ'um (Lin. syst. 228. mant. p. 47.) branches erect, loose; buds spinescent; leaves fascicled, obovate-lanceolate, obtuse, or spatulate, bent obliquely; flowers twin, or solitary; corolla funnel-shaped; stamens exserted, but shorter than the limb. ♄. H. Native of the South of Europe; and the North of Africa; in the Grecian Islands, common in hedges, but scarcely indigenous. Willd. enum. 1. p. 246. Sibth. et Smith, fl. græc. t. 236. L. salicifòlium, Mill. dict. no. 3.—Mich. gen. p. 224. t. 105. f. 1.—Mill. fig. t. 171. f. 2. Calyx 5-cleft, ruptured at the side. Corollas pale violet, reticulated with red veins; tube greenish. Clusius says, that the young shoots are eaten in Spain with oil and vinegar.

Var. α; berries yellow or fulvous.

Var. β; berries red.

European Boxthorn. Fl. May, Aug. Clt. 1730. Shrub 10 to 12 feet.

2 L. ba'rbarum (Lin. spec. 277.) branches dependent; buds spiny; leaves lanceolate, flat, glabrous, acute; flowers twin, extra-axillary, pedicellate; corolla funnel-shaped; stamens exserted, about equal in length to the limb. ♄. H. Native of the North of Asia, Africa, and South of Europe. Willd. spec. exclusive of Shaw, and the syn. of Lam. Wats. dendr. brit. t. 9. L. halimifòlium, Mill. dict. no. 6. L. Bárbarum a vulgàre, Ait. hort. kew. 1. p. 257. Schkuhr, handb. 1. p. 147. t. 46. Hayne, term. bot. t. 10. f. 5.—Dun. arb. 1. p. 306. t. 121. f. 4.—Mich. gen. t. 105. f. 1. Branches angular. Buds often without spines. Calyx 2-3-lobed. Corolla with a purple limb, and yellowish base. Stigma 2-lobed. Berry ovate, yellow. Stamens bearded near the base. There is a variety of this, having livid or pale corollas, and reddish yellow berries.

Barbary Boxthorn. Fl. May, Aug. Clt. 1696. Shrub cl.

3 L. Chine'nse (Mill. dict. no. 5.) branches pendulous, prostrate, striated; buds spinescent; leaves by threes, ovate, acute, attenuated at the base; peduncles much longer than the calyx, which is entire; stamens exserted. ♄. H. Native of China, about Pekin and Canton; and of Cochinchina. Bunge in mem. acad. petersb. 2. p. 123. Lam. ill. t. 112. f. 2. Wats. dend. brit. t. 8. L. Bárbarum, *β*, Chinénse, Ait. hort. kew. 1. p. 257. L. ovàtum, Duh. arb. ed. nov. p. 117. L. Bárbarum, Lour. coch. 1. p. 165.? Said by Bunge to be nearly allied to *L. Ruthénicum*, but differs in the leaves being broad-ovate. Corollas purple. Berries orange-coloured. Shoots very long, ex Mill. The Chinese use a decoction in wine, or an infusion in water of the berries, as a tonic, analeptic, and cephalic. We know not whether the plants described by Miller and Bunge be the same; the plant here meant is that of Bunge.

Chinese Boxthorn. Fl. May, Aug. Clt.? Shrub climbing.

4 L. Ruthe'nicum (Murr. comm. goett. 1779. p. 2. t. 2.) branches dependent; buds spinescent; leaves linear-lanceolate, fleshy, obtuse, attenuated at the base, solitary, or subfasciculate; peduncles longer than the calyx; calyx with 5 unequal teeth; stamens exserted, equal to the limb. ♄. H. Native of Siberia, in nitrous places; and at the Volga; and in Hyrcania. Bieb. fl. cauc. 1. p, 166. L. Tatáricum, Pall. fl. ross. 1. p. 78. t. 49. Calyx usually irregularly 5-toothed, rarely 2-3-lobed, as in *L. Bárbarum*. Corolla with a white tube, and purplish limb. Leaves grey, like those of *L. Afrum*.

Var. β, Cáspicum (Pall. fl. ross. t. 49. f. A.) leaves shorter; buds more spinose; flowers smaller. ♄. H. Native about the Caspian Sea.

Russian Boxthorn. Fl.? Clt. 1804. Shrub climbing.

5 L. Sha'wii (Rœm. et Schultes, syst. 4. p. 693.) branches dependent, rather tomentose at apex; buds spinescent; leaves ovate-lanceolate, thickish. ♄. H. Native of Barbary. L. Europœ'um, Mill. dict. no. 4.—Shaw. afr. p. 349. f. 349. Branches scattered. Prickles strong. Leaves short, thick, scattered. Flowers lateral, small, white.

Shaw's Boxthorn. Fl. June, July. Clt. 1700. Shrub 7 to 8 feet.

6 L. Trewia'num (Duh. abr. nov. ed. p. 116. t. 30. under L. Chinénse, as in Pers. ench. 1. p. 231. no. 9.) erect; branches diffuse, angular; buds spinose; leaves petiolate, lanceolate, acute; peduncles 1-flowered, solitary, or twin, extra-axillary; calyx 2-3-cleft; corolla funnel-shaped; stamens exserted. ♄. H. Native of China. L. Bárbarum, Lam. dict. 3. p. 509. ex Poir. suppl. 3. p. 427.—Trew. Ehret. t. 68. exclusive of the synonymes. This species differs from *L. Chinénse*, Mill. in the spines, and from *L. Bárbarum* in the leaves. Branches rufescent. Spines few. Corolla fine purple, with a white star in the centre. Filaments pilose at the base. Berry ovate.

Trew's Boxthorn. Fl. May, Aug. Clt. 1818. Shrub 6 feet.

7 L. lanceola'tum (Poir. suppl. 3. p. 429.) branches dependent, reflexed; buds spinescent; leaves lanceolate, nearly sessile, acute at both ends; flowers solitary, extra-axillary, pedicellate; corolla funnel-shaped; stamens exserted. ♄. H. Native of the South of Europe, as of Naples, Greece, &c. L. Europæ'um, *β*, D. C. fl. fr. no. 2699. Pers. ench. 1. p. 231. no. 8. —Duham, arb. nov. edit. p. 123. t. 32. Calyx unequally 5-toothed. Corolla purple, with a white bottom. Berry oblong, red.

Lanceolate-leaved Boxthorn. Fl. May, Aug. Clt.? Shrub climbing.

8 L. turbina'tum (Duh. arb. nov. edit. p. 119. t. 31. Pers. ench. 1. p. 231, exclusive of the syn. of Lam. no. 3.) stems erect, fascicled; branchlets dependent, terete; buds spiny; leaves sessile, lanceolate, acuminated; flowers aggregate, pedicellate, extra-axillary; corolla funnel-shaped; stamens exserted; calyx trifid; berry turbinate. ♄. H. Native of China. L. halimifòlium, Mill. dict. no. 6.? L. Bárbarum, *β*, D. C. fl. fr. no. 2700. Corolla violaceous, with a white bottom. Berries red.

Turbinate Boxthorn. Fl. May, Aug. Clt. 1709. Shrub climbing.

9 L. cilia'tum (Schlecht. in Linnæa, 8. p. 69.) branches elongated, subscandent; branchlets sometimes spiny; leaves alternate, broad-ovate, acute, denticulately ciliated, glabrous; flowers axillary, solitary, on short pedicels; calycine segments linear, acute, exceeding the berry, which is globose; corolla funnel-shaped, puberulous; genitals exserted. ♄. G. Native of the South of Brazil, at the Rio Negro, Sello. Calyx deeply 5-cleft. Filaments villous, as in *L. Bárbarum*. Corolla beset with glandular down, purple?

Ciliated-leaved Boxthorn. Shrub climbing.

10 L. obova'tum (Ruiz. et Pav. fl. per. 2. p. 46. t. 183. f. c.) branches spreading; spines stiff, leafy while young; leaves obovate, obtuse, petiolate, scattered, or fascicled; peduncles

solitary, extra-axillary, 1-flowered, drooping; corolla tubular: limb hairy, erect; calyx villous, 5-cleft. ♄. G. Native of Peru, in hedges at Tarma. Stem cinereous, much-branched. Calycine segments reflexed. Corolla purplish violet. Berry small, globose, orange-coloured. Old spines naked.

Obovate-leaved Boxthorn. Shrub.

11 L. sa'lsum (Ruiz. et Pav. l. c. t. 183. f. b.) branches long, pendulous; spines leafy; leaves obovate-oblong, sessile; flowers extra-axillary, drooping, solitary, on short pedicels; corolla funnel-shaped; stamens exserted. ♄. G. Native of Peru, in hedges near Lurin. Leaves small, fascicled. Calyx 5-toothed. Corolla small, whitish purple; segments oblong, clammy, obtuse, spreading. Berry small, ovate-oblong, acute, 2-celled, hardly pulpy. Seeds small yellow.

Salt Boxthorn. Shrub.

12 L. Thunbe'rgii; leaves lanceolate-elliptic; branches loose, sub-spinose. ♄. G. Native of the Cape of Good Hope, in Carro, between Roggefelt and Bokefelt. L. bárbarum, Thunb. in Lin. trans. 9. p. 152. Stem terete, grey, erect. Branches more or less spiny, elongated, usually simple. Leaves usually solitary beneath the spines, glabrous, 1½ inches long, and more.

Thunberg's Boxthorn. Shrub.

Sect. II. Isodòntia (from *ισος, isos*, equal; and *οδους οδοντος, odous odontos*, a tooth; in reference to the calyx being regularly 5-toothed.) Calyx urceolately campanulate, regularly 5-toothed. Corolla tubularly campanulate; limb 5-cleft, erect. Genitals inclosed.—Spiny shrubs. Leaves in fascicles. Peduncles almost axillary, solitary. Flowers drooping.

13 L. parvifòlium (Willd. rel. in Rœm. et Schultes, syst. 4. p. 698.) very spiny; leaves in fascicles, obovate, obtuse, glabrous; flowers almost axillary, solitary, pendulous; corollas tubular; stamens almost inclosed. ♄. F. Native of the Andes of Peru, between Caxamarca and Magdalena, at the altitude of 800 hexapods. L. microphýllum, Humb. et Bonpl. mss. but not of Duh. L. hórridum, H. B. et Kunth, nov. gen. amer. 3. p. 52. but not of Thunb. Leaves small. Calyx obsoletely 5-toothed, or nearly entire. Corolla tubular, a little curved, 6-7 times longer than the calyx. Filaments capillary, glabrous. Stigma thickened. Pedicels longer than the calyxes.

Small-leaved Boxthorn. Shrub 5 to 6 feet.

14 L. A'frum (Lin. spec. 277.) erect, spiny; leaves fascicled, linear, canescent, attenuated at the base, obtuse, fleshy; flowers almost axillary, solitary, drooping; corolla tubular, 3 times longer than the calyx; stamens inclosed. ♄. H. Native of the North of Africa, as of Palestine; and of Spain. Mill. icon. t. 171. f. 1. Sweet, fl. gard. n. s. t. 324. Ker. bot. reg. t. 354. Lam. ill. 112. f. 1.—Duh. arb. ed. nov. p. 107.-110. —Trew. ehret. 4. t. 24. f. 2.—Plenck. icon. t. 127.—Mich. gen. p. 224. t. 105. f. 2.—Nis. act. par. 1711. p. 420. t. 12. Bark grey coloured; the smaller branches frequently spiny. Leaves glaucous. Filaments bearded near the base, as in all the true species. Stigma slightly 2-lobed. Corolla violaceous, rich purple above. Berry globose, violaceous. Calyx 5-toothed.

African Boxthorn. Fl. June, July. Clt. 1712. Shrub 6 to 10 feet.

15 L. te'nue (Willd. enum. 1. p. 242.) erect, spiny; leaves linear, rather fleshy, in fascicles; flowers almost axillary, pedicellate, solitary, drooping; corolla tubular; stamens equal in length to the limb of corolla. ♄. F. Native country unknown, but probably of the Cape of Good Hope. Leaves narrower and shorter than in *L. A'frum*. Pedicels a little longer than the calyx. Calyx 5-toothed; teeth adpressed. The corolla is said by Willd. to be nearly like that of *L. Bárbarum*, and the stamens a little longer than the limb, and, therefore, probably belongs to the last section.

Slender Boxthorn. Fl. June, July. Clt. 1819. Shrub 5 to 6 feet.

16 L. propínquum; leaves linear-elliptic; branches strict; peduncles longer than the leaves. ♄. H. Native of the Cape of Good Hope. L. A'frum, Thunb. prod. 37. and in Lin. trans. 9. p. 158. but not of Lin. Stem stiff, erect; branches spinescent, somewhat verticillate, short, strict. Leaves fascicled, glabrous, a nail in length. Peduncles capillary, 1-flowered, about equal in length to the flowers. Corolla short, campanulate.

Allied Boxthorn. Shrub.

17 L. rígidum (Thunb. prod. 37. Lin. trans. 9. p. 153. t. 14.) erect, spiny; leaves linear, obtuse, in fascicles; peduncles shorter than the leaves and flowers; corolla tubular; stamens inclosed; calyx 5-toothed; teeth ciliated. ♄. F. Native of the Cape of Good Hope, about Cape Town. Willd. enum. 1. p. 245. L. carnòsum, Duh. arb. ed. nov. p. 111. Pers. ench. 1. p. 231. Poir. suppl. 3. p. 427. L. A'frum, *β*, Lam. dict. 3. p. 509. L. Itálicum, Mill. dict. no. 2.?—Trew. ehret. t. 24. f. 1. Stem flexuous, glabrous, grey; branches rugosely angular, cinereous, spiny at top. Leaves glabrous, curved, a nail in length. Flowers solitary, pedunculate, drooping. This species hardly differs from *L. A'frum*, unless in the pedicels being very short, the much dwarfer habit of the shrub, in the fewer spines, and in the leaves being paler. Pedicels solitary, or by threes. Calyx campanulate, 5-toothed; teeth acute. Corolla tubular, violaceous. Berry globose, size of a pea, and 2-celled.

Stiff Boxthorn. Fl. April, May. Clt. 1795. Shrub 3 to 4 feet.

18 L.? microphy'llum (Duh. arb. nov. ed. p. 112. Pers. ench. 1. p. 231.) erect, spiny, stiff, quite smooth; branches reflexed; leaves solitary, or in fascicles, parabolic; flowers axillary, solitary, pedicellate, drooping?; corolla funnel-shaped?; stamens inclosed?. ♄. F. Native of the East of Africa, and in India. Branches cinereous, terminated each by a strong spine. Leaves glaucous, small, linear?. Berry globose, dark blue. Perhaps not belonging to the present section.

Small-leaved Boxthorn. Fl. June, July. Clt. 1795. Shrub.

19 L. cine'reum (Thunb. prod. 1. p. 37. in Lin. trans. 9. p. 154. t. 16. Willd. spec. 1. p. 1059. enum. 1. p. 245.) branches terete, spreading, filiform; branchlets spiny, short; leaves lanceolate, obtuse, glaucous, glabrous, in fascicles; flowers axillary, solitary, drooping; corolla tubular; stamens inclosed. ♄. F. Native of the Cape of Good Hope. Pedicels shorter than the calyx, and twice as short as the leaves. Corolla purple?

Cinereous Boxthorn. Fl. June, July. Clt. 1818. Shrub.

20 L. hórridum (Thunb. prod. 37. in Lin. trans. 9. p. 154. t. 17. Ait. hort. kew. ed. 2d. vol. 2. p. 4.) branches strict; leaves obovate, fleshy, glabrous; flowers nearly sessile. ♄. F. Native of the Cape of Good Hope, in Saldanha Bay. Stem stiff, much branched, 3 feet high; branches nodulose, grey, spinescent. Leaves fascicled, 3-7 in each fascicle, flat above, and convex beneath, white, small. Flowers solitary, pedicellate. Pedicels terete, glabrous, a line long.

Horrid Boxthorn. Fl. July, Aug. Clt. 1791. Shrub 3 to 4 feet.

21 L. tetra'ndrum (Thunb. prod. p. 37. Lin. suppl. 150. Thunb. in Lin. trans. 9. p. 154. t. 15.) spiny, erect; branches angular, strict; leaves fascicled, ovate, obtuse; flowers nearly sessile; corollas quadrifid, tetrandrous. ♄. F. Native of the Cape of Good Hope, about Cape Town. Stem twisted, glabrous, angular, grey, stiff; branches horizontal, spiny. Leaves a line long. Flowers solitary, rising from the fascicles of leaves on short pedicels. Very like *L. A'frum*, but is distinguished

from that species in the leaves being more fleshy, and in the flowers being tetramerous and tetrandrous. It is also, perhaps, the *L. capénse*, Mill. dict. no. 7, of which he gives the following description. "Leaves oblong-ovate, thickish, crowded; spines strong, leafy. Leaves scattered, solitary, or fascicled, thick, pale green, permanent." This shrub has stood the open air throughout the winter in Chelsea botanic garden, but did not flower.

Tetrandrous-flowered Boxthorn. Fl. June, July. Clt.? Shrub 6 to 7 feet.

Sect. III. Anisodóntia (from *ανισος, anisos*, unequal; and *οδους οδοντος, odous odontos*, a tooth; in reference to the irregularly 5-toothed, or 5-cleft calyx.) Calyx urceolate, generally irregularly 5-cleft, or 5-toothed. Corolla tubular; limb erect, plicate, 5-10-toothed, rarely 5-cleft, or 5-lobed. Genitals inclosed, or nearly so.—Unarmed trees or shrubs. Leaves scattered. Flowers sub-axillary, or terminal, fasciculately umbellate.

§ 1. *Calyx 5-toothed, 5-cleft, or 5-lobed.*

22 L. fuchsioi'des (Humb. et Bonpl. pl. æquin. 1. p. 147. t. 42. H. B. et Kunth, nov. gen. amer. 3. p. 52.) branchlets puberulous; leaves obovate-oblong, bluntish, glabrous; umbels extra-axillary and terminal, sessile; corollas tubular, with a 5-toothed limb, glabrous; stamens hardly exserted. ♄. G. Native of the province of Quito, in cold places near Delay, Cumbe, and Cuenca, at the altitude of 1400 hexapods. Branches angular. Flowers pedicellate, pendulous. Calyx campanulate, 2-lobed, one of the lobes bidentate, and the other tridentate, or entire. Corolla purple. Filaments dilated and villous at the base. Stigma 2-lobed. Berry ovate, 1-celled, many-seeded, girded by the calyx.

Fuchsia-like Boxthorn. Fl. Aug. Shrub 6 to 8 feet.

23 L. gesnerioìdes (H. B. et Kunth, nov. gen. amer. 3. p. 53.) branchlets villously tomentose; leaves ovate, acute, glabrous above, and clothed with powdery pubescence beneath; umbels sub-axillary and terminal, sessile; corollas tubular, with a 5-lobed limb, downy; stamens hardly exserted. ♄. G. Native of the Andes of Quito, in temperate places near El Machin, and in the valley of the river Toche. Branchlets terete, glabrous. Pedicels villous. Calyx 5-toothed, downy. Corolla yellow; limb 5-lobed and plicate, downy. Berry girded by the calyx. Filaments a little dilated, and downy at the base. Stigma sub-capitate, 3-lobed.

Gesneria-like Boxthorn. Shrub 6 to 8 feet.

24 L. umbella'tum (Ruiz. et Pav. fl. per. 2. p. 45. t. 182. f. b.) branchlets downy; leaves oblong-lanceolate, glabrous, but powdery beneath; umbels axillary, on short peduncles; corolla tubular, with acute segments; stamens inclosed. ♄. S. Native of Peru, in the valley of Canta, in hedges by way sides. Leaves 6 inches long. Pedicels unequal. Corolla violaceous; segments of the limb acute. Filaments glabrous. Berry globose, orange-coloured, size of a pea. Seeds reniform.

Umbellate-flowered Box-Thorn. Shrub 10 to 15 feet.

25 L. cestroi'des (Schlecht, in Linnæa, 8. p. 70.) branches spinescent; leaves alternate, and falsely fascicled, broad, lanceolate, acute at both ends, glabrous; flowers pedicellate, rising in fascicles from the axils of the upper leaves, hence they are sometimes falsely umbellate; calyx tubular: teeth short, triangular, very acute; corolla tubular, glabrous, with downy margins; genitals inclosed; stamens unequal; berry nearly globose, exceeding the calyx a little, which is cleft at the side. ♄. H. Native of the South of Brazil, near San José do Uruquay, Sello. Largest leaves 2 to $2\frac{1}{2}$ inches long. Flowers large. Calyx downy, 5-toothed, at length cleft at the side. Limb of corolla bluntly 5-lobed. Berry globose, red. Seeds compressed. Embryo annular.

Cestrum-like Boxthorn. Shrub.

§ 2. *Calyx 10-toothed.*

26 L. Loxe'nse (H. B. et Kunth, l. c.) arboreous; branchlets pubescently tomentose; leaves ovate, somewhat acuminated, downy on both surfaces; umbels nearly axillary, and terminal, sessile; corollas tubular, with an obsoletely 10-toothed limb, downy; stamens inclosed. ♄. G. Native of Peru, near Loxa, at the altitude of 1050 hexapods. Branches terete. Leaves 3-$3\frac{1}{2}$ inches long. Pedicels clothed with hoary tomentum. Calyx campanulate, 5-toothed, downy. Corolla yellow, downy; limb plicate; alternate teeth very minute. Filaments a little dilated, and downy at the base. Stigma capitate. Berry ovate-oblong, girded by the calyx, 1-celled.

Loxa Boxthorn. Shrub 10 to 12 feet.

27 L. cornifòlium (H. B. et Kunth, l. c. p. 54.) arboreous; branchlets clothed with hoary tomentum; leaves roundish-ovate, sub-acuminated, complicate, puberulous above, but clothed with soft rufescent tomentum beneath; umbels almost axillary, and terminal, sessile; corollas tubular, with a 10-toothed limb, downy; stamens inclosed. ♄. G. Native of the province of Quito, in bushy places between Tiscan and Alausi, at the altitude of 1300 hexapods. L. ovàle, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 698. Leaves 3 inches long. Pedicels tomentose. Calyx downy, tubularly campanulate, 5-cleft. Corolla downy; limb plicate, the alternate teeth very minute. Filaments downy at the base. Stigma sublobate. Berry girded by the calyx.

Dogwood-leaved Boxthorn. Shrub 15 to 18 feet.

28 L. umbròsum (H. B. et Kunth, l. c.) arboreous; branchlets clothed with hairy down; leaves oblong, acuminated, smoothish: floral ones ovate-rhomboid; umbels almost axillary and terminal, sessile; corollas tubular, with a 10-toothed limb, hairy; stamens almost inclosed. ♄. G. Native of New Granada, in shady places near La Vega de St. Lorenzo, and Almaguer, at the altitude of 1200 hexapods, where it is called by the inhabitants *Upaquanda*. Branches rather angular. Leaves 6 inches long. Pedicels hairy. Corolla scarlet, widened at top, a little curved; the teeth of the limb obtuse and fimbriately ciliated. Filaments membranous at bottom and downy. Stigma obsoletely 3-lobed. Berry ovate, 1-celled, many-seeded. The plant is used in the cure of erysipelas.

Shaded Boxthorn. Shrub 12 to 16 feet.

† *Species hardly known.*

29 L. capsula're (Lin. amœn. acad. 4. p. 308.) leaves lanceolate, thin, glabrous; peduncles and calyxes downy; pericarp capsular. ♄. G. Native of Mexico, Miller. Willd. spec. 1. p. 1061. Lam. dict. 3. p. 510. Branches terete, furnished with spreading, axillary, simple spines. Leaves on short petioles. Peduncles simple, axillary, 1-flowered, shorter than the leaves. Calyx downy. Corolla rotate. Stigmas 2, straight, slender. Capsule ovate, mucronate, 2-celled. Certainly not a species of *Lycium*, from the capsular fruit and rotate corolla.

Capsular Box-Thorn. Shrub.

30 L. Carolinia'num (Walt. fl. carol. p. 84. Michx. fl. bor. amer. 1. p. 95.) unarmed; leaves narrow, spatulate-oblong; flowers quadrifid, tetrandrous, bluish. ♄. H. Native of Carolina, Georgia, Florida, by the sea shore, among rushes.

Caroline Box-Thorn. Fl. July, Sept. Clt. 1806. Shrub 4 to 5 feet?

31 L. obtu'sum (Willd. rel. ex Rœm. et Schultes, syst. 4. p.

698.) leaves obovate, on long petioles; peduncles crowded; branches spiny; flowers tetrandrous. ♄. S. Native of Cumana, Humb. et Bonpl.

Blunt-leaved Box-Thorn. Shrub.

32 L. GRANDIFLÒRA (Willd. rel. l. c.) leaves elliptic; peduncles aggregate; calyx 3-lobed. ♄. S. Native of Caraccas.

Great-flowered Box-Thorn Shrub.

33 L. INE'RME (Mill. dict. no. 9.) leaves lanceolate, alternate, permanent, petiolate. ♄. S. Native country unknown. Stem thick, woody. Branches numerous, short, brown. Leaves 3 to $3\frac{1}{2}$ inches long, dark green. Flowers white. Fruit unknown. Perhaps not a species of the present genus.

Unarmed Box-Thorn. Shrub.

34 L. COCHINCHINE'NSE (Lour. coch. p. 134. ed. Willd. 1. p. 165.) leaves oblong, obtuse; stem unarmed; cymes terminal. ♄. G. Native of Cochinchina, in woods. Shrub erect, branched. Leaves thick, glabrous, alternate. Calyx 5-cleft. Corolla white, tubular; limb 5-cleft, reflexed. Stamens 5, about equal in length to the corolla, clothed with many long hairs, which close up the tube. Berry roundish, 2-celled. Perhaps belonging to section *Eulycium*.

Cochinchina Box-Thorn. Shrub 4 to 6 feet.

Cult. The hardy kinds of Box-Thorn are well fitted for arbours, or to be trained against trellis-work or walls. The *L. A'frum*, and some of the Cape species belonging to the same section, are very handsome while in flower; and they will thrive and flower if trained against a wall, with a south or west aspect. They are all readily increased by ripened cuttings, under a hand-glass in sand. The stove and greenhouse species should be treated like other stove and greenhouse shrubs.

2 A. GUAYAQUILE'NSIS; arboreous; leaves elliptic-oblong, acute, downy above, but clothed with soft tomentum beneath; umbels extra-axillary, sessile. ♄. S. Native of Quito, near Guayaquil, in humid places. Lycium Guayaquilénse, H. B. et Kunth. nov. gen. amer. 3. p. 50. Branches terete, canescent, tomentose. Stigma capitate, somewhat 2-lobed. Corolla glabrous.

Guayaquil Acnistus. Tree or Shrub.

3 A. FLORIBU'NDUS; shrubby; leaves oblong, acute, glabrous above, and downy beneath; umbels extra-axillary, sessile, approximate. ♄. S. Native of Peru, on the Andes, between Caxamarca and the river Magdalena, at the altitude of 800 hexapods. Lycium floribúndum, H. B. et Kunth. nov. gen. 3. p. 51. Branches glabrous, white. Flowers larger than those of the preceding. Corolla downy outside. Stigma capitate, somewhat 2-lobed.

Bundle-flowered Acnistus. Shrub 3 to 6 feet.

4 A. SPATULA'TUS; glabrous; leaves obovate-spatulate, scattered or fascicled; umbels nearly axillary, sessile; corolla with acute downy segments. ♄. S. Native of Peru, about Huanuco, in hedges. Lycium spatulàtum, Ruiz. et Pav. fl. per. 2. t. 183. f. a. Branchlets angular. Leaves 1-2 inches long. Berry roundish, reddish-yellow, size of a pea.

Spatulate-leaved Boxthorn. Shrub.

5 A. SIDEROXYLOI'DES; leaves oblong-ovate, acute at both ends, downy beneath; umbels lateral, sessile. ♄. S. Native along the banks of the river Magdalena. A'tropa sideroxyloìdes, Herb. Willd. ex Rœm. et Schultes, syst. 4. p. 686.

Iron-wood-like Acnistus. Shrub.

Cult. For culture and propagation see the stove species of *Lycium*.

XIV. ACNI'STUS (meaning unknown to us.) Schotte, in wien. zeit. litt. 4. p. 1180. Linnæa, 6. p. 54. Schlecht, in Linnæa, 7. p. 66. Céstrum Lycium and A'tropa species of authors.

LYN. SYST. *Pentándria, Monogýnia.* Calyx campanulate, 5-toothed, nearly regular. Corolla funnel-shaped; tube short, dilated at the base; limb 5-parted, reflexed or spreading, imbricate in æstivation. Genitals exserted; filaments naked, dilated at the base. Anthers elliptic, cordate, dehiscing lengthwise. Stigma funnel-shaped. Berry 2-celled, many-seeded; placenta semiglobose, adnate by the middle to the dissepiment. Seeds reniform, compressed. Embryo?—Unarmed shrubs. Leaves and branches scattered, quite entire. Flowers fascicled, or in contracted racemes, from the axils of the leaves of the preceding year. Corollas white, sweet-scented at night. Berry red, or black, globose.

1 A. ARBORE'SCENS (Schlecht, in Linnæa, 7. p. 67.) shrubby; leaves elliptic, acute, downy above, but at length green, and clothed with white tomentum beneath; racemes umbellate, from the axils of the fallen leaves. ♄. S. Native of Martinico, Jamaica, Brazil, Peru, as about Lima and Chancay. Acnístus cauliflòrus, Schotte, l. c. A'tropa arboréscens. Lin. amœn. acad. 4. p. 307. Lam. dict. 1. p. 396. Swartz, obs. p. 91. Lycium aggregàtum, Ruiz. et. Pav. fl. per. 2. p. 45. t. 182. f. a. Céstrum campanulàtum, Lam. dict. 1. p. 688. Céstrum cauliflòrum, Jacq. hort. schœnbr. 3. p. 41. t. 325. A'tropa solanàcea, Allioni. Belladónna frutéscens, flore albo, Nicotianæ foliis, Plum. spec. 1. icon. t. 46. f. 1. Leaves 3-7 inches long, white from tomentum, powdery when young, but at length green. Filaments free almost to the base. Lycium Guayaquilénse, and L. floribúndum, H. B. et Kunth, 3. p. 39. does not seem to differ much from the present plant.

Arborescent Acnistus. Fl. May, June. Clt. 1821. Shrub 3 to 6 feet.

XV. JABORO'SA (a name given by Jussieu, derived from the Arabic word Jaborose, which was applied to the Mandrake, from its affinity to it.) Juss. gen. 125. ed. Usteri, p. 140. Lam. t. 114. Gill. et Hook. bot. misc. 1. p. 347. t. 71.

LIN. SYST. *Pentándria, Monogýnia.* Calyx short, 5-cleft; segments acute. Corolla campanulate or tubular, 5-cleft; segments acute. Stamens 5, inserted towards the top of the tube; filaments short, flat. Stigma capitate. Berry globose, 3-celled, ex Cav., 2-celled, ex Hook.; placenta fixed to the longitudinal dissepiment.—Herbs natives of Chili and Buenos Ayres. Leaves radical. Scapes 1-flowered. Corollas white.

1 J. CAULE'SCENS (Gill et Hook. in bot. misc. 1. p. 347. t. 71.) stems many, decumbent; leaves lyrately pinnatifid, spinulosely-toothed, petiolate; bracteas subulate, verticillate; corolla narrow, campanulate, hairy inside. ♃. G. Native of Chili, in the valleys of the Andes towards Mendoza. Root long, descending, nearly fusiform. Limb of corolla spreading, with acute segments. Capsule globose; receptacle fixed to a longitudinal dissepiment. Seeds numerous, black.

Caulescent Jaborosa. Pl. prostrate.

2 J. INTEGRIFÒLIA (Lam. dict. 3. p. 189. ill. t. 114.) stemless; leaves petiolate, oval, nearly entire; corolla with a long tube and acuminated segments. ♃. G. Native of Buenos Ayres. Hook. bot. mag. t. 3489. J. Bonariénsis, Gmel. syst. 1. p. 380. Leaves radical, 3-6 inches long. Scapes length of petioles. Corolla 2 inches long.

Entire-leaved Jaborosa. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

3 J. RUNCINA'TA (Lam. dict. l. c. Link, et Otto. pl. sel. p. 103. t. 48.) usually stemless; leaves petiolate, oblong-obovate, sinuately pinnatifid; corolla campanulate, with acute segments. ♃. G. Native of Monte Video, and Buenos Ayres, in the flats called Pampas. Leaves like those of *Taráxacum*, 2-4 inches long, and hardly $1\frac{1}{2}$ broad. Scapes a little shorter than the

leaves. Corolla hardly an inch long; segments of the limb spreading or reflexed. The specimens collected by Dr. Gillies have no stem; while the plant figured by Link and Otto has a stem 4-5 inches long, from which both the leaves and flowers have their origin; but in Gillies's specimens the leaves and flowers spring at once from the root.

Runcinate-leaved Jaborosa. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

Cult. For culture and propagation see *Netoúxia*, p. 454.

Tribe II. Nicotia'neæ. Limb of corolla plicate in æstivation. Stamens equal in number to the segments of the corolla. Fruit capsular, 2-celled. Calyx and corolla 5-cleft.

XVI. NICOTIA'NA (this genus takes its name of Jean Nicot, of Nismes in Languedoc, agent from the king of France to Portugal, who procured the seeds from a Dutchman, who had brought them from Florida, and sent them to France.) Tourn. inst. 1. p. 117. t. 41. Lin. gen. no. 248. Schreb. gen. no. 334. Juss. gen. 125. ed. Usteri, 139. Vent. tabl. 2. p. 369. St. Hil. fam. nat. 1. p. 286. t. 46. Lam. ill. 2. p. 6. t. 113. Schkuhr, handb. 1. p. 141. t. 44. Gærtn. fruct. 1. p. 264. no. 331. t. 55. f. 11. Lehm. nicot. p. 12. H. B. et Kunth, nov. gen. 3. p. 1.—Tábacus, Mœnch. meth. p. 448.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft. Corolla funnel-shaped or salver-shaped; limb 5-lobed, plicate, spreading. Stamens 5, length of the tube of the corolla. Anthers dehiscing lengthwise. Stigma capitate. Capsule 2-celled, covered by the permanent calyx, 2-valved; valves bipartite, therefore the capsule opens by 4 parts at the apex; placentas free, distant from the dissepiment. Seeds very numerous, minute.—Usually herbs, rarely subshrubs, generally clothed with clammy hairs or down. Flowers terminal, racemose or panicled, white, greenish or purplish.

Sect. I. Ta'bacum (the name Tobacco, which has superseded all others, is the appellation of a district in Mexico.) Leaves large. Flowers funnel-shaped, red; limb of corolla spreading, acuminated or acute; throat inflately ventricose.—Plants clothed with clammy down. Flowers disposed in short, many-flowered racemes, the whole constituting terminal subcorymbose panicles.

1 N. Ta'bacum (Lin. spec. 258.) herbaceous; leaves sessile, oblong-lanceolate, acuminated: lower ones decurrent; throat of corolla inflately ventricose; segments of the limb acuminated. ⊙. H. Native of America. Desf. fl. atl. 1. p. 109. Pursh, fl. 1. p. 141. Ruiz. et Pav. fl. per. 2. p. 15. Lam. ill. t. 113. Woodv. med. bot. p. 162. t. 69. Stev. et Church. med. bot. 1. t. 37. N. Havanénsis, Lag. elench. pl. hort. reg. madr. 1796.—Bull. herb. 3. t. 285.—Blackw. 1. t. 146.—Sabb. hort. rom. 1. t. 89. —Regn. bot. 1. t. 31. Plant downy, clammy. Leaves half stem-clasping. Calyx oblong, with lanceolate, acute, unequal segments. Corolla downy outside; limb rose-coloured. Capsule length of calyx, or a little longer.

The Spaniards are said to have first become acquainted with tobacco in the West Indies. It early attracted the notice of the English settlers in Virginia, especially after the founding of James Town in 1607. Shortly after this, it appears that tobacco was introduced in lieu of specie, as the tavern-keepers were compelled to exchange a dinner for a few pounds of tobacco; and government officers were paid in the same commodity.—Tatham, p. 180.

The species of Nicotiàna, principally grown as tobacco, are *N. Tábacum*, *N. macrophýlla*, and *N. rústica*. The two first are, however, generally preferred. The popular narcotic which it furnishes is probably in more extensive use than any other, and its only rival is the betel of the east. According to Linnæus, tobacco was known in Europe from 1560, being brought by the Spaniards from America, and was cultivated at Lisbon in the same year. It was brought to England from Tobago, in the West Indies, or from Tobasco, in Mexico (and hence the name), by Sir Ralph Lane, in 1586, but only the herb for smoking. Afterwards, according to Hakluyt, seeds were introduced from the same quarter. Sir Walter Raleigh first introduced smoking: in the house in which he lived at Islington were his arms, on a shield, with a tobacco plant on the top. Smoking has, consequently, been common in Europe for upwards of two centuries. Pallas, Rumphius, and Loureiro, are of opinion, that in China the use of tobacco is more ancient than the discovery of the new world.

Tobacco, from being the solace only of the Red Indians of America, has become one of the luxuries of the rich, and almost a necessary of life for the poorer inhabitants of a great portion of the globe. The Hindoo, slow to adopt strange customs, has been caught with the general infection, though some religiously abstain from its use: their nobles, as well as their women, may be seen inhaling it in the midst of perfumed essences; while the labouring bearer, and hard-working boatmen, seem to derive fresh vigour from their ever-in-hand hooqqas: the mountaineer, finding it inconvenient to carry such an apparatus over his rugged roads, makes a hole in the ground, through which he smokes. "Tobacco, as used by man," says Du Tour (Nouveau cours d'Agriculture, &c.) "gives pleasure to the savage and the philosopher, to the inhabitant of the burning desert and the frozen zone. In short, its use, either in powder, to chew, or to smoke, is universal; and for no other reason than a sort of convulsive motion (sneezing) produced by the first, and a degree of intoxication by the two last modes of usage. A hundred volumes," he adds, "have been written against it, of which a German has preserved the titles. Among those books is that of James Stuart, king of England, who violently opposed its introduction. The grand duke of Moscow forbade its entrance into his territory under pain of the knout for the first offence, and death for the next. The emperor of the Turks, the king of Persia, and Pope Urban VIII., issued similar prohibitions, all of which were as ridiculous as those which attended the introduction of coffee or jesuits' bark. At present, all the sovereigns of Europe, and most of those of other parts of the world, derive a considerable part of their revenue from tobacco."

Tobacco is cultivated in Europe as far north as Sweden; and is also grown in China, Japan, and other eastern countries. The sort preferred is *N. Tábacum*, which is an elegant plant, grown also in gardens as a border flower. *N. rústica*, the fausse tabac of the French, Bauern taback of the Germans, and Tabacca cimarosa of the Spanish, is also frequently cultivated, especially in Europe, it being considered hardier than the Virginian sort. Parkinson says he has known Sir Walter Raleigh, when prisoner in the Tower, prefer it to make good tobacco, "which he knew so rightly to cure." Tobacco has been successfully cultivated and cured in this country; but its growth is prohibited to encourage our commerce with America. It is now only grown as a curiosity, or for border flowers, or by gardeners for the destruction of insects. In Germany, and other northern countries, most families who have gardens grow enough of *N. rústica* for their own use; but as they do not know how to cure it, it is not much valued, and is never made into chewing tobacco. The cultivation of tobacco for commerce is chiefly carried on in Virginia, Maryland, &c., or almost from 35° to 40° north latitude. The other places of America celebrated for tobacco are Cuba, Vera Cruz, and Cumana; but in these places it is always grown

on elevated ground, where the temperature alone suits it in these latitudes.

In the culture of tobacco in America, the plants are reared on beds in spring; and when they have acquired about 4 leaves, they are planted in the field, in well prepared earth, about 3 feet distance every way. Every morning and evening the plants require to be looked over, in order to destroy a worm, which sometimes invades the bud. When 4 or 5 inches high, they are moulded up. As soon as they have 8 or 9 leaves, and are ready to put forth a stalk, the top is nipped off, in order to make the leaves longer and thicker, by diverting all the energies of the plant to them. After this, the buds which sprout from the joints of the leaves are all plucked, and not a day is suffered to pass without examining the leaves to destroy a large caterpillar which is sometimes very destructive to them. When they are fit for cutting, which is known by the brittleness of the leaves, they are cut with a knife close to the ground; and after lying some time, are carried to the drying-shed, where the plants are hung up by pairs, upon lines having a space between, that they may not touch each other. In this state they remain to sweat and dry. When perfectly dry the leaves are stript, and covered with blankets. Care is taken not to overheat them; for which reason the heaps are laid open to the air from time to time, and spread abroad. This operation is repeated till no more heat is perceived in the heaps; and the tobacco is then stowed in casks for exportation. Long. Jamaica, 3. p. 719. In Persia the seed of the Shiraz tobacco is sown in December, in a dark soil slightly manured; and to protect the seeds, the ground is covered with bushes, which are removed when the plants are 3 or 4 inches high; and during this period the plants are watered every 4 or 5 days, if the weather is dry. They are afterwards transplanted into a well moistened soil, on the tops of ridges made for them. As soon as the flowers appear, the buds are pinched off. After this operation the irrigation is continued, and the leaves increase in size and thickness till August or September, when each plant is cut close to the root, and again stuck firmly into the ground. At this season dews fall at night; and while exposed to these, the colour of the leaves change from green to the desired yellow colour; during this stage no water is given, and when they are sufficiently yellow, the plants are taken from the earth early in the morning; and while they are yet wet with the dew, and heaped on each other in a shed, the walls of which are made with bushes, where they are freely exposed to the wind,—while there, and in 3 or 4 days, those leaves which were still green, become of the desired pale yellow colour. The stalks and centre of each leaf are now removed and thrown away. The leaves are again heaped together in the drying-house for 3 or 4 days more, when they are in a fit state for packing. For this purpose the leaves are carefully spread on each other, and formed into a sort of cake, 4-5 feet in circumference, and 3-4 inches thick, great care being taken not to injure the leaves: these cakes are finally packed in bags. The leaf of the Shiraz tobacco is valued for being thick, tough, and of a uniform yellow colour.

In the manufacture of tobacco, the leaves are first cleansed from any earth, dirt, or decayed parts; next they are gently moistened with salt and water, or water in which salt along with other ingredients has been dissolved, according to the taste of the fabricator. This liquor is called tobacco sauce. The next operation is to remove the midrib of the leaf; then the leaves are mixed together, in order to render the quality of whatever may be the final application equal. It is then cut into small shreds for smoking, by a machine like a straw-cutter, or formed into small cords for chewing, or dried and ground for numerous varieties of snuffs. The three principal sorts of snuffs are called Rappees, Scotch or Spanish, and Thirds. The first is only granulated, the second is reduced to a very fine powder, and the third is the siftings of the second sort. The large Havannah cigars are probably made from the leaves of *N. macrophýlla*, or Oronoko tobacco; the smaller, or Queen's, are said to be made from those of *N. repánda*. The Indians of the rocky mountains of North America use the leaves of *N. quadriválvis* and *N. nàna*, and the Indians on the banks of the Columbia use those of *N. multiválvis*. *N. rústica* is the tobacco of Salonica, and probably also that of Latakkia, which is so much esteemed. Manilla has long been celebrated for its tobacco. Niebuhr describes it as very fine. Many smokers prefer Manilla cheroots to any other. The next tobacco which has obtained reputation in England is that of Darabjird in Fars, (Shiraz,) *N. Pérsica*. Still farther north, the tobacco commonly denominated Turkish, the produce of *N. rústica*, and grown on the coasts of the Mediterranean, is highly valued in India. There is an excellent kind of tobacco called Arracan, or Martaban. Dr. Ainslie states, that the finest tobacco in India, and perhaps in the world, is grown near the village of Woodanum, in the northern circars, in some of those low sandy islands formed at the mouth of the river Krishna (from which is made the famous Masulipatam snuff); also in the Delta of Godavery, where the soil is particularly rich and fertile. The Chunar and Bhilsa tobaccos are also celebrated in India.

The active constituents of tobacco are supposed to be an essential oil; for by long boiling, the decoction and extract of tobacco become inert, and by distillation an oil is obtained from it so active, that small animals are almost instantly killed when wounded by a needle dipped in it. Vauquelin has analysed tobacco, both in its fresh and prepared state. The expressed juice is manifestly acid, and contains a great quantity of albuminous matter, supermalate of lime, acetic acid, nitrate and muriate of potass, muriate of ammonia, and a red matter soluble in alcohol, and an acrid principle called narcotin, which is also soluble in alcohol and water. Narcotin is obtained in a state nearest to purity in the distilled water of the infusion of the dry, or of the expressed juice of the fresh plant.

Tobacco is capable of producing deleterious effects on the living body, whether taken into the stomach in substance or solution, or into the lungs in the form of smoke, or applied to abraded surfaces. The system, however, becomes easily habituated to the action of tobacco; and many people use very large quantities of it in several ways as a luxury, without experiencing any other bad effect than what arises from their being unable to relinquish it after the habit is confirmed. In medicine it is exhibited in various forms; when chewed, it causes an increased flow of saliva, and sometimes relieves the toothache; and reduced to powder, it proves an excellent errhine and sternutatory when snuffed up the nostrils. An infusion of it in water and wine, in small doses, so as to have little effect on the stomach, proves powerfully diuretic, and is employed with great success in dropsy and dysuria. The infusion is also applied externally for the cure of psora, tinea, and other cutaneous diseases. It is employed both in infusion and smoke, in the form of clysters in cases of obstinate constipation. An infusion of the leaves forms a powerful lotion for obstinate ulcers. The oil applied to a wound is said by Redi to be as fatal as the poison of a viper. The decoction, powder, and smoke of tobacco are used in gardening to destroy insects, and in agriculture for the same purpose, and to cure cutaneous eruptions in domestic animals.

Var. α, attenuàtum (Schrank, in Hoppe's bot. zeit. 1807. p. 260.) flowers attenuated; leaves lanceolate, acute, subdecurrent, attenuated at the base: lower ones large. ⊙. H. Flowers red.

Var. β, macrophyllum (Schrank, l. c.) corollas obtuse, flatly mucronate at the angles; petioles short, winged, at length

dilated and stem-clasping. ⊙. H. Flowers pale red, suborbicular, or with the margin obsoletely pentagonal. Perhaps not distinct from the species under the same name.

Var. γ, palléscens (Schrank, l. c.) corollas acute; leaves ovate, acuminated, attenuated at the base, sessile, subdecurrent. ⊙. H. Corolla white, with a rose-coloured margin, white beneath.

Var. δ, álipes (Schrank, l. c.) angles of corolla acuminated; leaves ovate, acuminated, attenuated into the petioles at the base, which are broadly winged; wings reflexed, at length half stem-clasping, and a little decurrent. ⊙. H. Flowers pale red. Leaves all large. Perhaps the same as *N. macrophýlla*, Spreng.

Var. ε, serótinum (Schrank, l. c.) leaves ovate, short-acuminated, subpetiolate, auriculately stem-clasping, and a little decurrent. ⊙. H. This is the latest flowering of all the sorts.

Var. ζ, gracílipes (Schrank, l. c.) flowers acute; leaves lanceolate, acute, very much attenuated at the base, running into a short-winged petiole. ⊙. H. Flowers as in var. α, and the leaves as in var. θ.

Var. η, Vérdan (Schrank, l. c.) leaves petiolate, ovate-lanceolate, longish, acute; petioles semi-terete, two-edged, somewhat decurrent at the base. ⊙. H. Flowers late.

Var. θ, línqua (Schrank, l. c.) corollas long, acute; leaves ovate, petiolate, longish, acute; petioles long, obsoletely margined, auricled at the base.

Common *Tobacco*, or Virginian or Sweet-scented Tobacco. Fl. July, Aug. Clt. 1570. Pl. 4 to 6 feet.

2 N. Loxe'nsis (H. B. et Kunth, nov. gen. amer. 3. p. 3.) leaves sessile, decurrent, oblong, acuminated, clammy and pilose; corolla 3 times longer than the calyx, greenish-white; lobes acuminated. ⊙. H. Native of New Granada, in shady places between the town of Loxa and Mount Uritusinga, at the altitude of 1060 hexapods. N. Tábacum, var. ?. Herb clammy and pilose. Leaves 5 inches long, and 2 broad. Calyx 5-cleft, rather unequal. This hardly differs from *N. Tábacum*, unless in the colour of the flowers.

Loxa Tobacco. Pl. 3 to 4 feet.

3 N. fruticòsa (Lin. spec. 258.) stem suffruticose, almost simple; leaves petiolate, lanceolate, obliquely acuminated; throat of corolla inflately ventricose: segments of the limb acuminated. ♄. G. Native of the Cape of Good Hope. Lehm. nicot. p. 23. no. 5. N. frutéscens, Cav. elench. pl. hort. madr. 1807. Plant pubescent and viscid. Axillary branches short. Leaves tapering into the petiole at the base. Calyx ovate, with unequal, lanceolate segments. Limb of corolla rose-coloured. Capsule conical, longer than the calyx.

Var. β, angustifòlia (Ehrh. beytr. 5. p. 169. Mill. icon. t. 185. f. 1.) leaves lanceolate, acute, sessile; calyxes acute; tube of corolla long. ♄. G. In Mill. dict. no. 5. there is mentioned a var. álba, which has broad leaves and white flowers, which is now unknown.

Shrubby Tobacco. Fl. July, Aug. Clt. 1699. Shrub 3 to 4 feet.

4 N. macrophy'lla (Spreng. ind. hort. hal. 1807. p. 45. Lehm. nicot. p. 10.) herbaceous; leaves stem-clasping, ovate, acute, auricled at the base; throat of corolla inflately ventricose: segments of the limb short, acuminated. ⊙. H. Native of America. Horn. hort. hafn. 1. p. 214. Lehm. nic. p. 19. N. latíssima, Mill. dict. no. 1. D. C. hort. monsp. 1813. p. 128. N. gigantèa, Enum. pl. hort. dorp. 1814. Plant downy, clammy. Stem branched from the base. Calyx ovate, with rather unequal, lanceolate, acute segments. Limb of corolla rose-coloured. Capsule ovate, obtuse, a little longer than the calyx.

Large-leaved, or Oronoko Tobacco. Fl. July, Aug. Clt.? Pl. 5 to 7 feet.

5 N. Chine'nsis (Fisch. in litt. ex Lehm. nic. p. 18.) stem suffruticose; leaves petiolate, ovate-lanceolate, quite entire; throat of corolla inflately ventricose: segments of the limb acute. ♄. G. Native of China. N. fruticòsa, Lour. coch. 1. p. 111.? exclusive of the synonymes. Plant pubescent, clammy. Stem branched at top. Calyx oblong, with nearly equal lanceolate-acute segments. Limb of corolla rose-coloured. Stamens a little exserted.

China Tobacco. Fl. July, Sept. Clt. 1819. Pl. 3 to 6 feet.

6 N. lancifòlia (Willd. herb. ex Lehm. nic. p. 26.) herbaceous; leaves sessile, linear-lanceolate, narrowly acuminated; throat of corolla inflately ventricose; segments of the limb acuminated. ⊙. H. Native of Quito, near Villa de Barra, at the altitude of 1180 hexapods. N. Ybarrénsis, H. B. et Kunth, 3. p. 4. Plant clothed with clammy hairs. Flowers paniculately corymbose. Calyx tubularly campanulate. Corolla purplish or rose-coloured. Capsule inclosed in the calyx.

Lance-leaved Tobacco. Fl. July, Sept. Clt. 1823. Pl. 2 to 3 feet.?

7 N. auricula'ta (Bertero, ined. ex Mor. elench. sard. ex Linnæa, 5. p. 93.) leaves oblong-lanceolate, acuminated, all auricled at the base, and stem-clasping; corolla with an inflated throat; segments acuminated. ⊙. H. Native of Sardinia. Spontaneous on the edges of fields, but has probably been introduced.

Auricled-leaved Tobacco. Pl.?

Sect. II. Ru'stica (from *rusticus*, rustic. *N. rústica* is generally grown by the peasants in the country, being much hardier than any of the other species.) Corollas yellow, funnel-shaped, salver-shaped, or tubular; segments bluntish, or acute.

§ 1. *Corolla funnel-shaped or tubular; tube inflated at top, and mouth contracted.*

8 N. pusi'lla (Lin. spec. 258.) stem herbaceous, dichotomous; leaves sessile: radical ones oblong-oval; calyx very short; tube of corolla subcylindrical, 3 times longer than the calyx; segments of the limb acute. ⊙. H. Native of Vera Cruz. Lehm. nicot. p. 29. N. hùmilis, Ehret, beytr. 5. p. 169. Mill. dict. no. 10. Plant pubescent. Radical leaves rosulate, 2-3 inches long; cauline leaves half stem-clasping. Racemes terminal. Calyx villous, 5-toothed; teeth acute. Capsule ovate, obtuse, glabrous, longer than the calyx. Corollas small, of a yellowish-green colour.

Var. β, hùmilis (Lehm. nicot. p. 29.) stem more humble, villous; leaves narrower, dilated at the base; flowers smaller; segments of corolla oblong, bluntish. ⊙. H. Native of Monte Video.

Small Tobacco. Fl. July, Aug. Clt. 1733. Pl. 1 foot.

9 N. undula'ta (Ruiz. et Pav. fl. per. 2. p. 16. t. 130. f. b. Lehm. nicot. p. 31.) stem herbaceous, angular; leaves petiolate, lanceolate, undulated; tube of corolla length of calyx; segments of the limb ovate, bluntish. ⊙. H. Native of Peru, in Tarma. Plant downy, clammy. Flowers disposed in terminal racemes. Corolla yellow; tube length of calyx, ventricose at top, with a contracted mouth, and a short limb. Stigma 2-lobed. Capsule ovate, inclosed in the calyx. Calyx sub-bilabiate, 5-toothed; upper tooth large, and very long.

Undulated-leaved Tobacco. Pl. 3 feet.

10 N. panicula'ta (Lin. spec. 259.) stem herbaceous, nearly simple; leaves petiolate, ovate, cordate, entire, obtuse, smoothish, quite glabrous, clavate; tube of corolla much longer than the calyx; segments of the limb very short and acute, ex Lehm., obtuse, ex Lin. ⊙. H. Native of Peru, near Patabilca, on the sea shore. Lin. in act. holm. 1753. vol. 15. t. 1.

Ruiz. et Pav. fl. per. 2. t. 129. f. b. Lehm. nicot. p. 36. N. viridiflòra, Cav. elench. madr. 1803.—Feuill. per. t. 10. Plant pubescent, clammy. Leaves petiolate. Flowers disposed in a terminal panicle. Filaments downy at the base. Capsule ovate, bluntish, glabrous. Corolla salver-shaped, with a contracted throat, green, or yellowish-green.

Panicled-flowered Tobacco. Fl. July, Sept. Clt. 1752. Pl. 2 to 3 feet.

12 N. CERINTHOI'DES (Horn. hort. hafn. 1. p. 214. Lehm. nicot. p. 38. t. 2.) stem herbaceous, branched from the base; leaves petiolate, all cordate, quite entire; tube of corolla clavate, downy, much longer than the calyx; segments of the limb very short, acute. ⊙. H. Native country unknown, but probably of America. Plant downy, clammy. Flowers disposed in a terminal panicle. Calyx 5-toothed; teeth unequal. Corolla tubular, greenish-yellow, having the throat a little contracted; segments subcordate, roundish, acute. Stamens nearly equal, villous at the base. Capsule conical, obtuse, a little longer than the calyx.

Honeywort-like Tobacco. Fl. Aug. Clt. 1821. Pl. 1 to 2 feet.

13 N. GLAU'CA (Graham, in bot. mag. 2837.) arboreous, erect, branched, glabrous; leaves unequally cordate-ovate, naked, glabrous, on long petioles; panicles terminal; corolla having the tube slightly curved, the throat slightly inflated, the mouth contracted, the limb small, cup-shaped, with short, acute segments. ♄. H. Native of Buenos Ayres. Plant glaucous in every part. Leaves sometimes slightly sinuated. Corolla green in the bud, afterwards yellow, covered with soft down. Calyx obscurely angled, with 5 sharp, unequal, erect, somewhat ciliated teeth.

Glaucous Tobacco. Fl. Aug. Oct. Clt. 1827. Shrub 10 to 20 feet.

14 N. LANGSDÓRFFII (Weinm. in litt. ex Rœm. et Schultes, syst. 4. p. 323.) stem herbaceous, branched; lower leaves ovate, obtuse, petiolate: superior ones almost sessile, decurrent; tube of corolla clavate: segments of the limb obtuse. ⊙. H. Native of Brazil. Sims, bot. mag. 2221. and 2555. Plant downy or pilose, viscid. Lower leaves tapering into the petioles, undulated: superior ones lanceolate, acute. Flowers terminal, panicled, green, or greenish-yellow. The two superior teeth of calyx longer. Tube of corolla an inch long; limb subplicate. Pollen blue. Capsule ovate, obtuse.

Langdorff's Tobacco. Fl. Aug. Clt. 1819. Pl. 3 to 5 feet.

§ 2. Corolla salver-shaped; tube inflated, cylindrical.

15 N. RU'STICA (Lin. spec. 258.) stem herbaceous, terete; leaves petiolate, ovate, quite entire; tube of corolla cylindrical, longer than the calyx: segments of the limb roundish, obtuse. ⊙. H. Native of Europe, Asia, Africa, and America. Desf. fl. atl. 1. p. 190. Mœnch, meth. 448. Lehm. nicot. p. 34.—Blackw. herb. t. 437.—Bull. herb. t. 289.—Sabb. hort. rom. 1. t. 90.—Regn. bot. 1. t. 52. Plant villous, clammy. Leaves thick, fleshy. Panicle composed of terminal racemes. Corolla greenish-yellow. Stamens villous at the base. Capsule nearly globose, obtuse, a little longer than the calyx. This is commonly called English Tobacco, from its having been the first introduced here; and being much more hardy than the other sorts, insomuch that it has become a weed in many places. It came, however, originally from America, by the name of Petum.

Var. β, Asiática (Schultes, obs. p. 43. Lehm. nicot. p. 34.) lower leaves ovate: superior ones cordate, pilose on both surfaces; flowers obtuse, mucronate. ⊙. H. N. Tatárica, Hort. cracov. N. Sibírica, Hort. parm. pl. hort. florent. 1797. N. scàbra, Cav. elench. matr. 1813. N. rugòsa, Mill. dict. no. 7. There are several other varieties of this species.

Rustic, Common or English Tobacco. Fl. July, Sept. Clt. 1570. Pl. 2 to 4 feet.

16 N. HU'MILIS (Link, enum. 1. p. 178. but not of Ehret.) stem nearly simple; leaves ovate, obtuse, repand, equal at the base; corolla with a cylindrical tube, which is twice as long as the calyx, and hairy, and the limb 4 times shorter than the tube. ⊙. H. Native country unknown. Very like *N. rústica;* but differs in the proportions of the corolla, and in the more slender habit.

Humble Tobacco. Fl. July, Sept. Clt.? Pl. ½ to 1 foot.

17 N. PULMONARIOI'DES (H. B. et Kunth, nov. gen. amer. 3. p. 2.) leaves petiolate, oblong, acute, running into the petioles at the base, rather pilose; flowers panicled; corollas salver-shaped, exceeding the calyx a little: limb obtuse. ⊙. H. Native of the Province de Los Pastos, near Rio Blanco, between Guachucal and Tulca, at the altitude of 1620 hexapods. Plant clammy and hairy. Calyx 5-cleft, with ovate, acute segments. Corolla green; tube ventricose at top. Capsule subglobose, acute, glabrous, inclosed in the calyx.

Lungwort-like Tobacco. Pl. 3 feet.

18 N. ANDI'COLA (H. B. et Kunth, nov. gen. 3. p. 1.) herbaceous; leaves sessile, lanceolate, acutish, narrowed at the base, smoothish; panicles terminal, nearly simple, spreading, clammy, and pilose; corolla somewhat salver-shaped, exceeding the calyx a little: lobes of limb obtuse, emarginate. ⊙. H. Native of the Andes of Peru, near Micuipampa, at the altitude of 850 hexapods. Herb clammy, and rather pilose. Calyx 5-cleft, with ovate, obtuse segments. Corolla green; tube ventricose at top. Stamens pilose at the base. Capsule glabrous, covered by the permanent calyx.

Andicolous Tobacco. Pl. 3 to 6 feet.

SECT. III. PETUNIOÌDES. Corollas salver-shaped, white; tube subcylindrical; segments of the limb obtuse or acute. Plants densely clothed with clammy villi. Flowers disposed in racemes or panicles, terminating the stem and branches.

19 N. SUAVE'OLENS (Lehm. nicot. p. 43.) stems herbaceous, nearly simple; leaves subpetiolate, ovate-lanceolate, undulated; tube of corolla cylindrical, much longer than the calyx; segments of the limb rather unequal, roundish, obtuse. ⊙. H. or ♃. G. Native of New Holland. N. undulàta, Vent. malm. t. 10. Jacq. fragm. t. 56. Sims, bot. mag. t. 673. R. Br. prod. p. 447. Stem villous at the base, and smoothish at top. Leaves with a few scattered soft hairs on the veins and midrib; radical ones subspatulate, bluntish, rosulate. Calyx deeply 5-cleft; segments acute, unequal. Limb of corolla white. Capsule ovate, obtuse, glabrous, inclosed in the calyx.

Sweet-scented Tobacco. Fl. May, Sept. Clt. 1800. Pl. 1 to 2 feet.

20 N. VINCÆFLÒRA (Lag. hort. madr. ex Link, enum. 1. p. 179.) leaves nearly sessile, oblong-lanceolate, attenuated at both ends, a little serrulated, glabrous; calycine segments equal, acuminated; tube of corolla elongated; segments of the limb blunt; stem rough at top. ♃. G. Native of South America. Very nearly allied to *N. suavèolens;* but differs in the plant being glabrous, and in the stem being warted at top.

Periwincle-flowered Tobacco. Fl. July, Sept. Clt. 1820. Pl. 2 feet.

21 N. LONGIFLÒRA (Cav. descr. p. 106. D. Don, in Sweet. fl. gard. n. s. no. 196.) scabrous; cauline leaves stem-clasping, cordate-lanceolate, acuminated; tube of corolla long, filiform, 5 times longer than the subfoliaceous calyx; lobes of corolla ovate-lanceolate, acute. ⊙. H. Native of Chili and Buenos

Ayres. Corolla at first of a dirty white, afterwards tinged with purple, greenish-yellow, and pubescent outside; inside of limb pure white. The whole plant is said to be villous, and the lower leaves petiolate, by Cavanilles.

Long-flowered Tobacco. Fl. July, Oct. Clt. 1832. Pl. 2 to 3 feet.

22 N. noctiflòra (Hook. bot. mag. t. 2785. Sweet, fl. gard. t. 262.) glandular and clammy, and beset with adpressed hairs; leaves petiolate, oblong-lanceolate, acute, undulately curled; tube of corolla cylindrical, much longer than the calyx; segments of corolla equal, obcordately emarginate. ♃. F. Native of Chili. Flowers disposed in terminal panicles. Corollas white, purple beneath, sweet-scented.

Night-flowering Tobacco. Fl. Aug. Clt. 1826. Pl. 2 to 3 feet.

23 N. Pe'rsica (Lindl. bot. reg. 1592.) clothed with clammy down; radical leaves oblong-spatulate: cauline ones sessile, half stem-clasping, acuminated, hardly repand; calyx acutely 5-toothed; corolla salver-shaped, with a long clavate tube, and ovate, obtuse, emarginate, rather unequal segments. ⊙. H. Native of Persia. Radical leaves cordate at the base. Flowers racemose, extra-axillary, on short pedicels, sweet-scented at night. Tube of corolla green, ventricose at top; limb green outside, and white inside. This kind of Nicotiàna furnishes the far-famed Shiraz tobacco. The *N. Tábacum* is, however, also cultivated in Persia.

Persian or Shiraz Tobacco. Fl. Sept. Oct. Clt.? Pl. 1½ to 3 feet.

24 N. acumina'ta (Sims, bot. mag. 2919.) downy; leaves broad-lanceolate, acuminated, undulated, on longish petioles; panicles few-flowered; calyx clothed with glandular down; calycine segments narrow; corolla with an elongated tube, and roundish obtuse segments. ⊙. H. Native of Valparaiso. Petùnia acuminàta, Graham, in edinb. phil. journ. july, 1828. Corolla with a spreading white limb.

Acuminated-leaved Tobacco. Fl. June, Sept. Clt. 1827. Pl. 2 feet.

25 N. angustifòlia (Ruiz. et Pav. fl. per. 2. p. 16. t. 130. f. a. Lehm. nic. p. 25.) herbaceous, branched; leaves petiolate: superior ones linear; tube of corolla widened and subventricose at top: segments of the limb spreading, acute. ⊙. H. Native of Chili, about Conception. Horn. hort. hafn. 1. p. 215. Pers. ench. 1. p. 218. Plant pubescent, clammy. Branches slender. Flowers disposed in diffuse, terminal panicles. Calycine segments unequal, lanceolate-linear, acute. Limb of corolla milk-coloured, nearly equal; tube greenish. Capsule conical, obtuse.

Narrow-leaved Tobacco. Pl. 2 to 3 feet.

26 N. dilata'ta (Link, enum. 1. p. 179.) stem herbaceous, rather tomentose, clammy; leaves sessile, lanceolate, attenuated towards the base, but dilated at the base, repand; tube of corolla much longer than the calyx, subclavate; segments of the limb acute. ⊙. H. Native country unknown. Lower leaves a foot long, and more than 3-4 inches broad; cauline leaves smaller, dilated at the base, all long-acuminated, and rather tomentose. Limb of corolla white. Link received this species under the name of *N. angustifòlia*.

Dilated-leaved Tobacco. Fl. July, Sept. Clt. 1820. Pl.

27 N. plumbaginifòlia (Viv. elench. pl. hort. dinegro, p. 26. t. 5.) stem herbaceous; leaves sessile: lower ones obovate-spatulate, bluntish: superior ones half stem-clasping, undulated; tube of corolla very long, subclavate; segments of the limb ovate, acute. ⊙. H. Native country unknown, but probably of South America. Lehm. nicot. p. 41. N. crìspa, Jacq. fragm. p. 57. t. 84. Desf. cat. hort. par. 1804. p. 67. N. cerinthoìdes, Vittmann. Plant rather scabrous and hairy. Branches slender. Superior leaves oblong, the uppermost ones lanceolate-linear. Racemes disposed in a terminal panicle. Calyx 5-cleft, 10-striped; segments unequal. Limb of corolla white above, and fuscescent beneath. Capsule ovate, glabrous, length of calyx.

Plumbago-leaved Tobacco. Fl. May, June. Clt. 1816. Pl. 1 to 2 feet.

28 N. repa'nda (Willd. herb. ex Lehm. nicot. p. 40. t. 3.) stem herbaceous; leaves stem-clasping, cordate-spatulate, roundish, repandly undulated, sometimes lyrate; tube of corolla slender, very long: segments of the limb ovate, acutish. ⊙. H. Native of Cuba, near Havannah. Sims, bot. mag. 2484. N. lyràta, H. B. et Kunth, nov. gen. amer. 3. p. 4. Plant almost glabrous, except the young leaves, which are downy. Flowers distant, disposed in terminal, elongated racemes. Calyx scaly, on being examined by a lens, 5-cleft; segments equal. Tube of corolla clavate at top; limb white above. Capsule ovate, obtuse, shorter than the calyx. The small Havannah cigars, or queen's, are said to be made of this species.

Repand-leaved Tobacco. Fl. June, July. Clt. 1820. Pl. 1 foot.

29 N. viscòsa (Lehm. nicot. p. 28.) stem herbaceous, clammy; leaves sessile, somewhat cuneiform, obtuse, dilated towards the base, half stem-clasping; tube of corolla subcylindrical, twice as long as the calyx: segments of the limb ovate, obtuse. ⊙. H. Native of Buenos Ayres. Stem angular. Axillary branches short, terminated by flowers. Leaves 2-3 inches long. Calycine segments unequal, short, obtuse. Corolla white? tube widened a little at top.

Clammy Tobacco. Fl. July, Sept. Clt. 1821. Pl. 2 to 3 feet?

30 N. Bonarie'nsis (Lehm. nicot. p. 27. t. 1.) stem herbaceous; leaves sessile, lanceolate, acute, broader towards the base, subrepand; tube of corolla cylindrical; segments of the limb ovate, obtuse. ⊙. H. Native of Buenos Ayres. Plant pubescently pilose. Leaves half stem-clasping at the base. Flowers racemose, terminating the stem and branches. Calycine segments nearly equal, narrow-lanceolate, acute. Corolla downy, white; tube a little dilated at top.

Buenos Ayrean Tobacco. Fl. July, Sept. Clt. 1821. Pl. 2 to 3 feet.

Sect. IV. Polydi'clia (from πολυς, *polys*, many; and δικλις, *diclis*, a valve; in reference to the capsule being 4 or more valved.) Corolla tubular, ventricose at the base, white inside, and livid outside. Capsule 4 or many-valved. Flowers axillary, solitary.

31 N. quadriva'lvis (Pursh, fl. amer. sept. 1. p. 141. Spreng. syst. p. 48. no. 95. Lehm. nicot. p. 45. t. 4.) stem herbaceous, branched; leaves petiolate, oblong; tube of corolla twice as long as the calyx; segments of the limb oblong, bluntish; capsule 4-valved, nearly globose. ⊙. H. Native of North America, at the Missouri river. Sims, bot. mag. t. 1778. The whole plant is clammy and pilose, with a bad smell. Superior leaves nearly sessile. Calyx deeply 5-cleft; segments unequal. Corolla tubular, white inside.

Four-valved-capsuled Tobacco. Fl. July, Aug. Clt. 1811. Pl. 1 to 1½ foot.

32 N. na'na (Lindl. bot. reg. t. 833.) plant dwarf; leaves lanceolate, pilose: radical ones longer than the solitary flowers; corolla longer than the calyx, with obtuse segments. ⊙. H. Native of North America, among the rocky mountains. Calyx turbinate, clothed with glandular hairs. Corolla white, downy outside. Flowers rising from the axils of the leaves. The Indians are said to prepare the finest of their tobacco from the leaves of this species.

Dwarf Tobacco. Fl. June. Clt. 1823. Pl. ¼ foot.

33 N. multiva'lvis (Lindl. bot. reg. t. 1057.) clothed with viscid hairs or down; leaves fleshy, ovate-lanceolate: lower ones petiolate; flowers axillary, solitary; calyx many-parted; capsule many-celled; segments of corolla obtuse, deeply veined. ⊙. H. This species is cultivated by the Indians, who inhabit the banks of the Columbia, for tobacco; for which purpose the calyx, which is very fetid, is selected in preference to any other part. Calyx inflated, ribbed. Corolla ventricose at the base; limb spreading, usually 6-cleft. Stamens equal in number to the segments of the corolla.

Many-valved-capsuled Tobacco. Fl. Aug. Sept. Clt. 1826. Pl. 2 feet.

† *Species not sufficiently known.*

34 N. crí spa (Cav. descr. p. 105.) leaves lanceolate-linear, curled, villous, clammy, petiolate; panicles dichotomous. ⊙. H. Native of North America, about San Blas. Stem slender, hard, villous. Branches alternate, forked at top. Leaves shorter than in *N. angustifòlia*, undulated. Calyx villous. Tube of corolla 5 inches long; limb small.

Curled-leaved Tobacco. Pl.

35 N. ala'ta (Link et Otto, abbild. p. 63.) stem erect, glandularly pilose; leaves oblong and lanceolate, repandly-toothed, scabrous, glandularly ciliated; teeth of calyx long, acute; tube of corolla very long; segments obtuse. ⊙. H. Native of Brazil.

Winged Tobacco. Fl. Aug. Oct. Clt. 1829. Pl. 2 feet?

36 N. tene'lla (Cav. descr. p. 105.) stem herbaceous, filiform; leaves sessile, acute: radical and lower ones ovate: superior ones lanceolate. ⊙. H. Native of Mexico, about Acapulco. Stem solitary, simple. Radical leaves 2 inches long, and 1 inch broad. Flowers solitary, axillary, pedicellate, distant. Tube of corolla slender, 1½ inch long; segments of the limb acute.

Slender Tobacco. Pl. 1 foot.

37 N. Forste'ri (Rœm. et Schultes, syst. 4. p. 323.) leaves lanceolate, subpetiolate, stem-clasping; flowers acute; stem shrubby. ♄. G. Native of the South Sea Islands. N. fruticòsa, Forst. floral. insul. austr. prod. p. 17. Lehm. nicot. p. 51.

Forster's Tobacco. Shrub.

38 N. mínima (Molina. voy. du. chili. p. 153. ed. 2d. p. 281.) leaves sessile, ovate; flowers obtuse. ⊙. ? H. Native of Chili. Leaves very like those of *Dictámnus Crética.*

Least Tobacco. Pl. small.

39 N. rugòsa (Mill. dict. no. 7.) leaves ovate, rugose, petiolate. ⊙. H. Native country unknown. Nicotiàna minor foliis rugosioribus amplioribus, Vaill. Stem tall. Leaves like those of *N. macrophýlla*, but twice their size, deeper green, and on longer petioles. Flowers larger than in *N. rústica*, but the form is the same. Perhaps only a variety of *N. rústica.*

Wrinkled-leaved Tobacco. Pl. 4 feet.

40 N. silenoi'des (Hort. Prince, Salm. Dyck. Dum. Cours. ed. 2d. suppl. p. 148. Perhaps the same as *N. suavèolens.*

Catchfly-like Tobacco. Pl.?

N.B. The following names are given in Loud. hort. brit. suppl. p. 594, of which we know nothing; they are probably only varieties of *N. Tábacum.* 1. N. Nepalénsis, Link et Otto. 2. N. Brasiliénsis, Link et Otto. 3. N. petiolàta, Agardh. 4. N. sanguínea, Link et Otto.

Cult. Most of the kinds of *Tobacco* are showy when in blossom, and some of them answer well for decorating flower-borders, particularly the white flowered species. The seeds of all require to be reared on a hot-bed in spring, and when the plants are grown with 2 or 3 leaves, they should be planted separately into small pots, and placed again in the frame; and about the end of May those which are intended for the flower border should be planted out in conspicuous situations, and those intended for leaves in rows 3 feet distant, with the balls entire.

XVII. SAIRA'NTHUS (from *σαιρω, sairo,* to clean; and *ανθος, anthos,* a flower; with reference to the ringent corolla which separates this genus from *Nicotiàna.*) Nicotiàna glutinòsa, Lin.

Lin. syst. *Didynàmia, Angiospérma.* Calyx campanulately ventricose, sub-bilabiate; limb 5-cleft, with linear-lanceolate, acutish, unequal segments. Corolla somewhat funnel-shaped, twice as long as the calyx; tube ventricose above, a little curved; limb 5-lobed, rather ringent, spreading a little; lobes ovate, acutish, nearly equal. Stamens 5, inserted in the tube, exserted a little, unequal, directed all to one side of the flower; filaments filiform, dilated and downy at the base. Anthers dehiscing lengthwise inside. Style curved at top. Stigma capitately thickened, green. Capsule roundish-ovate, acute, covered by the permanent calyx, and hardly exceeding it, 2-celled, 2-valved; valves at length bipartible at top. Placentas free, remote from the dissepiment. Seeds very minute, oblong, angular, verrucosely warted.—An erect, branched, villously clammy herb. Leaves petiolate, ovate-cordate, acuminated. Racemes terminal, erect, secund. Corollas rose-coloured, clothed with clammy hairs outside.

1. S. glutinòsus; ⊙. H. Native of Peru, in temperate places near Guancabamba, and elsewhere in South America. Nicotiàna glutinòsa, Lin spec. 259. Andr. bot. rep. 484. Ruiz. et Pav. fl. per. 2. p. 16. Lehm. nicot. 32. N. militàris, Lin. act. holm. 1753. vol. 15. p. 44. t. 2. Tábacus víridis, Mœnch. meth. p. 448. The whole plant is clammy and villous.

Clammy Sairanthus. Fl. July, Sept. Clt. 1759. Pl. 2 to 4 feet.

Cult. For culture and propagation see *Petùnia* below.

XVIII. LEHMA'NNIA (named in honour of Professor John George Christian Lehmann, of Hamburgh; author of Aperifoliæ nuciferæ, and Generis Nicotianarum Historia, and many other botanical papers.) Spreng. anleit. ed. 2d. 1817. 1. p. 458. Nicotiàna species, Ruiz. et Pav.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft, bilabiate; segments nearly equal, spreading. Corolla irregular; with a very narrow incurved tube, which exceeds the calyx a little; throat thickened; limb campanulate, with acute segments. Genitals exserted, recurved. Capsule ovate, half covered by the calyx. Seeds angular, wrinkled.—An erect, woody, rather clammy shrub, divided into many angular branches. Leaves scattered, lanceolate, decurrent, acute, quite entire, white, with purple veins. Panicles large, diffuse, clammy, villous. Corolla glabrous, purple.

1 L. tomentòsa (Spreng, l. c.) ♄. G. Native of Peru, in corn fields, and in waste places. Nicotiàna tomentòsa, Ruiz. et Pav. fl. per. 2. p. 16. t. 129. f. a. Poir. suppl. 4. p. 94.

Tomentose Lehmannia. Shrub 15 to 20 feet.

Cult. For culture and propagation see *Petùnia* below.

XIX. PETU'NIA (Petun or Petum is the name of tobacco in Brazil; the name is given to this genus on account of its affinity with *Nicotiàna.*) Juss. in ann. mus. 2. p. 215. t. 47. f. 2. Pers. ench. 1. p. 218. Sweet, fl. gard. 119.—Nicotiàna species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx deeply 5-cleft; segments oblong, subspatulate. Corolla salver-shaped, with a cylindrical tube, which is a little widened at top, and a spread-

ing, dilated, 5-lobed, obtuse, unequal limb. Stamens unequal, inclosed; anthers roundish, dehiscing lengthwise. Stigma capitate, slightly 2-lobed. Capsule girded by the calyx below, 2-celled, 2-valved at apex, many-seeded. Seeds minute.—Diffuse, pubescently villous, evergreen, herbaceous plants. Leaves alternate, on short petioles. Flowers axillary, pedicellate, white, shape of those of *Mirábilis dichótomus*.

1 P. nyctaginiflòra (Juss. l. c. p. 216. t. 47. f. 2.) herbaceous, diffuse, clothed with clammy, glandular villi; lower leaves alternate, ovate-oblong, obtuse, pubescent, attenuated into the petioles at the base: floral leaves sessile, cordate-ovate, opposite; flowers axillary, pedunculate; corolla large, having the tube 3-4 times longer than the calyx, and the limb broad and obtuse. ♃. F. Native of South America, at the mouth of the river Plata. Poir. suppl. 4. p. 375. Tratt. tab. t. 72. Sweet, fl. gard. 119. Sims, bot. mag. t. 2552. Nicotiàna axillàris, Lam. ill. no. 2287. Nicotiàna nyctaginiflòra, Lehm. nicot. p. 20. Branched. Stem hairy. Leaves pubescent. Pedicels villous, furnished with 2 opposite leaves at the base. Calyx pubescently villous, with unequal, oblong, obtuse, spreading, foliaceous segments. Corollas large, white, clammy, downy outside, similar to those of *Mirábilis*, hence the specific name.

Marvel-of-Peru-flowered Petunia. Fl. June, Oct. Clt. 1823. Pl. 2 to 4 feet.

2 P. parviflòra (Juss. l. c. p. 216. t. 47. f. 1.) herbaceous, prostrate; leaves sessile, oblong, obtuse, thickish; corollas small, hardly longer than the calyx; segments of the limb obtuse. ♃. F. Native of South America, at the mouth of the river Plata. Pers. ench. 1. p. 218. Stems many from the same root, rather villous. Leaves small, size of those of a species of *Cerástium*, downy. Segment of calyx oblong, bluntish, foliaceous, spreading. Corolla coarctate in the middle, red; limb plicate. Capsule inclosed in the calyx.

Small-flowered Petunia. Pl. prostrate.

3 P. intermèdia; clothed with short, glandular, clammy, hoary pubescence; leaves linear, obtuse; peduncles opposite the leaves, or terminal; corolla funnel-shaped, having the tube hardly longer than the calyx, and the segments emarginate; style clavate; capsule 5-ribbed; calycine segments foliaceous, unequal. ♄. or ♃. F. Native of Buenos Ayres, on the banks of the Parana. Nierembérgia intermèdia, Graham, in edinb. phil. journ. 1833. D. Don, in Sweet. fl. gard. n. s. t. 237. Salpiglóssis lineàris, Hook, in bot. mag. no. 3256, in a note. Tube of corolla yellow, striated; throat ventricose, yellow within; limb 5-lobed, of a rich purple.

Intermediate Petunia. Fl. Aug. Sept. Clt. 1832. Pl. ½ foot.

4 P. violàcea (Lindl. bot. reg. t. 1626.) prostrate, clothed with clammy hairs or down; leaves ovate, on short petioles, acute; corolla ventricose, with ovate, acute segments; flowers solitary, axillary, pedunculate. ♃. F. Native of Buenos Ayres, on the Uruquay. Nierembérgia punícea, D. Don, in Sweet, brit. fl. gard. n. s. t. 193. Salpiglóssis integrifòlia, Hook. bot. mag. t. 3113. Calycine segments linear-spatulate, obtuse, foliaceous. Corollas large, of a rose purple colour; limb irregular. Stamens inserted in the middle of the tube. Embryo short, straight; albumen copious.

Var. β, *Atkinsiàna* (D. Don, in Sweet, fl. gard. n. s. t. 268.) leaves ovate, acutish; calycine segments ligulate; tube of corolla twice as long as the calyx. ♃. F. A hybrid between *P. nyctaginiflòra* and *P. violàcea*. In habit it is much like the former, but the flowers are nearly intermediate between the two parents, but the colour is almost that of the latter.

Violaceous-flowered Petunia. Fl. July. Clt. 1831. Pl. 1 foot.

Cult. The species are all exceedingly elegant plants when in blossom. In the open border they succeed very well from May to September; and large patches of them have a very gaudy appearance. In autumn a few plants of each species should be put into pots, and removed to the greenhouse, so as they may be preserved from the frost of winter. All succeed best in a light rich soil, and are readily propagated from cuttings. Seeds of them are also sometimes ripened in this country, by which they may be increased.

XX. NIEREMBE'RGIA (named in honour of John Eusebius Nieremberg, a Spanish Jesuit; author of Historiæ Naturæ maximè peregrinæ. 1. vol. in folio. Antwerp, 1635.) Ruiz. et Pav. fl. per. 2. p. 13. t. 123. H. B. et Kunth, nov. gen. amer. 3. p. 8. t. 198.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx tubular, 5-cleft; segments lanceolate, acute. Corolla somewhat salver-shaped; with a very long, cylindrical, slender tube; and a 5-lobed, plicate, equal, blunt limb. Stamens 5, exserted; filaments connate at the base; anthers dehiscing lengthwise. Stigma peltately 2-lobed. Capsule 2-celled, 2-valved in the bottom of the permanent calyx; dissepiment parallel with the valves, at length free.—Stems suffruticose, or herbaceous, filiform, procumbent, and often creeping. Leaves scattered, solitary, sometimes twin, entire. Flowers extra-axillary, or opposite the leaves, solitary, almost sessile, white, and tinged with blue or red.

1 N. calycìna (Hook. bot. mag. t. 3371.) clothed with glandular pubescence; stems herbaceous, procumbent; leaves opposite and alternate, roundish-obovate, petiolate; peduncles lateral, 1-flowered, extra-alar, short; calyx large, campanulate, with obovate, 3-nerved, foliaceous segments; corolla with a very long, slender, cylindrical tube, and a 5-lobed, campanulate limb. ♃. F. Native of Buenos Ayres, on the Uruquay. Sweet, fl. gard. n. s. t. 319. Corolla rising from the broad calyx; limb white, its base alone yellow; tube yellowish. Habit of *Petùnia*.

Large-calyxed Nierembergia. Fl. Sept. Oct. Clt. 1834. Pl. procumbent.

2 N. spatula'ta (H. B. et Kunth, nov. gen. amer. 3. p. 8.) stems woody, creeping; leaves petiolate, elliptic-spatulate, glabrous, rather downy, and somewhat ciliated while young; calycine segments lanceolate, acute: lower ones a little smaller and reflexed; capsule few-seeded. ♄. F. Native of New Granada, near Santa Fe de Bogota, and Loxa, at the altitude of 1000 and 1300 hexapods. Stems filiform, prostrate; branches short, erect, puberulous. Leaves solitary or twin, obtuse or rounded at apex. Flowers pedicellate. Calyx pilose at bottom, a little arched. Corolla glabrous; tube slender, half an inch long, 4 times longer than the calyx; limb campanulately funnel-shaped. Stamens glabrous, membranous, linear. Capsule in the bottom of the ventricose calyx.

Spatulate-leaved Nierembergia. Pl. creeping.

3 N. re'pens (Ruiz, et Pav. fl. per. 2. p. 13. t. 123. f. c.) stems creeping at the base, but erectish at top, and filiform; leaves in fascicles of 5 or 6, oblong, obtuse, rather pilose; flowers sessile. ♃. F. Native of Chili, about Conception, in dry sandy pastures. Leaves ½ an inch long, and 2-3 lines broad. Corolla white, with a yellow throat, and with 3 purple lines on each of the segments of the limb.

Creeping Nierembergia. Fl. Cult. Pl. 1 foot.

4 N. angustifòlia (H. B. et Kunth, nov. gen. 3. p. 9. t. 198.) stems herbaceous tufted, diffuse; leaves sessile, linear-lanceolate, glabrous; calycine segments linear, acute, equal; capsule many-seeded. ♃. F. Native of Mexico, near Real del Monte, at the altitude of 1430 hexapods. Flowers opposite the leaves, on short pedicels. Corolla glabrous, white; tube longer than the calyx; limb campanulately urceolate, not plicate.

Narrow-leaved Nierembergia. Pl. diffuse.

5 N. PUBE'SCENS (Spreng. syst. 1. p. 615.) leaves oblong-linear, clothed with glandular hairs; capsule 2-valved, many-seeded; stem woody, diffuse. ♄. F. Native of Monte Video.

Downy Nierembergia. Shrub diffuse.

6 N. GRA'CILIS (Hook. bot. mag. t. 3108.) downy; stems erectish; leaves linear, subspatulate, obtuse; calycine segments linear, bluntish, much shorter than the tube of the corolla; flowers terminating the young branches; lobes of corolla rounded, obtuse. ♃. F. Native of Buenos Ayres, about the Uruquay. D. Don, in Sweet, fl. gard. n. s. t. 172. Corolla with a very long slender tube; the limb white, streaked with purple, with a yellow centre.

Slender Nierembergia. Fl. July, Aug. Clt. 1831. Pl. ½ foot.

7 N. FILICAU'LIS (Lindl. bot. reg. 1649. Hook. bot. mag. t. 3370.) glabrous, erect, filiform; leaves linear-lanceolate, acute, or obtuse; peduncles opposite the leaves, 1-flowered; tube of corolla glandular, as well as the filaments. ♃. F. Native of Buenos Ayres. D. Don, Sweet, fl. gard. no. 243. N. linariæfòlia, Graham. Stems ascending. Corolla with a slender tube. Calycine segments acuminated, equal in length to the tube of the corolla. Limb of corolla lilac, with a yellow centre. Stamens as if they were monadelphous, as in the rest. Corolla variable in colour from almost white to purplish.

Thread-stemmed Nierembergia. Fl. Clt. Pl. ½ to 1 foot.

8 N. ARISTA'TA (D. Don, in Sweet, fl. gard. n. s. t. 255.) smoothish; leaves linear, acuminated; calycine segments acuminated, much shorter than the tube of the corolla; stigma peltate; peduncles opposite the leaves; limb of corolla spreading: lobes rounded, slightly crenulated. ♄. F. Native of Buenos Ayres, on the banks of the Parana. Corolla white, suffused with purple, with the mouth of a deeper colour, glandular outside.

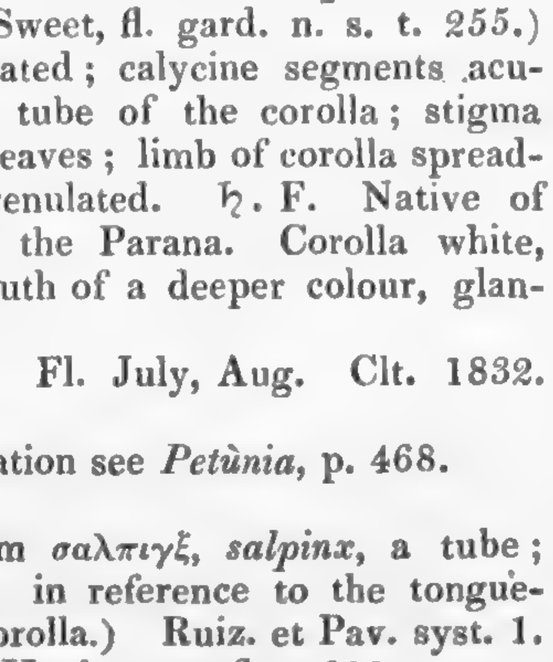
Awned-calyxed Nierembergia. Fl. July, Aug. Clt. 1832. Pl. ¼ to ¾ foot.

Cult. For culture and propagation see *Petùnia*, p. 468.

XXI. SALPIGLO'SSIS (from *σαλπιγξ*, *salpinx*, a tube; and *γλωσσα*, *glossa*, a tongue; in reference to the tongue-shaped style in the tube of the corolla.) Ruiz. et Pav. syst. 1. p. 163. Pers. ench. 2. p. 169. Hook. exot. fl. t. 229.

LIN. SYST. *Didynàmia*, *Angiospérmia*. Calyx 5-angled, 5-cleft, funnel-shaped, gradually widening to the top; limb 5-cleft, plicate; segments 2-lobed. Stamens 4, 2 long, and 2 short, with the rudiment of a fifth between the two longer ones. Style tongue-shaped at apex; stigma truncate, transverse. Capsule ovate, 2-celled, 2-valved; valves bipartible; dissepiment contrary, placentiferous on both sides. Seeds erect, angular, a little compressed, truncate, scabrous from elevated dots. Embryo arched, with short oval cotyledons.—Annual or biennial plants clothed with glandular, clammy hairs, natives of Peru and Chili. Stem paniculately branched at top; branches dichotomous, forked. Corolla large, purple, or straw-coloured, or variegated. Leaves alternate: lower ones petiolate, sinuated: upper ones narrower, entire.

FIG. 40.



1 S. SINUA'TA (Ruiz. et Pav. syst. p. 163.) plant clothed with glandular hairs; lower leaves petiolate, elliptic-oblong, sinuated: upper ones sessile, lanceolate-linear, quite entire; stem paniculately branched at top; branches racemose, dichotomous; filaments glandularly pilose. ♂. H. Native of Chili. S. atropurpùrea, Graham in bot. mag. 2811. Sweet. fl. gard. 271. Corollas large, dark purple, sometimes almost black, orange-coloured in the centre, and striped with deeper coloured veins.

Var. β, pícta; corolla elegantly variegated with yellow and bluish purple. ♂. H. Native of Chili. S. pícta, Sweet, fl. gard. t. 258. S. stramínea, β, pícta, Hook. bot. mag. t. 3365.

Var. γ, stramínea; corolla cream-coloured, veined with blue. ♂. H. Native of Valparaiso. S. stramínea, Hook. exot. fl. t. 229. Sweet, fl. gard. t. 231.

Var. δ, Barclayàna; corolla striped with brown and yellow. ♂. H. A hybrid. S. intermèdia, Sweet, fl. gard. n. s. t. 112. S. Barclayàna, Penny, mss.

Sinuated-leaved Salpiglossis. Fl. Aug. Sept. Clt. 1824. Pl. 1 to 2 feet.

Cult. For culture and propagation see *Schizánthus*, below. Showy plants, worth the cultivator's care.

XXII. SCHIZA'NTHUS (from *σχιζω*, *schizo*, to cut; and *ανθος*, *anthos*, a flower; in reference to irregularly cut or divided corolla.) Ruiz. et Pav. fl. per. 1. p. 13. t. 17. Hook. exot. bot. 3044. D. Don, in Sweet, fl. gard. n. s. no. 201.

LIN. SYST. *Diándria*, *Monogýnia*. Calyx 5-parted, nearly equal. Corolla with a narrow, short tube, and a 4-parted, irregular, shapeless limb, which is plicate in æstivation. Stamens 4, the 2 upper ones sterile; filaments altogether adnate; anthers inserted by the base, 2-celled; cells confluent at apex. Ovarium 2-celled, seated on a fleshy disk; stigma compressed, obtuse: lobes connate. Capsule 2-celled, many-seeded; valves bifid. Dissepiment parallel. Placentas 2, spongy. Seeds cochleate, tubercled. Albumen fleshy. Embryo arched, with a cylindrical, obtuse radicle, which is twice as long as the cotyledons.—Annual glandular herbs, natives of Chili. Leaves bipinnatifid. Flowers somewhat racemose, variegated. A peculiar acid secretion is given out by the glandular hairs, first pointed out by Miss Murray, a young lady of eminent botanical taste and knowledge.

1 S. PINNA'TUS (Ruiz. et Pav. fl. per. 1. p. 13. t. 17.) fructiferous peduncles inflexed at top, secund; lateral segments of the lower lip of the corolla longer than the intermediate one, which is obcordate: upper segment of the corolla cuneate, emarginate. ⊙. H. Native of Chili. Hook. exot. fl. 73. Ker. bot. reg. 725. Hook. bot. mag. t. 2404. Corolla rose-coloured, almost approaching to white towards the centre; the 2 lateral segments cut into blunt, spatulate, sometimes emarginate lobes; the lower lip deep, reddish-purple; the lower part of the upper segment yellow and spotted.

Var. β, hùmilis (Lindl. bot. reg. 1562. D. Don, in Sweet, fl. gard. t. 197.) stature more humble; leaves lyrate: segments roundish, crenated, or entire; racemes crowded. ⊙. H. Corollas as in the species.

Pinnate-leaved Schizanthus. Fl. June, Oct. Clt. 1822. Pl. 2 feet.

2 S. PÓRRIGENS (Graham, in Hook. exot. fl. t. 86.) fructiferous pedicels spreading, straightish; tube of corolla shorter than the calyx; lateral segments of the lower lip longer than the middle one: upper segment oblong, obtuse. ⊙. H. Native of Chili. Hook. bot. mag. 2521. Lateral segments of corolla doubly lobed; lobes bifid, obtuse, but not deep. Lower lip of flower violet or purple; the rest of the corolla pale red, except the centre of the upper segment, which is yellow.

Spreading-peduncled Schizanthus. Fl. June, Oct. Clt. 1822. Pl. 2 feet.

3. S. RETU'SUS (Hook. bot. mag. 3045. Lindl. bot. reg. 1544. D. Don, in Sweet, fl. gard. n. s. t. 201.) fructiferous peduncles erect; tube of corolla longer than the calyx; lateral segments of the lower lip shorter than the middle one, which is sagittate; upper segment rhomboid-oblong, retuse. ⊙. H. Native of the Andes of Chili, Dr. Gillies. Plant lively green. Leaves like those of the other species, deeply and interruptedly pinnatifid, almost pinnate, similar to those of *Tansy;* the segments lanceolate, rather blunt; and the primary ones deeply pinnatifid. Corolla pale violet; the lateral segments of an uniform lake colour, doubly 2-lobed; the lobes blunt, unequal, and divaricate; lower lip of a deep reddish purple, tripartite; the lateral segments linear, obtuse: the upper segment of the corolla yellow, marked with dark brown spots, veiny beneath, the edges revolute, with a cucullate base; the ends lilac.

Retuse-flowered Schizanthus. Fl. June, Oct. Clt. 1831. Pl. 2 feet.

4 S. HOOKE'RI (Gillies, mss. Graham, in edinb. phil. journ. 1830. Hook. in bot. mag. 3070.) pedicels erect; tube of corolla much longer than the calyx, and about equal in length to the limb; middle segment of the lower lip bicornute, much longer than the lateral ones, which are linear; upper segment, or upper lip long-acuminated. ⊙. H. Native of Chili. The whole corolla is of a pale rose-colour, except the middle of the upper segment, which is yellow. Leaves interruptedly bipinnatifid, like those of the other species.

Hooker's Schizanthus. Fl. June, Oct. Clt. 1828. Pl. 2 feet.

5 S. GRAHA'MII (Hook. in bot. mag. 3044.) fructiferous peduncles erect; tube of corolla equal in length to the calyx; lateral segments of the lower lip equal in length to the middle one, which is bifid: upper lip or segment ovate, acuminated. ⊙. H. Native of Chili, Dr. Gillies. Lateral segments of the corolla doubly bifid, obtuse, like those of other species, of a lilac colour, as well as the lower lip: upper lip or segment yellow, tipped with lilac. Leaves like those of the other species.

Graham's Schizanthus. Fl. June, Oct. Clt. 1831. Pl. 2 feet.

Cult. Schizánthus is a genus of the most elegant, most handsome, and showy annual plants. They succeed well if the seed be sown in the open border early in spring; or the plants may be reared in autumn, and preserved in a greenhouse or frame during winter if they are wanted to blossom early in summer; they may also be reared on a hot-bed in early spring, and the sets in part planted out in the open border, and the remainder grown singly in pots, and placed in the greenhouse. A light fresh earth, not too rich, will be found to suit the species best; and if they are to be kept in the greenhouse, a free admission of air and light is absolutely necessary to preserve them in health and vigour, and to give the flowers their proper tints of colour.

XXIII. SCOPO'LIA (named in honour of John Anthony Scopoli, a celebrated professor, and author of Methodus Plantarum, in 8vo. Vienna, 1754, Flora Carniolica, 1 vol. 8vo. Vienna, 1760, and a second edition in 1772, and several other botanical works.) Jacq. obs. 1. p. 32. t. 20.—Scopolìna Schultes, œstr. fl. ed. 2d. vol. 1. p. 335.—Hyocỳamus Scopòlia, Lin.

LIN. SYST. *Pentándria, Monogýnia.* Calyx campanulate, 5-cleft, mutic. Corolla campanulate, 5-cleft, 3 times longer than the calyx; segments obtuse, rather deep. Stamens approximate, bent towards the lower side of the corolla. Capsule circumcised, or opening transversely. Seeds reniform, scabrous. —An erect, glabrous plant, with many stems rising from the same root, which are bifid at top. Leaves petiolate, wrinkled a little, alternate, solitary, or twin. Flowers axillary, solitary, pedunculate, drooping, rising from the twin leaves. Corollas campanulate, dingy, or dusky purple.

1 S. CARNIÓLICA (Jacq. obs. 1. p. 32. t. 20.) ♃. H. Native of Carniola, Hungary, Bavaria, &c. in woods. Hyocỳamus Scopòlia, Lin. spec. St. Hil. 20. t. 6. Sims, bot. mag. t. 1126. Scopolìna atropoides, Schultes, œstr. fl. ed. 2d. no. 844. Rœm. et Schultes, syst. 4. p. 312. Leaves ovate-oblong, entire: cauline ones alternate, solitary; but those under the fork of the stem are 3 in a whorl, or 3 together: on the branches they are twin, having a solitary, pedunculate, drooping flower rising from between each of the pairs of leaves.

Carniolian Scopolia. Fl. April, May. Clt. 1780. Pl. 1 foot.

Cult. A light dry soil, and a shady situation suit this plant best. It is very desirable, as it flowers early in spring when very few hardy herbaceous border flowers are in blossom. It is easily increased by divisions of the root.

XXIV. PHYSOCHLA'INA (from φυσα, *physa*, a bladder; and χλαινα, *chlaina*, an outer garment; in reference to the inflated calyx.) Hyocỳamus species of authors.

LIN. SYST. *Pentándria, Monogýnia.* Calyx sub-inflated, 5-toothed; teeth ovate, obtuse. Corolla campanulately funnel-shaped, widening gradually to the mouth, slightly 5-lobed; lobes short, obtuse. Stamens 5, exserted; filaments fixed to the bottom of the corolla, hairy at the base. Stigma dilated. Anthers dehiscing lengthwise at the sides. Capsule similar to that of *Hyocỳamus.*—Herbaceous perennial plants. Stems simple, many from the same root. Leaves alternate, solitary, entire. Flowers fascicled, capitately corymbose, terminal. Corollas dark purple.

1 P. PHYSALOI'DES; leaves petiolate, ovate, acute, somewhat repand, or quite entire; flowers pedicellate, terminal, capitately corymbose; genitals a little shorter than the corolla; fructiferous calyx inflated, angular, glabrous, mutic, much larger than the capsule. ♃. H. Native of several parts of Siberia, as among rocks on the mountains at the river Tscharysch and Irtysch; and also on Mount Arkat, in the Kirghisean steppe. Hyocỳamus physaloìdes, Lin. amœn. acad. 7. t. 6. f. 1. Curt. bot. mag. t. 852. Sweet, fl. gard. t. 13. A'tropa physaloìdes, Georgi, beschr. russ. Reichs. nachtr. p. 261.—Gmel. fl. sib. 4. p. 93. no. 49. Root creeping a little. The whole plant glabrous. Stems simple or branched, scaly at the base. Leaves dark green, smoothish, ovate, truncate at the base, quite entire or repand. Corolla purplish-violet.

Physalis-like Physoclaina. Fl. March, April. Clt. 1777. Pl. 1 to $1\frac{1}{2}$ foot.

2 P. ORIENTA'LIS; leaves petiolate, deltoid-ovate, repand, or entire, acute, downy; flowers pedicellate, fasciculately and capitately corymbose; genitals a little exserted; fructiferous calyx tumid, downy, mutic, much larger than the capsule. ♃. H. Native of Iberia, in hidden places about Narzana. Hyocỳamus orientàlis, Bieb. fl. cauc. 1. p. 164. Sweet, fl. gard. t. 12. Sims, bot. mag. 2414. Hyocỳamus orientàlis betæ folio tuberosâ radice, Tourn. cor. p. 5. Stem villous. Corolla pale purplish-blue. This is very like *P. physaloìdes;* but differs in the higher stature, and more robust habit; in the herb being pale green, and more downy; the calyx being longer; and in the tube of the corolla widening gradually to the top; in the genitals being usually exserted; and in the calyx being less inflated, and hardly twice as long as the capsule.

Oriental Physoclaina. Fl. March, May. Clt. 1821. Pl. 1 to $1\frac{1}{2}$ foot.

Cult. The species of *Physochlàina* are extremely desirable plants; being early flowerers, and elegant when in blossom. They will grow in any soil, and are readily propagated by divi-

sions of the root, or by seed. They are well adapted for decorating borders in early spring.

XXV. HYOCY'AMUS (from ὑς ὑος, *hys hyos*, a hog; and κυαμος, *kyamos*, a bean, hog-bean; these animals, according to Ælian, being poisoned with it, unless drenched with water without and within.) Tourn. inst. p. 118. t. 42. Brunf. 224. Rivin. mon. t. 102. Lin. gen. no. 247. Schreb. gen. no. 333. Juss. gen. p. 124. ed. Usteri, p. 139. Gærtn. fruct. 1. p. 369. t. 76. Lam. ill. t. 117. f. 1. Nees, in Lin. trans. 17. p. 77.

LIN. SYST. *Pentándria, Monogýnia.* Calyx tubular, 5-cleft, permanent, ventricose at the base. Corolla campanulately funnel-shaped; limb rather oblique, 5-cleft; segments obtuse, one of which is much larger than the rest. Stamens inclinate. Stigma capitate. Capsule immersed in the calyx, 2-celled, many-seeded, operculate. Placenta fixed to the dissepiment. Seeds excavated and angular.—Coarse, clammy, downy, fetid, canescent herbs. Leaves decurrent, stem-clasping, sinuated. Flowers axillary, sessile, racemose, alternate, unilateral, disposed in 2 rows, dirty yellow, veined with purple, or yellow with a dark bottom.

1 H. NI'GER (Lin. spec. 257. hort. cliff. 56. fl. suec. no. 199.) clothed with clammy villi; stem branched; leaves sessile, semi-decurrent, stem-clasping, sinuated; flowers almost sessile; corolla reticulated; teeth of calyx mucronate. ♂. H. Native throughout Europe and Caucasus; and of the North of India, among rubbish; but always near the habitation of man; in many parts of Britain, among rubbish, and on dunghills. Oed. fl. dan. t. 1452. Smith, engl. bot. t. 591. Pursh, fl. amer. sept. 1. p. 141. Woodv. med. bot. 143. t. 52.—Blackw. herb. t. 550.—Plenck, icon. 97. H. flàvus, Fuschs. hist. 833. Stem branched. Radical leaves pinnatifidly sinuated. Corollas pale yellowish-brown, beautifully reticulated with purple veins; and with a deep purple bottom. Linnæus says it is not touched by any quadruped, except perhaps the goat. The English name of the genus is probably derived from its being noxious to poultry. In Germany the plant is called *Bilsenkraut;* in Dutch *Bulsenkruid;* in Danish *Bulsme* and *Honsebane;* in Swedish *Bolwort* and *Honsabale;* in French *La Jusquame;* in Italian *Guisquiamo, Favaporcina;* in Spanish *Belena* and *Velena;* in Portuguese *Miemendro, Velenho, Yosciamo;* in Russian *Belena.*

The leaves of henbane have a strong and peculiar smell when bruised, something like tobacco, especially when burnt; and on burning they sparkle as if they contained a nitrate. From the writings of Dioscorides and others, it appears to have been long used in the practice of medicine. By Celsus it was applied externally as a collyrium in ophthalmia; for allaying the pain of toothache; and he gave it internally as an anodyne. Its virtues depend upon an alkaloid principle discovered by M. Brandes, which is called hyocyamia. The use of henbane was for a long period entirely relinquished, until revived by Dr. Stoerk, of Vienna, in those cases where an anodyne is requisite; and where there are objections to the use of opium, it is now much employed. In a moderate dose it often produces sweat, and sometimes an eruption of pustules, generally sound sleep, succeeded by serenity of mind, and recruited vigour of the body; but, like other narcotics, instead of these, it sometimes gives rise to vertigo, headache, and general uneasiness. With some individuals it occasions vomiting, cholic pains, &c. In excessive doses its effects are fatal; general debility, delirium, remarkable dilatation of the pupils of the eyes, convulsions, and death. Upon the whole, like opium, it is a powerful anodyne; and, like cicuta, it is free from any constipating effects, having rather a contrary tendency. It is employed in wandering rheumatic pains, in indurations of the mammæ, painful swellings—whether schirrous or not, scrofulous and cancerous ulcers, &c.: under the form of a cataplasm of the bruised leaves, with bread and milk; of an ointment made of powder of the leaves, with wax and oil; of a simple powder sprinkled on the sore, or of a decoction with milk as an injection. An infusion, prepared by digesting the bruised leaves in olive oil, is also usefully applied in inflammations of the bowels, kidneys, urethra, &c. An extract from the leaves, or from the seeds, is the form in which it is given internally; and it has been used with advantage in a variety of nervous affections, as mania, melancholia, epilepsy, hysteria, &c.; in glandular swellings; in obstinate ulcerations; to allay inordinate action, or to mitigate pain. Its dose may be gradually increased from half a grain: Cullen pushed it to the length of 30 grains to a dose.

The extract of henbane has lately been much used by oculists, for dilating the pupils of the eyes; in order to facilitate the extraction or breaking down of the cataract; to diminish sensibility; to destroy adhesions; to reduce protrusions of the iris, and to dilate contraction of the pupil. The mode of application is by dropping a few drops of solution of the extract into the eye, or applying them with a camel's-hair pencil. The greatest effect is produced in about 4 hours, and it is generally over in 12 hours; and vision is not impaired during its action.

Black or Common Henbane. Fl. June, July. Britain. Pl. 2 to 4 feet.

2 H. AGRE'STIS (Kit. ex Schultes, œstr. fl. ed. 2d. p. 383.) stem simple, downy; leaves smoothish, sessile, semi-decurrent, sinuately toothed; flowers sessile; corolla reticulated. ⊙. H. Native of Bohemia, Austria, Hungary; as well as of the North of India, in corn-fields. Mart. et Koch. fl. germ. 2. p. 225. Sweet, fl. gard. 1. t. 27. H. nìger, Roxb. fl. ind. 2. p. 237. H. nìger, β, agréstis, Nees, in Lin. trans. 17. p. 77. H. nìger, β, ánnuus, Sims, bot. mag. 2394. H. Bohèmicum, Schmidt, fl. bohem. no. 230.? Flowers rather smaller than those of *H. niger*, and darker in colour.

Field Henbane. Fl. April, May. Clt. 1820. Pl. 1 foot.

3 H. PA'LLIDUS (Waldst. et Kit. ex Willd. enum. 1. p. 228.) leaves stem-clasping, angular; radical ones angularly toothed; flowers sessile; corolla one colour. ⊙. H. Native of Hungary. Very like *H. nìger;* but differs from it in the root being annual, and in the flowers being yellow, without any purple veins.

Pale-flowered Henbane. Fl. April, May. Clt. 1815. Pl. 1 to 2 feet.

4 H. A'LBUS (Lin. spec. 257. hort. cliff. 56.) leaves petiolate: lower ones orbicular, entire; the rest from cordate to ovate at the base, sinuated; flowers sessile. ⊙. H. Native from the South of Europe to Tauria, among rubbish, on walls, and on road sides near the sea. Lam. ill. t. 117. f. 2. Mill. fig. t. 149. Sibth. et Smith, fl. græc. t. 230. St. Hil. pl. fr. 45. t. 5.—Bull. herb. t. 99.—Sabb. hort. 1. t. 191.—Blackw. t. 111.—Besl. eyst. 8. t. 8. f. 2. Plant clothed with white hairs. Calycine segments ovate: lower ones the smallest. Corolla yellow, or greenish-yellow, with a white or greenish bottom. The corolla varies, with the base dark purple or green; hence Miller has made two species, *H. májor* and *H. álbus*. The first of these having the flowers on short pedicels, of a pale yellow colour, with very dark purple bottoms; and growing naturally on islands of the Archipelago. This is the H. major, albo similis, umbilico floris atropurpureo, Tourn. cor. p. 5; the plant figured in Flora Græca. The second has the flowers in larger bunches, sessile on the ends of the branches, of a greenish-yellow colour, with green bottoms. This is a native

of the South of Europe; and is the H. major albo similis, umbilico floris virente, Jussieu, and is the plant figured by Miller. There is also the var. mìnor. Clus. hist. 2. p. 84. f. 1.

White Henbane. Fl. July, Aug. Clt. 1570. Pl. 1 to 2 feet.

5 H. va'rians (Vis. in bot. zeit. 1829. p. 7.) plant woolly, viscid; leaves petiolate, sinuately lobed, obtuse: lower ones subcordate: floral ones ovate, attenuated at the base, almost entire; flowers racemose, secund, almost sessile: lower ones on long pedicels; tube of corolla incurved, dark purple inside, at length becoming green; limb irregular; the 3 superior lobes large and flat. ⊙. H. Native of Dalmatia, on walls, and in waste places.—An intermediate plant between *H. álbus* and *H. aúreus*. Anthers lilac, at length white.

Varying Henbane. Pl. 1 to 2 feet.

6 H. au'reus (Lin. spec. 257. syst. 220. hort. cliff. 56.) leaves petiolate, cordate-ovate, acute, angularly toothed; flowers pedicellate; the 3 larger segments of the corolla undulated. ♃. F. Native of the Levant, Candia, and the South of France. Curt. bot. mag. 87. Sibth. et Smith, fl. græc. t. 231.—Bull. herb. t. 20. H. Creticus luteus major et minor, Tourn. inst. p. 118. H. Créticus, Park. theatr. 362. f. 8.—Mor. hist. sect. 5. t. 11. f. 4.—Alp. exot. 99. t. 98. The whole plant is clothed with clammy hairs. Leaves undulated. Teeth of calyx short, roundish-ovate, mucronate. Corolla yellow, with a deep violaceous bottom; limb cleft at the side. Stamens and anthers violaceous. Capsules drooping.

FIG. 41.

Golden-flowered Henbane. Fl. March, Oct. Clt. 1640. Pl. 1 foot.

7 H. senecìonis (Willd. enum. 1. p. 228.) leaves petiolate, somewhat 3-lobed, deeply toothed; flowers pedicellate; segments of the limb of the corolla equal, flat. ♃. F. Native of Egypt. The whole plant is clothed with clammy hairs. Calycine segments ovate, acute. Corolla yellow, purplish in the bottom, as well as the base of the stamens; limb not cleft at the side. Anthers white.

Groundsel-like Henbane. Fl. March, Oct. Clt. 1812. Pl. 1 foot.

8 H. mu'ticus (Lin. mant. p. 45. syst. 220.) leaves petiolate, ovate, acute-angled; flowers pedicellate; calyxes mutic; bracteas undivided. ♂. H. Native of Egypt and Arabia; and the Levant. H. álbus Ægýpticus, Alp. exot. 193. t. 192.? H. mìnor, Mill. dict. no. 4. H. betæfòlius, Lam. dict. 3. p. 329. H. mìnor, albo similis, umbilico floris atropurpureo, Tourn. cor. p. 5. Plant downy. Corolla yellow outside, dark purple inside; the 2 lower segments white, smaller, at length the whole becomes white; limb cleft. Stamens purple.

Mutic-calyxed Henbane. Fl. March, April. Clt. 1822. Pl. 1 foot.

9 H. Datòræ (Forsk. ægypt. arab. p. 45.) leaves petiolate, ovate-lanceolate, a little toothed; flowers nearly sessile; floral leaves or bracteas entire. ♄. F. Native of Egypt, in deserts about Cairo. Plant villous. Calyx 5-toothed. Flowers disposed in long secund spikes, 3 at the top of each stem. Corolla villous outside, and yellowish, violaceous inside, white between the lower segments. Stamens villous at the base. The corolla in the plant cultivated is yellow, with a dark purple bottom, very like those of *H. aùreus*. It is perhaps the Nepénthes of Homer.

Datora Henbane. Fl. May, July. Clt. 1829. Shrub 1½ foot.

10 H. Canarie'nsis (Ker. bot. reg. t. 180.) shrubby, pilose; lower leaves petiolate, cordate-ovate, angular, obtuse: floral ones ovate or elliptic, entire; flowers pedicellate. ♄. G. Native of the Canaries. Corolla yellow, with a dark purple, or almost black eye or throat.

Canary Island Henbane. Fl. Year. Clt. 1816. Shrub 1½ foot.

11 H. pusi'llus (Lin. syst. 220. mant. p. 339.) leaves petiolate, oblong-lanceolate, a little toothed; flowers pedicellate; teeth of calyx mucronulately and spinosely-cuspidate. ⊙. H. Native of Persia. Lin. hort. cliff. 56. ups. p. 44.—Plukn. phyt. t. 37. f. 5. Plant pilose. Leaves tapering into the petioles: floral ones entire. Calyx nearly as long as the corolla. Corolla small, yellow, with a violaceous bottom; the lower side divided beyond the limb, ex Lin.

Least Henbane. Fl. July. Clt. 1691. Pl. ½ to 1 foot.

12 H. micra'nthus (Ledeb. mss.) leaves petiolate, oblong: radical ones pinnatifid: cauline ones toothed, or entire; flowers nearly sessile; teeth of calyx mucronate. ⊙. H. Native of Altaia, on the dry and rocky mountains of Arkaul, and Dolenkara, Tschingis-tau; and on the mountains of Kalmy-Tologoi, in the Kirghisean Steppe, Falck. H. pusíllus, Led. fl. alt. 1. p. 228, but not of Lin. Stem simple, or branched, sparingly pilose. Leaves nearly glabrous. Calyx attenuated towards the base; teeth elongated, lanceolate, mucronate. Corolla small, hardly longer than the calyx, yellow, with a deep violet bottom; the lower side cleft even to the middle of the tube. Capsule shorter than the calyx.

Small-flowered Henbane. Fl. June, July. Clt. 1829. Pl. ½ foot.

13 H. auricula'tus (Tenore, fl. nap. prod. p. 16. syn. p. 38.) stem erect, simple; leaves ovate, petiolate, sinuated, acute; petioles winged, auricled at the base; flowers sessile; corollas yellow, reticulated with purple veins at bottom. ⊙. H. Native of Naples, in the fields of Abellino.

Auricled-petioled Henbane. Fl. June, July. Clt. 1823. Pl. 1 foot.

Cult. The species of Henbane are plants of the most easy culture. The seeds of the annual and biennial kinds only require to be sown in the open ground. The half shrubby, or herbaceous kinds are well fitted for decorating rockwork during summer; but in winter they need protection by being covered with haulm of other plants, or by being preserved in pots in the green-house; and they are readily increased by cuttings and seeds.

Tribe III. DATU'REÆ (the plants contained in this tribe agree with the genus Datùra in the characters given below.) Limb of corolla plicate in æstivation, repandly 5-10-toothed. Capsule coriaceous, succulent, 2-celled, 4-valved; placentas septiform, free. Seeds reniform. Stamens 5, inclosed.

XXVI. DATU'RA (said to be a corruption of the Arabic name of one of the species *tatorah.*) Lin. gen. 246. Schreb. gen. 332. Juss. gen. 125. ed. Usteri. p. 139. H. B. et Kunth, nov. gen. amer. 3. p. 5. Nees, in Lin. trans. 17. p. 73. —Stramònium, Tourn. inst. 43, 44.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubular, angular, 5-toothed, falling off at top, leaving only the orbicular base; limb 5-cleft, irregular. Corolla conically funnel-shaped; limb plicate, repandly 5-10-toothed; teeth drawn out. Stamens

usually inclosed. Stigma 2-lobed. Capsule coriaceous, succulent, 2-celled, 4-valved, many-seeded. Placentas septiform, free. Seeds reniform.—Poisonous annual herbs. Flowers alar, solitary, white, or violaceous.

SECT. I. STRAMÒNIUM (a syncope of *στρυχνον μανικον*, the Greek name for the madapple; given to this plant on account of the fruit being the size of a small apple.) Limb of calyx acutely 5-angled, and acutely 5-lobed, or 5-toothed at apex, tubular. Margin of corolla acutely 5-angled, or 5-toothed. Stamens inclosed; anthers remote. Capsule erect, ovate, 2-celled at apex, but 4-celled beneath the apex, (but in *D. díscolor* 2-celled at the base,) dehiscing regularly. Seeds compressed, black, opaque, wrinkled.—Herbaceous annual plants. Leaves ovate, toothed. Flowers oblique.

§ 1. *Corollas purplish outside, and white inside.*

1 D. DI'SCOLOR (Bernhardi, in Linnæa, 8. p. 138.) leaves sharply and sinuately toothed, clothed with hoary down beneath; capsule 2-celled, muricated with prickles. ⊙. H. Native of the West Indies. Stramònium americanum minus, Alkekengi folio, Tourn. inst. p. 119. Boerh. ind. 1. p. 261. Stramònium Curassavica humilior, hyocyami folio, Herm. par. bat. p. 233, with a figure.

Two-coloured-flowered Thorn-apple. Pl. 2 to 3 feet.

§ 2. *Corollas white.*

2 D. INE'RMIS (Jacq. hort. vind. 3. p. 44. t. 82.) leaves ovate, angularly toothed, glabrous; capsule smooth, unarmed. ⊙. H. Native of Abyssinia. D. læ'vis, Lin. suppl. 146. Willd. spec. 1. p. 1009. Stramònium læ've, Mœnch, meth. p. 456.

Unarmed-capsuled Thorn-apple. Fl. June, Sept. Clt. 1780. Pl. 2 feet.

3 D. FE'ROX (Lin. amœn. 3. p. 403.) leaves ovate, angularly toothed, cuneiform at the base, glaucous; capsule furnished with unequal prickles: the upper prickles large and erect. ⊙. H. Native of Cochinchina and Nipaul. Mill. dict. no. 4. D. Stramònium, *β*, canéscens, Wall. in Roxb. fl. ind. 2. p. 229. Stramònium fèrox, Zan. hist. ed. Mont. p. 212. t. 162. Mor. hist. 3. p. 607. sect. 15. t. 2. f. 4. Bocc. rar. p. 50. Tourn. inst. 119.

Fierce Thorn-apple. Fl. July, Sept. Clt. 1731. Pl. 2 to 3 feet.

4 D. STRAMÒNIUM (Lin. spec. 255.) leaves ovate, angularly-toothed, cuneiform at the base, smoothish, green; capsule furnished with nearly equal sized spines or prickles. ⊙. H. Native of America, but now found almost throughout Europe, and north of Asia and Africa, among rubbish, and on dung hills, having escaped from gardens; always near the habitation of man. Ruiz. et Pav. fl. per. 2. p. 15. Pursh, fl. amer. sept. 1. p. 141. Smith, engl. bot. t. 1288. Curt. fl. lond. fasc. 6. t. 17. Svensk. bot. t. 43. Oed. fl. dan. t. 436. Woodv. med. bot. 338. t. 124. Hayne, arz. 4. t. 7. Blackw. off. t. 313. Bull. herb. t. 13. Plenck, off. t. 96.—Sabb. hort. 1. t. 92. Stramònium vulgàre, Mœnch. meth. p. 456. Stramònium fœ'tidum, Scop. carn. 2. p. 252. Stramònium vulgàtum, Gærtn. fruct. 2. p. 243. t. 132. Stramònium spinòsum, Lam. fl. fr. 2. p. 256. D. loricàta, Sieb. coll. sem. D. pseùdo-stramònium, Sieb. herb. mart. 286. D. Capénsis, Hort. Stramònium fructu spinoso oblongo, flore albo, Tourn. inst. p. 119.—Hall. helv. no. 586. D. Turcàrum, Besl. eyst. 3. 2. fol. 12. f. 1. a. Thlapatl, Hern. mex. 278, with a figure.

The leaves of *Common Thorn-apple*, or *Stramonium* have a disagreeable smell and nauseous taste. Every part of the plant is a strong narcotic poison, producing vertigo, torpor, and death. Dr. Barton mentions the cases of two British soldiers, who ate it by mistake for *Chenopòdium álbum*; one became furious, and ran about like a madman; and the other died with all the symptoms of tetanus. The best antidote to its effects is vinegar. The seeds contain the narcotic principle which pervades the whole plant, but in a more uniform degree than the other parts, and hence are more to be depended upon for internal use. An excellent analysis of the seeds has been published by Mr. Brandes, in Buchner's repertorium for 1821, and in which it is shown that its peculiar properties depend upon a peculiar alkaloid called Daturia.

Dr. Stoerk first tried Stramonium as a remedy in mania and melancholia with considerable success. It has also been employed in convulsive and epileptic affections. Dr. Barton of Philadelphia gives it in powder, beginning with doses of a few grains, and increasing them in some days to the extent of 15 to 20 grains. In a case in which it was exhibited to the extent of 30 grains it dilated the pupil of one eye, and produced paralysis of the eyelids, which was removed by a blister. Hufeland gave it in the form of a tincture prepared of two ounces of the seeds in four ounces of wine, and one of diluted alcohol, in diseases of the mind. The inspissated juice of the leaves has been most commonly used, but its exhibition requires the greatest caution. At first a quarter of a grain is a sufficient dose. An ointment prepared from the leaves has been said to give ease in external inflammations and hæmorrhoids. And the bruised leaves, according to Plenck, soften hard, inflamed tumours.

The smoke of *Stramònium* has been much extolled for the cure of asthma. Its use in this manner has been derived from the East Indies, where, however, other species of *Datùra* are employed. It is the root and lower part of the stem which is used in this way. This is dried quickly, and cut into slips, and used in the manner of tobacco. The smoke excites a sense of heat in the chest, followed by copious expectoration, and sometimes attended with temporary vertigo and drowsiness. In some cases a perfect cure is effected, but more commonly the relief is only temporary. Dr. Marcet, med. chirurg. trans. 7. p. 551, used Stramonium in the form of extract, and the result of his experience is, that the most common effect of it, when administered in appropriate doses from $\frac{1}{8}$ to 1 grain, in cases of chronic disease, attended with acute pain, is to lessen powerfully, and almost immediately, sensibility and pain; and it almost always excites those symptoms which are produced by intoxication.

Stramonium, or Common Thorn-apple. Fl. July, Sept. Britain. Pl. 2 to 3 feet.

5 D. TRAPE'ZIA (Nees, in Lin. trans. 17. p. 74.) leaves ovate, trapezoid, acute, repandly-toothed, and are, as well as the stem, downy; fruit furnished with nearly equal spines or prickles. ⊙. H. Native of the East Indies, on the banks of the Irrawaddy, Gomez. D. Stramònium, Wall. cat. suppl. no. 278.

Trapezoid-leaved Thorn-apple. Pl. 2 to 3 feet.

§ 3. *Corollas violaceous. Stems purplish.*

6 D. TA'TULA (Lin. spec. 256. Mill. dict. no. 2. Sweet, fl. gard. t. 83.) leaves cordate-ovate, angularly toothed, unequal at the base, glabrous; capsule furnished with nearly equal spines or prickles. ⊙. H. Native of America, but has now become naturalized in almost all the places along with *D. Stramònium*, but is less frequent. Pursh, fl. amer. sept. 1. p. 141. Stramònium Tátula, Mœnch, meth. p. 456. Stramònium fructu spinoso oblongo, flore purpureo, Tourn. inst. p. 119.

Tatula, or Purple Thorn-apple. Fl. July, Sept. Clt. 1629. Pl. 2 to 3 feet.

7 D. quercifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 7.) leaves sinuately pinnatifid, hairy on the veins beneath; capsule furnished with unequal prickles: the upper prickles the largest. ⊙. H. Native of Mexico, in temperate places near Zelaya and Molino de Sarabia, at the altitude of 930 hexapods. Branches hairy.

Oak-leaved Thorn-apple. Pl. 1 to 2 feet.

Sect. II. Du'tra (an alteration of the generic name.) Limb of calyx tubularly ventricose, angular, or terete, 5-lobed at apex. Margin of corolla 5-10-toothed. Stamens inclosed, or a little exserted; anthers remote. Capsule nearly globose, more or less drooping, or reflexed, 2-celled at apex, but 4-celled below the apex, dehiscing irregularly. Seeds pale, or brownish opaque, compressed, flat in the disk, convex on the margin, surrounded by 3 wrinkled ribs.—Annual herbs. Flowers oblique, showy.

8 D. a'lba (Nees, in Lin. trans. 17. p. 73.) leaves ovate, acuminated, repandly toothed, unequal at the base, and are, as well as the stem, smoothish; stamens inclosed; fruit prickly. ⊙. H. Native every where in the East Indies; as of Nipaul, Silhet, Tavoy. D. Mètel, Roxb. fl. ind. 2. p. 238. Wall. cat. 2639. Fleming, in asiat. res. 11. p. 165. Hardw. in asiat. res. 6. p. 351. under D. Stramònium. Stramònia I'ndica prima seu Dùtra álba, Rumph, amb. 5. p. 242. t. 87. f. 1. Humalu, Rheed. mal. 2. p. 47. t. 28. Corollas white.

White-flowered Thorn-apple. Pl. 2 to 3 feet.

9 D. fastuòsa (Mill. dict. no. 6. Lin. spec. p. 256.) leaves ovate, acuminated, repandly-toothed, unequal at the base, and are, as well as the stem, downy; fruit tubercled. ⊙. H. Native of the East Indies, and Egypt, and of Caraccas. Roxb. fl. ind. 2. p. 238. Stramònium fastuòsum, Mœnch, meth. p. 456. D. Coutarèna, Alp. exot. p. 181. icone. D. Ægyptìaca, Vesl. pl. ægypt. p. 203. icone.—Lob. icon. 264. Corolla violaceous outside, and white inside; teeth of the limb subulate.

Var. β; corollas double and triple, purple outside, and white inside. ⊙. H. Native of Malabar. Stramònium Malabáricum, fructu glabro, flore duplici et triplici, Tourn. inst. 119.—Sabb. hort. rom. 1. t. 93. Mudela-Nila Hummatu, Rheed. mal. 2. p. 51. t. 30.

Var. γ, *rùbra* (Bernhardi, in Linnæa, 8. p. 142.) corolla violaceous; fruit muricated; leaves dentately sinuated. ⊙. H. Native of the East Indies. Stramònium fructu spinoso rotundo; flore violaceo simplici, Tourn. inst. 118. There is also a double flowered variety of this, the Dùtra rùbra, Rumph. amb. 5. p. 243. t. 87. f. 2. Stramònium seu Datùra Ægyptìaca flore pleno Ponæ, Mor. hist. 3. p. 15. t. 2. f. 9. Stramònium fructu spinoso rotundo, flore violaceo duplici triplicive. Tourn. inst. 119.

Var. δ, *parviflòra* (Nees, in Lin. trans. 17. p. 74.) corolla smaller; calyx more than twice as short as the tube of the corolla. ⊙. H. Native of the East Indies, at Prome, Gomez. Wall. cat. suppl. no. 278.

Proud Thorn-apple. Fl. July, Sept. Clt. 1629. Pl. 2 to 3 feet.

10 D. du'bia (Pers. ench. 1. p. 216.) leaves quite entire, glabrous, as well as the stem; limb of corolla 5-6-toothed; stamens inclosed; capsule smooth, unarmed. ⊙. H. Native of the East Indies. D. fastuòsa, δ, capsulis muticis, Poir. dict. 7. p. 461. D. Tátula, β, Poir. l. c. D. Hammátu, Bernhardi, in Linnæa, 8. p. 141. Stramònium Malabáricum, fructu glabro, flore simplici violaceo, Tourn. inst. 119. Nila Hummatu, Rheed. mal. 2. p. 49. t. 29. Corolla violaceous. Perhaps a variety of *D. fastuòsa*.

Doubtful Thorn-apple. Pl. 2 to 3 feet.

11 D. murica'ta (Bernh. sem. 1818. gart. mag. 4. p. 163, with a figure. Link. enum. 1. p. 177.) leaves ovate, repand, when young toothed, glabrous; fruit muricated with strong short prickles, erectish. ⊙. H. Native country unknown, but probably of America. D. hùmilis, Desr. hort. par. D. hýbrida, Tenore. ? D. læ'vis, Schkuhr, handb. 1. p. 140. under D. fastuòsa. D. fastuòsa, fl. albo, Mœnch. meth. 456. D. Mètel, and D. innóxia, Mill. dict. no. 3 and 5.—Knor. del. 1. t. s. 12.—Besl. hort. eyst. 2. fol. 11. f. 1. a. Corolla long, white. The whole plant green. Leaves unequal at the base. Perhaps the same as *D. álba*, Nees.

Muricated-fruited Thorn-apple. Fl. July, Sept. Clt. 1820. Pl. 2 to 3 feet.

12 D. Me'tel (Lin. spec. p. 256.) leaves cordate, quite entire, or a little toothed, and are, as well as the stem, downy; limb of corolla 10-toothed; calyx terete; capsule furnished with prickles. ⊙. H. Native of the East Indies, in hot regions; Africa, and the Canary Islands. Sims, bot. mag. t. 1440. D. Mètel, and D. fruticòsa, Horn. hort. hafn. 1. p. 212. D. Mètel, et D. innóxia, Mill. dict. nos. 3 and 5, partly. Dùtra nìgra, Rumph. amb. 5. p. 243. Stramònium, fructu spinoso rotundo, flore albo, Tourn. inst. p. 118.—Ludw. ect. t. 158.—Knip. cent. 1. t. 24. D. Stramònium, Thunb. jap. p. 91, ex Lour. Corollas large, white.

Metel, or Hairy Thorn-apple. Fl. June, Sept. Clt. 1596. Pl. 2 feet.

13 D. Guayaquile'nsis (H. B. et Kunth, nov. gen. 3. p. 8.) leaves ovate, very unequal at the base, quite entire, or obsoletely and angularly toothed, downy, as well as the stem and branches; limb of còrolla angularly 10-toothed; stamens a little exserted; capsule muricately spinose. ⊙. H. Native of America, in humid places near Guayaquil. Stem and branches reddish. Calyx tubular, downy; limb cleft on one side. Corolla large, white. Perhaps a variety of *D. Mètel*.

Guayaquil Thorn-apple. Fl. July, Sept. Clt. 1826. Pl. 2 to 3 feet.

Sect. III. Ceratocau'lis (from κερας κερατος, *keras keratos*, a horn; and καυλος, *kaulos*, a stem; shape of stem.) Calyx nearly terete, entire, dehiscing by a lateral fissure at the apex. Limb of corolla 10-toothed. Stamens exserted a little; anthers contiguous. Capsule obovate, unarmed, pendulous. Seeds compressed, subovate, fuscescent, shining, rather scabrous.—An annual herb. Leaves ovate-lanceolate, toothed, hoary beneath. Corollas white, purple outside.

14 D. ceratocau'lon (Ort. dec. p. 11. Jacq. hort. schoenbr. 3. p. 48. t. 309.) ⊙. H. Native of Cuba and Mexico. Hook, bot. mag. t. 3352. D. macrocaúlis, Roth, beitr. p. 159. Stem terete, purplish, dichotomous, horn-formed, pilose at the base. Corolla smaller than that of *Brugmánsia cándida*, with a green tube, white limb, and purplish outside, sweet-scented. Capsule size of a nut, glabrous, smooth.

Horn-stemmed Thorn-apple. Fl. July, Sept. Clt. 1805. Pl. 2 to 3 feet.

Cult. The seed of all the commoner kinds of *Stramònium* only require to be sown in the open ground in April; but the rarer kinds answer better if reared on a hot-bed, and afterwards planted out in the open border about the middle of May, like other tender annuals.

XXVII. BRUGMA'NSIA (named in memory of Sebald Justus Brugmans, author of Dissertatio de plantis inutilibus et benenatis, 1. fasc. in 8vo. Groningen, 1783.) Pers. ench. 1. p.

216. D. Don, in Sweet, fl. gard. n. s. 272. Rœm. et Schultes, syst. 4. p. xxiii. Datùra species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubular, ventricose, 5-angled, permanent, coarctate at top, and 2-3-5-lobed. Corolla funnel-shaped, 5-plicate, 5-lobed; lobes cuspidate. Stamens 5, inclosed, coarctate; anthers conglutinate. Stigma thick, 2-lobed, with revolute margins. Capsule 2-celled, smooth, many-seeded. Seeds opaque, reniform, obsoletely trigonal, flat on the sides, and tubercularly wrinkled, a little ribbed on the convex side; testa corky, very thick.—Trees or shrubs natives of Peru. Flowers extra-axillary, pedunculate, or from the forks of the branches, as in *Datùra*, large, white, or blood red, drooping. Fruit oval, pendulous, golden yellow.

1 B. suave'olens; leaves elliptic-oblong, quite entire, glabrous above, and scarcely downy beneath; points of corolla short; capsule muricated?. ♄. S. Native of Mexico, Chili, and Peru. D. arbòrea, Mill. dict. no. 7, exclusive of the syn. and description. Stramònium arbòreum, Mœnch. meth. suppl. p. 173. Datùra suavèolens, Willd. enum. 1. p. 227. Flowers large, white. Calyx 5-toothed, or 5-lobed.

Sweet-scented Brugmansia. Fl. Aug. Sept. Clt. 1733. Tree 10 to 15 feet.

2 B. ca'ndida (Pers. ench. 1. p. 216.) leaves elliptic-oblong, quite entire, and are, as well as the petioles and branches, clothed with powdery pubescence; points of corolla elongated. ♄. G. Native of New Granada, Peru, and Chili. Datùra arbòrea, Lin. spec. 256. Ruiz. et Pav. fl. per. 2. p. 15. t. 128. Willd. enum. 1. p. 227.—Feuill. per. 2. p. 761. t. 46. Calyx 2-3-lobed?. Corollas white, 7-8 inches long.

White-flowered Brugmansia. Fl. Aug. Sept. Clt. 1813. Shrub 7 to 10 feet.

3 B. bícolor (Pers. ench. 1. p. 216.) leaves sinuately lobed, sub-tomentose, as well as the branches and petioles: points of corolla elongated; calyx 2-3-lobed. ♄. F. Native of New Granada and Peru, from whence it has been introduced to Chili. B. sanguínea, D. Don, in Sweet, fl. gard. n. s. t. 272. Datùra sanguínea, Ruiz. et Pav. fl. per. 2. p. 15. H. B. et Kunth, nov. gen. amer. 3. p. 6. In Peru the plant is called *Floripondio encarnado*, and *Campanillas encarnados*, and in New Granada it is called *Bovochevo*. From the bruised leaves an ointment is prepared, which is said to possess superior healing properties; and from the fruit a highly narcotic liquor is prepared. Corolla 7 inches long, pubescent, with 15 straight, prominent ribs; tube thick and fleshy, with 5 blunt angles, orange yellow, green towards the base; throat inflated and pitted outside; limb of a fine scarlet, or orange red.

Two-coloured-flowered Brugmansia. Fl. June, Oct. Clt. 1833. Shrub 3 to 12 feet.

Cult. All the species of *Brugmánsia* are free flowerers, and are desirable plants for conservatories, on account of their fine foliage, and large, trumpet-shaped, white, orange, or scarlet pendant blossoms. They grow best in a light, rich soil, and should not have much water given to them during winter, as they are liable to damp. They also succeed well in the open ground during summer in a warm, sheltered situation; here they grow luxuriantly, and flower freely, and the blossoms become larger, and of a finer colour, than if grown under glass, but here they are killed by the first frosts of winter if not protected. All the species strike readily from cuttings if placed in a moist heat.

XXVIII. SOLA'NDRA (so named by the younger Linnæus, in honour of Daniel Charles Solander, L.L.D. F.R.S., a Swede, and disciple of Linnæus; companion of Sir Joseph Banks in his voyage round the world, and the laborious collector of the botanical notes made during that celebrated expedition. His descriptions are preserved among the mss. in the British Museum, and attest his learning, diligence, and skill.) Lin. fil. in Swartz. act. holm. 1787. t. 11. prod. 42. fl. ind. occ. 1. p. 387. t. 9. Schreb. gen. no. 1732. Correa de Serra, in ann. mus. 8. p. 389. t. 4. f. 1, but not of Lam. Poir. nor Willd.

Lin. syst. *Pentándria, Monogýnia.* Calyx spathaceous, splitting on one side, 3-5-cleft at apex. Corolla large, clavately funnel-shaped; tube long; throat inflated; lobes fringed, a little acuminated. Berry or capsule globosely conical, 4-celled, many-seeded.—Erect or scandent trees, with broad, alternate leaves, and large, extra-axillary flowers, which are much like those of *Brugmánsia*.

1 S. grandiflòra (Lin. fil. in Swartz. act. holm. 1807. p. 300. t. 11.) leaves alternate, close together, viscid, and pubescent, petiolate, obovate-oblong, acuminated; flowers terminal, drooping, usually solitary, rarely 2-3; anthers a little lunate, 4-cornered, pointed, a little cloven at the base. ♄. ◡. S. Native of Jamaica; climbing and rooting on trees and rocks. Jacq. hort. schœnbr. 1. p. 21. t. 45. Sal. in Lin. trans. 6. p. 100. t. 6. Meen, exot. bot. t. 6. Sims, bot. mag. 1874. Tratt. tab. t. 352. Solándra scándens, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 700. Swártzia grandiflòra, Gmel. syst. p. 360. Datùra sarmentòsa, Lam. ill. 2. p. 9. no. 2295. Branches and stem radicant. Leaves, tender branches, and calyxes clothed with viscid down. Calyx and petioles pale, purplish green: the latter tubular, cornered, unequally cloven at 2-3 of the angles. Corolla 7-8 inches long; tube pale, yellowish green, widening gradually above, 5-cornered; limb white, the undivided part indistinctly 10-cornered, 5 of the corners painted with a dusky purple fillet; the segments are of a purplish colour outside, having the interstices minutely suborbicular at the base, and very finely ciliated. Genitals exserted. Fruit pyramidal, pale, yellowish green, 4-celled almost to the top, then 2-celled. Seeds reniform, sessile. The fruit ripens in August and September, and is of a sweet, sub-acid flavour.

Great-flowered Solandra. Fl. March, April. Clt. 1781. Shrub climbing.

2 S. nítida (Zuccagn. cent. in Rœm. coll. p. 128. no. 40.) leaves quite glabrous, shining, tapering into the petioles, crowded, oblong, acuminated, with revolute edges; flowers terminal, drooping, usually solitary, rarely 2-3-together; lateral anthers bicornute. ♄. S. Native country unknown. Portlándia grandiflòra, Hort. batav. Datùra sarmentòsa, *β*, Lam. ill. 2. p. 9. no. 2295. Petioles violaceous, furnished with a few hairs. Calyx 4-cleft; segments unequal, with scarious brown edges. Corolla half a foot long, yellowish white, with 6-7 nerves, brown inside, green outside; tube 6-7-angled; limb 6-7-cleft, with roundish crenately-undulated segments, violaceous outside, at first erect, but at length revolute. Stigma capitate, green. This species differs from *S. grandiflòra* in the leaves being quite glabrous and shining, in the bicornute anthers, and the calyx and corolla being glabrous outside. Stem arborescent, with chinky bark; branches elongated, flexile, divaricate, with deciduous bark.

Shining-leaved Solandra. Fl.? Clt. 1820. Tree or shrub.

3 S. viridiflòra (Sims, bot. mag. 1948.) leaves elliptic-oblong, attenuated at both ends, acuminated, glabrous; flowers terminal, solitary, pedunculate; calyx 5-cleft; the segments lanceolate, acute, and equal; tube of corolla suddenly swelling out into the throat, and again a little contracted; the segments elongated, and revolute. ♄. S. Native of Brazil, about Rio Janeiro. Leaves deciduous. Branches rugged from the elevated cicatrices occasioned by the falling of the leaves. Corolla green, drooping. Genitals much exserted.

Green-flowered Solandra. Fl. May, July. Clt. 1815. Shrub 2 to 3 feet.

4 S. gutta'ta (D. Don, in bot. reg. t. 155.) leaves broad,

elliptic-oblong, acute, downy beneath; flowers terminal, solitary; segments of corolla crispately crenated, spreading; tube about twice the length of the calyx, which is tubular and 3-lobed. ♄. S. Native of Mexico. Tecomaxochitl, Hern. mex. p. 408, with a figure. Shrub erect, branched. Branches rugged from the elevated cicatrices occasioned by the falling of the leaves. Leaves acute, or short-acuminated, 3-6 inches long, and 2-3 broad. Flowers erect, on short peduncles. Lobes of calyx ovate, acute, the third smaller. Corolla large, funnel-shaped, pale yellow, but marked with purple spots in the throat; lobes of limb very broad, roundish. Stamens hardly drawn out beyond the throat of the corolla. Style exserted. Ovarium 4-celled. Stigma capitate.

Spotted-flowered Solandra. Fl. Clt. Shrub 10 to 12 feet.

† *A species not sufficiently known.*

5 S. oppositifòlia (Hort. ex Loud. hort. brit. p. 71.) leaves opposite. ♄. S. Native of Ceylon. Corolla large, white.

Opposite-leaved Solandra. Fl.? Clt. 1820. Shrub 6 to 10 feet.

Cult. The species of *Solándra* are very handsome when in flower; the foliage very fine, and the blossoms large, much like those of *Brugmánsia*. If allowed plenty of space and moisture they grow rapidly, but produce no blossoms: the best way to avoid this is to plant them in loamy soil, and to encourage them to grow rapidly at first by giving plenty of water, and then withhold water altogether till their leaves drop off from drought, and they will then produce plenty of blossoms. Cuttings taken off from the plant, and planted in mould or tan will strike root without further care. The best way to have plants flower when small is to take the cuttings from flowering shoots.

XXIX. ULLO'A (named after Antonia Ulloa, a Spanish naturalist.) Pers. ench. 1. p. 218. Juanullòa, Ruiz. et Pav. fl. per. 2. p. 47. t. 85.

Lin. syst. *Pentándria, Monogýnia.* Calyx large, inflated, ovate, 5-parted; segments concave, lanceolate, acute, coloured, permanent. Corolla tubular, gibbous under the throat, contracted above; limb small, 5-lobed; segments rounded, spreading. Stamens 5; filaments villous at the base. Stigma oblong, somewhat emarginate at apex. Berry ovate, girded by the large calyx, 2-celled, many-seeded. Seeds oblong, reniform.—A parasitical, frutescent, pendent plant, with oblong, acuminated, alternate, thickish leaves; and dichotomous, hanging racemes of scarlet flowers and fruit.

1 U. parasítica (Pers. ench. 1. p. 218.) ♄. S. Native of Peru, in groves. Juanullòa parasítica, Ruiz. et Pav. fl. per. 2. p. 47. t. 185. Stems simple, woody, pendent. Berry size of a cherry. Said to be nearly allied to *Tanæcium parasíticum.*

Parasitic Ulloa. Fl.? Clt. 1824. Shrub parasitical.

Cult. This plant will grow well in decayed wood, or vegetable mould; and may be increased by cuttings.

Tribe IV. FRANCI'SCEÆ (this tribe contains plants agreeing with *Franciscea* in the characters given below.) Limb of corolla plicate in æstivation, 5-lobed, rather unequal. Stamens 4, didynamous, that is, 2 long and 2 short, inclosed, without any rudiment of a fifth. Ovarium girded by a cupulate disk. Capsule 2-celled, 2-valved; valves bipartible at top. Placentas inserted into the dissepiment. Seeds numerous, angular. Embryo straight, terete.

XXX. BRUNFE'LSIA (so named by Plumier, from Otho or Otto Brunfelsius, of Mentz, first a Carthusian monk, and afterwards a physician. He published the first good figures of plants in 1530, and died in 1534.) Plum. gen. 22. Lin. gen. no. 260. Schreb. gen. 1013. Juss. gen. 127. ed. Uster. p. 142. Lam. ill. t. 548.

Lin. syst. *Didynàmia, Angiospérma.* Calyx campanulate, 5-toothed, short. Corolla large, funnel-shaped; with a long tube, and a flat, 5-lobed, obtuse, nearly equal limb. Stamens 4, didynamous, with the rudiment of a fifth; anthers reniform. Stigma capitate. Capsule (berry, Lin.) larger than a cherry, 1-celled, ex Lin. but probably 2-celled, many-seeded; placenta large, central, fleshy.—Shrubs with alternate, entire leaves, and solitary, axillary, or terminal numerous flowers.—"Pericarp baccate outside, 1-celled, 2-valved, but since it opens by a distinct suture from the top to the base, it is rather a capsule than a berry. Seeds many, compressed, convex on one side, angular on the other, wrinkled from dots. Receptacle fastened to the bottom of the capsule, chaffy; palea coadunate, subulate at the tip, separating the seeds," ex Mart. Mill.

1 B. America'na (Lin. spec. 276.) leaves obovate, elliptic, -acuminated, longer than the petioles; corolla with an erect tube and entire segments. ♄. S. Native of the West Indies, in various islands. Swartz, obs. 90. t. 4. f. 2. Curt. bot. mag. 394. Brunfélsia flore albo, fructu croceo molli, Plum. gen. 12. icon. t. 65. Catesbæa, &c. Browne, jam. 141. Leaves glabrous or downy. Axillary flowers solitary: terminal ones numerous. Corollas at first yellow, then white, very sweet-scented. There are broad and narrow-leaved varieties of this species.

American Brunfelsia. Fl. June, July. Clt. 1735. Shrub 4 to 6 feet.

2 B. undula'ta (Swartz, prod. p. 90. fl. ind. occ. 2. p. 1035.) leaves lanceolate-ovate, tapering at both ends; petioles very short; corolla with a curved tube and undulated segments. ♄. S. Native of Jamaica. Ker. bot. reg. 228. Andr. bot. rep. 167. Corolla at first yellow, then white.

Undulated-flowered Brunfelsia. Fl. June, July. Clt. 1780. Shrub 4 to 6 feet.

3 B. grandiflòra (D. Don, in edinb. phil. journ. 1829. july.) leaves elliptic-oblong, acuminated; flowers corymbose, terminal; tube of corolla hardly longer than the limb. ♄. S. Native of Peru, at Uchiza, Tafalla. Branches twiggy. Leaves pale green, 3-6 inches long, and 1½ to 2 inches broad. Teeth of calyx acute. Limb of corolla 2 inches in diameter. Stamens nearly equal.

Great-flowered Brunfelsia. Shrub.

† *A species hardly known.*

4 B. viola'cea (Lodd. bot. cab. 792.) leaves and petioles deeply stained with purple. ♄. S. Native of the West Indies. Corolla of a livid colour.

Violaceous Brunfelsia. Fl. July, Aug. Clt. 1815. Shrub 2 feet.

Cult. The species are elegant free flowering shrubs, and are worth cultivating for the beauty and fragrance of their blossoms. A light rich soil, or one composed of loam and peat, answers them well; and cuttings of them strike root readily if planted in sand, with a hand-glass placed over them, in heat.

XXXI. FRANCI'SCEA (named by Pohl, after Francis I. emperor of Austria, a great patron of botany.) Pohl, bras. 1. p. 1. Sims, bot. mag. 2828.

Lin. syst. *Didynàmia, Angiospérma.* Calyx permanent, inflated, campanulate, 5-toothed; teeth equal. Corolla salver-shaped; limb 5-parted, nearly equal; lobes rounded, repand, with incumbent anthers; tube inflated at the apex, incurved. Style thickened at top; stigma 2-lobed. Capsule ovate, 2-celled, 2-valved; valves indivisible; dissepiment parallel with the valves, membranous, thin, separating at the base from the

parietes of the capsule at maturity.—Erectish, middle-sized shrubs. Leaves alternate, simple, oblong, entire. Peduncles permanent, somewhat geniculated, axillary and terminal, bracteate. Flowers bracteate, usually crowded, cymosely racemose, rarely solitary, violaceous or lilac, somewhat resupinate. Tube of corolla inflated. Receptacle nearly terete, spongy, scrobiculate, adnate to the dissepiment. This genus is said to be nearly allied to *Browállia;* but differs in the calyx being campanulate and inflated, equally 5-toothed, permanent, &c.

1 F. uniflòra (Pohl, bras. 1. p. 1. t. 1.) branches diffuse, spreading; leaves elliptic, acute; bracteas lanceolate, and are, as well as the calyxes, glabrous; flowers solitary. ♄. S. Native of Brazil, among bushes in the province of Rio Janeiro, in the road to Sumidorio and Governo, &c. F. Hopeàna, Hook. bot. mag. 2828. Lodd. bot. cab. 1332.—Piso, bras. p. 85. with a figure.—Margr. bras. p. 69. with same figure. Leaves pale green below. Branches greenish, hoary. Corolla with a whitish tube, and bluish-violet or purple limb.

One-flowered Franciscea. Fl. June, Aug. Clt. 1826. Shrub 1 to 3 feet.

2 F. latifòlia (Pohl, bras. 1. p. 3. t. 2.) branches very short, spreading; leaves broad-elliptic, acutish; bracteas lanceolate, acuminated, and are, as well as the calyxes, quite glabrous; flowers few, subcymose, terminal. ♄. S. Native of Brazil, at Tejuco, and not far from Rio Janeiro. Leaves canescent, green beneath, 6-7 inches long, and 2 to $2\frac{3}{4}$ broad. Corolla violaceous or purple.

Broad-leaved Franciscea. Shrub 2 to 3 feet.

3 F. acumina'ta (Pohl. bras. 1. p. 4. t. 3.) branches erectly spreading; leaves oblong, acuminated, attenuated a little at the base, glabrous; bracteas lanceolate, acuminated, and are, as well as the calyxes, quite glabrous; flowers few, subcymose, terminal. ♄. S. Native of Brazil, in the province of Rio Janeiro, among bushes at Mandioca. Branches greenish-brown. Leaves ciliated when examined by a lens, yellowish-green beneath. Corolla with a bluish-violet limb. Calyx brownish.

Acuminated-leaved Franciscea. Shrub 1 to 2 feet.

4 F. ramosi'ssima (Pohl, bras. 1. p. 5. t. 4.) branches twiggy; leaves lanceolate, attenuated at the base, rough from elevated dots; bracteoles petiolate, oblong, attenuated at the base, hairy; flowers cymose, axillary and terminal. ♄. S. Native of Brazil, in the province of Minas Geraes, among bushes about Villa Ricca; and on Serra Tingua, in the province of Rio Janeiro. Gerárdia Brasiliénsis, Spreng. syst. 2. p. 806. Cordóquia obovàta Montevidénsis, Spreng. syst. 3. p. 699. Epidermus yellowish-brown. Leaves yellowish-green beneath, hairy on the principal nerves. Calyx dark brown, hairy. Corolla with a bluish-violet limb.

Much-branched Franciscea. Shrub 3 to 4 feet.

5 F. confertiflòra (Pohl, bras. 1. p. 6. t. 5.) branches erectish; leaves nearly sessile, oblong, acute, attenuated at the base, rather pilose, ciliated; bracteas oblong; bracteoles oblong, attenuated at the base, and are, as well as the calyxes, clothed with rusty hairs; flowers cymosely crowded, terminal. ♄. S. Native of Brazil, in the province of Rio Janeiro, in shady places on the road to Villa Fanado, and Villa do Principe. Epidermis generally brownish-yellow, and pilose at top. Leaves yellowish-green above, and brownish-green beneath.

Crowded-flowered Franciscea. Shrub 1 to 2 feet.

6 F. divarica'ta (Pohl, bras. 1. p. 6. t. 6.) branches divaricate; leaves on short petioles, oblong-lanceolate, hairy; calyx inflated, clothed with rusty villi; flowers corymbose, terminal. ♄. S. Native of Brazil, in the province of Minas Geraes, among bushes at Rio St. Francisco, and on the road to Joâo Marco. Epidermis whitish-brown. Leaves yellowish, pilose beneath. Calyx yellowish-brown. Corolla bluish-violet. Seeds ovate, angular.

Divaricate Franciscea. Shrub 1 to 2 feet.

7 F. hydrangeæfórmis (Pohl, bras. 1. p. 7. t. 7.) stem a little branched; leaves oblong, acute, cuneiform at the base, quite glabrous; bracteas lanceolate, pilose, ciliated and scale-formed, aggregate; calyx hairy; cymes of flowers terminal, hemispherical, large. ♄. S. Native of Brazil, in the province of Rio Janeiro, among bushes; in shady places at Olana and Sumidorio, and on the way to Rio Parahybuna. This is the most elegant species of the genus, with the aspect of *Hydrángea hortènsia*. Leaves yellowish-green beneath, subverticillately aggregate, broad, a foot long. Racemes corymbose, terminal. Corolla of a beautiful bluish-violet.

Hydrangea-like Franciscea. Shrub 1 to 3 feet.

8 F. macrophy'lla (Cham. et Schlecht. in Linnæa, 2. p. 601.) leaves oblong, acuminated, cuneiform at the base, rugosely veined, downy beneath; bracteas scale-formed, ciliated, and are, as well as the inflated calyxes, clothed with glandular down; tube of corolla twice as long as the calyx; cymes terminal, compound, many-flowered, rather loose. ♄. S. Native of tropical Brazil. Very like *F. hydrangeæfórmis*. Leaves nearly a foot long, and $3\frac{1}{2}$ broad.

Long-leaved Franciscea. Shrub 2 to 3 feet.

9 F. pauciflòra (Cham. et Schlecht. in Linnæa. 2. p. 600.) leaves obovate-oblong, acuminated, cuneated at the base, on short petioles, glabrous; bracteas leaf-formed; bracteoles scale-formed, and are, as well as the calyxes, inflated, loose, and clothed with glandular down; tube of corolla hardly exceeding the calyx; cymes terminal, few-flowered, simple. ♄. S. Native of the South of Brazil, Sello. Leaves $6\frac{1}{2}$ inches long, ciliated with glandular hairs in the young state.

Few-flowered Franciscea. Shrub 2 to 3 feet.

Cult. The species are much more showy than those of *Brunfélsia;* and are more free flowerers; they are also more hardy, but require almost similar treatment.

XXXII. BROWA'LLIA (named by Linnæus, in honour of John Browallius, bishop of Aboa, who defended the sexual system of Linnæus, against Siegesbeck, in a book entitled "Examen epicriseos, &c." Aboa, 1739, and Leden, 1744. 8vo.) Lin. gen. no. 773. Schreb. gen. no. 1036. Gærtn. fruct. t. 53. Juss. gen. 123. ed. Usteri, p. 138. Lam. ill. 535. D. Don, in edinb. phil. journ. july, 1829.

Lin. syst. *Didynàmia, Angiospérma.* Calyx membranous, tubular, 10-ribbed, 5-toothed, more deeply cleft on both sides: teeth obtuse, keeled. Corolla salver-shaped, resupinate from the contortion of the peduncle; tube 15-nerved, ventricose at top; limb oblique, 5-lobed: lobes obtuse, emarginate, plicate in æstivation; upper segment (but more properly the lower one) larger, and 3-nerved; the others 1-nerved. Stamens 4, didynamous, without any rudiment of a fifth; filament flattened, bearded at top. Anthers of the upper filaments reniform: of the lower ones parallel with the filaments, having the upper cell the smallest, and sometimes abortive. Ovarium surrounded at the base by a large, cup-shaped, fleshy disk. Stigma 2-lobed, 4-tubercled, with 2 excavations on the back for the reception of the upper anthers; lobes glutinose, depressed at top. Capsule oblong, 2-celled, 2-valved, many-seeded; valves bipartible; dissepiment contrary. Placentas 2, fleshy, scrobiculate, inserted into the dissepiment. Seeds angular, scrobiculate from depressed dots. Albumen fleshy, white. Embryo terete, straight, with short rounded cotyledons.—Herbs or shrubs, with alternate leaves, and axillary and terminal blue or white flowers.

1 B. viscòsa (H. B. et Kunth, nov. gen. amer. 2. p. 373.)

leaves roundish-ovate; peduncles axillary, 1-flowered; branches, peduncles, and calyxes, clothed with clammy hairs. ⊙. G. Native of New Granada, near Loxa and Gonzanama, at the altitude of 1060 hexapods. Herb diffuse. Leaves obtuse, hairy, 1 to 1½ inch long. Peduncles crowded at the tops of the branches. Calycine segments lanceolate, acute. Limb of corolla violaceous, with obovate, emarginate segments; the largest segment spotted with white at the base; tube inflated at top, whitish.

Clammy Browallia. Pl. 1 to 2 feet.

2 B. demi'ssa (Lin. spec. 879. hort. cliff. 318. t. 17. H. B. et Kunth, nov. gen. 2. p. 373.) leaves ovate-oblong, acuminated, oblique at the base; peduncles axillary, 1-flowered, and are, sa well as the branches, downy; calyx glabrous. ⊙. G. Native of Panama, and other parts of South America; on Mount Avita, between Caraccas and La Venta Grande, Humb. et Bonpl., where it is called *Botanera*. Sims, bot. mag. 1136.—Sabb. hort. rom. 2. t. 100. Dàlea, phil. trans. no. 452. Leaves rather hairy. Calycine segments lanceolate. Corollas of a bright but pale blue colour, sometimes inclining to a purple or red; and often there are flowers of all three colours on the same plant. The segments are, like the rest, obovate, emarginate: the larger one white at the base.

Low Browallia. Fl. June, Sept. Clt. 1735. Pl. ½ to 1 foot.

3 B. ela'ta (Lin. spec. 880.) leaves oval, acuminated; peduncles axillary, one or many-flowered. ⊙. G. Native of Peru. Curt. bot. mag. t. 34. This species is higher than the first, and has stronger stalks, and sends out a great number of branches. The flowers are of a deep blue, and the calyx is beset with glandular hairs. Linnæus observes that the lower branches are almost the length of the stem, and that the floral leaves are almost smooth.

Tall Browallia. Fl. July, Sept. Clt. 1768. Pl. 1½ foot.

4 B. elonga'ta (H. B. et Kunth, nov. gen. amer. 2. p. 372.) leaves ovate, acuminated, rounded at the base; peduncles 1-flowered, axillary; branchlets, peduncles, and calyxes, clothed with hairy pubescence. ⊙. G. Native of New Granada, between the town of Mariquita and the mine of Santa Ana. B. láctea, Hort. Herb much branched. Branches rather angular, downy. Leaves rather hairy. Teeth of calyx lanceolate, erect. Limb of corolla blue, with obovate, emarginate segments: the larger segment spotted with white at the base. Nearly allied to *B. demissa*.

Elongated Browallia. Fl. July, Sept. Clt.? Pl. 1½ foot.

5 B. grandiflòra (Graham, in bot. mag. 3069. but not of bot. reg.) leaves ovate, acute, attenuated into the petioles at the base; peduncles 1-flowered, axillary, racemose at the tops of the branches; branches and adult calyxes glabrous. ⊙. G. Native of Peru, near Yazo, in the valley of Canta. Leaves acuminated. Stem much branched. Calyx and peduncles beset with glandular villi while young, with unequal, spreading, linear segments. Corolla with a greenish-yellow tube, which is clothed with glandular villi, and a white or very pale lilac limb; segments of the limb obovate and emarginate, like the other species.

Great-flowered Browallia. Fl. June, Dec. Clt. 1829. Pl. 1 to 2 feet.

6 B. corda'ta; leaves cordate-ovate, acuminated; peduncles 1-flowered, racemose at the tops of the branches; branches and adult calyxes glabrous. ⊙. G. Native of Peru, near Yazo, in the valley of Canta. B. grandiflòra, Lindl. bot. reg. t. 1284. but not of Graham. Leaves obscure green. Racemes secund, bractless. Limb of corolla pale blue, with obovate, emarginate segments, which are of a livid yellow colour beneath.

Cordate-leaved Browallia. Fl. July, Nov. Clt. 1829. Pl. 1 to 2 feet.

† *A doubtful species.*

7 B. aliena'ta (Lin. syst. 478.) superior leaves opposite; stamens 2, length of corolla. ⊙. G. Native country unknown. Browállia foliis lanceolatis petiolatis longis, caule ramoso, radice annuâ, Mill. icon. t. 68. Miller has omitted this species in the last edition of his dictionary.

Alienated Browallia. Pl. 1 foot?

Cult. The seeds of all the species should be reared in a hot-bed frame; and when the plants are large enough, they may be set in the greenhouse, where they make a showy appearance during the time the greenhouse plants stand out of doors.

Tribe V. ANTHOCE'RCEÆ (this tribe agrees with the genus *Anthocércis* in the characters given below.) Corolla not plicate, regular. Stamens didynamous, with the rudiment of a fifth. Embryo arched. Pericarp capsular or baccate, 2-celled, 2-valved.

XXXIII. ANTHOCE'RCIS (from ανθος, *anthos*, a flower; and κερκις, *kerkis*, a ray; in reference to the radiated corolla.) Labill. nov. holl. 2. p. 19. t. 158. R. Br. prod. p. 448.

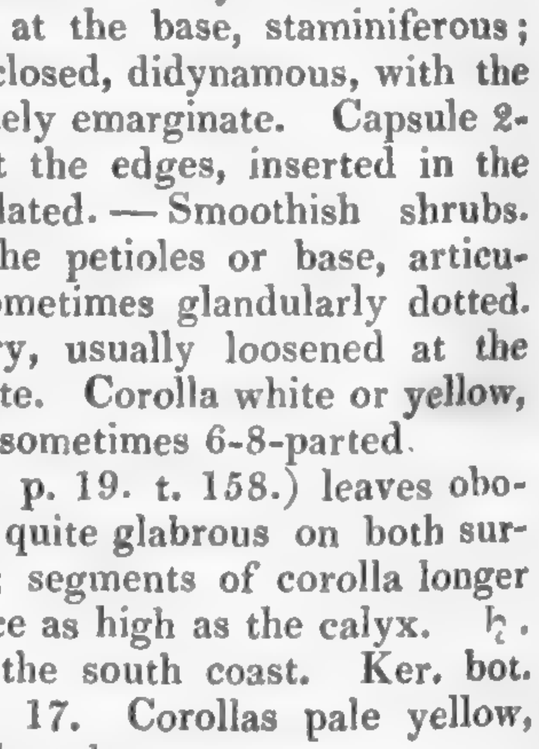
Lin. syst. *Didynàmia, Angiospérma*. Calyx 5-cleft. Corolla campanulate; tube coarctate at the base, staminiferous; limb 5-parted, equal. Stamens inclosed, didynamous, with the rudiment of a fifth. Stigma capitately emarginate. Capsule 2-celled, 2-valved; valves bent in at the edges, inserted in the parallel placenta. Seeds reticulated. — Smoothish shrubs. Leaves alternate, attenuated into the petioles or base, articulated with the branches, thick, sometimes glandularly dotted. Flowers axillary, generally solitary, usually loosened at the points; peduncles minutely bracteate. Corolla white or yellow, showy; tube striated inside; limb sometimes 6-8-parted.

1 littòrea (Labill. nov. holl. 2. p. 19. t. 158.) leaves obovate, dotless, with smooth margins, quite glabrous on both surfaces, as well as on the branchlets; segments of corolla longer than the tube; capsule oblong, twice as high as the calyx. ♄. G. Native of New Holland, on the south coast. Ker. bot. reg. t. 212. Sweet, fl. austral. t. 17. Corollas pale yellow, large, streaked with purple inside the tube.

Sea-shore Anthocercis. Fl. May, Aug. Clt. 1803. Shrub 1 to 2 feet.

2 A. a'lbicans (Cunningh. in Fields' New South Wales, append. 5. p. 335. with a figure. Sweet, fl. austral. t. 16.) leaves oblong, obtuse, densely tomentose on both surfaces, as well as the branches; segments of corolla longer than the tube. ♄. G. Native of New South Wales, frequent upon pine hills in the interior, Cunningham. Flowers fragrant, white, streaked with bluish-purple inside the tube.

FIG. 42.



Whitish-leaved Anthocercis. Fl. April, July. Clt. 1824. Shrub 1½ to 2 feet.

3 A. viscòsa (R. Br. prod. p. 448.) leaves obovate, glandularly dotted, with rather scabrous margins; young leaves and branches clothed with fine down; capsule ovate, equal in length to the calyx. ♄. G. Native of New Holland, on the south coast. Corollas large, white.

§ 1. *Anthocercis.* Fl. May, June. Clt. 1822. Shrub 5 feet.

Cult. This is a genus of elegant early flowering shrubs, worth cultivating in every collection. A light rich soil, or a mixture of sand, loam, and peat, suits them very well. Cuttings strike root readily if planted in sand, with a bell-glass placed over them.

XXXIV. DUBOI'SIA (named after Louis Dubois, author of "Methode eprouvée avec laquelle on peut parvenir facilement a connaître les plantes des environs d'Orleans," 1 vol. 8vo. Orleans, 1803; and of "Du Pommier du Poirier et du Cormier," 2 parts, 12mo. Paris, 1804.) R. Br. prod. 448.

Lin. syst. *Didynàmia, Angiospérma.* Calyx bilabiate, short, campanulately funnel-shaped; limb 5-parted, nearly equal. Stamens inserted into the bottom of the corolla, inclosed, didynamous, with the rudiment of a fifth. Stigma capitately emarginate. Berry 2-celled, many-seeded. Seeds subreniform.—A small glabrous tree, with the habit of *Myóporum.* Leaves alternate, articulated with the branches, entire. Panicles axillary, furnished with deciduous bracteas at the divisions. Flowers white, like those of *Myóporum.* Tube of corolla striated inside. Berry small, oval, black.

1 D. myoporoi'des (R. Br. prod. p. 448.) ♄. G. Native of New South Wales, about Port Jackson.

Myoporum-like Duboisia. Shrub.

Cult. For culture and propagation see *Anthocércis* above.

Tribe VI. NOLANIE'Æ (this tribe contains plants agreeing with *Nolàna* in the characters given below,) Corolla plicate in æstivation, 5-lobed. Stamens 5, adnate to the tube of the corolla. Ovaria 1 to 5, or more, crowded, seated on a fleshy annular disk. Stigma capitate. Drupe solitary, or 5 together, containing each a 2-4-celled, bony putamen. Embryo filiform, gyrate, sometimes peripheric.

XXXV. NOLA'NA (so named by Linnæus, from *nola,* a little bell, on account of the bell-shaped form of the corolla.) Lin. gen. 193. Schreb. gen. no. 254. Gærtn. fruct. 2. p. 242. t. 132. Juss. gen. 132. ed. Usteri, p. 147. D. Don, in Sweet, fl. gard. n. s. t. 305.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft. Corolla campanulate, 5-lobed, 5-plicate. Stamens 5, adnate to the tube of the corolla, nearly equal. Anthers 2-celled, dehiscing lengthwise. Ovaria 5 or more, crowded, seated on a fleshy annular disk. Stigma capitate. Drupes usually 5 at maturity, containing each a 3-4-celled, bony putamen, marked by 3-5 grooves, and 3-5 little holes underneath. Seeds roundish, with a membranous testa. Albumen fleshy, copious. Embryo filiform, gyrate, somewhat perepheric.—Herbs, natives of Peru and Chili, usually annual. Leaves alternate, quite entire. Flowers solitary, pedunculate, showy blue, alar, or axillary.

1 N. atriplicifòlia (Hortul. ex D. Don, in Sweet's fl. gard. n. s. t. 305.) stems procumbent, rather villous; calyx campanulate, with ovate-lanceolate, acute, connivent segments; leaves spatulate: radical ones large. ⊙. H. Native of Peru. N. grandiflòra, Lehm. Flowers large, colour of those of *Convólvulus tricolor;* limb blue; throat white, yellow inside. The radical leaves are large, and greatly resemble those of spinach. It comes nearest to *N. spatulàta,* and *N. coronàta,* Ruiz. et Pav.

Atriplex-leaved Nolana. Fl. June, Sept. Clt. 1834. Pl. procumbent.

2 N. spatula'ta (Ruiz. et Pav. fl. per. 2. p. 7. t. 113. f. a.) stem erect; leaves cordately triangular; calycine segments spatulate. ⊙. H. Native of Peru, on hills. The whole plant is downy. Branches angular towards the top. Leaves petiolate, alternate, twin, fleshy, obliquely obtuse, subsinuated. Calyx pentagonal, hispid. Corollas large, whitish-purple, villous inside the tube. Carpels or drupes 4.

Spatulate-leaved Nolana. Pl. 1 foot.

3 N. corona'ta (Ruiz. et Pav. fl. per. 2. p. 6. t. 112. f. b.) stems prostrate; leaves ovate-cordate, rather oblique; calycine segments subcordate; corolla with a villous throat. ⊙. H. Native of Peru, on hills, in arid sandy places. Root fusiform. Stems terete, much branched, rather villous. Leaves on long petioles, shining, and rather villous on both surfaces. Peduncles generally longer than the leaves. Corolla 3 times larger than the calyx, with a white bottom and blue border. Drupes elongated, filiform.

Crowned-flowered Nolana. Pl. prostrate.

4 N. prostra'ta (Lin. fil. dec. 1. t. 2.) stems prostrate; leaves ovate-oblong; calyx pyramidal, with triangularly sagittate segments, furnished with spur-like processes at the base. ⊙. H. Native of Peru, in sandy places near the sea. Ruiz. et Pav. fl. per. 2. p. 7. Curt. bot. mag. 731. N. prostràta gallinàcea, Pers. ench. 1. p. 168. A'tropa, Gouan, hort. monsp. 82. with a figure. Walkèria, Ehret, phil. trans. 1763. p. 130. t. 10. Zwingèra, Act. helv. 5. p. 267. t. 1. Neudórfia, Adans. p. 219. Tegànium procúmbens, Schmidel, icon. 67. t. 18. Leaves twin, rhomb-ovate, entire. Corolla pale blue. Drupes 2-4-celled.

Prostrate Nolana. Fl. July, Sept. Clt. 1761. Pl. prostrate.

5 N. paradóxa (Lindl. bot. reg. 865. but not of Hook.) stems prostrate, hairy; leaves ovate, obtuse, pilose; segments of calyx triangular; corolla campanulately funnel-shaped; drupes cumulated, 1-seeded. ⊙. H. Native of Chili, on the sea shore, about Conception. Corollas blue.

Paradoxical Nolana. Fl. Aug. Clt. 1825. Pl. prostrate.

6 N. tene'lla (Lindl. hort. trans. 7. p. 252.) clothed with viscid down; stems filiform; petioles ciliated; leaves ovate, obtuse at both ends; calyx campanulate, 2-lobed, 5-angled, one of the lobes emarginate, the other tridentate; ovarium 5-lobed. ⊙. H. Native of Chili. N. paradóxa, Hook. bot. mag. t. 2604. but not of Lindl. Peduncles hairy, filiform. Corolla pale blue, with a paler eye. Stamens villous, inclosed. This species differs from *N. prostràta* in the want of spur-like processes to the calyx.

FIG. 43.

Slender Nolana. Fl. July, Sept. Clt. 1824. Pl. prostrate.

7 N. infla'ta (Ruiz. et Pav. fl. per. 2. p. 7. t. 112. f. a.) stem prostrate; radical leaves on long petioles, ovate-lanceolate; calyx inflated, ovate, striated. ⊙. H. Native of Peru, on sandy hills about Cumana. Stems purple, angular, branched. Leaves downy, sinuated: radical ones entire, rarely toothed, 4-5 inches long, and 3 broad; lower stem leaves solitary, subpetiolate, and rather oblique at the base: upper cauline ones twin, hardly petiolate, ovate, cordate, quite entire. Panicle terminal, leafy; peduncles longer than the leaves. Corolla whitish-violet, 3 times longer than the calyx. Anthers blue. Drupes 4.

Inflated-calyxed Nolana. Pl. prostrate.

8 N. revolu'ta (Ruiz. et Pav. fl. per. 2. p. 8. t. 113. f. b.)

stems procumbent; leaves crowded, linear, with revolute margins; calyx ventricose, ovate, with lanceolate segments. ⊙. H. Native of Peru, in sandy places. Stems white, angular. Leaves sessile, twin, unequal in size, white beneath, obtuse. Peduncles very short. Corolla bluish-violet, thrice as long as the calyx.

Revolute-leaved Nolana. Pl. procumbent.

Cult. All the species of *Nolàna* are showy when in blossom, much like those of some trailing species of *Convólvulus*, and are, therefore, well adapted for decorating flower borders. The seeds should be sown on a gentle hot-bed in spring; and the plants, when of sufficient size, or about the middle of May, should be finally transplanted to the open ground, where they will flower and ripen seed; or the seeds may be sown at once in the open border, in a warm sheltered situation.

XXXVI. TRIGUE'RA (so named by Cavanilles after D. Triqueros, a Spanish botanist, first discoverer of the plant.) Cav. diss. 2. t. A. Schreb. gen. no. 282. Juss. gen. p. 125. ed. Usteri, p. 140. Lam. ill. t. 114.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft to the middle; segments unequal, acute, permanent. Corolla campanulate, irregular; throat dilated into a short, ventricose, subbilabiate, plicate limb, which is longer than the calyx; segments unequal: 2 superior ones sub-reflexed. Stamens 5; filaments very short, joined at the base by a 5-toothed, epipetalous membrane, which surrounds the ovarium. Anthers sagittate, conniving into a cone, dehiscing by 2 pores at the apex, ex Juss. Stigma capitate. Drupe small, globose, half covered by the calyx, furrowed, 4-celled; cells 2-seeded. Seeds ovate, compressed, usually only one in each cell coming to maturity.—Annual herbs, with extra-axillary, 2-flowered peduncles.

1 T. ambrosi'aca (Cav. diss. 2. append. 2. t. A.) stem furrowed, winged: superior leaves obovate, toothed, or serrated, downy, decurrent. ⊙. H. Native of Spain, in Andalusia, in gravelly places about Cordova. Lam. ill. t. 114. T. baccàta, Gmel. syst. p. 338. Verbáscum Osbéckii, Lin. spec. 255. —Buxb. cent. 5. t. 17. f. 52.—Tourn. itin. 2. p. 83. icone. Stem hardly branched. Radical leaves obovate, entire. Peduncles twin, or bifurcate. Corolla like that of *Hyocyàmus*, purplish-violet; segments of the limb roundish, crenated. Drupe dry. Cotyledons of *Datùra*, ex Poir. The plant has a strong scent of musk.

Ambrosiacal Triquera. Pl. 1 foot.

2 T. inodòra (Cav. diss. 2. append. 3.) leaves ovate-lanceolate, quite entire, glabrous, hardly decurrent. ⊙. H. Native of Spain, along with the preceding. The whole plant is glabrous. The flowers are prettier than those of the preceding; the tube of the corolla is shorter; the throat and rays pale violet; the limb cream-coloured; the lobes neither acuminated nor emarginate; the urceolus is larger, and almost wholly hides the ovarium.

Scentless Triquera. Pl. ½ to ¾ foot.

Cult. For culture and propagation see *Nolàna* above.

XXXVII. CRABO'WSKIA (named in honour of H. Crabowski, M.D., one of the editors of Flora Selesiaca.) Schlecht, in Linnæa, 7. p. 72. Lýcium species, Lin. Ehrètia species, Lher.

Lin. syst. *Pentándria, Monogýnia.* Calyx sub-campanulate, regularly 5-toothed, valvular in æstivation. Corolla with a short, funnel-shaped tube, and a 5-parted limb; segments of the limb spreading, or reflexed, 4 of which are convolute in æstivation, the fifth external, with the margins covering the edges of those near it. Genitals exserted. Stamens 5, equal; filaments free from a little above the base of the tube, densely villous in the middle; the villi decreasing toward the base. Style terete; stigma sub-capitate, or bifid. Ovarium Pl. cells 1-ovulate.? Drupe propped by the permanent calyx, bose, containing 2 2-celled, 2-seeded, woody putamens. Embryo hamately curved, cylindrical.—A shrub, with the habit of the genuine species of *Lýcium*, much branched, furnished with axillary spines. Leaves scattered, quite entire. Flowers from fascicles of leaves, or evolute branchlets, or sub-corymbose from the tops of the branchlets, hence they appear as if they were disposed in terminal panicles.

1 C. borhaaviæfòlia (Schlecht, in Linnæa, 7. p. 72.) ♄. G. Native of the South of Brazil, in woods, where it has been collected by Sello, but has been introduced from Peru into the gardens of this country. Lýcium borhaaviæfòlium, Lin. suppl. p. 150. Lam. dict. 3. p. 510. Ehrètia halimifòlia, Lher. stirp. 1. p. 45. t. 83. Duham. arbr. 1. p. 306. no. 5. Lýcium heterophýllum, Murr. comm. gœtt. 1783. p. 6. t. 21. Leaves coriaceous, glaucescent, with a saltish, bitterish taste. Corolla white, having the throat veined with green. Genitals white. Stigma green. Nuts form of those of *Coffèa Arábica*, convex on one side, marked by a slender furrow in the middle, obtuse at top, and perforated by 2 roundish holes at the base; hence it is tridentate, the first tooth from the middle of the back, the other 2 from the sides, sometimes, but only by abortion, 1-celled. Albumen copious, fleshy.

Borhaavia-leaved Crabowskia. Fl. April, May. Clt. 1780. Shrub 6 to 10 feet.

Cult. This singular shrub is of the most easy culture and propagation. A light rich earth suits it best; and cuttings strike root readily under a hand-glass.

Tribe VII. CESTRI'NEÆ (this tribe contains plants agreeing with the genus Céstrum in the characters given below.) Limb of corolla plicate, valvate, or induplicate in æstivation. Calyx 5-toothed. Corolla funnel-shaped, 5-lobed, regular; tube elongated; limb usually spreading. Stamens 5; anthers dehiscing lengthwise. Ovarium seated on a cupulate disk. Pericarp capsular or baccate. Placentas adnate to the dissepiment. Embryo nearly straight, with a cylindrical radicle, and roundish leafy cotyledons.

§ 1. *Pericarp baccate.*

XXXVIII. CE'STRUM (from Κεστρον, *Kestron*, the Greek name of betony, but for what reason applied to this genus is unknown to us.) Lin. gen. no. 261. Schreb. gen. no. 342. Juss. gen. p. 126. ed. Usteri, p. 141. H. B. et Kunth, nov. gen. 3. p. 56. Gærtn. fruct. 1. p. 378. t. 77. Lam. ill. t. 112.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubular, subcampanulate, 5-toothed, almost regular, valvate in æstivation. Corolla with an elongated tube, widening gradually to the top; limb 5-parted, subplicate, spreading, or revolute, regular, conduplicate in æstivation. Genitals inclosed; filaments naked, or furnished with a small tooth, or villi, or down near the base, or where the parts are adnate to the corolla. Anthers nearly globose, dehiscing lengthwise. Ovarium 2-celled, few-ovulate. Stigma subcapitate, concave, or somewhat 2-lobed. Berry girded by the permanent calyx, 2-celled, or only 1-celled from the dissepiment having vanished, ex Gærtn. few-seeded; placentas double, free, central. Seeds 3-sided. Embryo straightish, with a cylindrical radicle, and roundish foliaceous cotyledons.—Unarmed shrubs. Leaves and branches scattered, the former quite entire, and usually furnished with spurious bracteas, or small leaves in their axils. Flowers racemose; racemes bracteate, axillary, elongated, or short, disposed in corymbs, spikes, or fascicles. Corollas never blue, nor red, usually sweet-scented, having the sides of the segments generally tomentose. Berries black, or blackish blue. The leaves exhale a fetid, nauseous smell when bruised.

§ 1. *Filaments toothless and naked, and sometimes villous at their insertion.*

* *Flowers solitary, or aggregate, sessile.*

1 C. buxifòlium (H. B. et Kunth, nov. gen. amer. 3. p. 57.) leaves approximate, elliptic, bluntish, rather cordate, glabrous, shining; axillary flowers solitary: terminal ones crowded, sessile; filaments naked and toothless. ♄. S. Native of New Granada, near the monastery of Mont Serrat, at the altitude of 650 hexapods. Branchlets clothed with fuscescent tomentum. Leaves 7-8 lines long. Corollas white.

Box-leaved Bastard Jasmine. Shrub.

2 C. Mariquite'nse (H. B. et Kunth, l. c.) leaves oblong, acute, membranous, glabrous; axillary flowers solitary: terminal ones crowded, nearly sessile; segments of corolla ovate, acute; filaments naked and toothless. ♄. S. Native of New Granada, near Santa Ana and Mariquita, at the altitude of 550 hexapods. C. Bogoténse, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 807. Branches downy. Leaves 2-8 lines long. Corollas white. Berry ovate-elliptic, size of a pea.

Mariquita Bastard Jasmine. Shrub.

3 C. pendulìnum (Jacq. schœnbr. 3. p. 42. t. 327.) branches smoothish, leaves ovate-oblong, sub-acuminated, rather hairy; flowers crowded at the tops of the branches, almost sessile; segments of corolla oblong, obtuse, with reflexed edges; filaments naked and toothless. ♄. S. Native of New Granada, near Turbaco and Mahates; and of Caraccas. H. B. et Kunth, nov. gen. 3. p. 57. Branches rather downy. Leaves 2 inches long. Corolla greenish white. Berry elliptic, size of those of *Córnus álba*, blue. The branches are said to be pendulous.

Pendulous-branched Bastard Jasmine. Fl. June, July. Clt. 1824. Shrub 4 to 8 feet.

4 C. pauciflòrum (Nees, et Mart. in act. bonn. 11. p. 79.) leaves oblong-lanceolate, acute, downy beneath; flowers axillary, solitary, sessile; filaments naked, toothless. ♄. S. Native of Brazil, at the river Ilheos. Young branches muricated, but glabrous in the adult state. Leaves 3-4 inches long; petioles marginate, rather scabrous. Each flower is furnished with a lateral, subulate bracteole. Segments of calyx and corolla narrow, linear-lanceolate, keeled. Corolla yellowish, 4-5 lines long. Berry 2-celled, 4-seeded. *C. Mariquiténsis* differs from this species in the leaves being smaller and glabrous, in the segments of the corolla being broader, glabrous, and ovate, and it differs from all other species in the axillary, solitary flowers.

Few-flowered Bastard Jasmine. Shrub.

5 C. corymbòsum (Schlecht. in Linnæa, 7. p. 57.) glabrous; leaves elliptic, or obovate-lanceolate, cuneated at the base, rather coriaceous, shining; corymbs terminal, sessile; calycine teeth triangular, bearded at the tip; segments of corolla acute, very short; filaments villous at the adnate part; berries globose. ♄. S. Native of Brazil, Sello. Branchlets clothed with dirty, rusty, curled down. Leaves 2-3 inches long. Berry size of a large pea.

Corymbose-flowered Bastard Jasmine. Shrub.

6 C. vespertìnum (Lin. syst. 227.) glabrous; leaves elliptic; flowers aggregate, sessile, terminal, and axillary; filaments naked, toothless. ♄. S. Native of the West Indies. Jacq. schœnbr. 3. p. 43. t. 328. Lher. stirp. 1. p. 72. Murr. nov. comm. gœtt. 5. p. 41. t. 8. C. confértum, Mill. dict. no. 5. C. Jamaicénse, Lam. dict. 1. p. 687. C. ramosíssimum, Hort. patav. Jasmìnum, Sloane, hist. 2. p. 96. t. 204. f. 2.? Plum. ed. Burm. p. 150. t. 157. f. 1. Ixòra alternifòlia, Jacq. amer. pict. 16. t. 177. f. 8. Branches tomentose. Corolla greenish white, with narrow, acute segments; tube long, filiform. Berry blue. The flowers are disposed in short, crowded spikes.

Evening Bastard Jasmine. Fl. May, July. Clt. 1759. Shrub 10 to 12 feet.

7 C.? ròseum (H. B. et Kunth, l. c. p. 59. t. 197.) leaves oblong, bluntish, clothed with soft down on both surfaces; peduncles axillary and terminal, ? 4-6-flowered; flowers sessile, crowded into involucrated heads; calyx tubular, 5-cleft, downy; segments of the corolla ovate, narrow-acuminated; filaments naked, toothless. ♄. S. Native of Mexico, in frigid places, near Real del Moran and Hacienda de Regla, at the altitude of 1200 hexapods. Young branches clothed with villous down. Leaves 2 to 2½ inches long. Calycine segments lanceolate, acute, unequal, reflexed at top. Corolla glabrous, rose-coloured. Segments of corolla reflexed. Berry unknown.

Rose-coloured-flowered Bastard Jasmine. Shrub 6 feet.

** *Flowers spicate, or racemose. Spikes and racemes axillary and terminal.*

8 C. calyci'num (Willd. rel. ex Rœm. et Schultes, syst. 4. p. 809. H. B. et Kunth, l. c. p. 58.) branches and under sides of leaves clothed with canescent, stellate tomentum; leaves ovate-elliptic, glabrous and shining above, sub-acuminated, stiffish; peduncles axillary and terminal, many-flowered, short, spicate; flowers sessile; calyx elongated, 5-cleft; corollas tomentose; filaments naked, toothless. ♄. S. Native of Peru, near Gonzanama; and of Brazil, Sello. Leaves 2-3 inches long. Calycine segments ovate-lanceolate, acuminated. Corolla pale green. Stamens inserted at the top of the tube, glabrous. Habit of *Séssea*. Very like *C. stipulàtum*, Ruiz. et Pav.

Large-calyxed Bastard Jasmine. Shrub 10 feet.

9 C. petiola're (H. B. et Kunth, l. c.) branches and the nerves on the under sides of the leaves clothed with powdery tomentum; leaves on long petioles, glabrous above, elliptic-oblong, sub-acuminated, costately veined; peduncles axillary and terminal, few-flowered, very short, spicately approximate; flowers sessile; filaments naked, toothless. ? ♄. S. Native of Peru, in shady places between Ayavaca and Yanta, at the altitude of 800 hexapods. C. venòsum, Willd. herb. no. 4438. ex Rœm. et Schultes, syst. 4. p. 807. Séssea petiolàris, Spreng. syst. 1. p. 584. Branches glabrous: floriferous ones clothed with fuscescent tomentum. Leaves 5-7 inches long, and 2-3 broad. Petioles of the upper leaves biauriculate at the base; auricles lunate. Peduncles spicately approximate at the tops of the branches, tomentose. Teeth of calyx short, acute.

Petiolate-leaved Bastard Jasmine. Shrub.

10 C. conglomera'tum (Ruiz. et Pav. fl. per. 2. p. 29. t. 156. f. a. H. B. et Kunth, l. c. p. 60.) leaves oblong-lanceolate, acute, reticulately veined, stiff, glabrous, having the veins beneath prominent; spikes axillary, short, sessile; calycine teeth ovate, acute; filaments naked, toothless. ♄. S. Native on the western declivities of the Andes of Peru, among the debris of rocks. C. reticulàtum, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 808. Branches subtrigonal. Leaves 3-4 inches long. Spikes approximate at the tops of the branches. Corolla greenish yellow, with ovate, acute segments. The plant of Ruiz. et Pav. is probably the same as that of H. B. et Kunth, l. c.

Conglomerate-flowered Bastard Jasmine. Shrub.

11 C. affi'ne (H. B. et Kunth, l. c.) leaves lanceolate, or lanceolate-oblong, acuminated, membranous, glabrous; spikes axillary, short, sessile, approximate; flowers sessile; segments of corolla ovate, acute; filaments naked, glabrous. ♄. S. Native of Peru, on Mount Tinguragua: also near Ayavaca. C. Peruviànum, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 807. Branches trigonal, smooth. Leaves 5 inches long, and 1½ inch broad. Spikes approximate at the tops of the branches. Corolla whitish green, glabrous. Teeth of calyx

ovate, acute, with pilose edges. There is also a variety of this having hexamerous, hexandrous flowers. Very nearly allied to *C. Párqui* and *C. conglomeràtum*.

Allied Bastard Jasmine. Shrub 10 to 12 feet.

12 C. DIU'RNUM (Lin. spec. 277. Lher. stirp. 1. p. 74.) leaves oblong, acute, membranous, glabrous; spikes axillary, on long peduncles; flowers sessile, approximate; segments of corolla ovate, obtuse, reflexed; filaments naked, toothless. ♄. S. Native of Cuba, near the Havannah. Jasminòides, Dill. elth. 186. t. 154. f. 186. Leaves 3 inches long. Flowers sweet-scented, small, white. Teeth of calyx acute, a little ciliated.

Day-smelling Bastard Jasmine. Fl. Nov. Clt. 1732. Shrub 10 to 12 feet.

13 C. ODONTOSPE'RMUM (Jacq. schœnbr. 3. p. 44. t. 331.) glabrous; leaves oblong, acute, rather coriaceous; racemes short, axillary and terminal; flowers nearly sessile; segments of corolla lanceolate, acute, revolute; filaments naked, toothless. ♄. S. Native country unknown. Nearly allied to *C. diúrnum*, but the flowers are only sweet-scented at night, not in the day time. Seeds small, compressed, marked by a short tooth at the side. Leaves 3-4 inches long. Corolla white; tube cylindrical, with the mouth hardly dilated. Berry blackish, size of a small pea.

Tooth-seeded Bastard Jasmine. Fl. July, Aug. Clt. 1793. Shrub 6 feet.

14 C. FASTIGIA'TUM (Jacq. schœnbr. 3. p. 44. t. 330.) leaves ovate-oblong, acute, coriaceous, glabrous, shining above; peduncles elongated, axillary, spiked at top, equal in length to the leaves; corolline segments ovate, obtuse, reflexed, 5 or 6; filaments naked, toothless. ♄. S. Native country unknown. Leaves pale beneath. Spurious stipulas small, obtuse. Flowers white, sessile, sub-fastigiate on the tops of the peduncles, sweet-scented both by day and night. Berry roundish, size of a pea, blackish.

Fastigiate-flowered Bastard Jasmine. Fl. Nov. Clt.? Shrub 4 to 6 feet.

15 C. FŒTIDÍSSIMUM (Jacq. schœnbr. 3. p. 43. t. 329.) glabrous; leaves ovate and lanceolate, acute, petiolate; peduncles axillary and terminal, usually 3-6-flowered, racemose; flowers pedicellate, or sessile; teeth of calyx slender; segments of corolla short, ovate, emarginate; filaments bearded at the base, toothless. ♄. S. Native of the West Indies. Stem rough from dots, much branched. Leaves 2-4 inches long, very fetid. Flowers sweet-scented at night. Corolla yellowish. Berry oblong-cylindrical, black, containing 2 oblong seeds.

Very-fetid Bastard Jasmine. Fl. May, Aug. Clt.? Shrub 10 feet.

16 C. TENUIFLÒRUM (H. B. et Kunth, l. c. p. 61.) leaves ovate, acuminated, membranous, rather tomentose on the veins beneath; spikes axillary, very short, sessile, 8-12-flowered; flowers sessile; corolla with a very slender tube, and lanceolate, acuminated segments, having the edges revolute; filaments naked, toothless. ♄. S. Native of the Orinoco, on the declivities of Mount Duida, near Esmeralda; and of Para, in Brazil. C. floribúndum, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 807. C. ovàtum, Willd. rel. l. c. A much branched, suffruticose shrub. Branches terete, clothed with powdery tomentum. Leaves about 4 inches long. Petioles, branches, and rachis of spikes tomentose. Corollas sweet-scented, white, glabrous. Calyx glabrous, irregularly 4-5-toothed. Filaments pilose at the base.

Slender-flowered Bastard Jasmine. Shrub.

17 C. TINCTÒRIUM (Jacq. schœnbr. 3. p. 45. t. 332.) leaves ovate-lanceolate, glabrous, shining; racemes axillary and terminal; flowers on short pedicels; segments of corolla lanceolate, acute, at length reflexed, but at first spreading; filaments naked, toothless, adhering the whole length of the tube of the corolla. ♄. S. Native about Caraccas. Leaves coriaceous, 3 inches long. Corollas white, sweet-scented. Berry deep violet, roundish.

Dyer's Bastard Jasmine. Fl. April, June. Clt. 1823. Shrub 4 feet.

18 C. LATIFÒLIUM (Lam. ill. 2. p. 5. no. 2275. Vahl, eclog. p. 25.) leaves elliptic, acute, glabrous above, clothed with powdery villi beneath; racemes axillary, very short; filaments toothless. ♄. S. Native of the Island of Trinidad. Petioles and branches clothed with powdery villi, as well as the peduncles, pedicels, and calyxes. Corolla with a filiform tube, and lanceolate, acute segments. Stigma capitate. Vahl says this species differs from *C. hírtum* in the leaves not being cordate at the base, and in the segments of the corolla being acute, not obtuse, and in the stigma being capitate, not bifid.

Broad-leaved Bastard Jasmine. Fl. June, July. Clt. 1818. Shrub 6 to 12 feet.

19 C. LÆVIGA'TUM (Schlecht. in Linnæa, 7. p. 58.) glabrous; leaves elliptic, acuminated, rather papery, and rather opaque, petiolate; racemes subspicate, axillary, much shorter than the leaves, but sometimes these racemes are reduced to axillary fascicles; calyx nearly glabrous, ciliated on the margin, with very short, or no teeth; corolla glabrous, 6 times longer than the calyx; segments of the limb obtuse; filaments inserted in the upper part of the tube, rather pilose in the middle of the tube; berry ovoid. ♄. S. Native of Brazil, near Rio Janeiro and elsewhere. Céstrum racemòsum, Ruiz. et Pav.? Leaves 4-6 inches long. Spurious stipulas sometimes present. Corolla an inch long. Hairs on the filaments retrograde.

Var. α, *evolùtum* (Schlecht. l. c.) leaves larger, on longer petioles; and the racemes axillary, and on longer peduncles than in var. β.

Var. β, *paupérculum* (Schlecht. l. c.) leaves smaller, on shorter petioles; racemes short; flowers sometimes sessile in the axils of the leaves.

Smooth Bastard Jasmine. Shrub.

20 C. AMI'CTUM (Schlecht. in Linnæa, 7. p. 64.) quite glabrous; leaves lanceolate, acute at both ends, shining, petiolate; racemes subspicate, short, bracteate; calyx glabrous, with acute teeth, which are ciliated at top; corolla with a wide, glabrous throat, 6 times longer than the calyx; and the segments of the limb are ovate, acutish, with tomentose sides; filaments inserted in the upper part of the tube, furnished with fascicles of retrograde hairs at their insertion. ♄. S. Native of Brazil, Sello. Spurious stipulas small, reniform. This is distinguished from *C. bracteàtum* in the smoothness of the parts. Corollas greenish yellow, an inch long. Leaves almost 5 inches long.

Decked Bastard Jasmine. Shrub.

21 C. BRACTEA'TUM (Link, et Otto, abbild. 1. p. 11. t. 6. Graham, in bot. mag. t. 2974. Schlecht, in Linnæa, 7. p. 64.) leaves lanceolate, undulated, downy; flowers fascicled, axillary and terminal, pedicellate; false stipulas obliquely cordate, reniform; bracteas spatulate; filaments bearded at the base. ♄. S. Native of Brazil, about Rio Janeiro and elsewhere. Length of racemes variable, but hardly ever exceeding the leaves. Nearly allied to *C. petiolàre*. Branches covered with dense, greenish tomentum. Peduncles an inch long; pedicels short. Corolla salver-shaped, pale yellow; tube an inch long; segments ovate, acute.

Bracteate-flowered Bastard Jasmine. Fl. June, July. Clt. 1818. Shrub 8 to 10 feet.

22 C. SCHLECHTENDA'HLII; glabrous; leaves elliptic, acuminated at both ends, acute at apex, rather coriaceous, opaque, on short petioles; racemes axillary, sub-spicate; calyx gla-

brous, with short, obtuse teeth, which are densely ciliated on the margins; corollas glabrous outside, 6 times longer than the calyx; segments of the limb reflexed, triangular, acute; filaments inserted in the middle of the tube, where they are also villous; tube of corolla marked by a villous ring inside at the base. ♄. S. Native of Brazil, Sello. C. multiflòrum, Schlecht. in Linnæa, 8. p. 59. but not of Rœm. et Schultes. Leaves $3\frac{1}{2}$ to 5 inches long. This species differs from *C. lævigàtum*, in the shorter corolla, in the flowers being more copious, and in the leaves being coriaceous, &c.

Many-flowered Bastard Jasmine. Shrub.

* * * *Racemes compound, or panicled; or the peduncles are racemosely panicled.*

23 C. pa'llidum (Lam. dict. 1. p. 688.) glabrous; leaves ovate, acute; racemes compound, axillary; filaments toothless?; berry obovate. ♄. S. Native of Jamaica. C. venenàtum, Mill. dict. no. 6.—Plukn. alm. 35. t. 64. f. 5.—Sloane, hist. 2. p. 96. t. 204. Flowers small, like those of *C. diúrnum*, pale yellow. Leaves like those of *C. laurifòlium*, and the fruit like that of *C. vespertìnum*. Leaves $1\frac{1}{2}$ inch long, dark green. Racemes dense, shorter than the leaves. Segments of corolla short, bluntish. Berry violaceous, or dark blue, poisonous, ex Sloane.

Pale-flowered Bastard Jasmine. Shrub 7 to 8 feet.

24 C. panicula'tum (H. B. et Kunth, l. c. p. 62. Willd. rel. ex Rœm. et Schultes, syst. 4. p. 807.) twining; leaves twin, ovate-oblong, acute, glabrous; panicles terminal, simple; branches divaricate; flowers pedicellate; tube of corolla very slender; segments linear-lanceolate, acuminated; filaments naked, toothless. ♄. ◡. S. Native in humid places, on the banks of the river Guayre, near Caraccas. Branches triangular, glabrous. Leaves sometimes solitary, 3-4 inches long, and 2 broad. Flowers sweet-scented. Teeth of calyx ovate, acute, ciliated. Corolla greenish white.

Panicled-flowered Bastard Jasmine. Shrub twining.

25 C. sca'ndens (Vahl, eclog. 1. p. 24. Willd. spec. 1. p. 1055.) branches scandent; leaves ovate, attenuated, glabrous; racemes axillary, rather compound; filaments naked, toothless. ♄. ◡. S. Native of St. Martha, Rohr. Branches terete, glabrous. Leaves petiolate, remote, solitary. Spurious stipulas none. Segments of the limb subulate.

Climbing Bastard Jasmine. Shrub climbing.

26 C. racemòsum (Ruiz, et Pav. fl. per. 2. p. 29. t. 154. f. b.) leaves lanceolate-ovate, acute, glabrous; racemes short, compound, solitary, or by threes; the middle one very long; filaments toothless.? ♄. S. Native of Peru, in groves. Trunk glabrous, $1\frac{1}{2}$ foot high; branches elongated. Petioles twisted a little. Calyx small. Berry violaceous, globose, containing 4 oblong brown seeds.

Racemose-flowered Bastard Jasmine. Shrub.

27 C. longiflòrum (Ruiz, et Pav. fl. per. 2. p. 28. t. 154. f. a.) leaves ovate-oblong, acute, shining and glabrous above, but woolly beneath while young; peduncles terminal, paniculately racemose; corolla with a very long, curved tube; filaments toothless.? ♄. S. Native of Peru, in groves. Branches downy. Branches of panicle bearing 4-6 pedicellate flowers. Bracteas solitary, lanceolate. Corolla $1\frac{1}{2}$ inch long, purplish; margins of limb woolly; tube glabrous. Berry rather large, ovate, obscure, purple, containing many small, angular seeds.

Long-flowered Bastard Jasmine. Shrub.

28 C. strigilla'tum (Ruiz. et Pav. fl. per. 2. p. 29. t. 156.) clothed with short strigose tomentum; leaves cordate, acute; peduncles twin, racemosely panicled, the one shorter than the other; filaments naked, toothless. ♄. S. Native of Peru, in groves. Leaves pendulous, glabrous above. Flowers almost sessile, furnished each with 3 small bracteas. Corolla white, with a long, incurved tube, very like *Jasmine*. Berry truncate, ovate, obscure violet.

Strigillate Bastard Jasmine. Shrub 10 to 12 feet.

* * * * *Peduncles corymbose, axillary, or terminal.*

29 C. thyrsoi'deum (H. B. et Kunth, l. c. p. 63.) leaves ovate-oblong, acute, glabrous above, but clothed with fine down beneath; panicles terminal, corymbose, much-branched, leafy; flowers sessile; tube of corolla scarcely exceeding the calyx; segments of corolla ovate, acute, with inflexed edges; filaments naked, toothless. ♄. G. Native of Mexico, in the high plains near the town of Chalco, at the altitude of 1170 hexapods. Branches trigonal, canescent from powdery down. Leaves 3-4 inches long, running into the petioles at the base. Teeth of calyx short, ovate, acute, unequal. Corolla white. Said to be nearly allied to *C. Párqui*.

Thyrsoid-flowered Bastard Jasmine. Shrub.

30 C. auricula'tum (Lher. stirp. 1. p. 71. t. 35. Ruiz. et Pav. fl. per. 2. p. 28. t. 155. f. a. H. B. et Kunth, nov. gen. 3. p. 63.) leaves oblong, acuminated, glabrous; petioles biauriculate; corymbs axillary and terminal, approximate; corolla downy, with a very slender tube, and ovate-oblong, acute segments, having inflexed edges; filaments naked, toothless. ♄. S. Native of Peru, in temperate places between Loxa and Malacates, at the altitude of 1040 hexapods; and about Lima, where it is used by the natives externally to cleanse foul ulcers, and internally in the venereal disease; they also look upon it as a pectoral; but it seems to be a plant of suspicious character, on account of its belonging to *Solanàceæ*. Céstrum Hediúnda, Lam. dict. 1. p. 687. Rœm. et Schultes, syst. 4. p. 551. C. auriculàtum affìne, Pers. ench. 1. p. 230. Hediúnda Jasminiàno flòre, Feuill. per. 2. p. 25. t. 20. f. 2. Branches terete, glabrous. Leaves 4 inches long. Calyx, peduncles, and pedicels downy. Corolla white.

Auricled-leaved Bastard Jasmine. Fl. June, July. Clt. 1774. Shrub 10 to 12 feet.

31 C. multiflòrum (Rœm. et Schultes, syst. 4. p. 553.) leaves ovate-lanceolate, acute, glabrous; corymbs axillary, pedunculate, one-half shorter than the leaves; filaments toothless. ♄. S. Native country unknown. Branches quite smooth, green. Leaves rather membranous, $2\frac{1}{2}$ inches long. Peduncles downy; pedicels glabrous. Segments of corolla erect, acute, rather connivent.

Many-flowered Bastard Jasmine. Shrub.

§ 2. *Filaments furnished each with a sessile gland at the base.*

32 C. tomentòsum (Lin. suppl. p. 150. Ait. hort. kew. ed. 2d. vol. 2. p. 3.) leaves ovate-oblong, acuminated, smoothish above, but clothed with pilose down beneath, and canescent; peduncles axillary, short, 4-6-flowered, approximating in the manner of a spike; flowers sessile; calyx tubular, 5-cleft, and is, as well as the branches, villously tomentose; filaments furnished each with a gland. ♄. S. Native of Peru, between Vinayaca and the town of Loxa, at the altitude of 1060 hexapods. C. Granadénse, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 807. Branches terete, villously tomentose, hoary, as well as the peduncles. Leaves membranous, green above, glabrous, and rather scabrous, about 5 inches long, and 2 broad. Segments of corolla lanceolate, oblong, acute, nearly equal. Corolla glabrous, greenish; segments ovate, acute, with reflexed edges. Stigma capitately peltate. Berry oval, bisulcate at top, 2-4-celled, many-seeded, small, almost covered by the permanent calyx.

Tomentose Bastard Jasmine. Fl. June, July. Clt. 1790. Tree 12 to 18 feet.

33 C. Pa'rqui (Lher. stirp. 1. p. 73. t. 36.) leaves lanceolate, glabrous, attenuated at both ends, acute, or bluntish, subundulated; peduncles terminal, corymbose; filaments villous at the base, and furnished with a tooth. ♄. G. Native of Chili, and the South of Brazil. Schmidt, oestr. baumz. 3. p. 138. t. 15. Sims, bot. mag. 1770. C. Jamaicénse, β, Lam. dict. 1. p. 688. C. virgàtum, Ruiz. et Pav. fl. per. 2. p. 27. Párqui, Feuill. per. 2. p. 72. t. 32. f. 1. Leaves 3-5 inches long, attenuated at both ends, glabrous. False stipulas narrow. Flowers whitish yellow, very fragrant at night. Berry black, nearly globose. "Peduncles and calyxes sometimes tomentose, but also sometimes truly naked, except the orifice of the calyxes. Corolline segments usually reflexed and tomentose on the edges." Schlecht, in Linnæa, 7. p. 56.

Parqui Bastard Jasmine. Fl. June, July. Clt. 1787. Shrub 6 to 8 feet.

§ 3. *Filaments furnished each with a tooth or toothlet at their insertion.*

34 C. salicifòlium (Jacq. schœnbr. 3. p. 42. t. 326.) leaves lanceolate, acuminated, glabrous; racemes axillary, much shorter than the leaves; flowers pedicellate; filaments furnished each with a toothlet at the base. ♄. S. Native of America, in frigid places near La Venta Grande, between Caraccas and the port of La Guayra, at the altitude of 760 hexapods. Branches terete, glabrous. Leaves membranous, 5 inches long, and 1 broad. Racemes glabrous. Berry ovate-oblong, size of a berbery, girded by the calyx at the base. Calyx 5-toothed. Corolla greenish white, with a slender tube, and spreading, lanceolate, acutish segments. Filaments free only at top.

Willow-leaved Bastard Jasmin. Fl. April, June. Clt.? Shrub.

35 C. eua'nthes (Schlecht. in Linnæa, 7. p. 60.) glabrous; leaves elliptic, or oblong, attenuated at the base, acutish at the apex, shining, rather coriaceous, petiolate; racemes axillary, rather compound, leafy at the base; calyx puberulous, with short, obtuse teeth, which are tomentose at apex; corollas glabrous, 6 times longer than the calyx; segments of the limb oblong, bluntish; filaments inserted a little above the base of the tube, glabrous, rather denticulated. ♄. S. Native of the South of Brazil, Sello. Leaves 3-4 inches long. Margins of the segments of the corolla tomentose. Habit of *C. multiflòrum*, but differs from it in the racemes being sub-compound and leafy at the base, and in the filaments being glabrous and sub-denticulated.

Well-flowered Bastard Jasmine. Shrub.

36 C. hirsu'tum (Jacq. schœnbr. 3. p. 41. t. 324.) leaves oblong, acute, downy above, and tomentose beneath; spikes axillary, longer than the petioles; flowers sessile; filaments furnished with a little toothlet at the base. ♄. S. Native country unknown. Branches and calyx beset with white hairs. Leaves acute at both ends, 3-5 inches long. False stipulas falcate. Flowers fascicled in small, axillary corymbs. Calyx 5-toothed. Corolla with a glabrous, green tube, and spreading, lanceolate, acute, yellowish segments. Stigma capitate. Filaments bearded at the base.

Hairy Bastard Jasmine. Shrub 8 feet.

37 C. alaternoi'des (Hort. par. ex Poir. suppl. 2. p. 183. Hamilt. prod. p. 25. Rœm. et Schultes, syst. 4. p. 555.) leaves ovate-roundish, obtuse, or subelliptic undulated, coriaceous, shining, and glabrous above, and cinereous beneath, undulated; flowers fascicled, sessile, axillary, lateral, and terminal; filaments tooth-letted at the base. ♄. S. Native of the Antilles and Trinidad. Hook. bot. mag. 2929. Said to be nearly allied to *C. macrophýllum* by Hamilt. l. c. and the leaves size and shape of those of *Rhámnus alatérnus*. Branches terete, cinereous. Leaves 1½ inch long. Corymbs shorter than the leaves. Corolla greenish yellow; segments of the limb straight, acutish.

Alaternus-like Bastard Jasmine. Fl. Feb. April. Clt. 1824. Shrub 6 feet.

38 C. exstipula'tum (Ledeb. in Schrad. nov. journ. 4. p. 65.) leaves acuminated, villous; spikes terminal; filaments each furnished with a toothlet at the base. ♄. S. Native country unknown. False stipulas none. Habit of *C. auriculàtum*.

Exstipulate-leaved Bastard Jasmine. Shrub.

39 C. undula'tum (Ruiz. et Pav. fl. per. 2. p. 28. t. 155.) leaves ovate, acute, undulated, glabrous; peduncles axillary and terminal, few-flowered; filaments each furnished with a tooth at the base. ♄. S. Native of Peru, in waste places at the town of Huanaco. Trunk granular. Peduncles generally 8-flowered. Corolla yellow; limb downy outside. Anthers tetragonal. Berry violaceous, 2-celled, about 6-seeded. Seeds angular, truncate.

Undulated-leaved Bastard Jasmine. Fl.? Clt. 1825. Tree 15 feet.

40 C. suberòsum (Jacq. schœnbr. 4. p. 26. t. 452.) leaves oblong, acute, glabrous; racemes axillary and terminal, compound; flowers sessile, or nearly so, aggregate; filaments each furnished with a bifid tooth at the base. ♄. S. Native country unknown. Trunk cinereous, corky. Leaves 3-4 inches long. Corollas pale yellow, sweet-scented. Stigma capitate, umbilicate.

Corky-barked Bastard Jasmine. Fl. June, July. Clt. 1815. Shrub 5 to 6 feet.

41 C. hi'rtum (Swartz, prod. p. 49. fl. ind. occ. 1. p. 478.) leaves subcordate, acute, glabrous above, but hairy beneath, as well as the branches; spikes axillary, short, subracemose, 4-6-flowered; filaments each furnished with a toothlet at the base? ♄. S. Native of Jamaica, in woods. Bracteas none. Corolla with a long slender tube, and ovate, obtuse, connivent segments, without any toothlets between. Berry black, ovate, downy, 2-seeded. Calyx 5-toothed. Said to be nearly allied to *C. noctúrnum*; but is distinguished from it in the larger, broader, wrinkled leaves, and by the spicate crowded flowers.

Hairy Bastard Jasmine. Fl. June, July. Clt. 1800. Shrub 6 to 9 feet.

42 C. noctu'rnum (Lher. stirp. 1. p. 70.) leaves ovate, or ovate-lanceolate, acute, glabrous; peduncles subracemose, axillary, about equal in length to the leaves; filaments each furnished with a tooth at the base. ♄. S. Native of Jamaica, and Chili; and Mexico, near Jalapa, Schiede. Lam. dict. 1. p. 687. Jasminoìdes foliis pishaminis, flore virescente, noctu odoratissimo, Dill. elth. p. 183. t. 153. f. 185.—Plukn. alm. t. 64. f. 3.? Bark of trunk grey, corky at base. Branches terete, glabrous, dotted, green or greyish-brown. Leaves very like those of the orange. Corolla glabrous, greenish-yellow, with a slender, curved tube, and bluntish, rather irregular segments. Berry nearly globose, size of a pea, white, ex Lam.

Night-smelling Bastard Jasmine. Fl. Nov. Clt. 1732. Shrub 6 to 9 feet.

43 C. macrophy'llum (Vent. choix. t. 18.) leaves ovate-oblong, acuminated, quite glabrous; flowers fascicled, sessile; filaments each furnished with a toothlet at the base. ♄. S. Native of the Antilles, Porto Ricco, Riedle. Pers. ench. 1. p. 230. Poir. suppl. 2. p. 183. This is nearly allied to *C. laurifòlium*, and is probably a variety of it; the leaves are, however, much larger, and less approximate, hardly coriaceous. The flowers are cream-coloured at the time of expansion, but at length pale yellow, or rusty, rising above the articulations of the petioles. Bracteas linear, clothed with rusty tomentum, deciduous.

Long-leaved Bastard Jasmine. Fl. May, Aug. Clt. 1812. Shrub 6 to 7 feet.

44 C. VESTIOI'DES (Schlecht, in Linnæa, 7. p. 65.) branches downy; leaves oblong, nearly sessile, much attenuated at the base, bluntish at apex, rather coriaceous, glabrous above, and puberulous beneath; racemes terminal, leafy; calyx glabrous, with short, broad, subbarbately mucronulate teeth; corollas glabrous, 3-4 times longer than the calyx: segments of the limb ovate, bluntish; filaments furnished each with a villous tooth at their insertion, villous upwards to the middle of the tube. ♄. S. Native of Brazil, Sello. This is an elegant and showy species.

Vestia-like Bastard Jasmine. Shrub.

45 C. HIRTE'LLUM (Schlecht, in Linnæa, 4. p. 62.) branchlets hairy; leaves acute, and attenuated at the base, acuminated at the apex, membranous, shining, petiolate, downy on the primary nerves while young, but at length glabrous; racemes short, axillary, subspicate; calyx hairy, with elongated, triangular, very acute teeth, having the edges ciliated; corolla glabrous outside, 8 times longer than the calyx: segments of the limb narrow, acutish; filaments inserted in the superior part of the tube, glabrous, each furnished with an emarginate or 2-lobed toothlet. ♄. S. Native of Mexico, in the province of Jalapa, near the Hacienda de La Laguna. Corolla slender, greenish-white. Habit of *C. dumetòrum*.

Hairy Bastard Jasmine. Shrub.

46 C. DUMETÒRUM (Schlecht, in Linnæa, 7. p. 61.) branches glabrous; leaves elliptic, acuminated, acute at the base, and rather unequal, opaque, downy beneath, usually bearded at the axils, petiolate; racemes axillary and terminal, usually twin; calyx villous, with acute, rather unequal segments, which are tomentose at top; corollas glabrous outside, 3 times longer than the calyx; segments of the limb acute; filaments inserted in the upper part of the tube, glabrous, furnished each with a toothlet; lower part of tube clothed with retrograde down. ♄. S. Native of Mexico, among bushes near Vera Cruz and San Pablo, Schiede and Deppe. Tube of corolla slender. Leaves 4-5 inches long. Fruit ovoid, conical, glabrous.

Bush Bastard Jasmine. Shrub.

47 C. LAURIFÒLIUM (Lher. stirp. 1. p. 69. t. 34.) glabrous; leaves coriaceous, shining, ovate or elliptic, obtuse; flowers fascicled, pedicellate, on common peduncles, which are shorter than the petioles; filaments each furnished with a toothlet at the base, Lam., or naked, ex Willd. enum. 1. p. 245. ♄. S. Native of South America. Smith, spicil. 2. t. 2. C. venenàtum, Lam. dict. 1. p. 688. no. 5. exclusive of the syn. of Burm. and country. Laurèola latifòlia floribus albicantibus odoratis, Plukn. phyt. t. 95. f. 1. ex Willd.; but according to Lam. it refers to *C. diúrnum*. Leaves dark green, 1½ inch long; petioles rufescent. Flowers yellowish, in axillary, subsessile fascicles at the tops of the branches; segments ovate, bluntish, spreading.

Laurel-leaved Bastard Jasmine. Fl. May, Aug. Clt. 1691. Shrub 6 to 9 feet.

† *Species hardly known.*

48 C. FŒ'TIDUM (Medic. act. palat. 4. phys. p. 192.) corymbs sessile, leafy, terminating the branches. ♄. S. Perhaps the same as *C. vespertìnum*.

Fetid Bastard Jasmine. Shrub.

49 C. NERVÒSUM (Mill. dict. no. 3.) leaves lanceolate, opposite, with transverse nerves; peduncles branched. ♄. S. Native of Carthagena. Jasminoìdes Americànum lauri folio, flore albo odorato, Houst. mss. Leaves 4 inches long, smooth, pale green. Peduncles axillary, 4-5-flowered. Corolla inflated in the middle of the tube, and coarctate above; segments broad-flat, spreading, white, scentless.

Nerved-leaved Bastard Jasmine. Shrub 5 to 6 feet.

50 C. SPICA'TUM (Mill. dict. no. 4.) leaves ovate-lanceolate; flowers spicate, alar, and terminal. ♄. S. Native of Carthagena. Leaves 2½ inches long, and 1½ broad. Flowers inodorous. Berry globose, purplish, size of a pea; pulp grateful to the taste. Seeds flat.

Spicate-flowered Bastard Jasmine. Shrub 10 to 12 feet.

51 C. MUTI'SII (Willd. rel. ex Rœm. et Schultes, syst. 4. p. 807.) leaves oblong, acuminated at both ends; peduncles many-flowered, lateral, aggregate. ♄. S. Native of America, on Mount Quindiu. Humb. et Bonpl.

Mutis's Bastard Jasmine. Shrub.

52 C. PARVIFÒLIUM (Willd. rel. ex Rœm. et Schultes, l. c. p. 808.) leaves elliptic, subundulated, glabrous, coriaceous, shining above; flowers aggregate, sessile, nearly terminal. ♄. S. Native country unknown.

Small-leaved Bastard Jasmine. Shrub.

53 C. PAUCIFLÒRUM (Willd. rel. ex Rœm. et Schultes, syst. 4. p. 808.) leaves oblong-ovate, downy; heads terminal, few-flowered. ♄. S. Native country unknown.

Few-flowered Bastard Jasmine. Shrub.

54 C. AUGUSTIFÒLIUM (Lodd. bot. cab. 618.) ♄. S. Native of the West Indies. Flowers white. This species is hardly known, and may be synonymous with some other species.

Narrow-leaved Bastard Jasmine. Fl. June, July. Clt. 1820. Shrub 6 feet.

Cult. These are shrubs of the most easy culture; they grow well in any rich light soil; and are readily increased by cuttings, under a hand-glass, in heat.

XXXVIII(a). ACOKANTHE'RA (from *ακωκη, acoce*, a mucrone; and *ανθηρα, anthera*, an anther; anthers mucronate.) Lýcium species, Thunberg.

LIN. SYST. *Pentándria, Monogýnia.* Calyx divided even to the base into 5 segments. Corolla with a villous throat. Anthers terminated by a mucrone. Stigma elongated, papilliform, pilose. Ovarium 2-celled; cells 1-ovulate.—Shrubs, natives of the Cape of Good Hope. Leaves nearly opposite, as in *Apocýneæ*. Branches terminated by a spine, as in *Lýcium*. Flowers in axillary, sessile fascicles, rarely solitary.

1 A. VENENA'TA; leaves lanceolate-oblong, coriaceous; corymbs sessile, axillary, usually 8-flowered? ♄. G. Native of the Cape of Good Hope. Céstrum venenàtum, Thunb. prod. 1. p. 36. fl. cap. 1. p. 193. Céstrum citrifòlium, Retz. phyt. bl. 1. p. 36. Leaves shining, glabrous. Bracteas subulate. Corolla yellowish. Segments of corolla convolute, subulate, erect, tipped with brown, expanding in the afternoon. C. fasciculàris, Hort. berol?

Poisonous Aconanthera. Fl. Feb. April. Clt. 1787. Shrub 6 to 7 feet.

2 A. LAMA'RKII; leaves lanceolate, nerved, rather coriaceous; flowers in axillary sessile fascicles. ♄. G. Native of Africa, Sonnerat. Céstrum oppositifòlium, Lam. ill. 2. no. 2279. t. 112. f. 2. Poir. suppl. 2. p. 182. Branches terete, striated. Leaves nearly sessile, 2 inches and more long. Corolla small, with a slender tube, and short segments.

Lamark's Aconanthera. Shrub.

3 A. LYCIOI'DES; leaves elliptic, obtuse, narrowed at the base, in fascicles; flowers axillary, solitary, almost sessile. ♄. G. Native of the Cape of Good Hope. Céstrum lycioìdes, Lichtenst. spicil. fl. cap. mss. ex Rœm. et Schultes, syst. 4. p. 558. Branches obsoletely tubercular, when young glabrous and leafy. Calyx 5-cleft; segments erect, linear, acute, hardly attaining the height of the middle of the corolla. Corollas white; tube an inch long; segments of the limb acute, revolute. Anthers incumbent, exserted. Stigma capitate.

Box-Thorn-like Aconanthera. Fl. June, Sept. Clt. 1824. Shrub 5 to 6 feet.

4 A. pube'scens; leaves oblong-lanceolate, obtuse, attenuated at the base in fascicles, pubescent; flowers axillary, solitary, nearly sessile. ♄. G. Native of the Cape of Good Hope. Céstrum pubéscens, Licht. l. c. Stature of the preceding; but the branches are more rigid; the branchlets short, and pungent at top, or leafy. Spines as those of some species of *Lycium*. Flowers size, colour, and shape of those of *A. lycioìdes;* but the calyx is downy, and more deeply divided.

Downy Aconanthera. Shrub 5 to 6 feet.

Cult. For culture and propagation see *Crabówskia*, p. 481.

XXXIX. DUNA'LIA. (named in honour of Michael Felix Dunal, M.D. professor of botany at Montpelier; author of "Histoire Naturelle, Medicale, et Economique des Solanum, et des genres qui ont été confondus avec eux." Paris, 1813; and several other works.) H. B. et Kunth, nov. gen. 3. p. 55. t. 194.

Lin. syst. *Pentándria, Monogýnia.* Calyx urceolate, 5-toothed. Corolla funnel-shaped; tube elongated, nearly cylindrical; limb 5-cleft, plicate. Stamens 5, inclosed; filaments tripartite; lateral segments capillary: middle one antheriferous. Anthers dehiscing lengthwise. Style exserted; stigma capitate, emarginate. Berry globose, 2-celled, propped by the permanent calyx; placentas adnate to the dissepiment. Seeds many, lenticular, reniform, compressed, smooth.—A shrub, with alternate, solitary, nearly entire leaves, floccosely tomentose from stellate down. Umbels extra-axillary, sessile. Corolla whitish.

1 D. solana'cea (H. B. et Kunth, l. c. p. 56. t. 194.) ♄. S. Native of New Granada, in shady places near Fusagasuga, at Hato del Quemado, at the altitude of 800 hexapods. Habit of *Witheríngia;* but the structure of the flowers is that of *Céstrum;* distinguished from all the other genera of the present order by the tripartite filaments. Branches glabrous. Leaves petiolate, ovate-oblong, acuminated, rounded and unequal at the base, glabrous and green above, nearly 10 inches long.

Solanaceous Dunalia. Shrub.

Cult. For culture and propagation see *Céstrum*, p. 485.

XL. MEYE'NIA (meaning unknown to us.) Schlecht, in Linnæa, 8. p. 251.

Lin. syst. *Pentándria, Monogýnia.* Calyx campanulate, almost regular, 5-toothed, permanent, valvular in æstivation. Corolla clavately tubular; limb 5-toothed, contracted, erect, conduplicate in æstivation. Genitals inclosed. Stamens 5, regular; filaments free from the middle of the tube, naked; anthers oval-roundish, fixed by the back, 2-celled; cells near each other. Ovarium girded by a fleshy ring? Stigma sub-bilobed, subcapitate. Berry propped by the permanent spreading calyx, which is sometimes cleft lengthwise, 2-celled. Some of the seeds irregularly oval. Embryo straight, with roundish, foliaceous, flat cotyledons in the centre of the albumen, having the radicle pointing to the hilum.—Shrubs, natives of Mexico. Leaves alternate, quite entire, beset with articulated hairs. Flowers red, irregularly cymose.

1 M. fasciula'ta (Schlecht, l. c.) shrub clothed with tomentose down; flowers cymosely fascicled. ♄. S. Native of Mexico, near Chiconquiaco. Leaves petiolate, broad, ovate, acute, very variable in size, usually 3-4 inches long, and 1½ to 2 broad. Flowers scarlet, forming fascicles or racemes at the tops of the branches. Berry cuneated at the base. Seeds variable in shape from position and compression, wrinkled longitudinally.

Fascicled-flowered Meyenia. Shrub.

2 M. corymbòsa (Schlecht, l. c. p. 252.) glabrous; flowers disposed in elongated corymbs. ♄. S. Native along with the preceding, which it is very like; but differing in being glabrous. Leaves variable, the largest one 5 inches long, and 2 broad, but generally smaller. Calycine segments nearly subulate. Corolla red or scarlet.

Corymbose-flowered Meyenia. Shrub.

Cult. For culture and propagation see *Céstrum* above.

XLI. DA'RTUS (from δαρτος, *dartos*, excoriated; bark of fruit deciduous.) Lour. coch. p. 124. ed. Willd. 1. p. 152. Rœm. et Schultes, syst. 4. p. 55.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft; segments ovate, membranous. Corolla with a subglobose tube, which is longer than the calyx, and a 5-cleft limb; segments ovate, spreading. Filaments inserted into the middle of the tube, inclosed. Style very short; stigma 5-lobed. Berry small, round, excoriated, diaphanous, 1-celled, many-seeded. Seeds small, unequal.—A shrub, with alternate, serrated, large leaves; and small, axillary, oblong racemes of white flowers. Root reddish, rather aromatic.

1 D. perla'rius (Lour. l. c.) ♄. G. Native of Cochinchina, in shady places on the banks of rivers. Perlàrius alter, Rumph. amb. lib. 6. cap. 62. p. 122. t. 57. Branches ascending. Leaves oblong-ovate, soft from tomentum beneath, with oblique ribs; petioles rufous.

Pearl-berried Dartus. Shrub 6 feet.

Cult. For culture and propagation see *Céstrum*, p. 486.

§ 2. *Pericarp capsular.*

XLII. VE'STIA (named after Dr. Vest, of Clagenfurth.) Willd. enum. 1. p. 208. D. Don, in edinb. phil. journ. 1823. Schlecht, in Linnæa, 7. p. 53.

Lin. syst. *Pentándria, Monogýnia.* Calyx campanulate, regular, 5-toothed, permanent, valvular in æstivation. Corolla tubular; limb 5-parted, regular, conduplicate in æstivation. Genitals exserted: filaments free from the middle of the tube, villous under the place of insertion, the rest glabrous, variously curved before the expansion of the flowers; anthers oval, dehiscing lengthwise. Ovarium girded by a fleshy, glabrous, 5-tubercled ring, 2-celled, many-ovulate; ovula fixed to a thick central placenta. Stigma capitate? hardly bifid. Capsule girded by the calyx, and hardly larger than it, cylindrical, very blunt, marked lengthwise by 4 smooth furrows, which are disposed crosswise, 2-celled, 2-valved; valves at length bifid; placentas 2, adnate to the middle of the dissepiment, semi-globose. Seeds numerous.—A deciduous, erect, glabrous, fetid shrub, with ovate-lanceolate, entire leaves. Peduncles solitary, 2-3-flowered, terminal, and from the axils of the upper leaves, drooping. Corolla tubular, yellow, with a villous throat.

1 V. lycioi'des (Willd. l. c.) ♄. H. Native of Chili, about Conception, and elsewhere. Cántua ligustrifòlia, Juss. ann. mus. 3. p. 118. Cántua fœ'tida, Pers. ench. 1. p. 187. Periphrágmos fœ'tidus, Ruiz. et Pav. fl. per. 2. p. 17. t. 132. Céstrum vespertìnum, Hort. valent. Calyx violaceous. Capsule pendulous, 2-3-celled.

Box-Thorn-like Vestia. Fl. June. Clt. 1815. Shrub 3 to 6 feet.

Cult. Véstia is a very pretty hardy shrub, growing freely in summer, but requiring a little protection in winter, if severe. It is readily propagated by cut-

FIG. 44.

tings, under a hand-glass, or by seeds, which ripen in plenty in this country.

XLIII. SE'SSEA (named in honour of Martin Sesse, formerly director of the botanic garden of Mexico.) Ruiz. et Pav. fl. per. 2. p. 9. t. 115. f. b. and t. 116.

LIN. SYST. *Pentándria, Monogýnia.* Calyx tubular, pentagonal, 5-toothed; teeth ovate. Corolla funnel-shaped; tube twice as long as the calyx, with a globose orifice, and plicate limb; segments straight, ovate, with convolute margins. Filaments curved at the base, villous. Stigma 2-lobed; lobes unequal. Capsule cylindrical, a little arched, twice as long as the calyx, 2-celled, 2-valved; valves bifid. Seeds numerous, imbricate, oblong, compressed, with membranous edges.—Branched, fetid shrubs, natives of Peru, with the habit of *Céstrum*. Leaves alternate, entire. Racemes axillary and terminal; pedicels corymbose. Corollas yellow.

1 S. STIPULA'TA (Ruiz. et Pav. fl. per. 2. p. 9. t. 115. fig. b.) leaves lanceolate and cordate; false stipulas large, ovate, obtuse, deciduous; racemes axillary and terminal; pedicels corymbose. ♄. G. Native of Peru, on the mountains. Leaves petiolate: superior ones narrower, ovate, acuminated, 3-5 inches long, and 1-2 broad, glabrous above, and clothed with white tomentum beneath. Racemes and calyxes woolly. Corolla villous, yellow, twice as long as the calyx.

Stipulate Sessea. Shrub 5 to 6 feet.

2 S. DEPE'NDENS (Ruiz. et Pav. fl. per. 2. p. 9. t. 116.) leaves cordate-oblong; false stipulas wanting; racemes very long, pendulous; pedicels usually 3-flowered. ♄. G. Native of Peru, on the banks of rivers. Branches pendent. Leaves like those of the preceding, but powdery beneath, 3-4 inches long, and 2 broad. Calyx powdery. Corolla yellowish, twice as long as the calyx.

Hanging-branched Sessea. Tree 25 to 30 feet.

Cult. For culture and propagation see *Céstrum*, p. 486.

XLIV. FABIA'NA (named in honour of Francisco Fabiano, of Valencia in Spain, a promoter of botany.) Ruiz. et Pav. fl. per. 2. p. 12. t. 122. f. b. Hook. et Arn. in Beech. voy. pt. bot. p. 35.

LIN. SYST. *Pentándria, Monogýnia.* Calyx tubular, 5-angled, 5-toothed, permanent. Corolla funnel-shaped, with a very long tube, and a short, 5-cleft, plicate, revolute limb. Stamens 5, 2 longer than the other 3. Stigma capitate, emarginate. Capsule ovate, 2-valved, many-seeded. Seeds wrinkled, dotted.—Shrubs, with a habit like *Támarix*. Leaves scattered, or in fascicles, ovate or linear. Flowers terminal, solitary, pedunculate.

1 F. IMBRICA'TA (Ruiz. et Pav. l. c.) leaves small, ovate, sessile, concave, scale-formed, imbricate; flowers terminal, solitary; segments of the limb of corolla short, obtuse, reflexed. ♄. F. Native of Chili, in fields. Pers. ench. 1. p. 176. Poir. suppl. 2. p. 625. Shrub much branched. Corolla lilac, about an inch long.

Imbricate-leaved Fabiana. Shrub.

2 F. LANUGINÒSA (Hook. et Arn. in Beech. voy. pt. bot. p. 35.) branches woolly from white tomentum; leaves linear, in fascicles, very blunt, fleshy, spreading; calyx woolly; segments of the limb of corolla oblong, reflexed. ♄. F. Native of Chili, at Coquimbo. Flowers axillary, pedunculate, hardly the length of the leaves. Calyx tubular, 5-cleft, with unequal, linear, obtuse segments. Corolla glabrous. Stigma oblong, capitate.

Woolly Fabiana. Shrub.

3 F. VISCÒSA (Hook. et Arn. in Beech. voy. pt. bot. p. 36.) clothed with clammy down; leaves scattered, narrow-linear, spreading, obtuse, channelled on the back; peduncles terminal; fruit-bearing ones erect. ♄. F. Native of Chili, near Barasca, where it is called Pichanilla. This comes very near *F. thymifòlia*, St. Hil. Capsule 2-valved; margins of the valves bent in so as to form 2 cells, and bifid at apex. Receptacle central, becoming free from the dissepiment, and split through the middle, entire at the summit.

Clammy Fabiana. Shrub.

4 F. THYMIFÒLIA (St. Hil. in mem. mus. 12. p. 317. t. 9.) plant hairy and clammy; leaves small, linear, nerveless, scattered, bluntish; peduncles subaxillary, at first erect, but at length bent. ♄. S. Native of Brazil in the province of Rio Grande do Sul. Corolla yellow at bottom, and dirty purple above.

Thyme-leaved Fabiana. Shrub ½ to 1 foot.

Cult. These are very singular shrubs; they will grow in any light rich earth. They are rather hardy, and may be grown in the open air during summer; and they probably would stand our winters if protected by a mat, or the haulm of herbaceous plants, during frosts; and they will be readily propagated by cuttings, under a hand-glass, or by seed.

XLV. LAURE'RIA (meaning unknown to us.) Schlecht, in Linnæa, 8. p. 513.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-parted, alately pentagonal, permanent. Corolla tubular, with a short, 5-lobed, straight limb. Stamens 5, inclosed, villous at their insertion; anthers linear, fixed by the base. Stigma bilamellate. Capsule 2-celled, 2-valved? Seeds numerous, full of impressed dots, fixed to short lamelliform processes or placentas, which are attached to the dissepiment. Embryo cylindrical, curved.—A shrub, with alternate leaves, beset with stellate hairs. Flowers lateral, solitary.

1 L. MEXICA'NA (Schlecht, l. c.) ♄. G. Native of Mexico, at the Hacienda de La Laguna. Leaves ovate or broad-lanceolate, 4-6 inches long, and 2-3 broad.

Mexican Laureria. Shrub 6 feet.

Cult. For culture and propagation see *Céstrum*, p. 486.

XLVI. LAMA'RKIA (named in honour of Jean Baptist Monet de la Mark, author of "Flore Française." 3 vols. Paris, 1778. "Encyclopédie Méthodique Botanique." 4 vols. 4to. Paris, 1783—1796, (but vol. 5 to 8 of this work is by Poiret, Paris, 1804—1808. He is author of many other works on botany, and other branches of natural history.) Rœm. et Schultes, syst. 4. p. 28. Márkea, Richard. in act. soc. hist. nat. par. 107.

LIN. SYST. *Pentándria, Monogýnia.* Calyx long, tubular, pentagonally prismatic, semiquinquefid. Corolla nearly funnel-shaped; limb spreading, equally and bluntly 5-parted. Stamens equal, length of tube. Capsule oblong, terete, coarctate at top, many-seeded.—A glabrous shrub, with oblong-obovate, acuminated, shining leaves, which are bluntly rounded at the base. Corollas scarlet.

1 L. COCCI'NEA (Richard. l. c. under Márkea. Poir. suppl. 3. p. 293.) ♄. S. Native of Cayenne.

Scarlet-flowered Lamarkia. Shrub.

Cult. For culture and propagation see *Céstrum*, p. 486.

† *Addenda to Order Solanaceæ.*

1 SOLA'NUM QUERCIFÒLIUM (Schum. pl. guin. p. 121.) suffruticose, unarmed; leaves twin, ovate, somewhat repand, clothed with stellate down; racemes simple, infra-foliaceous, distich. ♄. S. Native of Guinea. Stem 2 feet. Leaves 4-8 inches. Corolla white, size of those of *S. dulcamàra*; segments ovate-lanceolate. Berry tomentose, 2-4-celled, size of a plum.

Oak-leaved Nightshade. Shrub.

2 Sola'num di'stichum (Schum. pl. guin. p. 122.) shrubby, unarmed, tomentose; leaves ovate, subrepand; racemes simple, infra-foliaceous, distich. ♄. S. Native of Guinea, at Aquapim. Leaves twin: tomentum stellate. Corollas size of those of *S. nìgrum*, white. Fruit size of bilberries, globose, glabrous, scarlet.

Distich-racemed Nightshade. Shrub 6 feet.

3 Sola'num A'tropo (Schum. pl. guin. p. 124.) sub-herbaceous, unarmed; leaves obovate, cuneated, angularly-repand, acutish, glabrous; peduncles opposite the leaves, usually twin, 1-flowered. ⊙.? S. Native of Guinea. Stem branched, glabrous. Corollas pale blue, size of those of *S. tuberòsum;* limb entire, plicate, having the angles ending each in a subulate point. Berry size of an apple, dirty yellow. Leaves 3-6 inches long. *A'tropo* is the vernacular name of the plant. Allied to *S. Melongèna*.

Atropo Nightshade. Pl. 2 feet?

4 Sola'num edu'le (Schum. pl. guin. p. 125.) sub-herbaceous, unarmed; leaves ovate, repandly-toothed, oblique, clothed with stellate tomentum; peduncles twin; calyx rather prickly. ⊙.? S. Native of Guinea. Stem beset with adpressed, stellate hairs. Racemes usually opposite the leaves. Corollas pale violet, size of those of *S. tuberòsum;* limb of 5 acuminated angles. Berry size of an apple, nearly globose, yellow. Nearly allied to *S. Melongèna* and *S. insànum*.

Edible Nightshade. Pl. 2 feet.

5 Sola'num dasyphy'llum (Schum. pl. guin. p. 126.) sub-herbaceous, rather prickly; leaves broad-cuneated, angularly-lobed, hairy, and are, as well as the calyxes, prickly; racemes opposite the leaves, few-flowered. ⊙. S. Native of Guinea, where it is called by the natives *Atropo-Bah*. Leaves nearly sessile, almost a foot long. Prickles subulate, straight. Corollas rotate, blue, villous outside, size of those of *S. tuberòsum;* limb acutely 5-angled. Berry nearly globose, size of an apple. Allied to *S. Melongèna*.

Thick-leaved Nightshade. Pl. 2 feet.

6 Sola'num runcina'tum (Ruiz. et Pav. fl. per. 2. p. 36. D. Don, in Sweet, fl. gard. n. s. t. 177.) unarmed; leaves pinnatifid, smoothish; panicles cymose; stigma clavate; calycine segments ligulate, recurved; stems herbaceous, diffuse. ♃. H. Native of Peru.—Feuill. per. 1. p. 722. t. 15. Corolla violaceous, 5-lobed. Perhaps the same as *S. pinnàtum*, Cav.

Runcinate-leaved Nightshade. Fl. Sept. Oct. Clt. 1832. Pl. diffuse.

Order CLXX. VERBA'SCINÆ (this order contains plants agreeing with the genus *Verbáscum* in important characters.) Nees ab Esenbeck, in Lin. trans. 17. p. 78. Solàneæ genera, Juss. gen. p. 123. edit. Usteri. p. 139. Scrophularíneæ, tribe A. Verbásceæ, Bartl. and Rchb.—See R. Br. prod. p. 444.

Corolla rotate, with a flat, 5-cleft, unequal limb, or ventricose, with a bilabiate limb. Stamens 5, of different forms; of these the upper one is sometimes sterile or wanting. Anthers 1-celled, adnate to a hatchet-shaped connective. Carpels 2, joined into a capsule, which opens from the apex. Endocarp changing into a bipartible dissepiment. Placenta marginal, combined into a central column, which is free from the margins, and constituting the axis of the dissepiment, and which is rather prominent in the hollow of both carpels. Seeds many, reniform, albuminose. Embryo a little arched, central.—Perennial or biennial herbs, of a mucilaginous substance. Leaves alternate, usually decurrent or opposite, on a straight or twiggy stem. Flowers disposed in terminal, usually elongated racemes or spikes, propped by the decreasing leaves. Corollas white, yellow, or purple. Filaments usually bearded.

This order differs principally from *Solanàceæ* in the 1-celled, reniform, or oblong anthers, which are sometimes bent in and complicate, often unequal, and of different forms in the same flower; it also differs from *Schrophulárinæ* by the same reason.

Synopsis of the genera.

1 Verba'scum. Calyx 5-parted. Corolla rotate or funnel-shaped. Stamens 5, inclinate, usually bearded, all antheriferous. Anthers lunate.

2 Ramóndia. Calyx 5-parted. Corolla rotate, rather unequal. Stamens 5, all antheriferous, approximate, bearded? Anthers perforated at the apex.

3 Ce'lsia. Calyx 5-parted. Corolla rotate. Perfect stamens 4, didynamous, bearded; anthers lunate.

4 Isanthe'ra. Flowers polygamous. Corolla in the male flowers rotate, in the female wanting. Stamens equal, glabrous; anthers reniform, dehiscing by a vertical chink.

I. VERBA'SCUM (of Pliny, who deduces it from *Verbèna;* but according to others, it should have been *Barbáscum*, from the bearded filaments. Hence it is called *Barbasso* in Italian; and one species is called *Thápsus barbàtus* by some old authors.) Tourn. inst. t. 61. Lin. gen. no. 245. Schreb. gen. no. 331. Juss. gen. p. 124. ed. Usteri, p. 139. Gærtn. fruct. t. 55. Lam. ill. 117. f. 2. Schrad. verb. in colum. soc. goett. vol. 2. 1813. Nees, in Lin. trans. 17. p. 79.—Blattària, Tourn.

Lin. syst. *Pentándria, Monogýnia*. Calyx 5-parted. Corolla rotate or funnel-shaped. Stamens 5, all antheriferous, inclinate, usually bearded. Anthers all or only some of them in the same flower, lunate. Capsule 2-valved; valves bent in. Seeds fixed to the central placenta.—Usually strong, erect, perennial, or biennial herbs. Leaves broad, usually decurrent, decreasing in size as they ascend the stem, until they become bracteas. Flowers yellow, white, purple, or copper-coloured, disposed in elongated, dense or loose, racemes or spikes.

§ 1. *Leaves decurrent. Flowers disposed in dense spikes.*

1 V. Tha'psus (Lin. spec. p. 252.) leaves crenulated, decurrent, lanceolate-oblong, tomentose: superior ones acute; racemes spicate, dense; calycine segments lanceolate, acute, tomentose above, equal in length to the fruit; corolla subrotate, with oblong, obovate, obtuse segments; anthers nearly equal. ♂. H. Native throughout Europe, Siberia, Tauria, and Caucasus, in sterile and waste places, especially on a gravelly or calcareous soil; plentiful in Britain, in like situations; also of Nipaul and Kamaon. Smith, engl. bot. t. 549. Oed. fl. dan. t. 631. Schkuhr, handb. 1. p. 136. t. 42. Woodv. med. bot. p. 342. t. 125. V. lychnìtis, Schultz, starg. no. 185. V. pállidum, Nees, in flora, 2. p. 295. V. I'ndicum, Wall. cat. no. 2630. B. C. and F.—Gmel. sib. 4. p. 91. no. 415.—Hall. helv. no. 581.—Blackw. herb. t. 3.—Mor. hist. 2. sect. 5. t. 9. f. 1. —Lob. icon. 1. p. 561. Plant soft from tomentum in every part. Lower leaves a foot long. Racemes densely spiked, fascicled, simple, or branched, often 3 feet long. Corolla yellow.

The 3 smaller filaments densely clothed with white hairs; but the 2 larger ones but sparingly so in the middle. This plant is very apt to run into mules by the impregnation of other species. The leaves and whole herb are mucilaginous, and recommended as emollients, both internally and externally. A pint of cow's milk, with a handful of the leaves, either of this or any allied species, boiled in it to half a pint, sweetened with sugar, strained, and taken at bed-time, is a pleasant emollient, and nutritious medicine for allaying a cough, and more particularly for taking off the pain and irritation of hæmorrhoids. It is often applied externally in this disorder; and is used as an injection in tenesmus with advantage. In diarrhœas of an old standing, a decoction of it is useful to ease the pains of the intestines: two ounces of the leaves are boiled in a quart of water, and 4 ounces are given every 3 hours. In pulmonary complaints of cattle it is found to be of great use; and hence its name of Cow's Lungwort. It is well known to the country cow-leeches under the name of Murrain-grass, which is a corruption of Mullien. The French call it Bouillon blanc, and use an infusion of the flowers in coughs, supposing them to possess anodyne and pectoral virtues. It does not seem to have much of the narcotic powers for which the *Solanàceæ* are distinguished. The seeds, however, are said to stupify fish so much that they may be taken with the hand.—Woodville. In the East Indies, the natives have the superstitious notion of the efficacy of this plant in protecting them from the visitation of evil spirits.

The plant has many names in English. Gerarde enumerates *Mullien*, or rather *Woollen*, *Hig-taper*, *Torches*, *Lung-woort*, *Bullock's Lung-woort*, and *Hare's Bearde*. Withering adds *Ladies' Foxglove*. It is probable that Gerarde's correction of *Mullien* to *Woollen* is right, especially as it is called in Dutch *Wullkraut*. The French name *Molene* is probably borrowed from our word Mullien. *Hig-taper* is altered to *High-taper* in all modern books, supposing it to have been so named from its high tapering stem; but in the North it is called *Hag-taper*, probably from its supposed efficacy in sorcery.

Var. β; flowers white. ♂. H. V. elongàtum, Willd. enum. 1. p. 223. V. II. flore albo, Tabern. krauter. p. 956. with a figure.

Var. γ; leaves narrower. ♂. H. V. angústius, Dodon. hist. p. 143. with a figure.—Mor. hist. 2. sect. 5. t. 9. f. 7. Schrank, in Hoppe, taschen. 1809. p. 90.

Shepherd's-Club, or Common Mullien. Fl. July, Aug. Britain. Pl. 3 to 6 feet.

2 V. I'NDICUM (Wall. in Roxb. fl. ind. 2. p. 236. cat. no. 2630. Nees, in Lin. trans. 17. p. 80.) leaves decurrent, elliptic-oblong, crenated, undulated, clothed with woolly tomentum; racemes spicate, dense; bracteas and calyxes woolly, cuspidate, longer than the fruit; corolla subrotate, with roundish segments; anthers nearly equal. ♂. H. Native of Nipaul. V. Thápsus, Roxb. fl. ind. l. c. Flowers yellow. Nearly allied to *V. Thápsus*, but perfectly distinct.

Indian Mullien. Fl. July, Aug. Clt.? Pl. 3 to 4 feet.

3 V. MACROU'RUM (Tenore, fl. neap. prod. 5. ex Linnæa, 3. p. 98.) leaves decurrent, elliptic, crenulated, clothed with white tomentum; spike very dense and very long, usually simple; bracteas ovate-lanceolate, about equal in length to the calyx; corolla funnel-shaped, with orbicular segments, which are woolly beneath; filaments clothed with yellow wool; anthers about equal. ♂. H. Native of Calabria, at the foot of the mountains. This species differs from *V. Thápsus*, in the spikes being much more crowded; in the flowers being altogether sessile, imbricate; in the corolla being twice the size; in the filaments being equal, and densely woolly.

Long-tailed Mullien. Fl. July, Aug. Pl. 3 to 4 feet.

4 V. THAPSIFÓRME (Schrad. verb, p. 21.) leaves decurrent, crenulated, tomentose: superior ones acuminated; racemes spicate, dense; corolla rotate, with obovate-rounded segments. ♂. H. Native of Lower Saxony, in waste sterile places; and not far from Paris. V. intermèdium, Leman, ined. V. Thápsus, Merat, fl. par. p. 85. no. 407. Habit of *V. Thápsus*. Tomentum yellowish-green. Lower leaves 4 to 6 inches long. Racemes more than a span long, simple. Flowers twin, or by threes, rarely solitary, sweet-scented, form and colour of those of *V. phlomoìdes*. The 2 longer filaments naked, or furnished with a few hairs on the inner side, bearing oblong anthers; the other 3 bearded.

Thapsus-formed Mullien. Fl. July, Aug. Clt. 1817. Pl. 3 to 4 feet.

5 V. CRASSIFÒLIUM (Hoffm. et Link, fl. port. 1. p. 213. t. 26. Schrad. mon. p. 22.) leaves decurrent, obsoletely crenulated, densely tomentose: superior ones acutish; racemes spicate, dense; filaments glabrous; 2 of the anthers oblong. ♂. H. Native of Portugal, in sandy places. V. Thápsus, Brot. fl. lus. 1. p. 270. Plant densely clothed with rusty yellow tomentum. Stem simple. Lower leaves obovate-elliptic. Very like *V. thapsifórme*, and agreeing with it in the form of the anthers; but it is readily distinguished, in the filaments being all glabrous. V. crassifolium, of D. C. fl. gall. no. 2670. exclusive of the synonymes, may be the same.

Thick-leaved Mullien. Fl. July, Aug. Clt. 1818. Pl. 2 to 3 feet.

6 V. CUSPIDA'TUM (Schrad. verb. p. 23. t. 1. f. 1.) leaves decurrent, crenulated, tomentose: superior ones cuspidate; fascicles of racemes remote; 2 of the anthers oblong. ♂. H. Native about Vienna, in mountain groves. V. Thápsus, Bot. vindob. The stem is usually more dwarf than in *V. Thápsus*, less thick, and the leaves and the tomentum thinner. The upper cauline leaves are drawn out into long taper points. The disposition and form of the flowers come near to *V. phlomoìdes*. Fructiferous pedicels about equal in length to the calyx, not twice as short as in *V. Thápsus*. Corolla exactly rotate, with obovate unequal segments, larger than those of *V. Thápsus*, but smaller than those of *V. phlomoìdes*. The colour of the plant is pale green, as is generally observed in *V. Thápsus*.

Cuspidate-leaved Mullien. Fl. May, June. Clt. 1817. Pl. 3 to 4 feet.

7 V. NI'VEUM (Tenor. fl. neap. p. 90. t. 22. syn. p. 36. prod. p. 16. Gussone, pl. rar. 103.) leaves crenated, clothed with white floccose tomentum; racemes spicate, dense; anthers equal. Schrad. verb. p. 23. Radical leaves petiolate, obovate, cuneated: cauline ones stem-clasping, elliptic, crenated, clothed with white tomentum on both surfaces; spike simple, compact; filaments bearded with white hairs. ♂. H. Native of Naples, in the province of di Bari e di Lecce, in pastures; and of the mountains of Lucania, and of Calabria. The whole plant white from tomentum, except the upper surfaces of the adult leaves, which are green. Flowers yellow, nearly sessile, fascicled. Raceme simple, not branched. All the filaments clothed with white wool. Leaves never decurrent. There are varieties of this having the tomentum either white or yellowish.

Snow-white Mullien. Fl. April, May. Clt. 1823. Pl. 3 to 4 feet.

8 V. DENSIFLÒRUM (Bertol. pl. rar. ital. 3. p. 52. Schrad. verb. p. 24.) leaves tomentose: radical ones long-lanceolate, crenated, deeply serrated at the base: upper cauline leaves acuminated, dentate, semidecurrent; racemes spicate, dense; anthers equal? ♂. H. Native of Italy, on the top of Mount Bruciana, which is situated between Carraria and Massa. Upper part of plant clothed with fulvous tomentum. Radical leaves more than 1½ foot long, green above, but paler beneath. Raceme simple, more than a foot long, fascicled. Corollas large,

yellow. Filaments clothed with white wool. Capsule tomentose.

Dense-flowered Mullien. Pl. 4 to 6 feet.

9 V. THAPSOÏ'DES (Hoffm. et Link, fl. port. 1. p. 214. exclusive of the synonymes. Schrad. verb. p. 25. t. 5. f. 2.) leaves crenulated, tomentose: radical ones oblong-lanceolate: cauline ones oblong, acute, semidecurrent; racemes subspicate; fascicles of flowers rather crowded; anthers nearly equal. ♃. H. Native of Portugal. Stem branched at top; branches floriferous. Plant clothed with canescent tomentum. Upper surfaces of the leaves green in the adult state, and less tomentose. Radical leaves a span to a foot and more long. One or two of the flowers in each fascicle usually fertile, the rest sterile. Corolla yellow, size of those of *V. Lychnìtis*. Filaments clothed with white wool. Perhaps *V. Lychnìtis*, Brot. fl. lus. 1. p. 272.

Var. β, simplex; stem simple, and more humble. ♃. H. V. símplex, Hoffm. et Link. fl. port. 1. p. 216. V. dùbium, Rœm. et Schultes, syst. 4. p. 330.

Thapsus-like Mullien. Fl. July, Aug. Clt. 1819. Pl. 4 to 6 feet.

10 V. PLANTAGI'NEUM (Mor. elench. sard. ex Bull. 14. p. 348.) plant clothed with fulvous tomentum; leaves obsoletely crenulated, thick: cauline ones decurrent, crowded, oblong: radical and lower leaves attenuated into the petioles, ovate-elliptic, obtuse; racemes densely spicate; filaments clothed with coppery villi. ♂. H. Native of Sardinia, on the hills of Cala and D'Ostia Pula, in arid pastures. Said to be nearly allied to *V. thapsoìdes*.

Plantain-leaved Mullien. Pl. 4 to 5 feet.

11 V. GOSSYPI'NUM (Bieb. fl. cauc. suppl. p. 152.) leaves decurrent, crenulated, green, and rather woolly above, but clothed with white wool beneath; racemes simple, tailed; pedicels fascicled, rather shorter than the calyx. ♂. H. Native of Iberia. Habit of *V. gnaphaloìdes;* the down, inflorescence, flowers, and capsules, are also the same; but the leaves are narrower, and the crenæ more minute. Filaments copper-coloured; the 2 shorter ones clothed with white tomentum above the middle; the other 3 longer, and naked. Corollas yellow.

Woolly Mullien. Fl. July, Aug. Clt. 1820. Pl. 4 to 6 feet.

12 V. MACRA'NTHUM (Hoffm. et Link. fl. port. 1. p. 215. t. 27.) leaves crenulated, tomentose: radical ones elliptic-oblong, attenuated at the base: cauline ones oblong, acute, semidecurrent; fascicles of racemes remote; two of the anthers oblong. ♂. H. Native of the North of Spain, by way sides. Schrad. verb. p. 27. Plant tomentose. Leaves green above: radical ones 3-4 inches long. Racemes a foot long, or more. Corollas large, showy, yellow, with broad, obovate-roundish, unequal segments. Filaments clothed with copper-coloured wool; but the 2 longer ones only at the base.

Large-flowered Mullien. Fl. June, July. Clt. 1820. Pl. 3 to 4 feet.

13 V. AUSTRA'LE (Schrad. verb. p. 28. t. 2.) leaves crenated, tomentose: radical ones oblong-lanceolate, tapering into the petioles: cauline ones oblong, acute, decurrent: uppermost ones broad-ovate, cuspidate, semidecurrent; fascicles of racemes remote; 2 of the anthers oblong. ♂. H. Native of the South of Europe. Plant clothed with tomentum, like *V. phlomoìdes*. Radical leaves a foot and more long. Racemes simple, 1½ foot long; but sometimes, as in strong plants, it is branched at the base. Flowers sweet-scented. Corolla, calyx, stamens, and stigma, size, colour, and structure of those of *V. phlomoìdes*.

Southern Mullien. Fl. July, Aug. Clt. 1815. Pl. 4 to 6 feet.

14 V. PHLOMOI'DES (Lin. spec. 253.) leaves crenated, tomentose: radical ones elliptic, or ovate-elliptic, petiolate: cauline ones oblong, acute: superior ones broad-ovate, cuspidate, stem-clasping, decurrent; fascicles of racemes rather remote; 2 of the anthers oblong. ♂. H. Native of Europe, Tauria, Caucasus, and Turkey, in sterile and uncultivated places. Sibth. et Smith, fl. græc. t. 224. Bieb. fl. cauc. no. 398. exclusive of the syn. of Tabern. and Dodon. Mœnch, hass. no. 170. t. 4. Mill. fig. t. 273. V. tomentòsum, Lam. fl. fr. 2. p. 260. V. rugulòsum, Willd. enum. 1. p. 224. V. pulveruléntum, Spreng. hal. no. 233. V. Thápsus, Plenck, med. t. 109. V. thapsoìdes, Vill. dauph. 1. p. 490. V. grandiflòrum, Mill. dict. no. 5. Stem branched at top, tomentose, as well as the leaves and calyxes. Leaves usually yellowish-green: radical ones 3-4 inches long. Racemes from a span to a foot, or longer, branched a little at the base. Flowers sweet-scented. Corolla yellow, showy, size of those of *V. macránthum*, with broad obovate-roundish, unequal segments. The 3 smaller filaments clothed with dense purple wool; the 2 longer ones, for the most part, naked, or but rarely furnished with a few hairs in the middle. Capsule roundish-ovate, blunt.

Var. β, albiflòrum; flowers white. Lob. icon. t. 560. f. 2.

Phlomus-like Mullien. Fl. June, July. Clt. 1739. Pl. 3 to 4 feet.

15 V. CONDENSA'TUM (Schrad. verb. p. 31. t. 3.) leaves tomentose: radical ones elliptic-oblong, attenuated at the base, unequally and doubly crenated: cauline ones oblong, acute, simply crenated; superior ones roundish-ovate, cuspidate, decurrent; racemes dense, fascicled; two of the anthers oblong. ♂. H. Native of Austria, in sterile places. Stem divided at top into floriferous branches. Radical leaves 1 to 1½ foot long. Racemes a foot to 1½ foot long. Flowers and fruit agreeing with *V. phlomoìdes*.

Close-flowered Mullien. Fl. July, Aug. Clt. 1820. Pl. 5 to 6 feet.

16 V. NEMORÒSUM (Schrad. verb. p. 32. t. 1. f. 2.) leaves acute, crenated, tomentose: radical ones oblong, attenuated at both ends: lower cauline ones lanceolate, narrowed at the base: middle ones oblong-lanceolate: and the superior ones oblong and decurrent; fascicles of racemes rather remote; 2 of the anthers oblong. ♂. H. Native of Austria, in groves, Schott. Nearly allied to *V. phlomoìdes*, but with a different habit. Radical leaves a span and more long: lower cauline ones more than a foot long. Racemes solitary, simple. Calyxes, corolla, and fruit, as in the two preceding species.

Grove Mullien. Fl. July, Aug. Clt. 1820. Pl. 4 to 5 feet.

17 V. MONTA'NUM (Schrad. hort. gött. fasc. 2. p. 18. t. 12. verb. p. 33.) leaves tomentose: radical ones oblong-elliptic, crenulated, petiolate: cauline ones oblong, acutish, obsoletely crenulated: superior ones acute, decurrent; raceme subspicate; fascicles of flowers rather crowded; anthers nearly equal. ♂. H. Native of the Pyrenees; also of Switzerland and Germany. V. phlomoìdes, Spreng. hal. no. 231. Schleich. pl. rar. cent. 1. no. 27. Stem simple, clothed with rusty yellow tomentum, as well as the leaves and other parts. Radical leaves 3-5 inches long. Racemes 3 inches to ½ a foot. Flowers sometimes solitary, but usually fascicled. Corolla size, colour, and form of those of *V. Thápsus*. The 3 smaller filaments clothed with white wool: the 2 larger ones beset with scattered hairs, rarely naked. Capsule ovate, obtuse, about equal in length to the calyx. In shady places this plant becomes 6 feet high, and branched at top; and the leaves shining, green above; but in dry exposed places not above 2 feet, and unbranched.

Mountain Mullien. Fl. July, Aug. Clt. 1819. Pl. 2 to 6 feet.

18 V. COLLI'NUM (Schrad. verb. p. 35. t. 5. f. 1.) leaves crenate, tomentose: lower ones elliptic-oblong, petiolate: middle cauline ones oblong-lanceolate, acutish, attenuated at the base: superior ones oblong, acute, decurrent; fascicles of racemes remote; anthers equal. ♃. H. Native of the North of Germany, on dry grassy hills. Stem simple, reddish-green at bottom, tomentose. Leaves pale green above, and canescent beneath: radical ones 4 or 4½ inches long. Racemes 1 to 1½ foot long, solitary; but in strong plants there are sometimes 1-2 small branches at the base. Calyx and corolla almost as in *V. nìgrum;* and the filaments are clothed with purple wool as in it; pollen red. Capsule small, oblong-ovate, obtuse.

Hill Mullien. Fl. July, Aug. Clt. 1820. Pl. 3 to 4 feet.

19 V. VERSIFLÒRUM (Schrad. verb. p. 36.) leaves crenated, tomentose: lower ones elliptic-oblong, petiolate: cauline ones oblong, acute, decurrent: upper ones acuminated; racemes panicled; fascicles remote, few-flowered; anthers equal. ♃.? H. Native near Prague, in sandy places, Tausch. This elegant species comes very near the V. rubiginòsum, Waldst. et Kit, but differs in the colour of the flowers. Plant clothed with greenish-yellow tomentum. Stem divided into many floriferous branches towards the apex. Radical leaves 3½ to 6 inches long. Racemes more than a foot long, panicled. Flowers size of those of *V. phœníceum*, sweet-scented. Corolla of a reddish copper-colour, verging to yellow towards the tube, with obovate-roundish segments, furnished with yellow wool at the base of the smaller ones, as in *V. Blattària*, as well as the smaller filaments; but the 2 longer filaments are clothed with purple wool. Pollen white. Capsule ovate, obtuse, a little larger than the calyx. Corollas sometimes twice the size of those of *V. phlomoìdes.*

Party-flowered Mullien. Fl. June, July. Clt. 1823. Pl. 3 to 4 feet.

20 V. RAMI'GERUM (Link, in litt. ex Schrad. verb. p. 37. t. 4.) leaves clothed with fine tomentum: radical ones oblong-lanceolate: cauline ones oblong, acute, doubly crenated, semidecurrent: upper ones acuminated; racemes panicled; fascicles remote, many-flowered; anthers equal. ♂. H. Native of Germany. Habit of *V. Lychnìtis.* Stem much branched, tomentose. Leaves canescent beneath: radical ones often a foot long. Calyx as in *V. phlomoìdes*, but one half smaller, nevertheless larger than that of *V. Lychnìtis*, but the stamens are the same.

Branch-bearing Mullien. Fl. July, Aug. Clt. 1824. Pl. 4 to 6 feet.

21 V. BASTA'RDI (Rœm. et Schultes, syst. 4. p. 335.) leaves oblong-lanceolate, downy or villous, crenated, and subdecurrent; flowers twin or glomerate; stem much branched. ♂. H. Native on argillaceous hills about Mayenne, near Montreuil-Belfroy. V. blattarioìdes, β. caule ramosissimo, Bast. suppl. fl. Main. et Loire, p. 42.? V. ramosíssimum, D. C. fl. fr. suppl. p. 416. no. 4679. a. but not of Poir. Stem purplish at bottom, downy. Leaves villous, particularly beneath, half stem-clasping. Branches of panicle elongated. Flowers pedicellate. Corolla yellow; hairs of stamens purple. Said to be nearly allied to *V. ramigerum*, and probably only a variety of it.

Bastard's Mullien. Fl. July, Aug. Clt. 1824. Pl. 5 to 6 feet.

22 V. MUCRONA'TUM (Lam. dict. 4. p. 218. Schrad. verb. p. 38.) leaves crenated, clothed with hoary tomentum: radical ones oblong-lanceolate: cauline ones oblong, acute, semidecurrent: upper ones ovate, long-acuminated; spikes panicled; flowers glomerate. ♂. H. Native of Candia, Labillardiere. Verbáscum orientàle, maximum, candidissimum, ramis candelabrum æmulantibus, Tourn. cor. p. 8.? The whole plant clothed with hoary tomentum. Stem branched at top. Radical leaves in the cultivated plant 1½ to 2 feet long. Flowers almost sessile. Corolla large, ex Lam., yellow, middle-sized, ex Spec. Filaments all clothed with white wool.

Mucronate-leaved Mullien. Fl. July, Aug. Clt. 1814. Pl. 6 to 8 feet.

23 V. CANDIDI'SSIMUM (D. C. fl. fr. suppl. p. 413. no. 2670.) leaves and whole plant white from floccose tomentum: lower leaves petiolate, oblong-lanceolate, attenuated at both ends, acute: upper cauline ones ovate, acuminated, all decurrent and finely crenated; racemes panicled; fascicles many-flowered, remote. ♂. H. Native near Montpelier, at Port Juvenal. The upper part of the plant is sometimes deficient of floccose tomentum. Calyx small. Corolla yellow, middle-sized. Perhaps the same as *V. mucronàtum* or *V. níveum.*

Var. β; flowers approximate; stem rubiginose.

Very-white Mullien. Fl. July, Aug. Clt. 1823. Pl. 4 to 5 feet.

24 V. AURICULA'TUM (Smith, prod. fl. græc. 1. p. 149. Sibth. et Smith, fl. græc. t. 223.) leaves crenulated, elliptic-oblong, tomentose on both surfaces, auricled at the base: upper ones half stem-clasping; racemes panicled, flexuous; fascicles many-flowered, remote; anthers equal. ♂. H. Native of the Island of Samos. Verbáscum orientàle, maximum, candidíssimum, ramis candelàbrum æmulantibus, Tourn. cor. p. 8. Corollas yellow. Filaments beset with cream-coloured wool. Anthers fulvous.

Auricled-leaved Mullien. Pl. 3 to 4 feet.

25 V. SINUA'TUM (Lin. spec. p. 254.) leaves clothed with powdery tomentum: radical and lower cauline ones sinuated: superior ones crenated, decurrent; spikes panicled; flowers subglomerate; anthers equal. ♂. H. Native of Italy, South of France, Portugal, and Barbary, in arid stony places; very common in Greece. Sibth. et Smith, fl. græc. t. 227. Verbáscum nìgrum foliis papaveris corniculàti, Tourn. inst. p. 147. Verbáscum críspum et sinuàtum, Bauh. hist. 3. p. 860. with a figure.—Mor. hist. 2. sect. 5. t. 9. f. 6. V. intubàceum, Tabern. kraut. p. 956. with a figure. Stem tomentose, branched at top. Radical leaves 3-5 inches long, obtuse. Leaves naked on the upper surface in the adult state. Spikes 1 to 1½ foot long. Flowers on short pedicels. Calyx small. Corolla yellow, like those of *V. Lychnìtis*, but a little larger. Filaments all clothed with purple wool. Anthers all reniform; pollen of a vermilion colour.

Sinuated-leaved Mullien. Fl. July, Aug. Clt. 1570. Pl. 3 to 4 feet.

26 V. HY'BRIDUM (Brot. fl. lus. 1. p. 170.) leaves tomentose: radical ones obovate-lanceolate, undulated, and subsinuated: cauline ones subdecurrent, cordate, oblong, acute, crenated; racemes panicled; flowers glomerate, each glomerule furnished with 3 bracteas. ♂. H. Native of Portugal, in hedges, and in shady, gravelly places about Coimbra. This is said to be a hybrid between *V. sinuàtum* and *V. pulveruléntum.* Stem branched from the base to the apex, villous. Radical leaves 1½ foot long, and 7 inches broad. Corollas yellow; the throat striped with purple. Filaments all clothed with purple villi. The plant is green, though tomentose.

Hybrid Mullien. Fl. July, Aug. Clt.? Pl. 4 to 5 feet.

27 V. CONOCA'RPUM (Mor. elench. sard. ex Linnæa, 5. p. 93.) clothed with white tomentum; leaves somewhat crenated: lower ones elliptic or oblong, petiolate: upper ones ovate, acuminated, somewhat decurrent; fascicles of flowers loosely racemose; capsule oblong-conical, acutish. ♃. H. Native of Sardinia, in the fissures of rocks by the sea shore. Corolla yellow, with a deep violet centre. Filaments bearded with violaceous hairs, the 2 longest ones naked at top.

Cone-fruited Mullien. Pl. 4 to 5 feet.

§ 2. *Leaves not decurrent.*

* *Flowers glomerate.*

28 V. SYRI'ACUM (Schrad. verb. 2. p. 6. t. 1. f. 1.) leaves quite entire, clothed with woolly tomentum: lower ones obovate-lanceolate: superior ones lanceolate; spike simple. ♃. H. Native of Syria, in sterile waste places. The whole plant is clothed with woolly tomentum. Stem 2-3 from the same root, woody at the base. Radical leaves 3 or $3\frac{1}{2}$ inches long. Spike longer than the stem; bundles or glomerules 5-7-flowered. Corolla middle-sized, yellow. Filaments all woolly; anthers equal. Nearly allied to *V. simplex*, Labill.

Syrian Mullien. Pl. 1 to 2 feet.

29 V. UNDULA'TUM (Lam. dict. 4. p. 221.) leaves densely tomentose: lower ones lyrately sinuated, undulated: cauline leaves subsinuated: superior ones oblong-ovate, sessile; spike solitary. ♃. H. Native of the Levant. Stems woody at the base, simple, a little divided, pale, yellowish from tomentum, as well as the leaves. Radical leaves 3-4 inches long. Spike a foot and more long; bundles 3-4-flowered. Corolla yellow. Filaments all woolly.

Undulated-leaved Mullien. Fl. July, Aug. Clt. 1819. Pl. $2\frac{1}{2}$ to 3 feet.

30 V. CERATOPHY'LLUM (Schrad. verb. p. 7. t. 1. f. 2.) leaves tomentose on both surfaces: lower ones sub-pinnatifid: upper ones entire; spikes panicled; outer bracteas quite entire. ♂. H. Native of the Levant. Stem branched at top, tomentose. Radical leaves a span or more long: uppermost cauline leaves half-stem clasping, unequally serrated. Spikes a foot and more long; bundles remote, 3-4-flowered. Corolla like that of *V. blattària*, yellow. Filaments all clothed with yellow wool. Pollen yellow.

Buckhorn-leaved Mullien. Pl. $2\frac{1}{2}$ to 3 feet.

31 V. PINNATI'FIDUM (Vahl, symb. 2. p. 39. Bieb. fl. cauc. 1. p. 404. Schrad. verb. 2. p. 8.) leaves tomentose beneath: lower ones bipinnatifid: upper ones pinnatifid; spikes panicled; outer bracteas serrated. ♂. H. Native of Tauria, in the sea sand; and of the Islands of the Archipelago. Sibth. et Smith, fl. græc. t. 228. V. bipinnatífidum, Sims, in Curt. bot. mag. t. 1777. V. sinuàtum, Habl. taur. p. 156. Stems sometimes branched from the base, clothed with hoary tomentum. Radical leaves 3-4 inches long. Spikes a span and more long, but those of the branches shorter. Corollas like those of *V. blattària*, yellow. Filaments orange-coloured, clothed with white or fulvous wool; pollen vermillion. Anthers all reniform.

Pinnatifid-leaved Mullien. Fl. July, Aug. Clt. 1788. Pl. $2\frac{1}{2}$ to 3 feet.

32 V. PLICA'TUM (Sibth. et Smith, fl. græc. t. 226.) leaves tomentose, plicately pinnatifid: upper cauline ones sessile; spike simple, interrupted, leafy; anthers equal. ♂. H. Native of the Island of Hydra; plentiful near Athens. V. sinuàtum, β, Lin. spec. p. 255. V. pinnatífidum, Ait. hort. kew. ed. 2d. vol. 1. p. 386, but not of Vahl. V. Græcum fruticosum, folio sinuato candidissimo, Tourn. cor. p. 8. itin. 1. p. 128, with a figure. Plant densely clothed with woolly, cream-coloured tomentum. Leaves obovate-oblong, lyrately sinuated: radical ones a span long, petiolate. Filaments bearded with yellow hairs. Corolla yellow.

Plicate-leaved Mullien. Pl. 2 to 3 feet.

* * *Flowers fascicled.*

33 V. CHRYSE'RIUM (Schrad. verb. 2. p. 9.) leaves quite entire, tomentose: lower ones obovate-lanceolate, obtuse, tapering into the petioles: cauline leaves oblong-lanceolate, acutish, nearly sessile: uppermost ones broad-ovate, acuminated, half stem clasping; racemes panicled; pedicels about equal in length to the calyx; anthers equal. ♂.? H. Native of Palestine, Sieber. Plant clothed with yellowish tomentum. Stem simple, or divided a little at top. Leaves thick: radical and lower cauline ones 4-5 inches long. Racemes about a span long. Corolla yellow; ? filaments glabrous.

Golden Mullien. Pl. 2 to 3 feet.

34 V. SCHOTTIA'NUM (Schrad. verb. 2. p. 13. t. 3. f. 2.) leaves crenated, tomentose: lower ones oval-oblong, acutish, petiolate: middle cauline leaves oblong, acute, sessile: superior leaves ovate, acuminated, subcordate, half stem-clasping; racemes panicled; pedicels twice as long as the calyx. ♂. H. Native of Austria, in groves. Allied to the preceding. Stem simple, or divided a little at top. Radical leaves a span to 1 foot long. Racemes a span long; fascicles 5-10-flowered. Calyx and corollas as in *V. speciòsum*. Filaments clothed with purple wool. Anthers all reniform; pollen vermillion. The leaves are nearly naked in summer.

Schott's Mullien. Pl. 3 to 4 feet.

35 V. LEPTOSTA'CHYUM (D. C. fl. fr. suppl. no. 2676.) leaves oblong, tomentose: lower ones bluntish, crenulated, tapering into the petioles: cauline leaves acute, quite entire, sessile: superior ones ovate, acuminated, half stem-clasping; racemes elongated; pedicels shorter than the calyx. ♂. H. Native near Montpelier, in stony fields near Port Juvenal, D. C. Schrad. verb. 2. p. 14. Plant clothed with white tomentum. Stem simple, terete. Radical and lower cauline leaves 3-5 inches long: the middle cauline leaves 2-3 inches long. Raceme solitary; fascicles 5-7-flowered. Calyx nearly the size of *V. phlomoìdes*. Corolla like that of *V. speciòsum*, yellow. Filaments all woolly; anthers equal. In strong plants the stem is furnished with a branch or two at top.

Slender-spiked Mullien. Fl. July, Aug. Clt. 1825. Pl. 3 to 4 feet.

36 V. ROTUNDIFÒLIUM (Tenore, prod. suppl. 2. p. 66. syn. p. 37. fl. neap. p. 92. t. 23.) leaves crenated, sub-undulated, clothed with hoary tomentum: lower ones oval, petiolate: cauline leaves ovate-elliptic, nearly sessile: uppermost ones roundish-ovate, acute, half stem-clasping; racemes subspicate; pedicels shorter than the calyx. ♂. H. Native of Sicily; and of Capra Island. Schrad. verb. 2. p. 50.—Micheli. in Till. hort. pis. p. 171. Habit of *V. gnaphalòdes*, but the tomentum is finer, and hoary. Upper leaves clasping at the base, adnate, not free. Racemes 1 to $1\frac{1}{2}$ foot, simple, or furnished with 1 or 2 small branches at the base; fascicles remote, few-flowered. Corolla yellow. Filaments clothed with purple wool.

Round-leaved Mullien. Fl. July, Aug. Clt. 1823. Pl. 4 to 5 feet.

37 V. LONGIFÒLIUM (Tenore, fl. neap. 1. p. 89. t. 21. prod. p. 16. syn. p. 37. Gussone, pl. rar. p. 102.) leaves quite entire, tomentose; lower ones oval-lanceolate, petiolate: cauline ones oblong, acuminated, half stem-clasping; racemes elongated; pedicels twice as long as the calyxes; two of the anthers oblong. ♂. H. Native of Abruzzo, plentiful in mountain pastures. Verbáscum montanum, tomentosum longifòlium luteum, foliis non serratis, flore parvo, caule rotundo, Micheli, in Till. hort. pis. p. 171. Plant clothed with yellowish floccose tomentum. Stem branched at top. Radical leaves $1\frac{1}{2}$ foot long. Racemes 2 feet or more long; fascicles remote, many-flowered. Corollas rather mealy, and covered with stellate pili outside, yellow, like those of *V. pyramidàle*. Filaments clothed with purple wool, but the 2 longer ones only at the base inside. The lower leaves in the cultivated plant are repand inside, rarely sub-sinuated, and the superior ones are crenulated. There are

varieties of this species having the stem simple, or branched, and the tomentum sometimes white.

Long-leaved Mullien. Fl. July, Aug. Clt. 1824. Pl. 4 to 5 feet.

38 V. MICRA'NTHUM (Moretti, dec. pl. itin. 3. p. 6. Guss. pl. rar. p. 103.) stem branched; radical leaves petiolate, oblong-lanceolate, acute, crenulated, canescent beneath: cauline leaves scattered, sessile, becoming gradually narrower as they ascend the stem; racemes compound; fascicles remote. ♂. H. Native of Abruzzo, in stony and shady places on the mountains called Morone, Magella, Aquila, Chiarino. Filaments copper-coloured: the 2 longer ones from the base to the middle, bearded by white villi: the 3 shorter ones all their length. Anthers equal, copper-coloured.

Small-flowered Mullien. Pl. 3 to 4 feet?

39 V. SPECIÒSUM (Schrad. hort. gœtt. fasc. 2. p. 22. t. 16. verb. 2. p. 12.) leaves tomentose, quite entire: lower ones oval-lanceolate, tapering into the petioles: cauline ones auriculately cordate, sessile; racemes panicled; pedicels twice or thrice as long as the calyx; anthers equal. ♂. H. Native of Hungary, Austria, and France, in mountain groves. V. longifòlium, D. C. fl. gall. suppl. p. 414. Stem angular, and branched at top. Plant clothed with white tomentum. Radical leaves 1 to 1½ foot long. Racemes 1-2 feet long; fascicles many-flowered. Corolla yellow. Filaments copper-coloured, clothed with white wool. Pollen vermillion, rarely copper-coloured.

Var. β; stem much branched. ♂. H. Native of Austria. V. thapsoìdes, Host, fl. austr. p. 115. V. cærùleum, Schanz, in cat. sem. hort. vind. 1822. It should have been *V. caulés-cens*, instead of *V. cærùleum*.

Showy Mullien. Fl. July, Aug. Clt. 1818. Pl. 4 to 7 feet.

40 V. GNAPHALÒDES (Bieb. fl. cauc. suppl. p. 152. Schrad. verb. 2. p. 15.) leaves crenated, clothed with dense, floccose tomentum beneath: lower ones oval-oblong, petiolate: cauline ones oblong, acute, nearly sessile: upper ones roundish-ovate, long-acuminated, half stem-clasping; racemes terminal, very long; pedicels about equal in length to the calyxes. ♂. H. Native of the South of Tauria. V. Stevènii, Cat. sem. hort. vind. 1821. Very like *V. floccòsum*, but the habit is more robust, and the leaves evidently crenated. Racemes 3 feet long and more, sometimes furnished with a few short racemes; lower fascicles remote: upper ones crowded. Corolla yellow. Plant clothed with white floccose tomentum, except the upper surfaces of the adult leaves.

Gnaphalium-like Mullien. Fl. July, Aug. Clt. 1825. Pl. 6 feet or more.

41 V. FLOCCÒSUM (Waldst. et Kit. pl. hung. 1. p. 81. t. 71.) leaves undulately-crenulated, densely clothed with floccose tomentum: lower ones oblong-oval, petiolate: cauline ones oblong, acute, sessile: uppermost ones roundish-ovate, long-acuminated, half stem-clasping; racemes panicled; pedicels equal in length to the calyx. ♂. H. Native of Portugal, France, Switzerland, Italy, Sicily, shores of Austria, Hungary, and Calabria, in sterile, sandy places. D. C. fl. fr. suppl. no. 2673. a. Schrad. verb. 2. p. 16. V. pulveruléntum, Hoffm. et Link. fl. port. 1. p. 217, exclusive of the syn. of Villars. V. pulvinàtum, Thuill. fl. par. p. 109.—Hall. helv. no. 583.—Bauh. hist. 3. p. 872. and 873, with a figure.—Mor. hist. 2. sect. 5. t. 9. f. 3. Stem simple, or a little branched at top. Plant clothed with floccose tomentum. Radical and lower cauline leaves ½ a foot, or a span or more long; uppermost leaves sometimes cordate, half stem-clasping. Flowers size, colour, form, and disposition of *V. Lychnìtis flàva*, as well as the structure of the stamens.

Var. β; flowers larger. ♂. H. Native of England. V. pulveruléntum, Smith, fl. brit. 1. p. 251. engl. bot. t. 487.

Var. γ, *nìgro-pulveruléntum* (Schrad. verb. 2. p. 16.) V. pulveruléntum, β, Smith, l. c. V. mixtum, D. C. fl. fr. no. 2674. Said to be a hybrid from *V. floccòsum*, impregnated by the pollen of *V. nìgrum*.

Floccose Mullien. Fl. June, Aug. Clt. 1805. β and γ, England. Pl. 4 to 6 feet.

42 V. PULVERULE'NTUM (Vill. dauph. 2. p. 490, exclusive of the synonymes. Schrad. verb. 2. p. 17.) leaves doubly crenated, tomentose beneath: lower ones oblong-oval, petiolate: cauline ones ovate-oblong, acutish, nearly sessile: upper ones roundish-ovate, acuminated; racemes panicled; pedicels equal in length to the calyxes. ♂. H. Native of Dauphiny. This species has been confused with *V. Lychnìtis flàva*, and *V. floccòsum*, but differs from both in the stem being more humble and terete, and in the leaves being naked above, and in the smaller calyxes, and in the leaves being doubly crenated, and in the tomentum being finer.

Powdery Mullien. Fl. June, Aug. Clt.? Pl. 2 to 4 feet.

43 V. LYCHNI'TIS (Lin. spec. p. 253.) leaves crenated, smoothish above, but clothed with powdery tomentum beneath: lower ones oval-oblong, bluntish, tapering into the petioles: superior ones ovate-oblong, acute, nearly sessile: upper ones ovate, acuminated; racemes panicled; pedicels twice as long as the calyx. ♂. H. Native of Europe, North of Asia, and North America, among rubbish, in waste fields and groves. Jaume, St. Hil. pl. fr. 4. t. 392. V. pulveruléntum, Bieb. fl. cauc. no. 400, and of other Floras. D. C. fl. fr. no. 2672. Stem more or less branched. Radical leaves half a foot long: middle cauline ones 2-4 inches. Racemes a span long, or longer; fascicles 5-7-flowered; the superior fascicles 2-3-flowered. Flowers middle-sized, sweet-scented. Corolla yellow. Filaments clothed with white wool, the 2 longer ones only at the base. Anthers equal; pollen vermillion. *V. Weldènii*, Morelli is only a var. of *V. Lychnìtis*.

Var. β; flowers white. ♂. H. Native along with the species, also in many parts of Britain. V. Lychnìtis, β, Lin. spec. p. 253. Willd. spec. 1003. β. and γ. o. b. Lychnìtis, β, Lam. dict. 4. p. 218. Smith, fl. brit. 1. p. 250. engl. bot. t. 58. Oed. fl. dan. t. 586. V. Mœ'nchii, Schultz, starg. suppl. p. 14. V. thapsoìdes of English authors. V. álbum, Mœnch, meth. p. 447. Bess. fl. gal. no. 267.—Hall. helv. no. 583. β.—Mor. hist. 2. sect. 5. t. 9. f. 4.—Bauh. hist. 3. p. 873, with a figure.—Tabern. kraut. p. 956. icone.—Lob. icon. 1. p. 562.

Var. γ; flowers without petals. ♂. H.

Lychnitis Mullien. Fl. June, Aug. Britain. Pl. 2 to 6 feet.

44 V. RAMOSI'SSIMUM (Poir. suppl. 3. p. 718.) lower leaves ovate-oblong, crenated, nearly glabrous, on short petioles; panicle much branched, beset with glandular hairs; flowers solitary, pedicellate; stem angular, nearly glabrous. ♂. H. Native country unknown; probably of hybrid origin. Plant deep green. Leaves at least 8 inches long: upper ones stem-clasping. Panicle 1 to 2 feet; branches a foot long. Flowers shorter than the pedicels. Corolla yellow. Filaments bearded with purple hairs.

Much-branched Mullien. Fl. July, Aug. Clt. 1824. Pl. 4 to 6 feet.

45 V. MONSPESSULA'NUM (Pers. ench. 1. p. 215. Schrad. verb. 2. p. 20. t. 2. f. 2.) leaves glabrous above, clothed with fine tomentum beneath: cauline ones ovate-oblong, acutish, unequal, crenately serrated, petiolate: upper ones ovate-lanceolate, acute, sessile; racemes panicled; pedicels twice as long as the calyx. ♂. H. Native about Montpelier. Stem sim-

ple, tomentose. Lower cauline leaves $2\frac{1}{2}$ inches long. Terminal raceme half a foot: lateral ones shorter; fascicles remote, 5-7-flowered: upper ones 3-flowered. Flowers yellow, like those of *V. Lychnìtis*, but a little smaller.

Montpelier Mullien. Fl. June, Aug. Pl. 2 to 3 feet.

46 V. ova'tum (Schrad. hort. gött. fasc. 2. p. 21. t. 15. verb. 2. p. 21.) leaves ovate, crenated, glabrous above, and clothed with fine tomentum beneath: lower and cauline ones obtuse, petiolate: superior ones acute, sessile, half stem-clasping; racemes panicled; pedicels twice as long as the calyx. ♂. H. Native of Spain. Stem usually branched from the base, beset with fascicles of stellate hairs, which constitute fine tomentum at top. Radical and lower cauline leaves 3-4 inches long. Lower racemes a span long, leafy at base: superior ones shorter. Flowers scentless, smaller than those of *V. Lychnìtis*, yellow. Filaments clothed with purple wool. Anthers equal; pollen copper-coloured.

Ovate-leaved Mullien. Fl. July, Aug. Clt. 1824. Pl. 2 to 3 feet.

47 V. Austri'acum (Rœm. et Schultes, syst. 4. p. 341. Schrad. verb. 2. p. 22.) leaves crenated, glabrous above, and pubescent beneath: lower and cauline ones oblong-ovate, petiolate: superior ones ovate, acute, nearly sessile; racemes panicled; pedicels about equal in length to the calyx. ♃. H. Native of Austria, and Hungary, on mountains among bushes. V. nìgrum, Plenck. icon. pl. off. t. 110. Habit of *V. Lychnìtis*. Stem simple, or branched, beset with fascicles of small hairs, brownish purple. Leaves deep green: radical ones 4 inches to a span long. Racemes a span or more long: lower ones leafy, and often divided; fascicles 5-7-flowered: upper ones 3-flowered. Flowers sweet-scented. Calyx, corolla, and stamens as in *V. nìgrum*, but the capsule is larger, and the down stellate.

Austrian Mullien. Fl. July, Aug. Clt. 1818. Pl. 3 to 4 feet.

48 V. orienta'le (Bieb. fl. cauc. no 401. and suppl. p. 154. exclusive of the syn. of Schrad. and D. C.) leaves crenated, glabrous above, but clothed with fine tomentum beneath: lower ones oblong, tapering into the petioles: cauline ones oblong-ovate, cordate, on short petioles: upper ones acuminated, nearly sessile; racemes panicled; pedicels hardly exceeding the calyx. ♃. H. Native of the Ukrain, along with *V. nìgrum*. Schrad. verb. 2. p. 23. V. nìgrum, Pall. ind. taur. ex Bieb. Stem flexuous and branched. Leaves opaque. Corolla yellow.

Eastern Mullien. Fl. June, July. Clt. 1821. Pl. 2 to 3 feet.

49 V. alope'curos (Thuill. fl. par. p. 110. D. C. fl. fr. no. 2626.) leaves crenated, downy above, clothed with hoary tomentum beneath: lower ones oblong-ovate, subcordate, petiolate: cauline ones oval-oblong, on short petioles: upper ones oblong-ovate, nearly sessile; racemes simple; pedicels longer than the calyx. ♃. H. Native of France, in arid places. Schrad. verb. 2. p. 26. Very nearly allied to *V. nìgrum*. Stem tomentose, as well as all the plant, with the exception of the upper surfaces of the leaves. Radical and cauline leaves a span long, doubly crenated. Racemes usually simple, a span or more long. Filaments clothed with white wool. The rest as in *V. nìgrum*.

Fox-tail-racemed Mullien. Fl. July, Aug. Clt. 1820. Pl. 3 to 4 feet.

50 V. Cha'ixii (Vill. dauph. 2. p. 491. t. 13. exclusive of the synonymes. Schrad. verb. 2. p. 27.) leaves oblong-ovate, cordate, petiolate, crenated, clothed with fine tomentum: lower ones pinnatifid at the base; racemes panicled; pedicels longer than the calyx. ♂. H. Native of Piedmont, Dauphiny, southern provinces of France, in rocky places. Lam. dict. 4. p. 220. D. C. fl. fr. no. 2680. and suppl. p. 480. Very like *V. nìgrum*, but is less robust, and usually branched above. Leaves deep green. Racemes more numerous, smaller, and more slender, disposed in a panicle, and the flowers are a little smaller.

Var. β, *urticæfòlium*; lower leaves less cut. ♂. H. V. urticæfòlium, Lam. dict. 4. p. 220.

Var. γ, *dentàtum* (Rœm. et Schultes, syst. 4. p. 339. β.) stem twiggy, branched at top; flowers racemosely spicate; corollas villous outside; leaves lanceolate, sessile, tomentose beneath, and rather villous above, serrated: radical ones petiolate, doubly toothed. ♂. H. Native of the Pyrenees. V. dentàtum, Lapeyr. fl. pyr. p. 114. D. C. fl. fr. suppl. no. 2680. a.

Chaix's Mullien. Fl. June, Aug. Clt. 1821. Pl. 3 to 4 feet.

51 V. ni'grum (Dodon. hist. p. 144. icon. Lin. spec. p. 253.) leaves crenated, nearly glabrous above, but clothed with fine tomentum beneath, or pubescent: lower and cauline ones oblong-ovate, cordate, petiolate: superior ones ovate-oblong, nearly sessile; racemes elongated; pedicels twice as long as the calyx. ♃. H. Native throughout Europe and Siberia, in waste places, way-sides, and in hedges; plentiful in some parts of Britain. Smith, engl. bot. t. 59. Oed. fl. dan. 1088. Schrad. verb. 2. p. 24.—Hall. helv. no. 584.—Mor. hist. 2. sect. 5. t. 9. f. 5.—Bauh. hist. 3. p. 873. icone.—Lob. icon. 1. p. 562. Stems simple, or divided a little at apex, brownish-purple, downy, or glabrous. Leaves opaque above. Racemes $1\frac{1}{2}$ foot long, simple, or furnished with 1 or 2 short branches at the base; fascicles many-flowered: lower ones remote: upper ones crowded. Corolla yellow. Filaments clothed with purple wool. Anthers all reniform; pollen vermillion. Down branched, or stellate.

Var. β; racemes subpanicled. ♃. H. Native of France. V. Parisiénse, Thuill. fl. par. p. 110.

Var. γ, *gymnostèmon* (Rœm. et Schultes, syst. 4. p. 345.) stamens glabrous, or naked.

Var. δ, *albiflòrum*; flowers white.

Var. ε; flowers funnel-shaped, proliferous. ♃. H. Native of Siberia. Verbáscum, Gmel. sib. 4. p. 91. t. 47.

Black-rooted Mullien. Fl. May, Aug. England. Pl. 3 to 4 feet.

52 V. Bana'ticum (Schrad. verb. 2. p. 28.) lower leaves oval-oblong, petiolate, triply crenated, tomentose, pinnatifid at the base: cauline leaves oblong-ovate, doubly crenated, nearly sessile: superior ones broad-ovate, subcordate, smoothish, sessile; racemes panicled; pedicels longer than the calyx. ♂. H. Native of Banatu, near Alt-orsowa, and frequent about Topliz. V. sinuàtum, Rochel, pl. ban. exsic. no. 136. V. sinuàtum, β, Banáticum, Rochel, in litt. and Schrad. Upper cauline leaves half stem-clasping, all glabrous above. Down stellate. Herb deep green. Disposition and structure of flowers that of *V. sinuàtum*.

Banatic Mullien. Pl. 2 to 4 feet?

53 V. lana'tum (Schrad. verb. 2. p. 28. t. 2. f. 1.) leaves clothed with woolly tomentum beneath: lower and cauline leaves oblong, petiolate, somewhat triply crenated: upper ones oblong-ovate, sessile, acutely crenated; racemes simple; pedicels twice as long as the calyx. ♃. H. Native of Italy, Bassi; Carnea, Wulf; Carinthia, Bernhardi. Plant clothed with white woolly tomentum, except the upper surfaces of the leaves. Lower leaves 3-4 inches long. Racemes a span long, simple; fascicles remote, 4-6-flowered: lower ones leafy. Flowers sweet-scented. Calyx and corolla as in *V. nìgrum*, but the tube is sometimes spotted with purple. Stamens, structure, and colour of those of *V. nìgrum*.

Woolly Mullien. Fl. July, Aug. Clt. 1825. Pl. 3 to 4 feet.

54 V. RUBIGINÒSUM (Waldst. et Kit. pl. hung. 2. p. 216. t. 197.) leaves crenated, pubescent beneath: lower ones oblong, obtuse, petiolate: cauline ones oblong-ovate, acutish, sessile: superior ones ovate, acute, sub-cordate, half stem-clasping; racemes panicled; pedicels much longer than the calyx. ♂. H. Native of Hungary, about Pesth, Akazto, and elsewhere, Waldst. et Kit.; south of Podolia, Besser; and of Caucasus, in high, grassy lands between Tyra and Borysthene; very rare at the river Terek, Bieb. Habit and flowers of *V. ferrugíneum;* and the leaves like those of *V. phœníceum.* Stem downy. Leaves deep green: radical ones 3-4 inches long. Racemes a foot long, leafy at the base, generally simple; fascicles remote, 3-5-flowered, rarely 6-flowered: upper ones usually 2-flowered. Flowers scentless, size of those of *V. Blattària.* Corolla of a reddish rust colour outside, and of a yellowish rust colour inside, spotted with red towards the tube. Filaments clothed with purple wool. Anthers equal; pollen copper-coloured.

Rusty-flowered Mullien. Fl. June, Aug. Clt. 1817. Pl. 3 to 4 feet.

55 V. HYOSERIFÒLIUM (Schrad. verb. 2. p. 31. t. 3. f. 1.) leaves tomentose: lower ones linear-lanceolate, attenuated at the base: superior ones oblong, acutely-crenated, sessile: upper ones broad-ovate, auriculately cordate; racemes panicled; pedicels twice as long as the calyx. ♂.? H. Native of the Levant. Stem erect, simple, tomentose. Leaves greenish grey beneath: radical and lower cauline leaves a span long, sub-sinuated: upper cauline leaves half stem-clasping. Racemes a span to a foot long; fascicles 4-7-flowered: lower ones remote. Corolla middle-sized, yellow, a little larger than those of *V. Lychnìtis.* Filaments all clothed with yellowish wool; anthers equal.

Hyoseris-leaved Mullien. Pl. 3 to 4 feet.

56 V. VIMINA'LE (Guss. pl. rar. p. 101. t. 21.) stem simple; leaves oblong-elliptic, crenulated, green, and beset with ad-pressed villi above, but clothed with white tomentum beneath; racemes rather crowded; lower fascicles remote; bracteas, calyxes, and capsules densely clothed with mealy tomentum. ♂. H. Native of Japygia, on arid hills, as on Massafra, Castellaneta, and Taranto. Stem tomentose, green, or purplish, 2-4 feet high, tough, and serve for tying, hence the specific name. Radical leaves 5-6 inches long: cauline leaves sessile: upper ones half stem-clasping, drawn out at the base, and therefore somewhat decurrent. Racemes solitary, 1 to 1½ foot long; fascicles 2-4-flowered, one of the flowers usually fertile. Corolla not seen.

Twiggy Mullien. Pl. 3 to 6 feet.

* * * *Flowers twin and solitary.*

57 V. ANGUSTIFÒLIUM (Tenore, prod. suppl. 2. p. 64. syn. p. 37.) leaves crenulated, tomentose: lower ones linear-lanceolate, tapering into the petioles: upper ones oblong-ovate, sessile; spike simple; flowers solitary, sessile. ♂. H. Native of Calabria, and Nicotera, in dry fields. V. Calábricum, Richard, in litt. Stem simple, clothed with canescent tomentum, dwarf. Leaves calvescent above in the adult state. Radical and lower cauline leaves length of stem: upper cauline ones half stem-clasping. Corolla yellow, larger than those of *V. Lychnìtis.* Filaments beset with white hairs. Anthers reniform. The whole plant is densely clothed with canescent tomentum, which becomes loose, and falls off in part during summer.

Narrow-leaved Mullien. Fl. July, Aug. Clt. 1824. Pl. 1 to 1½ foot.

58 V. SÍMPLEX (Labill. pl. syr. dec. 4. p. 10. t. 5.) leaves crenated, tomentose: lower ones obovate-spatulate, tapering into the petioles: upper ones ovate, sessile; racemes subspicate; flowers twin and solitary. ♃. H. Native in sandy places near Damascus. Schrad. verb. 2. p. 32. Stems simple, many from the same root, which is woody, tomentose. Radical and lower cauline leaves 2½ inches long. Flowers nearly sessile: lower and upper ones solitary: the rest twin, but very rarely by threes. Corolla like that of *V. blattària,* but smaller. Stamens all woolly: anthers all reniform. There is a variety of this having the superior flowers smaller and sessile.

Simple-stemmed Mullien. Pl. 1 to 1½ foot.

59 V. MAJA'LE (D. C. fl. fr. suppl. no. 2673. b. Schrad. verb. 2. p. 33.) leaves crenated, tomentose: lower ones ovate-oblong, and ovate, petiolate: upper ones oblong-ovate, sub-cordate, sessile; racemes subspicate; flowers twin and solitary; anthers equal. ♂. H. Native of the Pyrenees, Flügge; in sandy, sterile places near Nice, Rohde; Montpelier at Cambrettes, and elsewhere, D. C. This is a very polymorphous plant, densely clothed with white floccose, caducous tomentum. Stem simple, purplish brown. Radical and lower cauline leaves 2 to 2½ inches long: upper ones half stem-clasping. Flowers on short pedicels. Corolla yellow, size of those of *V. Blattària* and *V. phlomoìdes.* The 3 smaller filaments clothed with purple wool; the 2 longer ones pilose only in the middle.

Var. β, longibracteàtum (Schrad. verb. 2. p. 34.) lower bracteas twice as long as the calyx; the plant is, however, less tomentose, and larger in all its parts than the species.

Hog Mullien. Fl. July, Aug. Clt. 1817. Pl. 2 to 3 feet.

60 V. BUGÙLÆFÒLIUM (Lam. dict. 4. p. 226. Schrad. verb. 2. p. 35. exclusive of the syn. of Lin.) lower leaves broad-ovate, crenated, glabrous, petiolate: superior cauline ones lanceolate, acuminated, deeply serrated, rather pilose; racemes subspicate; flowers solitary; anthers equal. ♂. H. Native about the Bosphorus. Blattària orientàlis, Bugulæ folio, flore maximo virescente, lituris luteis in semicirculum striato, Tourn. cor. p. 8. itin. 2. p. 83. with a figure.—Buxb. cent. 5. p. 17. t. 32. Stem simple, rather villous. Radical leaves 1½ to 2 inches long, obtuse. Flowers on short pedicels. Corollas larger than those of *V. phlomoìdes,* pale green, verging to yellow, marked by 2 purple stripes. Filaments clothed with purple wool; the 2 larger ones only in the middle.

Bugloss-leaved Mullien. Pl. 2 to 3 feet.

61 V. COMPA'CTUM (Bieb. fl. cauc. no. 399, exclusive of the syn. of Till. pis. suppl. p. 151. Schrad. verb. 2. p. 35.) leaves ovate, coarsely crenated, tomentose beneath: lower ones tapering into the petioles: cauline ones petiolate: upper ones sub-cordate, sessile; spikes compact; flowers solitary; 2 of the anthers oblong. ♂. H. Native of Tauria and Caucasus; and Iberia, Bieb.; Lower Volga, Heming. Stem tomentose, simple, or divided a little at top. Leaves at length almost glabrous above. Tomentum of a greyish green colour. Lower leaves 2-3 inches long: upper cauline ones half stem-clasping. Spike ½ a foot to a span long, dense, interrupted a little at the base. Corolla yellow. Filaments copper-coloured, beset with orange-coloured wool, unequal; the 2 longer ones only pilose inside. Pollen vermillion. There is a variety having the radical leaves repandly crenated.

Compact-flowered Mullien. Fl. July, Aug. Clt. 1820. Pl. 2 to 3 feet.

62 V. OVALIFÒLIUM (Donn, hort. cant. ed. 4. p. 42. Sims, bot. mag. t. 1037.) stems simple; leaves oval, sessile, dentately crenated, tomentose beneath, and nearly glabrous above; spike long, simple; flowers solitary? ♃. H. Native of Caucasus. Habit of *Célsia Crética.* Each flower furnished with 3 bracteas: the middle one orbicular, acuminated: lateral ones small. Corolla large, orange-yellow. Filaments fulvous: the 3 smaller ones bearded, the other 2 naked. Capsule globose. Perhaps the same as *V. compáctum.* Leaves large.

Oval-leaved Mullien. Fl. July, Sept. Clt. 1804. Pl. 2 to 3 feet.

63 V. FORMÒSUM (Fisch. hort. gorenki, 1812. p. 25. Schrad. verb. 2. p. 36.) leaves tomentose beneath: lower ones elliptic-ovate, somewhat triply crenated, and are, as well as the cauline ones, petiolate: upper ones ovate, cordate, simply crenated; spikes elongated; flowers solitary; 2 of the anthers are oblong. ♂. H. Native of Tauria, Caucasus, and Iberia. Steven and Ledebour. D. Don, in bot. reg. t. 558. Schrank, hort. mon. t. 22. Stem simple, or branched at top. Spikes dense. Corolla large, yellow, with a dark purple centre. Filaments clothed with purple wool.

Handsome Mullien. Fl. July, Aug. Clt. 1818. Pl. 2 to 4 feet.

64 V. BETONICÆFÒLIUM (Desf. cor. de Tourn. p. 33. t. 23. and in ann. mus. 11. p. 54. with a figure. Schrad. verb. p. 37.) leaves crenated, villous: lower and cauline ones oblong, cordate, petiolate: upper ones oblong-lanceolate, sessile; raceme spicate; flowers solitary; 2 of the anthers are oblong. ♃. H. Native of Armenia. Schrad. verb. 2. p. 37. Stem simple, villous. Leaves deep green: lower and cauline ones 2-3 inches long. Racemes 2-3 inches long. Flowers crowded, on short pedicels. Corollas yellow, smaller than those of *V. Blattària*. Three of the filaments are woolly, and the other two declinate and glabrous. Capsule roundish.

Betony-leaved Mullien. Fl. June, Aug. Clt. 1825. Pl. 1½ to 2½ feet.

65 V. PUNI'CEUM (Schrad. hort. gött. fasc. 2. p. 20. t. 14. verb. 2. p. 38.) leaves doubly crenated, pubescent: radical and lower cauline ones ovate, cordate, petiolate: upper ones oblong-ovate, sessile; racemes elongated; pedicels usually twin, twice as long as the bracteas. ♃. H. Native of the South of Europe. Stems many from the same root, branched at top, rarely simple, more or less downy. Leaves green: radical and lower cauline ones 4-6 inches long, obtuse; one of the lobes at the base longer than the other: upper ones half stem-clasping, acute, or acuminated. Racemes flexuous, drooping at top: terminal one 1 foot and more long; but the lateral ones are much shorter. Flowers twin, except the upper ones, remote. Corolla dirty red. Filaments clothed with purple wool. Anthers all reniform; pollen copper-coloured. Down simple. There is a variety of this having the lower leaves subtriply crenate: the upper ones recurved at top, and the uppermost ones rounded at the base, not cordate.

Light-red-flowered Mullien. Fl. June, Aug. Clt. 1820. Pl. 2 to 4 feet.

66 V. SPECTA'BILE (Bieb. fl. cauc. suppl. p. 158.) leaves oblong-ovate, cordate, doubly crenated, rather villous above, but villously tomentose beneath: lower and cauline leaves petiolate: superior ones sessile, half stem-clasping; raceme terminal, elongated; pedicels twin and solitary, about equal in length to the bracteas. ♃. H. Native of the South of Tauria, on mountains about Sobla; at the fountains of the river Salgir; and on mountains above Utu-Usen, Bieb. Stem simple, and is, as well as the under sides of the leaves, tomentose. Leaves all cordate, green above, but paler beneath: radical and lower cauline ones 2½ to 3½ inches long. Raceme length of stem; those of the branches, if present, shorter. Lower pedicels twin, beset with simple and glandular hairs. Corolla showy, yellow, spotted with purple in the bottom. Capsule downy, mucronate.

Eminent Mullien. Fl. June, July. Clt. 1820. Pl. 2 to 4 feet.

67 V. TRI'STE (Smith, prod. fl. græc. 1. p. 151.) leaves pubescent: lower ones elliptic-ovate, cordate, subsinuated, unequally crenated, petiolate: superior cauline leaves sessile; racemes elongated; pedicels solitary, spreading, much longer than the bracteas. ♃. H. Native on Mount Athos. Schrad. verb. 2. p. 40. V. ferrugíneum, Andr. bot. rep. t. 162. but not of others. Corollas rust-coloured, or yellowish-red.

Sad-flowered Mullien. Fl. July, Aug. Clt. 1788. Pl. 2 to 4 feet.

68 V. FERRUGI'NEUM (Mill. dict. no. 10. Ait. hort. kew. 1. p. 237.) leaves rather villous, wrinkled: cauline ones nearly sessile, equally crenated: radical ones oblong, cordate, doubly crenated; racemes spicate; pedicels twin and solitary: lower ones 3-4 together. ♃. H. Native of the South of Europe. Trew. ehret. p. 3. t. 16. f. 1. Miller says the radical leaves are almost entire, dark green above and paler beneath, on long petioles: cauline leaves acute, sessile. Corolla rust-coloured.

Rusty-flowered Mullien. Fl. May, Aug. Clt. 1683. Pl. 3 to 4 feet.

69 V. PHŒNI'CEUM (Lin. spec. p. 254) leaves pubescent beneath: lower ones elliptic, or ovate-oblong, subcordate, crenated, petiolate: upper cauline leaves crenulated, sessile; raceme terminal, elongated: pedicels solitary, much longer than the bracteas. ♃. H. Native of the South and East of Europe, on the margins of woods, and in stony grassy fields; and of Caucasus and Siberia. Lam. ill. t. 117. Gærtn. fruct. 1. p. 262. t. 55. Jacq. fl. austr. 1. t. 125. Curt. bot. mag. t. 885. Ker. bot. reg. 637.—Mor. hist. 2. sect. 5. t. 9. f. 1.—Bauh. hist. 3. p. 875. with a figure.—Tab. kraut. 959. icone.—Lob. icon. 1. t. 565. Stem downy, simple, or divided into a few floriferous branches. Leaves deep green, nearly glabrous above: radical ones 2-4 inches long: upper cauline ones half stem-clasping. Raceme length of stem. Flowers remote. Corolla deep purple, beset with small purple hairs at the base. Two of the filaments are clothed with purple hairs, and the other 3 with white hairs. Anthers all reniform; pollen copper-coloured. Down on the stem and lower leaves simple; of the other parts guttuliferous or glandular. Verb. Cisalpìni, Bisol. is a var. of this, ex Coll. in act. acad. taur. vol. 26. p. 507.

Purple-flowered Mullien. Fl. May, Aug. Clt. 1796. Pl. 2 to 4 feet.

70 V. CU'PREUM (Curt. bot. mag. t. 1226.) leaves cordate, wrinkled, crenated, woolly beneath; pedicels solitary, unibracteate. ♃. H. Native country unknown. Corolla of a rust-colour. The 3 shorter filaments covered with long, glandular, purple hairs; the 2 longer ones naked; anthers of the long filaments moon-shaped and naked: of the shorter ones nearly circular and hairy. Perhaps a hybrid between *V. ovalifòlium* and *V. phœníceum*.

Copper-coloured-flowered Mullien. Fl. May, Aug. Clt. 1798. Pl. 2 to 4 feet.

71 V. REPA'NDUM (Willd. enum. 1. p. 226. Schrad. verb. 2. p. 44.) leaves glabrous: lower ones obovate-oblong, attenuated at the base, somewhat sinuated: cauline leaves oblong, acute, crenated, sessile: superior ones broad-ovate, cordate, acuminated, acutely crenated, stem-clasping; racemes elongated; pedicels solitary: superior ones longer than the bracteas. ♂. H. Native country unknown. Célsia heterophýlla, Pers. ench. 1. p. 161. This species differs from *V. Blattària*, in the superior leaves being always broader, and exactly cordate, stem-clasping, and acutely crenated; in the bracteas being larger, broader, and serrulated. Racemes as in *V. blattarioìdes*, 3 feet long, and more. Flowers yellow, never white.

Repand-leaved Mullien. Fl. July, Aug. Clt. 1813. Pl. 4 to 6 feet.

72 V. BLATTA'RIA (Lin. spec. p. 254.) leaves glabrous: lower ones obovate-oblong, attenuated at the base, somewhat sinuated: cauline ones oblong, acute, crenated, sessile: superior leaves subcordate, acuminated, half stem-clasping; raceme terminal,

elongated; pedicels solitary, twice as long as the bracteas. ♂. H. Native of Middle and South Europe, in gravelly places; Tauria, and Caucasus, Bieb.; Palestine, Sieber; North America, Michx.; plentiful in some parts of Britain. Jaume St. Hil. pl. fr. t. 469. Smith, engl. bot. t. 393.—Sab. hort. 2. t. 56.—Mor. hist. 2. sect. 5. t. 10. f. 6. Bauh. hist. 3. p. 874. icone. Lob. icon. 1. t. 564. Lob. hist. p. 304. icone. Plant glabrous. Stem simple, or divided into floriferous branches at top. Leaves deep green. Calyx, peduncles, pedicels, bracteas, and ovarium, beset with very short guttuliferous hairs. Corollas yellow, larger than those of *V. phœníceum*. Filaments clothed with purple villi: the 2 longer ones only in the middle, on the inner side. Anthers all reniform.

Var. β, albiflòrum; flowers white. ♂. H. Native along with the species. V. glàbrum, Mill. fig. t. 67. dict. no. 8.—Barrel. icon. t. 1249.—Bauh. hist. 3. p. 874.—Lob. icon. 1. p. 563.

Moth Mullien. Fl. July, Aug. Britain. Pl. 4 to 6 feet.

73 V. BLATTARIOI'DES (Lam. dict. 4. p. 225. Schrad. verb. 2. p. 45.) leaves downy: lower ones elliptic-oblong, tapering into the petioles, coarsely crenated: cauline leaves oblong, acute, sessile: superior leaves oblong-ovate, subcordate, acuminated, acutely crenated, half stem-clasping; raceme terminal, very long; pedicels usually twin, shorter than the bracteas, and are, as well as the calyxes, clothed with viscid hairs. ♂. H. Native of France, by way sides, and in waste fields, on gravelly soil. V. crystallostèmon, Cat. sem. hort. dorp. 1818. V. glandulòsum, Thore. V. viscídulum, Pers. ench. 1. p. 215. V. glàbrum, Willd. enum. 1. p. 225. Stem pubescent, like the leaves; hairs simple, mixed with guttuliferous pili. Leaves glabrous on the upper surface in the adult state: radical and cauline ones 4-6 inches long. Raceme twiggy, simple, or a little branched at base. Bracteas 3 to each flower. Corolla yellow; the smaller segments furnished with a few hairs at the base, as in *V. Blattària*. Hairs of the longer filaments purple; of the rest purple on one side, and white on the other. Anthers as in *V. Blattària*.

Var. β, Lusitánicum (Schrad. verb. 2. p. 45.) larger in all its parts; lower leaves a foot long: the stem ones acuter, and doubly and acutely crenated; bracteas narrower. ♂. H. Native of Portugal. V. blattarioìdes, Brot. fl. lus. 1. p. 272. Hoffm. et Link. fl. port. 1. p. 219.

Blattaria-like Moth Mullien. Fl. July, Aug. Clt. 1805. Pl. 4 to 6 feet.

74 V. VIRGA'TUM (With. arrang. p. 250. Smith, engl. bot. t. 550.) leaves oblong-lanceolate, pubescent, toothed, sessile: radical ones sublyrate; stem branched; flowers in fascicles, nearly sessile. ♂. H. Native of Britain, in corn-fields and by way sides. V. blattarioìdes, β, virgàtum, Schrad. verb. 2. p. 45. Blattària magno flore, Bauh. hist. 3. p. 859. Lob. icon. 1. t. 564. Stem branched from the base. Leaves dentately crenated, pinnatifidly cut at the base, shining above: superior ones cordate, sessile. Flowers disposed in nearly sessile fascicles, yellow, large, with a purplish mouth. Perhaps only a variety of *V. blattarioìdes*, as considered by Schrader.

Twiggy Moth Mullien. Fl. July, Aug. Britain. Pl. 5 to 6 feet.

75 V. GRANDIFLÒRUM (Schrad. hort. gött. fasc. 2. p. 19. t. 13. verb. 2. p. 47.) leaves coarsely crenated, pubescent beneath: lower ones elliptic-oblong, attenuated into the petioles: cauline ones oblong, acute, sessile: superior ones broad-ovate, cordate, acuminated, stem-clasping; racemes spicate, elongated; pedicels solitary, shorter than the bracteas, and are, as well as the calyxes, downy. ♂. H. Native country unknown, but probably of Spain. Stems many from the same root, divided into floriferous branches at top. Leaves deep green, and glabrous above. Bracteas 3 to each flower. Racemes 1-2 feet long. Flowers crowded, but at length more remote. Corolla yellow. The 3 smaller filaments woolly: the 2 larger ones pilose on the inner side. Anthers of the longer filaments oblong.

Great-flowered Moth Mullien. Fl. July, Aug. Clt. 1820. Pl. 4 to 6 feet.

76 V. PYRAMIDA'TUM (Bieb. fl. cauc. 1. p. 161. suppl. p. 155.) leaves downy beneath: lower ones oval-oblong, doubly crenated, petiolate: cauline ones oblong-ovate, cordate, acute, nearly sessile: superior ones broad-ovate, acuminated, sessile; racemes panicled; pedicels usually solitary, shorter than the bracteas. ♃. H. Native of Caucasus and Iberia; and of Hungary, in woods, hedges, and among bushes. Schrad. verb. 2. p. 48. Sweet, fl. gard. t. 31. V. Caucásicum, Hort. Stem downy, branched at top. Leaves at length canescent, smoothish above, a span to 1 foot long, wrinkled. Racemes subspicate, disposed in a panicle, like those of *V. Lychnìtis* and *V. floccòsum*. Flowers remote, sweet-scented: the lower ones sometimes twin. Pedicels a little shorter than the calyxes. Bracteas solitary. Corollas yellow, size of those of *V. Thápsus*. Filaments clothed with purple villi. Anthers equal; pollen vermilion. Capsule downy.

Pyramidal-flowered Mullien. Fl. July, Aug. Clt. 1804. Pl. 5 to 8 feet.

77 V. SPINÒSUM (Lin. amœn. acad. 4. p. 307.) stem frutescent, spiny. ♄. F. Native of Candia, on the higher mountains, but never below the altitude of 300 hexapods; but in sterile places about Alexandria. Lam. dict. 4. p. 222. Sibth. et Smith, fl. græc. t. 229. Verbáscum Créticum, spinòsum frutéscens, Tourn. cor. p. 8.—Mor. hist. 2. sect. 5. t. 10. f. 8.—Alp. exot. p. 37. t. 36.—Clus. hist. p. 299. with a figure. Habit distinct from other species. Stem much branched; bark scabrous. Branches tomentose, but naked in summer; branchlets naked, flexuous, leafless, spinescent. Leaves linear-lanceolate, an inch long, obtuse, more or less sinuated, becoming gradually smaller and more entire as they ascend; with fascicles of smaller entire leaves in the axillæ of the upper ones. Peduncles at the extremity of the branches, scattered, spinescent, propped each by a small bractea. Corollas small, yellow, tomentose outside. Filaments clothed with white wool. Anthers all reniform: pollen orange-coloured.

Spiny Mullien. Fl. May, June. Clt. 1824. Shrub 1 to 1½ foot.

† *Doubtful species.*

78 V. BOERHAA'VII (Lin. mant. 45.) leaves sublyrate; flowers sessile. ☉. H. Native of the South of Europe. Willd. spec. 1. p. 1002. V. lùteum, Mill. fig. 273. V. blattàriæ foliis nigrum amplioribus, floribus luteis, apicibus purpurascentibus, Boerh. ludgb. 1. p. 228. Till. pis. t. 50.? Leaves sessile, a little decurrent, spatulate, narrowed at the base, sinuated, naked above, and tomentose beneath. Spike like that of *V. Thápsus*, but not so crowded, and with numerous bracteas to each flower. Corolla yellow. Genitals purple, ex Lin. Perhaps a hybrid between *V. phlomoìdes* and some allied species.

Boerhaave's Mullien. Fl. July. Aug. Clt. 1731. Pl. 2 to 3 feet.

79 V. HÆMORRHOIDA'LE (Ait. hort. kew. ed. 1. p. 236.) leaves ovate-oblong, attenuated at the base, tomentose, obsoletely crenulated; racemes spike-formed, elongated; fascicles of flowers bractless. ♂. H. Native of Madeira. It is doubtful whether this is a true species of the genus, from the want of bracteas, and it is not enumerated in the second edition of Hort. kew.

Hæmorrhoidal Mullien. Fl. June, Aug. Clt. 1777. Pl. 2 to 4 feet.

80 V. corda'tum (Desf. fl. atl. 1. p. 186.) leaves tomentose: radical ones cordate, petiolate, crenulated, obtuse: cauline ones stem-clasping, quite entire. ♂.? H. Native of Mount Atlas, near Tlemsen. Stem simple, or a little branched, tomentose, erect, thickness of a finger. Flowers unknown.

Cordate-leaved Mullien. Pl. erect.

81 V. Claytònii (Michx. fl. bor. amer. 1. p. 148.) glabrous; stem very simple; cauline leaves nearly lanceolate-oblong, deeply crenated: the crenæ again crenated; spikes like those of *V. Blattària*. ♂. H. Native of Carolina. This is probably only a variety of *V. Blattària*.

Clayton's Mullien. Pl. 4 to 6 feet.

82 V. stri'ctum (Clark. trav. ed. 2d. pt. 2. sect. 1. p. 262.) stem shrubby, erect; lower leaves spatulate-ovate, petiolate: superior leaves ovate-lanceolate, obsoletely toothed or quite entire, sessile; all canescent from stellate hairs; racemes elongated; pedicels divaricate, longer than the calyx. ♄. F. Native of the Island of Rhodes. Plant tomentose. Leaves 1½ to 2 inches long and more. Racemes panicled. Flowers large, an inch in diameter, yellow.

Strict Mullien. Shrub 5 to 6 feet.

83 V. laxiflòrum (Presl. del. prag. 1. p. 76.) leaves crenulated, densely clothed with stellate tomentum on both surfaces: radical ones oblong-ovate, mucronate: cauline ones sessile: upper ones ovate, acuminated; flowers panicled; fascicles many-flowered, loose. ♂. H. Native in the region of Mount Ætna.

Loose-flowered Mullien. Pl.?

84 V. bractea'tum (Presl. del. prag. 1. p. 214.) leaves ovate-oblong, toothed, green on both surfaces, rather tomentose beneath: radical ones acute: lower cauline ones acuminated, petiolate: upper ones lanceolate-linear, exceeding the aggregate fascicles of flowers. ♂. H. Native of Bohemia. Very nearly allied to *V. lychnìtis*, and is probably only a variety of it.

Bracteate-flowered Mullien. Pl. 3 to 4 feet.

85 V. gla'brum (Delarb. in journ. de santé et d'hist. nat. bourd. 2. p. 166. and in journ. soc. pharm. par. 1. p. 154.) stem angular, branched; leaves glabrous, obscure green: radical ones petiolate, elliptic, crenated: cauline ones subdecurrent, cordate, auricled; fruit spicate, sessile, bracteate. ♂. H. Native of France. If the cauline leaves of this species are truly subdecurrent, it is distinct from all others.

Glabrous Mullien. Pl.

86 V. a'nnuum (Mill. dict. no. 11.) radical leaves oblong, quite entire, deep green on both surfaces: cauline leaves acute, sessile; flowers aggregate, pedicellate. ♂.? ⊙.? H. Native of Sicily. Blattària annua, flore majore luteo, capsulâ item majore, Mor. hist. 2. p. 498. Lower leaves 10 inches long, rounded at apex. Raceme long, loose, terminal. Flowers fascicled, deep yellow. Capsule large, brownish. Perhaps V. glàbrum, Willd.; the V. blattarioìdes, Lam.

Annual Mullien. Fl. July, Aug. Clt.? Pl. 4 to 9 feet.

Cult. The species of *Verbáscum* are generally tall, robust plants, they therefore should be grown at the back of flower borders, or in shrubberies, where they will make a showy appearance. They thrive in any common soil, and are all readily increased by seeds; and some of the perennial kinds by divisions of the root. As there is hardly any genus more liable to sport into hybrids than *Verbáscum* by promiscuous impregnation, it is difficult to say what is a hybrid, or what is a species in the gardens. These hybrids we have found, however, to become abortive generally about the third generation, plainly showing that nature has its limits.

II. RAMO'NDIA (named in honour of L. Ramond, a French botanist, and traveller in the Pyrenees; author of "Voyages au Mont Perdu," 1 vol. 8vo. Paris, 1801.) Richard in Pers. ench. 1. p. 216. Lam. et D. C. fl. fr. syn. 1. p. 236. Mycònia, Lapeyr. Chaìxia, Lapeyr. Verbáscum species, Lin.

Lin. syst. *Pentándria, Monogýnia.* Calyx campanulate, 5-parted. Corolla rotate, 5-lobed, or 5-parted, rarely 4-parted, rather unequal, hairy at the base of the sinuses of the lobes. Stamens approximate. Anthers perforated at the apex. Stigma roundish. Capsule 1-celled, 2-valved: valves bent in at the margins, forming dissepiments; placentas 2, parietal, many-seeded.—A stemless plant, with radical, rosulate, wrinkled, hairy leaves, and 1, or few-flowered scapes, and large purple corollas.

1 R. Pyrena'ica (Rich. in Pers. ench. 1. p. 216.) ♃. H. Native of the Pyrenees and Piedmont, in groves. R. scapígera, Jaume St. Hil. fam. nat. 1. p. 280. Verbáscum Mycòni, Lin. spec. p. 255. Mill. icon. t. 277. Curt. bot. mag. 236. Mycònia borragínea, Lapeyr. abr. p. 115. Chaìxia Mycòni, Lapeyr. abr. suppl. p. 37. Cortùsa foliis ovatis sessilibus, Lin. hort. cliff. p. 50. Trew. ehret. p. 26. t. 57. Auricula Ursi Myconi, Dalech. hist. p. 837. Leaves radical, ovate, tapering into the petioles, disposed in a rosulate manner, broadly and deeply crenated, clothed with long, rufous, silky hairs on the under side and along the margins, and white hairs above. Scapes naked, pubescent, 2-4 inches long, usually 1-flowered, rarely 2-5-flowered.

Pyrenean Ramondia. Fl. May. Clt. 1731. Pl. ¼ foot.

Cult. This is a pretty little alpine plant. It grows well in common garden earth, and is well fitted for the front of flower borders, or to be grown among other alpine plants. It is readily propagated by division.

III. CE'LSIA (named by Linneus, in honour of Olaus Celsius, D.D. professor of the Greek language, and afterwards of theology, in the University of Upsal.) Lin. gen. no. 757. Schreb. gen. no. 1015. Juss. gen. p. 124. ed. Usteri. p. 139. Gærtn. fruct. 1. p. 262. t. 55. Nees in Lin. trans. 17. p. 80. Verbáscum species, Tourn.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted. Corolla rotate, 5-lobed. Perfect stamens 4, didynamous, that is 2 long and 2 short, all bearded. Anthers woolly.—Herbs. Leaves simple, or pinnate. Flowers disposed in loose, terminal racemes, rising each from the axil of a bractea, or small leaf.

Sect. I. Arctu'rus (from *αρκτος, arctos*, a bear; and *ουρα, oura*, a tail; in reference to the long raceme of flowers, which has been compared to a bear's tail.) Benth. scroph. ind. p. 5. Herbs. Filaments all bearded; anthers of all fixed by the middle, 2-celled, and, with the cells, confluent.

1 C. orienta'lis (Lin. spec. 866. hort. ups. 179. t. 2.) lower leaves jagged: cauline ones bipinnate. ⊙. H. Native of Cappadocia and Armenia. Lam. ill. 1. t. 532. Sibth. et Smith, fl. græc. t. 605. Verbáscum orientàle Sophiæ folio, Tourn. cor. 8.—Buxb. cent. 1. p. 14. t. 20. and 5. p. 17. t. 33. Plant glabrous or downy. Segments of leaves narrow. Calyx clothed with glandular down. Flowers shorter than the bracteas, of a rusty yellow colour outside, and yellow inside.

Eastern Celsia. Fl. June, July. Clt. 1713. Pl. 2 feet.

2 C. Pe'rsica (Meyer, verz. pflanz. p. 111.) perennial, pubescent; radical leaves bipinnatifid: cauline ones cut; pedicels much longer than the sublinear bracteas; calycine segments sublinear, one half shorter than the capsule, which is pear-shaped. ♃. H. Native of Caucasus, in dry stony places on the Talusch mountains.

Persian Celsia. Pl. 2 feet.?

3 C. Arctu'rus (Lin. syst. 561. Vahl, symb. 3. p. 79.) radical leaves lyrate: superior ones oblong; pedicels longer than the bracteas; calycine segments linear, quite entire. ♂. H. Native of Candia. Curt. bot. mag. t. 1962. Verbáscum Arctùrus, Lin. spec. 254. Jacq. hort. vind. 2. t. 117.—Column. ecphr. 2. p. 81. t. 82.—Alp. exot. p. 123. t. 122. Floral leaves sessile, cordate, serrately toothed. Corollas large, yellow. Filaments bearded with purple hairs.

Bear's Celsia. Fl. July, Sept. Clt. 1780. Pl. 4 to 6 feet.

4 C. Coromandelia'na (Vahl, symb. 3. p. 79. Nees in Lin. trans. 17. p. 80.) clothed with hoary villi; lower leaves lyrate: floral ones cordate, half stem-clasping; peduncles 3 times as long as the calyx; calycine segments ovate, somewhat serrated. ⊙. H. Native of the East Indies. Flowers yellow, size of those of *C. Arctùrus*.

Var. β, heterophýlla (Nees, l. c. p. 81.) lower leaves pinnate: terminal leaflet large, ovate-lanceolate: upper leaves sessile, subcordate; stem much branched; branches twiggy, racemose. ⊙.? H. Native of the East Indies.? C. heterophýlla, Pers. ench. 1. p. 161. Flowers small, yellow.

Coromandel Celsia. Fl. July, Aug. Clt. 1783. Pl. 4 to 6 feet.

5 C. viscòsa (Roth, catalect. fasc. 2. p. 69. fasc. 3. p. 50. Nees, in Lin. trans. 17. p. 81.) clothed with clammy pubescence: lower cauline leaves lyrate: floral ones cordate, half stem-clasping; peduncles equal in length to the flowers; calycine segments oblong-lanceolate, quite entire. ⊙. H. Native of the East Indies, at Tanjore. Link. enum. 2. p. 146. C. Coromandeliàna, Vahl, symb. 3. p. 79. diagnosis, but not the description. Willd. spec. 3. p. 280. Corolla yellow, like those of the preceding.

Clammy Celsia. Fl. July, Aug. Clt. 1816. Pl. 3 to 4 feet.

Sect. II. Pseudotha'psus (from ψευδης, *pseudes*, false; and *thapsus*, the name of the shepherd's club.) Benth. scroph. ind. p. 5. Herbs. The 2 longer stamens glabrous, with oblong adnate anthers: the 2 shorter stamens bearded, having the anthers fixed by the middle, with the cells confluent.

6 C. Cre'tica (Lin. syst. 469. Vahl, symb. 3. p. 80.) radical leaves lyrate: upper ones oblong; flowers nearly sessile, length of bracteas; calycine segments ovate, serrated. ♂. H. Native of the North of Africa and Candia. Curt. bot. mag. 964. Upper leaves or bracteas cordate, serrated, stem-clasping. The 2 lower filaments smooth. Corolla yellow, large, marked by 2 rust-coloured spots at the bottom on the upper side. Plant hoary.

Cretan Celsia. Fl. July, Sept. Clt. 1752. Pl. 5 to 6 feet.

7 C. betonicæfòlia (Desf. fl. atl. p. 58. Willd. spec. 3. p. 281.) hairy; leaves ovate-oblong, wrinkled, crenated: floral ones lanceolate, half stem-clasping, shorter than the pedicels; calycine segments ovate, acute, with serrated or entire edges. ♂. F. Native of Algiers, in waste fields. Blattària Hispánica maximo flore, Dodart. icon. Shaw. afr. no. 78. Stem simple, or branched. Leaves glabrous, or scarcely hairy, often pinnate at the base. Corolla yellow, the 2 superior segments marked each by a purple spot. Lower filaments glabrous.

Betony-leaved Celsia. Fl. July, Aug. Clt.? Pl. 2 to 3 feet.

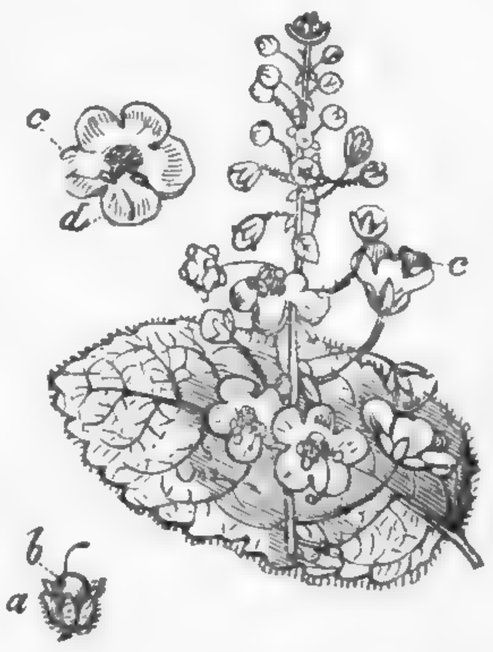
Sect. III. Neffle'a (meaning unknown to us.) Benth. l. c. Small shrubs. Filaments all bearded. Anthers all terminal, 1-celled, dehiscing by 2 ovate-acute valves.

8 C. lanceola'ta (Vent. hort. cels. t. 27.) rather tomentose; leaves lanceolate, serrated, attenuated at the base; pedicels rather shorter than the floral leaves; calycine segments entire, acute. ♄. F. Native at the mouth of the Euphrates. Corolla yellow, marked with purple spots at the base.

Lanceolate-leaved Celsia. Fl. July, Sept. Clt. 1816. Shrub 3 to 4 feet.

9 C. sublana'ta (Jacq. fragm. 79. no. 247. t. 126. Ker. bot. reg. 438.) shrubby, clothed with woolly tomentum; leaves oval-oblong, obtuse, crenated, wrinkled, soft. ♄. G. Native country unknown. Leaves doubly crenated, alternate, petiolate, or furnished with 1 or 2 pairs of sessile leaflets at the base. Bracteas sessile, acute, small, subserrated. Flowers sweet-scented.

FIG. 45.



Woolly Celsia. Fl. July, Sept. Clt. 1818. Shrub 1 to 2 feet.

10 C. parviflòra; radical leaves pinnatifidly runcinate, tomentose on both surfaces; stem branched, nearly naked; flowers small. ♄. H. Native country unknown. Verbáscum parviflòrum, Lam. dict. 4. p. 222. Pers. ench. 1. p. 216. Radical leaves size of those of *Leóntodon Taráxacum*. Segments ovate, or ovate-oblong, acutish, entire, or a little toothed. Flowers in fascicles. Ovarium tomentose. Flowers size of those of *Scopària dúlcis*. Capsule size of *Coriander* seed.

Small-flowered Celsia. Shrub 1 to 1½ foot.

† *Doubtful species.*

11 C. Bernade'sii; stem nearly naked; leaves lanceolate, dentately sinuated, glabrous; peduncles solitary. ♂.? H. Native of Spain, on hills towards the town called Ortalezza. Verbáscum Bernadèsii, Vahl, symb. 2. p. 39. Stem glabrous, simple. Radical leaves numerous, petiolate, hardly 3 inches long, somewhat pinnatifid, acute, with lanceolate toothed segments; floral leaves small, cordate, cuspidate. Calycine segments unequal both in size and shape, all a little denticulated. Corolla yellow, Vahl. Peduncles an inch long.

Bernades's Celsia. Pl. 1 to 2 feet.

12 C. lyra'ta; hairy; radical leaves lyrately-pinnatifid at the base, having the margins angularly-toothed: cauline leaves unequally toothed, nearly sessile; calycine segments serrated. ♂.? H. Native of Spain?. Verbáscum lyràtum, Lam. dict. 4. p. 222. Stem weak, flexuous, leafy. Leaves glabrous above, or almost so, 3-4 inches long. Cauline leaves cordate, acute: upper ones stem-clasping. Flowers large, yellow, on short pedicels, solitary, disposed in a long raceme. Calycine segments unequal. Corolla 3 inches in diameter. The two lower filaments naked. Perhaps the same as *C. Crética*.

Lyrate-leaved Celsia. Fl. July, Aug. Clt. 1819. Pl. 2 to 4 feet.

Cult. The species of *Célsia* have much the habit of the species of *Verbáscum*, and like them bear showy yellow flowers. The seeds of them should be reared on a gentle hot-bed; and when the plants are of sufficient size they should be set separately in pots, as they require protection of a greenhouse or frame the first winter. In May of the second year they may be planted out into the open border in any warm, sheltered situation, where they will flower and ripen their seed. *C. sublanàta* and *C. parviflòra*, being shrubby, will require the same treatment as a geranium, or other common greenhouse shrub.

IV. ISANTHE'RA (from ισος, *isos*, equal; and ανθηρα, *anthera*, an anther; in reference to the stamens being 5, and equal.) Nees, in Lin. trans. 17. p. 82.

LIN. SYST. *Polygàmia, Diœ'cia.* Flowers polygamous. Calyx 5-cleft. Corolla rotate. Stamens 5, equal, straight, glabrous. Anthers reniform, 1-celled, opening by a vertical, longitudinal chink, clasping a semicircular connective. Stigma truncate. Capsule 2-celled, many-seeded. Seeds small, inserted in 4 lamelliform placentas. Female flowers without any corolla. Pistil as in the hermaphrodite flowers. Rudiments of stamens tubercle-formed.

1 I. PERMÓLLIS (Nees, l. c.)—Native of the East Indies, but in what particular part is unknown. Plant clothed with soft rusty wool. Leaves obovate-cuneiform, acute, tapering into the petioles, green above, white beneath, and rusty on the nerves and rib beneath. Flowers fasciculately glomerate in the axils of the leaves, nutant. Calyx woolly. Corolla glabrous, shorter than the calyx. Stem erect, filled with white medulla. Down simple.

Soft Isanthera. Pl. ?

Cult. For culture and propagation see *Célsia*, p. 499.

ORDER CLXIX. SCROPHULARI'NEÆ (this order contains plants agreeing with the genus *Scrophulària* in particular characters.) R. Br. prod. p. 433. D. Don, in edinb. phil. p. 108. Benth. scroph. ind. p. 15.—Scrophulàriæ and Pediculàres, part. Juss. gen. p. 99. & 117. Personàtæ part. Lin. nat. ord.

Calyx 4-5-parted, permanent. Corolla monopetalous, hypogynous, deciduous, irregular, bilabiate, personate, or ringent, imbricate in æstivation. Stamens usually 4, didynamous, sometimes only 2, and sometimes with the rudiment of a fifth. Ovarium 2-celled. Style one; stigma 2-lobed, or undivided. Fruit capsular, rarely baccate, 2-celled, 2-4-valved. Seeds small. Albumen copious. Embryo terete, erect, inclosed, straight. Radicle inferior looking to the umbilicus.—Herbs or shrubs, various in habit, usually with opposite leaves. Inflorescence various.

From the great diversity of form found in this order, and from its partaking, both in habit and structure, of those orders to which it is more immediately allied; for example, the group *Scrophularièæ* closely approximates them to *Verbáscinæ* and *Solanàceæ;* the *Gratiòleæ* connects them with *Lentibulàreæ;* the *Antirrhineæ* and *Gerardièæ* with *Chelòneæ* and *Bignoniàceæ;* the *Calceolàreæ* with *Gesneriàceæ;* the *Euphrasièæ* with *Rhinanthàceæ;* and their affinity to *Verbenàceæ* is clearly established through the *Buddleièæ.* The *Verbáscinæ* approach so closely to the first group as to be only distinguished by their symmetrical flowers.

The greater part of Linnæus's *Didynàmia Angiospérmia* are found in this order. Capsular fruit and didynamous stamens being amongst the most obvious characteristics of the order. The species are natives of all parts of the world. Some of the plants of this order are highly ornamental, as *Digitàlis, Calceolària, Verónica, Russèlia, Alonsòa, Linària, Maurándya, Antirrhìnum, Gerárdia, Mímulus, Collinsia,* &c.; others are mere weeds. Most of them have a weak, unpleasant smell, a bitterish taste, and acrid and suspicious properties; the taste is refreshing in *Mímulus lùteus,* which is a culinary plant in Peru, and the ordinary acrid properties become emollient in some *Antirrhìnums.* The leaves and roots of *Scrophulària aquática, Gratìola officinàlis,* and *Peruviàna* and *Calceolària* act as purgatives, or, in strong doses, produce vomiting; these properties exist in a high degree in *Digitàlis purpùrea.* The leaves of this plant reduced to powder excite vomiting and vertigo, excite urine and saliva, and lower the pulse; in too strong doses they cause death; in moderate doses they are useful in scrophula, dropsy, asthma, &c.

Synopsis of the genera.

TRIBE I.

SCROPHULARIE'Æ. Calyx deeply 5-parted; segments dilated, with scarious edges, imbricate in æstivation. Corolla tubular, or campanulate, ventricose; limb bilabiate, 5-lobed. Stamens 4, fertile, didynamous; cells of anthers confluent at apex, inserted in a fleshy connective. Stigma capitate, or 2-lobed. Capsule crustaceous; dissepiment double, fixed to the inflexed margins of the valves, placentiferous on both sides. Testa of seeds thick, spongy, corrugated. Albumen fleshy. Embryo almost the length of the albumen.—Shrubs and herbs. Leaves opposite and alternate. Flowers terminal, racemose, yellow, purple or scarlet.

1 DIGITA'LIS. Corolla tubular, declinate; lower lip the longest.

2 ISOPLE'XIS. Corolla tubular, incurved; upper lip the longest.

3 SCROPHULA'RIA. Corolla with a subglobose tube, and a very unequal limb.

4 ALONSÒA. Corolla subrotate, resupinate from the twisting of the pedicels.

5 RUSSE'LIA. Corolla tubular, straight. Valves of capsule bipartible.

TRIBE II.

ANTIRRHI'NEÆ. Calyx deeply 5-parted, imbricate in æstivation. Corolla personate, ventricose; limb 5-lobed, bilabiate. Stamens 4, fertile, didynamous, sometimes with the rudiment of a fifth. Cells of anthers distinct at top. Stigma 2-lobed. Capsule crustaceous; dissepiment undivided; placentas spongy, adnate. Seeds with a thick, spongy, corrugated, or cellular testa. Albumen fleshy. Embryo almost the length of the seeds.—Herbs or sub-shrubs. Leaves opposite, or alternate. Flowers terminal, spicately racemose, or axillary solitary.

6 ANTIRRHI'NUM. Corolla personate, saccate, or gibbous at the base. Capsule opening by 3 valvate pores under the apex, rarely by 2 irregular holes.

7 LINA'RIA. Corolla personate, spurred at the base. Capsule opening by 2 lids at top, or by 4-10-tooth-formed, or valve-formed parts.

8 ANARRHI'NUM. Corolla bilabiate, spurred, or spurless at the base; throat open and naked. Capsule opening by 2 valve-formed lids at top.

9 GALVE'SIA. Corolla bilabiate; throat naked; tube elongated, gibbous at the base. Capsule bursting irregularly under the apex.

10 MAURA'NDYA. Corolla personate, gibbous at the base. Capsule dehiscing by 10 teeth at apex.

11 LOPHOSPE'RMUM. Corolla bilabiate; tube wide, gibbous at the base. Capsule dehiscing irregularly under the apex.

12 Neme'sia. Corolla personate, spurred at the base. Capsule compressed, truncate at apex.

13 Leucophy'llum. Corolla tubularly campanulate, bilabiate, without any spur at the base; palate convex.?

Tribe III.

Gratiòleæ. Calyx usually tubular, 5-cleft. Corolla tubular, ventricose, sometimes personate; limb 5-cleft, bilabiate. Stamens 4, didynamous, all, or only 2 of them, fertile; cells of anthers diverging, distinct at apex. Stigma usually bilamellate. Capsule often membranous, 2-celled, 2-4-valved, rarely almost 1-celled; dissepiment membranous, fixed to the inflexed margins of the valves; placentas spongy, at length free. Testa of seeds somewhat crustaceous. Albumen fleshy. Embryo length of seeds.—Herbs rarely sub-shrubs. Leaves opposite, or verticillate. Flowers axillary or terminal, usually yellow or purple.

§ 1. *Stamens 2, or 4, when 4, 2 of them are sterile.*

14 Grati'ola. Corolla tubular. Two upper stamens fertile. Capsule 4-valved.

15 Beyri'chia. Corolla tubular. Two lower stamens fertile. Valves of capsule hardly cleft.

16 Acheta'ria. Corolla tubular. Two lower stamens fertile. Valves of capsule bipartible.

17 Montìra. Corolla funnel-shaped; limb 5-cleft, almost equal. Capsule didymous, 4-valved.

18 Dopa'trium. Corolla much longer than the calyx, with a wide throat. Two upper stamens fertile. Capsule 4-valved.

19 Microcarpæ'a. Corolla minute, hardly exceeding the calyx. Stamens 2, none sterile. Capsule 2-valved.

20 Pepli'dium. Corolla equal in length to the calyx. Stamens 2, none sterile. Capsule dehiscing irregularly.

21 Bonna'ya. Stamens 4, 2 lower ones sterile. Capsule dehiscing valvately. Valves entire.

22 Hydrótriche. Corolla nearly regular. Stamens 2, without any rudiments of sterile ones.

23 Hemia'nthus. Calyx 4-toothed, cleft. Upper lip of corolla obsolete: lower one tripartite. Stamens 2; lateral clefts antheriferous.

24 Pterosti'gma. Two upper stamens fertile; upper segment of calyx the largest. Capsule with a loculicidal dehiscence; valves bifid.

§ 2. *Stamens 4, all fertile, sometimes with the rudiment of a fifth.*

25 Lindenbe'rgia. Cells of anthers separate. Calyx half 5-cleft.

26 Stemòdia. Cells of anthers separate. Calyx 5-parted.

27 Doda'rtia. Calyx tubular; teeth straight. Lower lip of corolla papillosely bigibbous at the base.

28 Ma'sus. Calyx campanulate; teeth spreading. Lower lip of corolla papillosely bigibbous at the base.

29 Limnóphila. Calyx tubularly campanulate. Lower lip of corolla glabrous, with flat segments.

30 Morga'nia. Calyx 5-parted, equal. Lower lip of corolla with obcordate, equal segments.

31 Herpe'stis. Segments of calyx very unequal. Corolla bilabiate, with flat segments. Valves of capsule bipartite, with flat margins.

32 Mecardònia. Segments of calyx unequal. Corolla tubular, sub-bilabiate. Stigma oblique, sub-capitate; valves of capsule entire, parallel.

33 Bra'mia. Segments of the calyx unequal. Corolla campanulate, somewhat regularly 5-cleft. Ovarium girded by a toothed disk. Valves of capsule bipartite.

34 Sphærothe'ca. Segments of the calyx nearly equal. Valves of capsule bipartite, with flat margins.

35 Di'ceros. Segments of calyx equal. Corolla funnel-shaped: limb bilabiate. Anthers bicornute. Capsule globose; valves entire.

36 Loxophy'llum. Calyx 5-parted, bilabiate. Corolla bilabiate; upper lip emarginate, erect. Stamens exserted. Capsule globose; valves bipartite.

37 Matou'rea. Calycine segments rather unequal. Valves of capsule nearly entire.

38 Cacona'pea. Calycine segments unequal: upper one the largest. Stamens inclosed. Valves of capsule bipartite.

39 Rana'ria. Calycine segments equal in length: the 3 outer ones the broadest. Limb of corolla 4-cleft, nearly equal. Valves of capsule bipartite.

40 Vande'llia. Calyx nearly equal, 5-toothed, or 5-parted. Two lower filaments appendiculate, or gibbous at the base. Valves of capsules entire.

41 E'llobum. Calyx equal. Corolla funnel-shaped: limb bilabiate; upper lip retuse. Stamens exserted; anthers connected, mutic. Capsule silique-formed, subulate.

42 Artane'ma. Calyx nearly equal. Tube of corolla furnished with 4 scales inside. Two lower filaments appendiculate, or gibbous at the base.

43 Tore'nia. Calyx plicate, obliquely 5-toothed. Two lower filaments appendiculate, or gibbous at the base.

44 Hetera'ntha. Anthers of the upper filaments large, and clasping the style. Calyx 5-cleft.

45 Linde'rnia. Anthers equal. Lower filaments bifid. Calyx 5-parted. Valves of capsule entire.

46 Limose'lla. Anthers equal. Calyx 5-toothed, or 5-cleft. Valves of capsule entire.

47 Hydranthe'lium. Calyx deeply 4-parted. Corolla funnel-shaped; limb 3-lobed: the hind lobe large and emarginate. Anthers equal.

48 Conòbea. Calyx 5-cleft. Capsule 1-celled, 4-valved. Anthers sagittate.

49 Mímulus. Calyx 5-toothed. Corolla personate. Capsule 2-valved, with flattish margins.

50 Leucoca'rpus. Calyx 5-toothed. Corolla personate. Fruit baccate.

51 Uveda'lia. Calyx 5-toothed. Corolla ringent. Capsule 4-valved, with flattish edges.

52 Hemiphra'gma. Corolla tubular, sub-bilabiate. Capsule baccate, 2-valved; valves bipartite.

53 Colli'nsia. Corolla gibbous above the base: limb very irregular. Capsule 2-valved; valves bipartite.

Tribe IV.

Gerardie'æ. Calyx tubular, 5-toothed. Corolla campanu-

lately ventricose; limb 5-lobed, bilabiate. Stamens 4, didynamous, usually exserted; anthers 2-celled, often bearded; cells diverging, distinct at apex, usually spurred at the base. Stigma clavate, undivided. Capsule bipartible; dissepiment composed of two combined lamina; placentas narrow, spongy. Seeds angular; testa loose, thick, favosely cellular. Albumen fleshy. Embryo sub-foliaceous, nearly the length of the seeds; radicle short, obtuse.—Herbs or subshrubs. Leaves opposite, scabrous. Flowers axillary, solitary, or terminal, and spicately racemose, yellow or purple.

§ 1. *Calyx tubularly campanulate, 5-toothed, or 5-cleft.*

54 Gera'rdia. Calyx 5-toothed, or semi-5-cleft. Corolla campanulate, or tubularly campanulate; tube longer than the calyx. Stamens inclosed. Cells of anthers equal.

55 Sopu'bia. Calyx 5-toothed. Corolla campanulate; tube shorter than the calyx. Stamens exserted, equal. Cells of anthers unequal.

56 Seyme'ria. Calyx deeply 5-cleft. Corolla with a short tube, and a subrotate spreading limb. Stamens a little longer than the corolla; cells of anthers nearly equal.

57 Macranthe'ra. Calyx 5-cleft, foliaceous; segments denticulate. Corolla cylindrically tubular, nearly equal, with a 5-toothed apex. Stamens exserted.

58 Esterha'zia. Calyx 5-toothed. Corolla tubularly funnel-shaped. Stamens much exserted.

59 Glossóstylis. Calyx 4-5-toothed. Corolla oblique, campanulate. Stamens exserted.

60 Phtheirospe'rmum. Calyx 5-cleft. Corolla campanulate. Stamens inclosed.? Stigma 2-lobed.

61 Escobe'dia. Calyx tubular, pentagonal, 5-toothed. Corolla funnel-shaped. Stamens inclosed.

§ 2. *Calyx inflated, 5-toothed or 5-cleft.*

62 Physoca'lyx. Calyx inflated, 5-toothed. Corolla funnel-shaped.

63 Mela'sma. Calyx inflated, 5-cleft. Corolla campanulate.

64 Gastrome'ria. Calyx inflated, 5-toothed. Corolla campanulate.

§ 3. *Calyx compressed, cleft on one side, at length somewhat 4-lobed.*

65 Centranthe'ra. Character the same as that of the section.

Tribe V.

Veroni'ceæ. Calyx 4-5 parted, imbricate in æstivation. Corolla rotate, 4-lobed, or tubular and sub-bilabiate. Stamens 2 or 4, exserted, distant; anthers incumbent; cells parallel, distinct. Stigma capitate. Capsule membranous; dissepiment narrow, composed of two separable lamina; placentas very short, in the middle of the dissepiment. Seeds compressed, with a membranous testa. Albumen cartilaginous. Embryo minute, terete, located in the base of the albumen.—Herbs or subshrubs. Leaves usually opposite. Flowers axillary or terminal, solitary or racemose, blue, red or white.

§ 1. *Stamens 2.*

66 Vero'nica. Calyx 4-5-parted. Corolla rotate, unequal.

67 Diplophy'llum. Calyx of 2 sepals. Corolla rotate, unequal. Capsule 4-seeded.

68 Lepta'ndra. Corolla tubular, sub-ringent: lower segment the smallest.

69 Pæderòta. Corolla tubular, straight, bilabiate: upper lip entire, or emarginate.

70 Calorha'bdos. Corolla tubular, incurved, with an oblique, 2-3-cleft mouth.

71 Wulfe'nia. Corolla tubular, declinate; limb 4-5-cleft.

72 Gymna'ndra. Corolla tubular, straight, with a sub-bilabiate limb.

§ 2. *Stamens 4, didynamous.*

73 Picrorhi'za. Corolla campanulate, shorter than the calyx.

74 Geochórda. Corolla funnel-shaped.

Tribe VI.

Buchne'reæ. Calyx tubular, striated, 5-cleft. Corolla salver-shaped; limb nearly equal. Stamens 4, didynamous, inclosed. Anthers for the most part 1-lobed, from the cells being contiguous, seated on a thick, elevated connective. Stigma, undivided. Capsule with a simple dissepiment; placentas narrow, columnar, adnate longitudinally, or at length free. Seeds minute, smooth, scrobiculate, with a membranous testa. Albumen fleshy. Embryo much shorter than the seed.—Herbs or subshrubs. Leaves opposite or alternate. Flowers terminal, spicately racemose, white or red.

§ 1. *Valves of capsule entire.*

75 Strìga. Tube of corolla abruptly incurved; limb bilabiate.

76 Buchne'ra. Calyx short, tubular, 5-toothed. Corolla salver-shaped. Capsule straight.

77 Rhamphica'rpa. Calyx campanulate, 5-cleft. Corolla salver-shaped. Capsule obliquely beaked.

78 Cy'cnium. Calyx long, tubular, foliaceous. Corolla salver-shaped. Capsule straight, fleshy.

§ *Valves of capsule bifid.*

79 Nycteri'nia. Calyx bilabiate. Stamens 2, inclosed; with oblong-linear anthers; the other 2 a little exserted, with short or abortive anthers.

80 Polycare'na. Calyx bilabiate. Anthers all exserted, and similar.

81 Phyllopòdium. Calyx 5-cleft. Anthers all exserted, and similar. Bracteas adnate to the pedicels.

82 Sphena'ndra. Calyx 5-cleft. Anthers similar, exserted. Corolla rotate.

83 Chænóstoma. Calyx 5-cleft. Anthers similar, exserted. Bracteas free from the pedicels. Corolla campanulate or funnel-shaped.

84 Lype'ria. Calyx 5-cleft. Anthers all inclosed. Tube of corolla gibbous or incurved; limb bilabiate. Peduncles axillary, or disposed in leafy racemes or spikes.

85 Manu'lea. Calyx 5-cleft. Anthers all inclosed. Corolla tubular; limb nearly equal.

86 Eri'nus. Calyx 5-parted. Corolla tubular, with a 5-

parted, nearly equal limb; lobes obcordate. Stamens nearly equal, inclosed. Capsule ovate.

Tribe VII.

Buddleie'æ. Calyx campanulate, 5-toothed. Corolla tubular; limb 4-cleft, equal, spreading. Stamens 4, nearly equal, inclosed. Anthers composed of 2 parallel distinct cells. Stigma clavate, 2-lobed. Capsule crustaceous; dissepiment constituted from the bent-in margins of the valves, inserted in the thick spongy placenta. Seeds angular, scobiform, with a loose, membranous testa. Albumen fleshy. Embryo almost the length of the seeds. Cotyledons oblong-compressed. Radicle very short.—Shrubs with quadrangular branches, opposite, reticulately veined leaves; and terminal, capitate, spicate, or panicled flowers. Corollas generally orange-coloured.

87 Buddle'a. Character the same as that of the tribe.

Tribe VIII.

Calceolarie'æ. Calyx 4, rarely 5-parted, valvate in æstivation. Corolla irregular, bilabiate. Stamens 2-4, inserted in the throat of the corolla. Cells of anthers diverging at the base, but confluent at the apex. Stigma undivided, capitate. Capsule membranous. Dissepiment constituted from the bent-in margins of the valves; placentas 2, stipitate, or adnate to the dissepiment. Seeds minute, with a mucrone-formed umbilicus; testa membranous. Albumen fleshy. Embryo terete, half the length of the albumen.—Herbs or subshrubs, usually clothed with glandular pubescence. Leaves opposite, usually undivided. Flowers terminal, for the most part corymbosely panicled, or racemose, yellow, rarely purple.

88 Calceola'ria. Lower lip of corolla incurved, calceolate: upper lip small. Stamens 2.

89 Jovella'na. Both lips or lobes of corolla concave, nearly equal, spreading. Stamens 2.

90 Bæ'a. Corolla spreading; lower lip 2-parted: upper 3-lobed. Capsule long, corniculate. Stamens 2.

91 Hemímeris. Lower lip of corolla concave, blunt; upper lip cloven, with a kind of bag at the base. Stamens 2, or didynamous.

92 Thylaca'ntha. Lower lip of corolla large, saccate at the base, trifid: upper lip short, bifid. Stamens 4, didynamous. Capsule round, valveless.

93 Angellònia. Lower lip of corolla saccate at the base, trifid: upper one smaller, bifid. Stamens 4, didynamous. Capsule 2-valved.

Tribe IX.

Euphrasie'æ. Calyx tubular, 5-toothed. Corolla bilabiate. Stamens 4, didynamous. Cells of anthers parallel, usually spurred at the base. Stigma undivided. Capsule crustaceous; dissepiment placentiferous on both sides. Seeds with a membranous testa. Albumen fleshy. Embryo terete, slender, straight, almost the length of the albumen.—Herbs with opposite leaves, and terminal, subspicate, bracteate flowers.

§ 1. *Cells of anthers spurred at the base.*

94 Euphra'sia. Calyx campanulate, 4-cleft. Superior lip of corolla galeate, emarginate; lower lip large, spreading, with emarginate segments.

95 Odonti'tes. Calyx campanulate, 4-cleft. Upper lip of corolla emarginate, galeate: segments of the lower lip equal, linear. Anthers oblong, a little exserted.

96 Ba'rtsia. Calyx campanulate or tubular, 4-cleft. Upper lip of corolla galeate, compressed, entire; segments of the lower lip quite entire, reflexed.

97 Bu'ngea. Calyx tubular, 4-cleft. Upper lip of corolla tridentate: lower one trifid.

98 Siphoneste'gia. Calyx funnel-shaped; tube elongated; limb 4-5-parted. Upper lip of corolla incurved; lower one short, with entire segments.

99 Lamourou'xia. Corolla tubular, compressedly ventricose; upper lip galeate, entire: lower one with obtuse lobes.

§ 2. *Cells of anthers mutic at the base.*

100 Castille'ja. Calyx compressed, bifid or quadrifid, cleft on one side. Upper lip of corolla linear, channelled, entire. Cells of anthers unequal.

101 Orthoca'rpus. Calyx tubular or campanulate, 4-cleft. Upper lip of corolla small, compressed. Cells of anthers unequal.

102 Schwa'lbea. Calyx compressed, obliquely 5-cleft. Upper lip of corolla arched. Cells of anthers equal.

103 Lafue'ntea. Calyx tubular, 5-parted. Cells of anthers equal.

Tribe X.

Teedie'æ. Calyx 5-parted. Limb of corolla nearly equal. Fruit baccate.

104 Tee'dia. Calyx 5-parted. Corolla salver-shaped.

105 Freyli'nia. Calyx 5-parted. Corolla funnel-shaped.

Tribe XI.

Hallerie'æ. Calyx small, 3-lobed, unequal, permanent. Corolla large, funnel-shaped; throat ventricose; limb erect, oblique, 4-cleft, unequal; upper segment the largest, and emarginate. Stamens 4, didynamous. Fruit baccate, roundish, terminated by the style, 2-celled, many-seeded.—A shrub with opposite leaves, with the habit of *Vìtex*.

106 Halle'ria. Character the same as that of the tribe.

† *Genera not sufficiently known.*

107 Pi'kria. Calyx deciduous, 4-leaved, longer than the corolla. Corolla ringent, bilabiate. Stamens 4, didynamous; the 2 longer stamens bearing 1-celled anthers, and the 2 shorter stamens bearing 2-celled anthers. Berry ovate, 2-celled, many-seeded.

108 Diplanthe'ra. Calyx 3-cleft; hind segment entire: lateral ones bifid. Corolla bilabiate; upper lip obcordate. Stamens 4, exserted, nearly equal. Cells of anthers diverging. Ovarium 2-celled; placentas 2, adnate in each cell. Stigma bilamellate.

109 Goma'ria. Calyx 4-cleft. Corolla irregular; tube curved. Nectary cup-shaped. Stamens 4, didynamous. Capsule 2-celled.

110 Rhyncoglóssum. Calyx 5-cleft, bilabiate. Stamens 4, 2 sterile. Capsule 1-celled, 2-valved.

Tribe I.

SCROPHULARIE'Æ (this tribe contains plants agreeing with Scrophulària in the characters indicated below.) D. Don, in edinb. phil. journ. 19. p. 110. July, Oct. 1835. Calyx deeply 5-parted; segments usually dilated, with scarious margins, imbricate in æstivation. Corolla tubular or campanulate, ventricose; limb 5-lobed, bilabiate. Stamens 4, didynamous, often with the rudiment of a fifth. Cells of anthers confluent at apex, inserted into a fleshy connective. Stigma capitate or 2-lobed. Capsule crustaceous; dissepiment double, formed from the bent-in margins of the valves, placentiferous on both sides. Testa of seed thick, spongy, corrugated. Albumen fleshy, nearly the length of the albumen.—Herbs or shrubs, mostly natives of Europe. Leaves opposite and alternate. Flowers terminal, racemose, yellow or purple. This tribe comes near to *Verbascineæ* in habit more than in character.

I. DIGITA'LIS (so named from the resemblance of the flower to the finger of a glove, *digitale*, or from the adjective *digitàlis*, of or belonging to a finger. Parkinson says, some thinking Foxglove to be a foolish name, do call them finger flowers, because they are like unto the fingers of a glove, the ends cut off.) Fuschs. hist. p. 892. Tourn. inst. p. 165. t. 73. Lin. gen. no. 758. Schreb. gen. no. 1017. Juss. gen. p. 120. ed. Usteri. p. 135. Gærtn. fruct. 1. p. 247. t. 53. Lindl. dig. mon.—Campánula, Trag. kreut. 2. cap. p. 125.—Vírga règia Cæsalp. pl. 348.—Gesnèria spec. Lin. hort. cliff. p. 318.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx unequal. Corolla tubular at the base, funnel-shaped: limb obliquely 4-lobed: upper segment much shorter than the lower one or lip, and is, as well as it imbricate in æstivation. The rudiment of the fifth; stamen hardly conspicuous. Stigma simple, or bilamellate. Capsule ovate, acuminated.—Herbs with alternate leaves, and terminal racemes of secund, bracteate, drooping flowers.

§ 1. *Corolla oblong-ventricose; upper segment transverse. Stamens shorter than the tube.*

1 D. PURPU'REA (Fuschs. hist. 892. t. 893. Lin. spec. 866.) leaves oblong, rugose, crenated; calycine segments ovate-oblong; segments of corolla transverse, acute; peduncles straight, about equal in length to the calyxes. ♃. H. Native of Europe, as of Denmark, Germany, Switzerland; Britain, in sandy gravelly soils near London; it grows plentifully about Charlton wood, Norwood, &c. Gærtn. fruct. 1. p. 247. t. 53. Curt. fl. lond. fasc. 1. t. 48. Woodv. med. bot. 71. t. 24. Oed. fl. dan. t. 74. Hoffm. et Link, fl. port. p. 222. Lindl. dig. t. 2. Stev. et Church, med. bot. 1. t. 18.—Blackw. t. 16.—Riv. mon. t. 104.—Lob. icon. 1. p. 572. f. 1, 2.—Mor. hist. sect. 5. t. 8. f. 1. Plant pubescent. Corollas large, purple, marked inside with dark purple spots, which are edged with white. The colour, however, varies from dark purple to cream-colour and white.

Foxglove has been analysed by Destouches. Four ounces of the dried leaves yielded successively 9 drachms of watery and 78 grains of alcoholic extract. The first was brown, smooth, and of a consistence fit for making pills. The second had a very deep green colour, a virose and disagreeable smell, the consistence of tallow, but more tenacious, did not furnish ammonia by distillation, and was not acted upon by acids. The ashes contained salts of lime and potass. The effects of *Foxglove* when taken into the stomach are to diminish the frequency of the pulse, and the irritability of the system; and to increase the action of the absorbents, and the discharge by urine. In excessive doses it produces vomiting, dimness of sight, vertigo, delirium, hiccough, convulsions, collapse, and death. For these symptoms the best remedies are cordials and stimulants. Internally *Digitàlis* has been recommended. 1. In inflammatory diseases, from its very remarkable power of diminishing the velocity of the circulation. 2. In active hæmorrhages, and phthisis. 3. In some spasmodic affections, as in spasmodic asthma, palpitation, &c. 4. In mania from effusion on the brain. 5. In anasarcous and dropsical effusions. 6. In scrophulous tumours. 7. In aneurism of the aorta, and hypertrophy of the heart. Externally it has been applied to scrophulous tumours. It may be exhibited—1. In substance, either by itself, or conjoined with some aromatic, or made into pills, with soap or gum ammoniac. Withering directs the leaves to be gathered before the plant comes into flower; he rejects the petioles and midrib, and dries the remaining part either in the sunshine or before the fire. In this state they are easily reduced to fine green powder, which is given in doses of one grain twice a day, and the dose is gradually increased until it acts upon the kidneys, stomach, pulse, or bowels, when its use must be laid aside, or suspended. 2. In infusion: the same author directs a drachm of dried leaves to be infused for 4 hours in eight ounces of boiling water, and an ounce of any spirituous water to be added to the strained liquor for its preservation. Half an ounce, or an ounce of this infusion may be given twice a day. 3. In decoction. Darwin directs that four ounces of the fresh leaves be boiled in two pounds of water, until they are reduced to one, and that half an ounce of the strained decoction be taken every two hours, for four or more doses. 4. In tincture, put one ounce of the dried leaves, coarsely powdered, into four ounces of diluted alcohol: let the mixture stand by the fire-side 24 hours, frequently shaking the bottle, and the saturated tincture, as Darwin calls it, must then be separated from the residuum by standing, or decantation. Twenty drops of the tincture were directed to be taken twice or thrice a day, but the dose is dangerous. The Edinburgh college use eight ounces of diluted alcohol to one of the powder, but let it digest seven days. 5. The expressed juice and extracts are not proper forms of exhibiting this very active remedy.—Woodville and Duncan.

Var. albiflòra; flowers white. ♃. H. Native along with the species.—Gerard. emac. 790. f. 2.

Purple-flowered, or Common Foxglove. Fl. Clt. Pl. 3 to 5 feet.

2 D. THA'PSI (Lin. spec. 867.) leaves oblong, rugose, crenated, undulated, decurrent; calycine segments ovate; segments of corolla ovate-roundish; peduncles slender, arched, much longer than the calyx. ♃. H. Native of Spain, Portugal, Savoy, &c. Smith, exot. bot. p. 83. t. 43. Hoffm. et Link, fl. port. p. 223. t. 30. Lindl. dig. p. 10. t. 3. D. verbascifòlia, Bocc. mus. t. 85. D. Hispánica purpùrea minor, Tourn. inst. p. 165. —Barrel. icon. 1183. Plant tomentose, in habit much like *D. purpùrea.* Corollas purple; throat pale, marked with blood red dots.

Var. β, *intermèdia* (Lindl. dig. p. 11. t. 4.) stems simple, taller; segments of corolla obsolete. ♃. H. Native of Portugal about Cintra and Grandola. D. purpùrea, Tab. icon. t. 568. D. tomentòsa, Hoffm. et Link, fl. port. p. 220. t. 20. Sims, bot. mag. 2194.—Besl. hort. eyst. ord. 1. fol. 2. f. 2.

Mullien-like Foxglove. Fl. June, Sept. Clt. 1752. B. 1818. Pl. 2 to 4 feet.

3 D. MI'NOR (Lin. mant. p. 567. syst. ed. 13. p. 470.) radical leaves recurved to the ground, lanceolate, flat, denticulated; racemes few-flowered; segments of corolla ovate-roundish, dilated, quite glabrous: superior one bifid; peduncles 3-times longer than the calyxes. ♃. H. Native of Spain. Sims, bot. mag. 2160. Lindl. dig. p. 12. t. 5, 6. D. Hispánica purpùrea, mìnor, Tourn. inst. p. 165. Stem glabrous, or downy. Leaves glabrous above, downy beneath: upper ones quite entire. Corolla purplish, large for the size of the plant, marked by many spots inside.

Smaller Foxglove. Fl. June, July. Clt. 1789. Pl. ½ to ¾ foot.

4 D. AMBI'GUA (Murr. comm. goett. p. 6. Lin. syst. p. 562.)

leaves ovate-lanceolate, toothed, sessile, nerved; lower bracteas about equal in length to the flowers; corolla reticulated: with ovate, transverse, obtuse segments. ♃. H. Native of Austria, Switzerland, Germany, East of Siberia and Persia, in shady places. Schkuhr, handb. t. 174. Lindl. dig. p. 13. t. 7. R. Br. hort. kew. 4. p. 28. D. lùtea, Guildst. reis. 1. p. 425. Poll. pal. no. 599. D. grandiflòra, All. ped. 1. p. 70. Mill. dict. no. 4. Lam. fl. fr. 2. p. 332. D. mèdia, Roth, catalect. 2. p. 60. D. intermèdia, Pers. ench. 2. p. 162. Plant hairy. Leaves downy beneath. Corollas large, yellowish, reticulated with brown. Genitals glabrous.

Ambiguous Foxglove. Fl. July, Aug. Clt. 1596. Pl. 2 to 3 feet.

5 D. OCHROLEU'CA (Jacq. austr. 1. p. 36. t. 57.) leaves ovate-lanceolate, acuminated, toothed, and are, as well as the stem, villous; bracteas lanceolate: lower ones twice as long as the flowers; corolla villous, reticulated: segments ovate, acute: lip bearded. ♃. H. Native of Austria, Germany, Croatia, Carpathian mountains. Lindl. dig. p. 14. t. 8. D. ambígua, Schrank, mon. 3, with a figure. D. lùtea, Tabern. icon. t. 567. Roth. fl. germ. 1. p. 267.—Besl. eyst. ord. 1. fol. 1. f. 3.—Knip. cent. 6, with a figure. Corolla yellow, reticulated with brown.

Var. β, fuscéscens (Lindl. dig. p. 14.) flowers smaller, brown. ♃. H. Native of Croatia. D. fuscéscens, Waldst. et Kit. 3. p. 304. t. 274.

Cream-coloured-flowered Foxglove. Fl. July, Aug. Clt.? Pl. 2 to 3 feet.

6 D. FU'LVA (Lindl. dig. p. 15. t. 9.) leaves lanceolate, ciliated; bracteas all not half so long as the flowers; corolla downy, reticulated: segments ovate, acute: lip bearded; stamens about equal in length to the tube. ♃. H. Native country unknown. D. obscùro-ferrugínea, Kœlr. in act. petrop. 2. p. 261.—Park. par. 381. f. 5.? Plant glabrous. Leaves ciliated and pilose on the veins beneath, smooth, bullate, and tainted with purple above. Calyx downy. Corolla fulvous, reticulated with rust-colour. Stamens glabrous. Perhaps a hybrid between *D. obscùra* and *D. ferrugínea*.

Tawny-flowered Foxglove. Fl. July, Aug. Clt.? Pl. 2 to 3 feet.

§ 2. *Corolla roundish-ventricose. Lip length of tube. Stamens equal in length to the tube.*

7 D. LÆVIGA'TA (Waldst. et Kit. pl. hung. 2. p. 171. t. 158.) glabrous, branched; leaves linear-lanceolate; flowers scattered, glabrous. ♃. H. Native of Croatia, on calcareous rocks. Lindl. dig. p. 16. t. 10. Radical leaves obovate-lanceolate, obscurely-toothed; upper ones recurved, 5-nerved. Corolla fulvous, reticulated; lip ciliated, white; segments obtuse.

Smooth Foxglove. Fl. July, Aug. Clt. 1816. Pl. 2 to 3 feet.

8 D. SIBI'RICA (Mill. dict. no. 9. Lindl. dig. p. 16. t. 11.) villous, branched; leaves ovate, distantly-toothed; flowers scattered, pilose. ♃. H. Native of Siberia, Tartary. Upper leaves quite entire. Calyxes villous. Corolla hairy; segments ovate, transverse, acute; lip drawn out. Corolla rust-coloured, reticulated.

Siberian Foxglove. Fl. June, July. Clt.? Pl. 2 to 3 feet.

9 D. FERRUGÍNEA (Tab. icon. t. 573. Lin. spec. 867.) raceme dense, pyramidal; calycine segments margined; lip of corolla ovate, entire, bearded. ♃. H. Native of Piedmont, Spain, Hungary, Caucasus, Iberia, and Persia. Bieb. cauc. 2. p. 80. Lindl. dig. p. 17. t. 12. Sims, bot. mag. 1828. D. latifòlia flore ferrugineo, Tourn. inst. p. 166.—Mor. hist. 1. p. 477. sect. 5. t. 8. f. 2, 3.—Riv. mon. irr. t. 105.—Sabb. hort. rom. 2. t. 86.—Ger. emac. 790. f. 4.—Park. par. 380. no. 1. f. 6. Stem glabrous, densely leafy. Leaves glabrous, or ciliated. Racemes long. Corolla rusty, reticulated inside, downy outside.

Var. β, parviflòra (Lindl. dig. p. 17.) flowers about half the size of those of the species. ♃. H. Native of Persia and Caucasus.

Iron-coloured-flowered Foxglove. Fl. July, Aug. Clt. 1597. Pl. 4 to 6 feet.

10 D. AU'REA (Lindl. dig. p. 18. t. 13.) racemes many-flowered; calycine segments marginate; corolla arched: lip ovate, tridentate. ♃. H. Native of Mounts Parnassus and Olympus. D. ferrugínea, Smith, prod. fl. græc. 1. p. 439. fl. græc. t. 606.—Mor. hist. 1. p. 478. sect. 5. t. 8.—Park par. 381. f. 6. Stem downy. Leaves distant, distantly-toothed, nearly glabrous: superior ones linear-lanceolate. Corolla fuscescent, brownish purple outside, yellow, and reticulated inside.

Golden-flowered Foxglove. Fl. July, Aug. Clt. 1816. Pl. 2 to 3 feet.

11 D. LEUCOPHÆ'A (Sibth. et Smith, prod. fl. græc. 1. p. 439. fl. græc. t. 607.) raceme dense, cylindrical, many-flowered; lip of corolla unguiculate, lunate; bracteas linear, longer than the flowers. ♃. H. Native of Greece, on Mount Athos. Lindl. dig. p. 18. t. 14. Corolla rust-coloured; lip white.

Grey-flowered Foxglove. Fl. July, Oct. Clt. 1788. Pl. 2 to 3 feet.

12 D. LANA'TA (Ehrh. beitr. 7. p. 153. Waldst. et Kit. 1. p. 76. t. 74.) leaves oblong; rachis woolly; lip of corolla ovate. ♃. H. Native of Hungary, in vineyards. Sims, bot. mag. 1159. Lindl. dig. p. 19. t. 15. D. Wintérli, Roth, catal. 1. p. 71. D. ferrugínea, β, Lam. dict. 2. p. 280. R. Br. hort. kew. 4. p. 29. D. orientàlis, Elm. mon. 45. t. 1. D. eriostàchya, Fisch. ex Loud. hort. brit. p. 251.? Leaves deep green, ciliated with wool. Racemes dense, many-flowered. Bracteas shorter than the flowers. Calycine segments villous, acute. Corolla downy, grey, reticulated; lip white, naked, sometimes purplish.

Woolly-spiked Foxglove. Fl. July, Aug. Clt. 1789. Pl. 2 to 3 feet.

13 D. ORIENTA'LIS (Lam. dict. 2. p. 280. but not of Mill.) quite glabrous; leaves linear; flowers scattered; lip of corolla oblong. ♃. H. Native of the Levant. Lindl. dig. p. 19. t. 16. Ker. bot. reg. 554. Sims, bot. mag. 2253. D. orientàlis, tragapogi folio, flore albido, Tourn. inst. p. 166. Stem glabrous. Leaves linear-lanceolate, recurved, 3-nerved. Rachis naked. Calycine segments obtuse, ciliated. Corolla campanulate, grey, pale outside, reticulated with purple inside, pilose: lateral and superior segments minute; lip white, obtuse.

Eastern Foxglove. Fl. June, July. Clt. 1820. Pl. 2 to 3 feet.

§ 3. *Corolla funnel-shaped, a little ventricose; upper segment bifid. Stamens equal in length to the tube.*

14 D. PARVIFLÒRA (Jacq. vind. 6. t. 17. Ker. bot. reg. t. 257.) leaves oblong-lanceolate, undulated, deflexed, ciliated with wool, entire; racemes dense, cylindrical; segments of corolla, as well as those of the calyx, roundish. ♃. H. Native country unknown. Lindl. dig. p. 20. t. 17. R. Br. in hort. kew. ed. 2d. vol. 4. p. 29. D. ferrugínea, var. γ, Lam. dict. 2. p. 280. Leaves margined with wool: radical ones obovate. Corollas small, brownish purple, pilose.

Small-flowered Foxglove. Fl. June, Aug. Clt. 1798. Pl. 1½ to 3 feet.

15 D. VIRIDIFLÒRA (Lindl. dig. p. 21. t. 18.) clothed with glandular hairs; leaves oblong, toothed; segments of corolla ovate; sepals subulate. ♃. H. Native of Greece, on Mount Athos. Racemes long, not dense. Corolla small, green; segments ovate, veiny.

Green-flowered Foxglove. Fl. June, July. Clt.? Pl. 2 to 3 feet.

16 D. RI'GIDA (Lindl. dig. p. 21. t. 19.) plant clothed with glandular hairs; leaves oblong-lanceolate, wrinkled, undulated, toothed; racemes secund, many-flowered; corolla downy, with ovate, obtuse, glandular segments. ♃. H. Native country unknown. Corolla small, yellow, purplish above.

Stiff Foxglove. Fl. June, Aug. Clt.? Pl. 1½ to 2 feet.

17 D. PURPURA'SCENS (Roth, catal. 2. p. 62. D. C. fl. fr. 5. p. 411. exclusive of the var. Lindl. dig. p. 22. t. 20.) leaves linear-lanceolate, serrated, glabrous; racemes secund; corolla glabrous, with roundish segments. ♃. H. Native of Germany and Italy, in stony places on mountains. D. erubéscens, Dry-and. mss. R. Br. in hort. kew. 4. p. 29. Habit of *D. lùtea*. Radical leaves obovate, pilose on the nerves beneath. Corolla reddish, spotted inside; segments ciliated: upper one entire.

Purplish-flowered Foxglove. Fl. June, Aug. Clt. 1776. Pl. 2 to 3 feet.

18 D. LUTE'SCENS (Lindl. dig. p. 22. t. 21.) leaves cordate-oblong, flat, crenated, glabrous; racemes secund; corolla glabrous, with very blunt segments; bracteas all shorter than the flowers. ♃. H. Native country unknown. Stem slender, nearly naked. Bracteas, calyxes, and ovaria beset with a few hairs. Corolla long, tubular, glabrous; segments ciliated; upper lip bifid. Anthers yellow, spotted with blood colour. Corolla pale yellow.

Yellowish-flowered Foxglove. Fl. July, Aug. Clt.? Pl. 2 to 3 feet.

19 D. TUBIFLÒRA (Lindl. dig. p. 22. t. 22.) segments of corolla ovate, obtuse; flowers declinate. ♃. H. Native country unknown. Nearly allied to *D. lùtea*. Corolla pale yellow, long, narrow.

Tube-flowered Foxglove. Fl. June, Aug. Clt.? Pl. 2 to 3 feet.

20 D. LU'TEA (Lin. spec. 867.) leaves lanceolate, toothed, glabrous; racemes secund; corolla glabrous, with ovate, bearded segments; lower bracteas longer than the flowers. ♃. H. Native of the temperate parts of Europe, as of France, Switzerland, Silesia, Carniola, Piedmont, Italy, &c. Bull. herb. t. 373. Jacq. vind. 2. p. 47. t. 105. Ker. bot. reg. t. 251. R. Br. hort. kew. 4. p. 29. Lindl. dig. p. 23. t. 23. D. parviflòra, All. pedem. 1. p. 70. D. C. fl. fr. 3. p. 597.—Riv. mon. t. 105. D. mìnor luteo parvo flore, Tourn. inst. p. 165.—Lob. icon. t. 573.—Mor. hist. 1. p. 479. sect. 5. t. 8.—Sabb. hort. rom. 2. t. 98. Stem simple, smooth, angular, glabrous, or downy. Superior leaves subcordate at the base. Racemes dense. Peduncles glabrous, or downy. Corolla pale yellow, downy towards the top. Anthers pilose.

Var. β, micrántha (Lindl. dig. p. 23.) calycine segments about equal in length to the corolla. ♃. H. Native of Europe. D. micrántha, Elm. mon. 46. t. 2.

Var. γ, hýbrida (Lindl. dig. p. 23. t. 24.) flowers large, pale; stem more erect. ♃. H. Native of Auvergne, and the Pyrenees. D. hýbrida, Salv. nov. bull. 3. p. 337. t. 6. Journ. phys. 1782. p. 285. t. 1. f. 1, 2. D. intermèdia, Lapeyr. abr. D. purpuráscens, var. β and δ, D. C. fl. fr. 5. p. 411. Elm. mon. p. 45.

Var. δ, fucàta (Lindl. dig. p. 23. t. 25.) flowers larger, brownish purple; stem more erect. ♃. H. Native of Europe. D. fucàta, Ehrh. beitr. 7. p. 151. Pers. ench. 2. p. 162. D. purpuráscens, D. C. fl. fr. 5. p. 411.

Yellow-flowered Foxglove. Fl. July, Aug. Clt. 1629. Pl. 1½ to 3 feet.

21 D. LACINIA'TA (Lindl. bot. reg. 1201.) leaves lanceolate, acuminated, jagged, glabrous; raceme subsecund; corolla downy, with ovate, bearded segments: lower lobe or lip ovate, acute; bracteas all much shorter than the pedicels. ♃. H. Native of Spain, on the mountains about Malaga, P. B. Webb. Corolla yellow. It differs principally from *D. lùtea* in the cut leaves.

Jagged-leaved Foxglove. Fl. June, July. Clt. 1827. Pl. 1½ to 2 feet.

22 D. OBSCU'RA (Lin. spec. 867.) suffruticose; leaves linear-lanceolate, quite entire, glabrous; corolla ventricose. ♃. G. Native of Spain. Jacq. hort. vind. 1. p. 40. t. 91. Sims, bot. mag. t. 2157. Lindl. dig. p. 24. t. 25. R. Br. hort. kew. 4. p. 30. D. Hispánica angustifòlia, flore nigricante, Tourn. inst. p. 166.—Bocc. mus. p. 136. t. 98. Stem simple, glabrous. Leaves deep green. Racemes loose, few-flowered. Calyx downy. Corolla arched, downy, rufous outside, golden yellow inside, veined with dark brown lines; upper lip emarginate, villous inside at the base. Anthers ciliated with glands.

Obscure Foxglove. Fl. July, Aug. Clt. 1778. Shrub 1 to 2 feet.

† *Species hardly known.*

23 D.? COCHINCHINE'NSIS (Lour. coch. 378.) leaves lanceolate, rough; flowers sessile, solitary, axillary; calyxes acute; corollas obtuse, emarginate at top. ♃. G. Native of Cochinchina. Leaves quite entire, opposite. Calyx 5-cleft. Corolla pale violet, bell-shaped, ventricose at bottom; segments obtuse: the upper one emarginate. Capsule ovate, acute, 2-celled. Certainly not a species of *Digitàlis*.

Cochinchina Foxglove. Pl. 1½ foot.

24 D.? SINE'NSIS (Lour. coch. p. 378.) leaves ovate, hairy; flowers solitary, axillary; segments of calyx awl-shaped; segments of corolla obtuse, all entire. ♃.? G. Native of China. Stems tufted, smooth. Leaves opposite, serrated. Upper segment of the calyx larger, and sometimes bifid. Corolla dusky purple, bell-shaped, ventricose, 4-cleft: its upper segment the largest. Stigma screw-shaped. Capsule ovate-conical, 2-grooved, 2-celled. Certainly not a species of *Digitàlis*.

China Foxglove. Pl. 1 foot.

25 D. MILLE'RI; leaves ovate-lanceolate, nerved; calyxes acute. ♃. H. Native of Tartary. D. orientàlis, Mill. dict. no. 7, but not of Lam. Leaves smooth: cauline ones half stem-clasping. Corolla yellow, size of those of *D. ambígua*.

Miller's Foxglove. Fl. May, July. Clt. 1759. Pl. 1 foot.

Cult. Most of the species of Foxglove are showy, and well fitted for decorating flower borders. They all grow freely in common garden earth, and are readily increased by seed. Some of the more tender species require protection in winter.

II. ISOPLE'XIS (from ισος, *isos*, equal; and πλεκω, *pleco*, to plait; the upper segment of corolla is equal in length to the lip.) Lindl. dig. p. 25. Digitàlis species, Lin.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx unequal. Corolla tubular at the base, campanulate; limb obliquely 4-lobed; upper segment equal in length to the lip, and, like it, incumbent in æstivation. Stigma bilamellate.? Capsule ovate, acuminated.—Stems shrubby. Racemes pedunculate.

1 I. CANARIE'NSIS (Lindl. dig. p. 25. t. 27.) segments of the corolla acute. ♄. G. Native of the Canary Islands. Digitàlis Canariénsis, Lin. spec. p. 868. Mill. fig. 1. t. 120. Ker. bot. reg. t. 48. R. Br. hort. kew. ed. 2d. vol. 4. p. 30.—Plukn. mant. t. 325. f. 2.—Comm. hort. 2. p. 105. t. 53. Stem simple, downy. Leaves permanent, lanceolate, serrated, pilose on the edges. Calycine segments subulate: upper one the largest. Flowers dense, golden yellow: superior lip obovate, emarginate; lateral segments subulate.

Canary-Island Isoplexis. Fl. June, July. Clt. 1698. Shrub 4 to 6 feet.

2 I. sce'ptrum (Lindl. dig. p. 26. t. 28.) segments of corolla obtuse; racemes comose. ♄. G. Native of Madeira, in shady woods. Digitàlis scéptrum, Lin. suppl. 282. Lher. angl. p. 21. t. 24. Smith, exot. bot. 2. p. 27. t. 73. R. Br. in hort. kew. 4. p. 31. Trunk di-trichotomous. Young branches fleshy, pilose. Leaves obovate-lanceolate, denticulated, pilose beneath, crowded at the tops of the branches. Racemes thyrsoid. Flowers dense, pendulous, of a yellowish brown colour. Calycine segments pilose, spatulate, the 3 upper the shortest. Corolla pilose, reticulated; segments oblong-roundish: superior one flat, bipartite: lateral ones spreading a little smaller: lower one concave.

Sceptre Isoplexis. Fl. July, Aug. Clt. 1777. Shrub 3 to 4 feet.

Cult. Both species of *Isoplèxis* are very showy when in blossom. A light rich soil answers them well; and they may be either increased by cuttings under a hand-glass, or by seed, which ripen plentifully.

III. SCROPHULA'RIA (so named from its supposed use in the cure of scrofula.) Tourn. inst. p. 166. t. 74. Lin. gen. no. 756. Schreb. gen. no. 1014. Juss. gen. p. 119. ed. Usteri. p. 133. Gærtn. fruct. 1. p. 249. t. 53. Neck. elem. 1. p. 343. Lam. dict. 7. p. 27. ill. t. 533. Scrofulària, Spreng. anleit. ed. 2d. 1. p. 394. Wydler. mon. scrof.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted, or usually 5-cleft, nearly equal. Corolla with a ventricose subglobose tube, and a short 5-lobed limb: segments short, roundish: the 2 upper ones combined with the upper lip. Stamens 4, fertile, didynamous, declinate, the rudiment of a fifth often present; anthers 1-celled. Style simple, thickened at the apex. Stigma emarginate. Capsule almost globose, or ovoid, often acuminated; valves entire, but often also shortly bifid at apex. The fifth filament, when present, is adnate, bearing a sessile, lamelliform, or emarginately spatulate anther or tip.—Herbs or under-shrubs with a fetid smell. Leaves opposite; or the superior ones are sometimes alternate, entire, or deeply pinnatifid, sometimes full of pellucid dots. Inflorescence thyrsoid; peduncles opposite, or alternate, cymosely many-flowered, rarely 1-flowered.

Sect. I. Veni'lia (in myth. the wife of Neptune.) Rudiment of a fifth stamen none.

§ 1. *Thyrse leafy.*

1 S. verna'lis (Lin. spec. p. 864.) hairy; leaves roundish-cordate, coarsely and multiplicately serrated, acute; peduncles opposite; lobes of calyx without a membrane, lanceolate; lobes of corolla short, connivent; genitals exserted. ☉. H. Native of Europe, in shady, humid places; particularly on the Caucasian Alps. It is to be found in woods and hedges in some parts of England, but is hardly indigenous. Schkuhr, handb. 2. t. 173. Smith, engl. bot. t. 567. Hook. fl. lond. t. 70. Oed. fl. dan. t. 411. S. cordàta, Waldst. et Kit. hung. 1. p. 75. t. 73.—Barrel. icon. t. 273.—Mor. hist. p. 482. sect. 5. t. 8. f. 2. —Riv. mon. irr. t. 107. f. 2. Upper leaves alternate and smaller. Size and form of bracteas variable. Lobes of calyx obtuse, or acute, full of pellucid dots. Corolla yellow. Ovarium clothed with stipitate glands. Capsule oblong, pear-formed.

Vernal Figwort. Fl. March, May. Britain. Pl. 2 feet.

§ 2. *Thyrse leafless.*

2 S. pauciflòra (Benth. scroph. ind. p. 17.) glabrous; stem hardly angular; leaves roundish-ovate, coarsely, acutely, and doubly serrated; thyrse elongated, few-flowered, with short, remote cymes; calycine segments lanceolate, acute, without membranes, shorter than the capsule; genitals inclosed. ♃. H. Native of Gosaingsthan, Wall. Corolla yellowish, with nearly equal segments. Capsule ovate, obtuse.

Few-flowered Figwort. Pl. 2 to 3 feet?

3 S. orienta'lis (Lin. spec. 864.) glabrous; lower leaves pinnatifidly cut: superior ones lanceolate, all regularly and sharply serrated; peduncles subverticillate; lobes of calyx membranous, ovate; genitals exserted. ♃. H. Native of the Levant, Siberia, and Caucasus. Schkuhr, handb. 2. p. 196. t. 175. Wydler. scrof. p. 26. S. ebulifòlia, Bieb. fl. cauc. 2. p. 77. and 3. p. 415.? but not of Link. S. orientàlis foliis cannábinis, Tourn. cor. p. 9. Lower leaves 3-4 in a whorl, pinnatifid, or appendiculate at the base; segments petiolate, all acuminated. Corolla greenish yellow outside, striped lengthwise with purple inside: lobes of the upper lip shorter than the others. Stigma pilose. Capsule oblong-conical, acuminated.

Eastern Figwort. Fl. July, Aug. Clt. 1710. Pl. 3 to 4 feet.

Sect. II. Scorodònia (from σκορδον, *scorodon*, the Greek name of garlic; in reference to the fetid smell of the species.) Sterile stamen present, adnate at the base, but free at the apex, dilated and spatulate, or emarginate and reniform. Calycine lobes roundish, or ovate, usually with membranous edges. Corollas purplish-green, greenish, purplish white, rarely yellowish. Genitals inclosed, or exserted. Fertile anthers yellow. Roots fibrous, rarely tubercular and woody. Stem usually herbaceous, but in a few species shrubby. Thyrse loose.

§ 1. *Thyrse leafy.*

4 S. grandiflòra (D. C. cat. hort. monsp. p. 143. Wydler, scroph. p. 26.) leaves clothed with soft villi: lower ones interruptedly and lyrately pinnatifid: lobes alternate, ovate, acute, toothed: terminal one large, broad, lanceolate; upper leaves ovate-lanceolate; calyx membranous; genitals inclosed. ♃. H. Native of South America.? Leaves sometimes doubly toothed; teeth ciliated, mucronate; petioles villous. Peduncles 5-flowered, much shorter than the leaves. Pedicels and calyxes villous. Corolla large, deep red. Anther or top of sterile filament reniform. Capsule almost globose.

Great-flowered Figwort. Fl. June, Aug. Clt. 1820. Pl. 2 to 3 feet.

5 S. sambucifòlia (Alp. exot. 203. t. 202. Lin. spec. p. 865.) glabrous; lower leaves deeply pinnate: upper ones ternate, or undivided; leaflets ovate, acute, deeply toothed: terminal one large; calyxes membranous; genitals inclosed. ♃. H. Native of Spain, Portugal, Corsica, North of Africa, Levant, &c. Hill. veg. syst. 19. t. 48. Mirb. elem. bot. (1815.) t. 30. f. 7. S. mellífera, Vahl, symb. 2. p. 68. Desf. fl. atl. 2. p. 53. t. 143. S. viridiflòra, Poir. voy. barb. 2. p. 194. S. Hispánica sambuci folio, glabro, Tourn. inst. p. 166. —Mor. hist. 2. p. 483. sect. 5. t. 8. f. 6.—Munt. phyt. 45. f. 238. Mill. fig. 2. t. 231. Leaflets sometimes petiolate. Anther or top of sterile stamen reniform. Capsule acuminated. Corolla purple; lower lip greenish.

Var. β, hirsùta (Wydler, scroph. p. 27.) plant hairy in every part, canescent. ♃. H. Native of Portugal. S. sambucifòlia, Willd. enum. 645. Link, fl. port. p. 272. S. grandiflòra, Rchb. icon. cent. 1. t. 98. but not of D. C. S. maxima Lusitanica, sambucifólio lanuginoso, Tourn. inst. p. 166. S. Lusitanica, maximo flore, foliis dissectis, Ray, hist. suppl. 396. This is very like the species, but differs in all its parts being hairy.

Var. γ, thýrso aphýllo (Wydler, l. c.) thyrse leafless.

Elder-leaved Figwort. Fl. May, July. Clt. 1640. Pl. 2 to 3 feet.

6 S. peregri'na (Math. comm. in Diosc. Cam. hort. p. 157. t. 43. Lin. spec. p. 866.) glabrous; leaves cordate, shining,

glabrous; peduncles alternate, 2-5-flowered; lobes of calyx not membranous, glabrous, acute; genitals inclosed. ⊙. H. Native of Greece, Italy, Crete, Balearic Islands, and Provence, along way-sides, in hedges, and shady places. D. C. fl. fr. 3. p. 580. in add. p. 729. S. geminiflòra, Lam. fl. fr. 2. p. 336. S. sexangulàris, Mœnch. meth. p. 445. S. mìnor, Sav. fl. pis. 2. p. 81. S. argùta, Ait. hort. kew. ed. 1st. vol. 2. p. 342.—Mor. hist. 2. p. 481. sect. 5. t. 8. f. 1.—Chabr. sciagr. 470. icone Γαλίοψις, Diosc. Stem acute-angled at the base, but obtuse angled at apex, dark purple. Leaves full of pellucid dots. Corollas small, purple, veiny; lobes all denticulated. Anther or tip of sterile stamen reniform. Capsule almost globose.

Foreign Figwort. Fl. July, Aug. Clt. 1640. Pl. 1 to 2 feet.

7 S. Scorodònia (Lin. spec. p. 864.) pilose; leaves cordately triangular, doubly toothed, acute, wrinkled, all opposite; edges of the lobes of calyx white and membranous, clothed with glandular hairs outside; genitals inclosed. ♃. H. Native of the Island of Jersey, Siberia, Galicia, Portugal, Tunis, in humid places and hedges. Hill. veg. syst. 19. t. 45. Lam. ill. t. 533. Smith, engl. bot. 2209. S. scordiifòlia, Grisl. vir. lus. p. 75. S. melissæfòlia, Tourn. inst. p. 166. Petiv. brit. 2. p. 35. f. 11. S. scorodoniæfòlia, Mor. hist. 2. p. 482. sect. 5. t. 35. f. 6. Plukn. phyt. t. 59. f. 5. S. foliis cordatis, duplicato-serratis; racemo composito, Gmel. sib. 3. p. 195. Corolla small, brownish purple. Anther or tip of sterile stamen reniform. Capsule roundish. The plant of Desfontaines, under this name, differs from that of Linnæus in the thyrse being leafless, and the size of the corolla.

Var. β. Leaves jagged at the base.

Balm-leaved Figwort. Fl. July, Aug. Britain. Pl. 2 to 3 feet.

8 S. Castagnea'na (Wydler, scroph. p. 29.) angles of stem rather downy; leaves oblong-cordate, doubly and deeply toothed, acute, rather downy: lower ones opposite: upper ones alternate; edges of the lobes of the calyx red, membranous, glabrous outside; genitals inclosed. ♃. H. Native of Turkey, about Constantinople, Castagne. Stem simple, striated. Leaves full of pellucid dots; teeth finely ciliated. Peduncles bifid; pedicels equal. Lobes of calyx ovate. Corollas larger than those of *S. nodòsa*, purple. Anther or tip of the fifth stamen roundish, emarginate.

Castagne's Figwort. Pl. 1½ to 2 feet.

9 S. urticæfòlia (Wall. cat. no. 3922. Benth. scroph. ind. p. 18.) downy, but at length nearly glabrous; leaves roundish-ovate, coarsely and doubly toothed, cordate at the base; peduncles opposite, 3-7-flowered; segments of the calyx broad ovate, obtuse, with membranous edges; genitals inclosed. ♃. H. Native of Nipaul and Gosaingsthan, Wall. Corolla greenish: upper lip longer than the lower segments. Anther or tip of sterile filament dilated, spatulate, and emarginate.

Nettle-leaved Figwort. Pl. 1 to 2 feet?

10 S. Himalaye'nsis (Royle, mss. ex Benth. scroph. ind. p. 18.) downy, tall; stem obtuse-angled; leaves ovate-lanceolate, somewhat doubly-toothed, subcordate at the base; thyrse ample, panicled, leafy at the base; segments of the calyx ovate, roundish, hardly membranous; genitals exserted. ♃. H. Native of the Himalaya, common. Corolla greenish. Anther or tip of sterile stamen dilated, spatulate, and emarginate.

Himalaya Figwort. Pl. 3 to 4 feet?

§ 2. *Thyrse leafless.*

11 S. polya'ntha (Royle, mss. ex Benth. scroph. ind. p. 18.) downy, tall; stem rather angular; leaves ovate-lanceolate, somewhat doubly toothed, narrowed unequally at the base, or furnished with a few lanceolate segments; thyrse elongated, large, panicled; segments of calyx ovate-roundish, with membranous edges; genitals exserted. ♃. H. Native of Mussooree, Royle. Corolla greenish.

Many-flowered Figwort. Pl. 2 to 4 feet?

12 S. ela'tior (Wall. cat. no. 3921. Benth. scroph. ind. p. 18.) glabrous, tall; stem angular, or winged; lower leaves ovate, cordate at the base: superior ones ovate-lanceolate, all doubly-toothed; thyrse large, panicle-formed, almost leafless; segments of calyx deep, lanceolate, acute, not membranous; genitals exserted. ♃. H. Native of Gosaingsthan, Wall. Anther or tip of sterile stamen dilated, spatulate, and emarginate.

Tall Figwort. Pl. 3 to 4 feet?

13 S. lanceola'ta (Pursh. fl. amer. sept. 2. p. 419. Nutt. gen. amer. 2. p. 44.? Wydler, scroph. p. 29.) glabrous; lower leaves ovate-lanceolate: superior ones lanceolate, all acute, serrated; peduncles bifid, 2-5-flowered; calycine segments with membranous edges; capsule roundish. ♃. H. Native of Carolina, Pennsylvania, &c. S. Marylándica, herb. D. C. et Desf. Stem very simple. Leaves not cordate at the base. Petioles shorter than the leaves. Corolla greenish yellow. Genitals inclosed.

Lanceolate-leaved Figwort. Fl. July, Aug. Clt. 1820. Pl. 2 to 3 feet.

14 S. nodòsa (Lin. spec. p. 863.) root tubercular; stem acute-angled, glabrous; leaves glabrous, cordately triangular, doubly serrated: teeth drawn out at the base; segments of calyx not membranous; genitals inclosed. ♃. H. Native of shady, humid places, and edges of ditches, throughout Europe; plentiful in some parts of Britain, particularly in the north. Schkuhr, handb. 2. p. 194. Smith, engl. bot. 1544. Oed. fl. dan. 1167. Gunn. fl. norv. 2. p. 87. no. 732. t. 4. f. 1—3. Hayne, arz. 5. t. 35.—Petiv. 193. f. 194.—Mor. hist. p. 482. sect. 5. t. 8. f. 3.—Riv. mon. irr. t. 107. f. 1.—Blackw. herb. t. 87.—Lob. icon. 533. Roots knobbed. Leaves full of small pellucid dots, sometimes not cordate at the base. Corollas greenish; lip purplish. Anther or tip of sterile stamen reniform. Capsule nearly globose. This species has the name Figwort and formerly Kernelwort from its knobbed roots, and Brownwort from the brown tinge of the leaves. In medicine the plant is hardly known in modern practice, but the rank smell, like elder, and bitter taste of the leaves, seem to indicate some active properties. Swine that have the scab are cured by washing them with a decoction of the leaves. Wasps resort greatly to the flowers. Goats eat the plant; but cows, horses, sheep, and swine refuse it.

Var. β; leaves 3 in a whorl.

Var. γ; flowers green.

Knotty-rooted Figwort. Fl. May, July. Britain. Pl. 2 to 3 feet.

15 S. Maryla'ndica (Lin. spec. p. 863.) stem obtuse-angled; leaves cordate, serrated, acute, rounded at the base. ♃. H. Native of North America and Siberia. S. nodòsa, β, Americàna, Michx. fl. bor. amer. 2. p. 21. S. Marylándica, longo profunde serrato urticæ folio, Ray, hist. suppl. p. 396. This species hardly differs from *S. nodòsa*, unless in the stem being taller, in the teeth of the leaves being deeper; but the calyx, corolla, and capsule are the same as those of *S. nodòsa*.

Maryland Figwort. Fl. May, July. Clt. 1759. Pl. 3 to 4 feet.

16 S. Scopòlii (Hoppe. cent. exsic. D. C. fl. fr. suppl. 406. Wydler, scroph. p. 31.) downy; leaves ovate-cordate, regularly and doubly crenated, or serrated, acute, wrinkled; lobes of calyx broad, ovate, with whitish, membranous edges; genitals inclosed. ♃. H. Native of the Alps of Hungary, Carniola, Pyrenees; in hedges, orchards, gardens, and waste places; north of Caucasus, in groves; and south of Tauria. Bertol.

amœn. ital. p. 382. S. auriculàta, Scop. carn. ed. 2d. vol. 1. p. 446. t. 32. S. rugòsa, Willd. enum. suppl. p. 42.? S. nepetefòlia, Smith, in Rees' cycl. 32. no. 7.—Barrel. icon. 274. S. màjor hirsùta, Tourn. inst. 166. Lower leaves very large, all full of pellucid dots, without any auricles. Anther or tip of sterile stamen reniform. Capsule nearly globose.

Var. β; pedicels elongated, filiform. Wydler, scroph. p. 31.

Scopoli's Figwort. Fl. May, Sept. Clt. 1816. Pl. 2 feet.

17 S. grandidenta'ta (Tenore, fl. nap. suppl. 2. p. 69. Guss. pl. rar. p. 255.) stems and petioles villous; leaves cordate-oblong, downy beneath, deeply bidentate; teeth diverging; thyrse panicled; peduncles trichotomous. ♃. H. Native of Naples, Calabria, and Hungary, on the mountains. S. glandulòsa, Waldst. et Kit. hung. 3. p. 238. t. 214. S. Scopòlii, β, glandulòsa, Wydler, scroph. p. 31. Leaves 3-nerved, downy. Peduncles and bracteas clothed with glandular hairs.

Large-toothed-leaved Figwort. Fl. May, Sept. Clt. 1806. Pl. 2 to 3 feet.

18 S. Califórnica (Cham. et Schlecht, in Linnæa, 2. p. 585. Hook. et Arn. in Beech. voy. pt. bot. p. 153.) stem acute-angled, glabrous, the floriferous part clothed with glandular down; leaves oblong-triangular, acute, cordate at the base, doubly serrated, glabrous above, but sparingly beset with glandular down beneath; thyrse leafless; calycine segments ovate, acute, mucronate, the margins furnished with a narrow membrane; capsule ovate, conical. ♃. H. Native of California. Said to be nearly allied to *S. nodòsa* and *S. Marylándica*.

Californian Figwort. Pl. 2 feet.

19 S. betonicæfòlia (Tourn. inst. 166. Lin. mant. p. 87. Wydler, scroph. p. 31.) rather pilose; leaves cordate-oblong, acute, unequally toothed, wrinkled; lobes of calyx roundish, with rusty, membranous edges; genitals inclosed. ♃. H. Native of Portugal, Canary Islands; in Madeira, at the altitude of from 2500 to 4000 feet. Hill. veg. syst. 19. t. 46. Spreng. syst. 2. p. 785, exclusive of the syn. of Horn.—Barrel. icon. 274.? S. rugòsa, hort. lugd. ex herb. Balb. Stem purplish. Petioles ciliated. Leaves unequally and doubly toothed, or rarely crenated; the teeth ciliated with glandular hairs. Thyrse usually leafless, but sometimes leafy. Corolla greenish purple, or of a rusty green, size of those of *S. nodòsa*. Anther or tip of sterile stamen green, marked with purple, reniform. Capsule globose. *S. betonicæfòlia*, of Brotero and Link, a native of Portugal, is quite distinct from this.

Var. β, *glàbra* (Wydler, scroph. p. 31.) plant glabrous.

Var. γ, *thýrso foliòso* (Wydler, l. c.) thyrse leafy.

Betony-leaved Figwort. Fl. June, Aug. Clt. 1752. Pl. 2 to 3 feet,

20 S. Hermi'ni (Link, et Hoffm. fl. port. 1. p. 266.) stem hairy; leaves cordate and subcordate, oval, and somewhat doubly crenate-toothed, not wrinkled, downy; capsule conical, long. ♃. H. Native of Portugal, on Serra Estrella. Leaves on long petioles. Lobes of calyx small, margined a little. Upper lip of corolla pale brown, lower one green. Stamens and anthers yellow.

Hermin's Figwort. Pl. 2 to 3 feet.

21 S. Alta'ica (Murr. in comm. gœtt. 1781. p. 35. t. 2.) plant clothed with glandular villi; leaves cordate, doubly toothed, downy beneath, acute; lobes of calyx broad-lanceolate, acute, not membranous; capsule roundish. ♃. H. Native of Altaia. Leaves sinuately toothed; teeth acute: lower teeth reverse. Thyrse beset with glandular villi. Lobes of calyx lanceolate, acuminated, ciliated. Anther or tip of sterile stamen reniform. Genitals sub-exserted. Corolla whitish yellow.

Altaian Figwort. Fl. May, June. Clt. 1786. Pl. 1 foot.

22 S. Smi'thii (Horn. hort. hafn. suppl. 68. Link, enum. 2. p. 139. Wydler, scroph. p. 33.) hairy; leaves ovate-cordate, multiplicately and deeply crenated, acute; lobes of calyx roundish, with red or yellowish membranous edges; capsule somewhat ovate. ♃. G. Native of the Canary Islands. Stem quadrangular, dark purple, branched. Corolla yellow. Genitals inclosed. Anther or tip of sterile stamen reniform.

Smith's Figwort. Fl. April, Aug. Clt. 1815. Pl. 2 to 3 feet.

23 S. glabra'ta (Ait. hort. kew. 2. p. 341. and ed. 2d. vol. 4. p. 22.) glabrous; stem suffruticose; leaves cordate-lanceolate, acute, doubly and triplicately toothed; lobes of calyx with white membranous edges; genitals exserted; capsule ovate-globose. ♂. G. Native of Teneriffe, among rocks on the Pic de Teyde, at the altitude of 7000 or 8000 feet, where it is called *Yerba de Cumbre*. Jacq. hort. schœnbr. 2. p. 44. t. 209. Willd. spec. 3. p. 272. exclusive of the syn. of Vahl. Wydler, scroph. p. 33. Leaves full of pellucid dots. Lobes of calyx roundish ovate. Corolla purple, veined, size of that of *S. canìna*. Anthers margined with red.

Var. β, ? *pubéscens* (Wydler, scroph. p. 33.) stem and leaves downy. ♃. H. S. betonicæfòlia, D. C. in herb. Balb. This differs from *S. betonicæfòlia*, Lin. in the lobes of the calyx not being margined with rust colour.

Smooth Figwort. Fl. April, May. Clt. 1779. Pl. 2 to 3 feet.

24 S. biserra'ta (Willd. enum. p. 644. Wydler, scroph. p. 33.) leaves oblong-lanceolate, deeply cordate, sharply and doubly serrated, glabrous. ♃. H. Native country unknown. Very like the preceding, and probably only a variety of it.

Doubly-sawed-leaved Figwort. Fl. June, Aug. Clt. 1816. Pl. 2 to 3 feet.

25 S. fœ'tida (Wydler, scroph. p. 34.) glabrous; leaves ovate-oblong, deeply and multiplicately crenated. ♃. H. Native country unknown. Plant fetid. Stem simple, or a little branched, striated. Leaves full of pellucid dots. Peduncles alternate, bifid. Lobes of calyx broad-ovate, sometimes glandular outside, with membranous, chestnut-coloured edges. Corolla size of those of *S. nodòsa*, yellow, ex. D. C.

Fetid Figwort. Pl. 2 to 3 feet.

26 S. trifolia'ta (Lin. spec. p. 865.) glabrous; stem almost simple; leaves ovate, or roundish, cordate, deeply-toothed, or lobately crenated, often appendiculate at the base, according to several authors, or deeply cut; lobes of calyx roundish, with reddish white membranous margins; capsule ovate-conical. ♂. H. Native of Corsica, in mountainous places; and of Portugal, and the north of Africa. D. C. fl. fr. 3. p. 581. Wydler, scroph. p. 34. S. lævigàta, Vahl, symb. 2. p. 67. S. appendiculàta, Jacq. schœnbr. 3. p. 19. t. 286.—Plukn. alm. 338. t. 313. f. 6.? but the thyrse is leafy.—Bocc. mus. t. 60.? Stem tetragonal. Corolla globose: lower lip whitish, the other reddish. Filaments white. There is probably two species confounded; the one having the leaves never appendiculate, or ternate, and downy beneath.

Trifoliate Figwort. Fl. May, Sept. Clt. 1731. P. 2 feet.

27 S. hi'spida (Desf. fl. atl. 2. p. 55. Wydler, scroph. p. 35.) hispid; leaves pinnate at the base, doubly crenated: terminal lobe large, cordate; cymes dense flowered; lobes of calyx margined with white. ♃. H. Native of Mount Atlas, in the fissures of rocks near Tlemsen. Genitals inclosed.

Hispid Figwort. Fl. June, Aug. Clt. 1824. Pl. 2 feet.

28 S. auricula'ta (Lin. spec. p. 864. exclusive of the synonymes. Wydler, scroph. p. 35.) leaves cordate-oblong, appendiculate at the base, tomentose beneath. ♃. H. Native of Nice and Algiers, on the sides of ditches. D. C. fl. fr. 3. p. 580. Desf. fl. atl. 2. p. 56. exclusive of the syn. of Lob. Stem tetragonal, rather pilose; angles membranous. Leaves rather pilose, crenated; crenæ broad, mucronulate. Segments of calyx roundish, with red membranous edges, glandular outside.

Corolla, stamens, and sterile anther and capsule as in *S. aquática*. Smith considers this to be a variety of *S. Scorodònia*, but Wydler considers it a variety of *S. aquática*.

Auricled-leaved Figwort. Fl. June, Aug. Clt. 1772. Pl. 2 to 3 feet.

29 S. AQUA'TICA (Lin. spec. p. 864.) glabrous; angles of stem acute, membranous; leaves ovate, or elliptic, subcordate at the base, crenate-toothed: lower leaves usually appendiculate; lobes of calyx margined with red; genitals inclosed. ♃. H. Native throughout Europe, and in Caucasus, in moist places by the sides of ditches, &c.; plentiful in Britain. Blackw. herb. t. 86. Schkuhr, handb. 2. p. 195. t. 173. Smith, engl. bot. t. 854. Oed. fl. dan. 507. Hayne, arz. 5. t. 36. Chaumet, fl. med. t. 321. S. Balbìsii, Horn. hort. hafn. 577. Balb. cat. hort. taur. 1813. p. 69. exclusive of the syn. of All. S. appendiculàta, Balb. herb. S. auriculàta, Loefl. itin. p. 292.? Asso. arr. p. 81.? Schkuhr, handb. 2. p. 195. t. 173. Water Figwort, Petiv. brit. 2. t. 33. f. 10.—Mor. hist. pract. p. 147. t. 68. f. 1.—Mor. hist. 2. p. 482. sect. 5. t. 78. f. 4.—Loes. pruss. p. 248. t. 75.—Lob. icon. t. 533. Leaves sometimes without auricles, but always full of pellucid dots. Cymes usually dense-flowered. Corolla blood red. The plant is called *Water Betony*, *Brownwort*, and *Bishop leaves*. The leaves are recommended medicinally for the same purposes as those of *S. nodòsa*; in taste and smell they are similar, but weaker. M. Marchant has reported, in the memoirs of the French Academy, that this plant is identical with the Equetaia of the Brazilians, celebrated as a corrector of the ill flavour of senna: the Edinburgh college, in their common infusion of that drug, directed two thirds of its weight of water Figwort leaves to be joined; but as they have since discarded this ingredient, we may presume that it was not found to be of much use. The disagreeable smell which attends this plant when bruised makes it rejected by cattle in general. Bees collect much honey from the flowers.

Var. β; stem simple; leaves lanceolate-elliptic; flowers less dense. ♃. H. Native of ditches about Geneva. Wydler, scroph. p. 37.

Var. γ; thyrse leafy. ♃. H. Wydler, scroph. p. 37.

Water Figwort, or Water Betony. Fl. May, Sept. Britain. Pl. 3 to 5 feet.

30 S. LYRA'TA (Willd. enum. p. 545. hort. berol. t. 55.) leaves hairy on both surfaces: lower ones lyrately and interruptedly pinnate: superior ones ternate: upper ones simple, auricled; terminal lobe large, oblong-ovate, subcordate, bluntly and doubly toothed. ♃. H. Native country unknown. Bracteas beset with glandular hairs. Corolla brownish purple. Genitals inclosed.

Lyrate-leaved Figwort. Fl. June, Aug. Clt. 1816. Pl. 2 to 4 feet.

31 S. EBULIFÒLIA (Hoffm. et Link, fl. port. 1. p. 270. Wydler, scroph. p. 37. but not of Bieb.) glabrous; lower leaves lyrate: segments somewhat duplicately, acutely, and deeply crenated: superior leaves deeply pinnatifid: segments dentately crenated. ♃. H. Native of Portugal, on the seashore near Setuval. Nearly allied to *S. lyràta*.

Var. β; leaves shining. ♃. H. Native of Portugal, on Serra de Gerrez.

Danewort-leaved Figwort. Pl. 2 to 3 feet.?

32 S. TANACETIFÒLIA (Willd. hort. berol. t. 56. Link, enum. 2. p. 140.) glabrous; leaves interruptedly pinnate; leaflets petiolate, oblong-ovate, deeply toothed, the terminal lobe the largest; genitals exserted. ♃. H. Native of North America. Anther or tip of sterile stamen nearly orbicular. Fertile anthers dark purple. Segments of calyx with white membranous edges, usually shining. Root and stem often woody. Leaves more or less fleshy, rarely undivided, but usually pinnatifid, or pinnate. Corolla brownish purple.

Tansy-leaved Figwort. Fl. July, Sept. Clt. 1804. Pl. 2 to 4 feet.

33 S. VERBENÆFÒLIA (Desf. cat. hort. par. p. 77. Poir. suppl. 5. p. 117. Wydler, scroph. p. 38.) stem simple, glabrous, herbaceous; leaves cordate-oblong, laciniately pinnatifid, unequally crenated and serrated, lower segments the deepest, often auricled; genitals exserted. ♃. H. Native of Croatia, on calcareous rocks. S. laciniàta, Waldst. et Kit. hung. 2. p. 185. t. 170. Segments of calyx margined with white. Corolla size of that of *S. nodòsa*, greenish; upper lip purple.

Vervain-leaved Figwort. Fl. June, July. Clt. 1806. Pl. 1½ to 2 feet.

34 S. PATRINIA'NA (Wydler, scroph. p. 39.) stem simple, glabrous, herbaceous; leaves ovate, acute, deeply and acutely toothed: lower ones pinnatifid at the base: lobes acute. ♃. H. Native of Dauria. Stem striated. Leaves glabrous, on short petioles. Peduncles 2-3-flowered. Lobes of calyx broad, ovate. Corolla as in *S. canìna*. Sterile anther roundish, white.

Patrin's Figwort. Pl. 2 to 3 feet.

35 S. INCI'SA (Weinm. ind. pl. hort. dorp. 1810. p. 136. Ledeb. fl. ross. alt. ill. t. 156. fl. alt. 2. p. 442.) leaves oblong, attenuated at both ends, petiolate, deeply serrated, thickish, glabrous; panicle elongated, clothed with glandular villi: lower branches 3-5-flowered: superior ones 2-3-flowered. ♃. H. Native of Altaia, on rocks among the mountains of Arkaul and Tschingistau; and on the borders of the river Tschuja, &c. Said to be nearly allied to *S. laciniàta*, but the leaves are never cordate at the base. Stem and branches bluntly quadrangular. Corolla and anthers dark purple. Genitals exserted. Margins of calyxes white, and membranous.

Cut-leaved Figwort. Fl. May, June. Pl. 2 feet.

36 S. DIVARICA'TA (Led. ind. sem. hort. dorp. 1822. p. 17. Led. fl. ross. alt. ill. t. 121. fl. alt. 2. p. 440.) leaves cordate, acuminated, doubly serrated, downy on both surfaces; racemes axillary, dichotomous; calycine segments acutish, adpressed; genitals inclosed. ♃. H. Native of Iberia, near Tiflis. Stem and branches bluntly tetragonal, beset with glandular hairs, and longer simple ones. Margins of the segments of the calyx membranous. Corolla yellowish-green. Capsule nearly globose, acuminated. The thyrse of this species being leafy, it ought to have been placed in the preceding section: the leaves of the thyrse are deeply jagged.

Divaricate Figwort. Fl. May, Oct. Pl. 4 to 6 feet.

37 S. OLIVIERIA'NA (Wydler, scroph. p. 39.) stem glabrous; leaves ovate, deeply and dentately crenated, more or less pinnate at the base; segments or leaflets petiolate, roundish. ♃. H. Native of the Levant. Stem nearly simple, woody at the base, striated, dark purple. Upper leaves roundish, subcordate. Lobes of calyx roundish. Corolla form, size, and colour of *S. canìna*. Sterile anther white. This is very nearly allied to *S. Urvilleàna*, but differs in the lobes of the calyx being broader, and in the petioles being dilated.

Olivier's Figwort. Pl. 1 to 2 feet.

38 S. MICRA'NTHA (D'Urv. enum. arch. p. 75.) stem branched at the base, glabrous, ascending; branches weak; leaves petiolate, oblong, obtuse, auricled at the base, coarsely toothed; flowers small. ♃. H. Native of the Island of Ferasia, near Thera. Wydler, scroph. p. 39.

Small-flowered Figwort. Pl. 1 to 2 feet.

39 S. URVILLEA'NA (Wydler, scroph. p. 40. t. 11.) stem simple, glabrous; leaves roundish-cordate, lobed, rarely crenated. ♃. H. Native of the Island of Melos, and at Thera, on walls and on rocks, d'Urville. Stems numerous, dark purple. Lower bracteas like the leaves. Peduncles alternate; cymes 3-6-flowered. Segments of calyx margined with white. Corolla small, purple. Capsule roundish. This species hardly differs from the preceding, and might with propriety be joined to it.

Var. β, *lyràta;* lower leaves ovate: superior ones cordate-ovate, all lyrately pinnate; leaflets cuneate, ovate, sometimes petiolate: terminal one large, all deeply crenated. ♃. H. Native along with the species. Wydler, scroph. p. 40. t. 3.

D'Urville's Figwort. Pl. 1 to 1½ foot.

40 S. VARIEGA'TA (Bieb. casp. 177. app. no. 48. fl. cauc. 3. p. 416.) stem suffruticose; leaves ovate, lobately toothed: lower ones pinnatifid at the base, and rather downy. ♃. H. Native of Caucasus, in stony places. Rchb. icon. cent. 3. t. 257. Corolla purple; lower lip white, as well as one of the segments of the upper lip. Genitals exserted.

Variegated-flowered Figwort. Fl. June, Aug. Clt. 1816. Pl. 2 feet.

41 S. RUPE'STRIS (Bieb. fl. cauc. 2. p. 79. and 3. p. 417.) stems nearly terete, clothed with hoary down; leaves oblong-ovate, attenuated at both ends, toothed, glabrous. ♃. H. Native of the South of Tauria, among rocks. Willd. spec. 3. p. 274. Rchb. icon. cent. 3. t. 258. S. orientàlis, Habl. taur. p. 164. ex Bieb. There is a variety of this having the lower leaves cut at the base, and downy on the nerves beneath, which is probably a variety of *S. variegàta.* Genitals exserted.

Rock Figwort. Fl. July, Aug. Clt. 1818. Pl. 2 feet.

42 S. LI'VIDA (Smith, prod. fl. græc. 1. p. 437. fl. græc. t. 601.) leaves pinnate: leaflets pinnatifid; thyrse twiggy; genitals inclosed. ☉. H. Native of Asia Minor, Sibthorp. Calyx edged with white. Corolla greenish yellow; upper lip purple.

Livid Figwort. Pl. 1 to 2 feet.

43 S. BI'COLOR (Sibth. et Smith, fl. græc. t. 602.) leaves bipinnate; racemes panicled; peduncles many-flowered; capsule globose, mutic; stamens exserted. ♃. H. Native of Sicily. Calyx edged with white. Corolla blood-coloured, with a white base; lateral segments short, white; the rest blood-coloured, edged with white.

Two-coloured-flowered Figwort. Pl. 3 feet.

44 S. MULTI'FIDA (Willd. enum. p. 646. hort. berol. t. 58.) stem simple? glabrous, herbaceous; lower leaves bipinnate; segments or leaflets lanceolate, deeply toothed, acute: superior ones pinnate, or pinnatifidly cut: uppermost ones tripartite, the middle segment long and toothed. ♃. H. Native of Sicily and Asia Minor. S. silaifòlia, Clark. voy. ex Spreng. syst. Corolla brownish-purple.

Multifid Figwort. Fl. June, Aug. Clt. 1816. Pl. 2 to 3 feet.

45 S. LU'CIDA (Lin. spec. p. 865.) stem simple, glabrous, shrubby; leaves thickish, shining, pinnate; leaflets pinnatifid, roundish or acute, toothed; thyrse short, dense. ♃. H. Native of Italy, Greece, Levant, Iberia, and the North of Africa. D. C. fl. fr. 3. p. 582. Willd. hort. berol. t. 57. S. glauco folio in amplas lacinias diviso, Tourn. cor. 9. voy. 1. t. 85. (ed. 1717.) 1. t. 221.—Bocc. mus. t. 117.—Mor. hist. 2. p. 483. sect. 5. t. 9. f. 7. Σιδηριτις τριτη, Diosc. This species is readily distinguished from the rest in the peduncles and pedicels being thick; the calyx larger, and the membranes broader. Stems always leafy at the base. Corolla pale, with a red upper lip; but according to Miller dark brown. Genitals inclosed.

Var. β; leaves narrower. ♃. H. Wydl. scroph. p. 42.

Shining Figwort. Fl. June, Sept. Clt. 1596. Pl. 1 to 2 feet.

46 S. FILICIFÒLIA (Mill. dict. ed. 8th. no. 10. Sibth. et Smith, prod. fl. græc. 1. p. 436. Rees' cycl. vol. 32. no. 26.) radical leaves interruptedly pinnate; leaflets pinnatifid, lanceolate; lobes acutely toothed: teeth mucronate; flowers distant. ♃. H. Native of Greece. S. Crética, Riv. mon. irreg. t. 94. Trev. in Linnæa, 2. p. 53. Radical leaves a foot long. Thyrse 1½ foot long, not short as in *S. lùcida;* and the peduncles are not thickened as in *S. lùcida.* Segments of calyx margined with white. Corollas small, purple, edged with white, ex Mill. Genitals exserted.

Fern-leaved Figwort. Fl. July, Aug. Clt. 1700. Pl. 2 to 3 feet.

47 S. DECOMPÓSITA (Royle, mss. ex Benth. scroph. ind. p. 18.) glabrous, shining; leaves opposite, thickish, pinnate; leaflets deeply pinnatifid, lanceolate: lower ones petiolate; thyrse strict; lower peduncles opposite: superior ones alternate, short, stiff, 3-5-flowered; segments of calyx with white margins, and rufous membranes; genitals exserted. ♃. H. Native of Kinnour, Royle. Perhaps only a variety of *S. lùcida.* Sterile stamen with an orbicular tip.

Decompound-leaved Figwort. Pl. 2 to 3 feet.

SECT. III. CANI'NA (so called on account of the species agreeing in character and habit with *S. canìna.*) The fifth or sterile stamen deficient of an anther; that is to say, the free part or tip is acute. The rest as in the last section.

§ 1. *Thyrse compound; cymes many-flowered.*

48 S. DESE'RTI (Delile. fl. d'egypt. p. 96. t. 33. f. 1.) stem suffruticose at the base, and branched; leaves cut, glabrous, with cartilaginous edges: lower ones sublyrate: superior ones pinnatifid; segments narrow-obovate, toothed. ♃. F. Native of the deserts of Egypt. Margins of calyx cartilaginous.

Desert Figwort. Pl. 1 to 2 feet.

49 S. FRUTE'SCENS (Lin. spec. p. 866.) stem shrubby; leaves usually alternate, cuneate-ovate, or lanceolate, running into the short petioles, toothed. ♄. F. Native of Portugal, in the sand by the sea side; Greece, and the North of Africa. Hill, veg. syst. 19. t. 46. Herm. lugdb. 545. t. 547. S. Lusitanica verbenacæ folio, Tourn. inst. 167. Stem quadrangular. Corollas small, dark purple, with the lateral segments white.

Var. β; leaves cut or jagged. ♄. F. Wydler, scroph. 43.

Shrubby Figwort. Fl. June, Aug. Clt. 1768. Shrub 2 feet.

50 S. PINNATI'FIDA (Brot. fl. lus. 1. p. 202. Hoffm. et Link, fl. port. 1. p. 269.) stem suffruticose; leaves sessile, lanceolate, deeply crenate-toothed, or cut and pinnatifid at the base. ♄. F. Native of Portugal, in sandy places.—An intermediate plant between *S. frutéscens* and *S. canìna*, and probably only a variety of the first. Stem erect, much branched, glabrous. Leaves usually alternate, sometimes opposite, narrowed at the base.

Pinnatifid-leaved Figwort. Fl. July, Aug. Clt. 1819. Shrub 2 feet.

51 S. HETEROPHY'LLA (Willd. spec. 3. p. 274. d'Urv. enum. arch. 75.) stem shrubby; leaves on long petioles, rather fleshy: lower ones pinnate: superior ones 3-lobed and elliptic, all remotely and deeply toothed; thyrse very long. ♄. F. Native of Candia, and the Island of Melos; and of Ferasia, near Thera. Sibth. et Smith, fl. græc. t. 603. S. frutéscens, var. β, Smith, prod. 1. p. 437. S. Sibthorpiàna, Spreng. syst. 2. p. 786. S. crética frutéscens folio vario et carnoso, Tourn. cor. p. 9. Very nearly allied to *S. frutéscens;* but the leaves are all on long petioles. Branches bluntly tetragonal. Corolla scarlet. Genitals exserted.

Various-leaved Figwort. Shrub 2 to 3 feet.

52 S. CANI'NA (Lin. spec. 865.) root woody; stems herbaceous; lower leaves pinnate: superior ones pinnatifid or bipinnatifid; segments roundish or lanceolate, toothed. ♃. H. Native of the South of Europe, in dry, sandy, or gravelly places; Greece, and the Balearic Islands; North of Africa, on the Mediterranean sea. Hill. veg. syst. 19. t. 48. D. C. fl. fr. 3. p. 582. S. multífida, Lam. fl. fr. 2. p. 337. S. chrysanthemifòlia, Balb. herb.—Mor. hist. 483. sect. 5. t. 9. f. 8. Σιδηριτις ἑτερα, Diosc. Thyrse sometimes leafy, strict, *long;* branches of cyme kneed. Corollas purple, with a mixture of green. Genitals exserted.

Var. β, *chrysanthemifòlia* (Wydler, scroph. p. 44.) flowers small, purple, margined with white. ♃. H. Native of Tauria. S. chrysanthemifòlia, Bieb. fl. cauc. 2. p. 78. and 3. p. 416. Willd. hort. berol. t. 59. S. canìna, β, Willd. spec. 3. p. 277. exclusive of the syn. of Tourn. S. pinnàta, Mill. dict. no. 155.? S. orientàlis, chrysanthemifòlia, flore minimo variegato, Tourn. cor. 9.

Var. γ, *nàna* (D. C. fl. fr. 3. p. 582.) stem more humble; leaves very narrow; racemes short; flowers dense. ♃. H. Native of Mount Jura, in many places. S. praténsis, Schleich. cent. exsic. no. 67.

Var. δ, *pubéscens*; stems downy. ♃. H. Native of the valley of Boden, near Windisch-Bleiberg, Hoppe. S. canìna, Hoppe, cent. 4. S. canìna, var. γ, D. C. fl. fr. 3. p. 582.

Var. ε, *albiflòra* (Wydler, scroph. p. 45.) flowers white; leaves broader, with rounded segments. ♃. H.

Dog's Figwort. Fl. June, Aug. Clt. 1683. Pl. 2 to 3 feet.

53 S. PYRAMIDA'LIS (Wydler, scroph. p. 45.) stems very long; leaves alternate: lower ones lanceolate, denticulated: upper ones pinnatifid; thyrse very long. ♃. H. Native about the Black Sea, near Donnums Bercy. Perhaps only a variety of *S. canìna*; the peduncles are longer, and the capsule ovate-roundish, acuminated, small.

Pyramidal-flowered Figwort. Pl. 2 to 3 feet.

54 S. CALYCI'NA (Benth. scroph. ind. p. 18.) glabrous or downy; stem angular; leaves broad-ovate, toothed: lower ones cordate at the base: rameal ones roundish; thyrse short, dense, almost leafless; calyx 5-parted, with lanceolate, acuminated, downy segments, which are longer than the capsule; genitals inclosed; anther or tip of sterile filament ovate-acute. ♃. H. Native of Kamaon. Verónica thyrsiflòra, Wall. cat. no. 6393. Leaves wrinkled. Calyxes not membranous. Segments of the corolla short, nearly equal. Capsule large, acuminated.

Large-calyxed Figwort. Pl. 1 foot.

§ 2. *Thyrse simple; cymes few-flowered from the abortion of the pedicels.*

55 S. RAMOSI'SSIMA (Lois. fl. gall. 2. p. 381. D. C. fl. fr. suppl. 406. exclusive of the synonymes) stems rather woody, much branched; leaves opposite, subpetiolate, ovate-oblong, deeply toothed or pinnatifid; peduncles 1-2-flowered. ♃. H. Native of Corsica, by the sea side; also of Provence, by the sea side, &c. S. frutéscens, D. C. fl. fr. 3. p. 729. but not of Lin.

Much-branched Figwort. Fl. June, Aug. Clt. 1821. Pl. 2 to 3 feet.

56 S. CÆ'SIA (Sibth. et Smith, fl. græc. t. 604. prod. 1. p. 438.) stems humble, numerous, tufted; leaves opposite, glaucescent, lyrately pinnatifid, cut; peduncles simply dichotomous, 2-3-flowered. ♃. H. Native on rocks about Athens, &c. S. orientàlis minor melissæ fòlio, Tourn. cor. p. 9.—Buxb. cent. 5. 10. t. 17. f. 2. ex Smith. Stems a span high, glabrous. Perhaps distinct from the preceding. Corolla greenish; upper lip dark purple. Genitals exserted.

Grey Figwort. Pl. ½ to 1 foot.

57 S. DENTA'TA (Royle, mss. ex Benth. scroph. ind. p. 19.) humble, tufted, downy; leaves alternate, thick, oblong, narrowed at the base, deeply toothed at the apex; thyrse simple, few-flowered; peduncles 1-3-flowered; genitals exserted; tip of sterile stamen oblong, acute. ♃. H. Native of Kinnour. Margins of the calyxes membranous. Very nearly allied to *S. cretàcea*, but distinct.

Toothed-leaved Figwort. Pl. ½ to 1 foot.

58 S. CRETA'CEA (Fisch. in Spreng. syst. 2. p. 788. Wydler, scroph. p. 46. t. 4.) leaves alternate, on short petioles, lanceolate, serrated, attenuated at both ends; peduncles 1-2-flowered. ♃. H. Native of Siberia, on cretaceous mountains, at the river Don. Stem simple, clothed with white, glandular, powdery down. Leaves ½ inch long, generally running into the petioles, glabrous. Corolla small, dark purple. Capsule brown, size of a pea.

Cretaceous Figwort. Fl. July, Aug. Clt. 1827. Pl. 1 to 2 feet.

59 S. HYPERICIFÒLIA (Wydler. scroph. p. 46. t. 5.) stem woody; leaves opposite, ovate, quite entire, running into the short petiole; peduncles 1-2-flowered. ♃. H. Native of Arabia, in deserts. Branches with whitish bark, sometimes spinescent. Leaves small, glabrous, full of pellucid dots. Abortive pedicels spinescent. Segments of calyx roundish, with white margins. Corolla small, purple. Genitals exserted. Capsule roundish, large in respect to the size of the flower.

St. John's-wort-leaved Figwort. Shrub.

§ 3. *Flowers capitate.*

60 S. MI'NIMA (Bieb. fl. cauc. 2. p. 79.) humble; stems quite simple; leaves petiolate, ovate, sublobate, toothed; heads of flowers terminal, dense, nearly globose. ♃. H. Native of Iberia. S. orientàlis minima, folio subrotundo, Tourn. cor. p. 9. ex Bieb. Flowers size of those of *S. vernàlis*, rose-coloured; the lip paler. Tip of sterile stamen unknown.

Least Figwort. Pl. ½ foot?

† *Species not sufficiently known.*

61 S. MICRA'NTHA (Herb. Desv. ex Hamilt. prod. fl. ind. occ. p. 47. but not of d'Urv.) stem nearly simple; leaves ovate, acute, deeply toothed, quite glabrous; flowers in loose almost terminal spikes. ♃.? H. Native of Hispaniola.

Small-flowered Figwort. Pl.?

62 S. SUBVERTICILLA'TA (Moris, stirp. sard. fasc. 3. p. 8.) stem tetragonal, full of glandular dots; leaves oblong-lanceolate, doubly toothed: lower ones pinnate; racemes terminal, almost leafless; peduncles opposite, distant, short, densely cymose. ♃. H. Native of Sardinia, near rivulets about Ozieri and Bono, &c. Corolla deep purple. Leaves pilose beneath.

Whorled Figwort. Fl. May, July. Pl. 2 to 3 feet.

63 S. RIVULA'RIS (Moris, l. c. p. 7.) stem tetragonally winged; lower leaves ovate: upper ones oblong-lanceolate, crenate toothed, glabrous, running into the petioles; racemes terminal, nearly naked; peduncles branched. ♃. H. Native of Sardinia, on mountains, near rivulets. Corolla obscure purple; lip green. Habit of *S. aquática*, but the stems and petioles are more conspicuously winged; the leaves are bluntish, and more bluntly toothed.

Rivulet Figwort. Fl. May, June. Pl. 3 to 4 feet.

64 S. OBLONGIFÒLIA (Lois. not. in mem. soc. Lin. par. vol. 6.) glabrous; stem tetragonal; leaves oblong-lanceolate, serrated, tapering into the petioles; racemes terminal, naked; peduncles branched. ♃. H. Native of Corsica.

Oblong-leaved Figwort. Pl. 2 to 3 feet.

65 S. NUDICAU'LIS (Wydler. scroph. p. 48.) stem almost simple, leafy at the base, but almost leafless above; leaves pinnatifid, strigose; racemes simple. ♃. H. Native of Asia Minor, on Mount Elwend. Root woody. Stem clothed with stipitate glands. Lower leaves deeply pinnatifid, beset with adpressed hairs, rather glaucous; segments alternate, acute, toothed, finely ciliated. Cauline leaves small, pectinately pinnatifid. Calyx glandular; segments ovate-lanceolate, acuminated, not membranous. Corolla and capsule not seen. Perhaps belonging to a distinct genus.

Naked-stemmed Figwort. Pl.?

66 S. SCKE'LLII (Spreng. syst. 2. p. 783.) stem quadrangular, smooth; leaves lanceolate, acute, glabrous, equally serrated,

on short dilated petioles; panicle terminal, with trichotomous branches. ♃. H. Native country unknown.

Sckell's Figwort. Pl. 2 to 3 feet?

67 S. NEPETÆFÒLIA (Presl. del. prag. 1. p. 73.) stem shrubby; branches quadrangular; leaves cordate, obtuse, doubly toothed, glabrous on both surfaces; peduncles dichotomous, 3-flowered. ♄. F. Native of the South of Spain. S. glabràta, Spreng. syst. 2. p. 784.? Leaves almost like those of *Népeta catària*. Flowers of a livid yellow, like those of *S. aquática*, but not half the size. Capsule ovate.

Cat-mint-leaved Figwort. Fl. May, July. Pl. 2 to 3 feet?

68 S. MELISSÆFÒLIA (D'Urv. enum. pl. arch. p. 75.) stem erect, quadrangular, quite glabrous; cauline leaves petiolate, ovate-lanceolate, sharply serrated; bracteas lanceolate, erectish; peduncles downy, many-flowered; panicle elongated. ♃. H. Native about Trebizond, on hills. Flowers small, purple. Peduncles 3-4 times forked. Nearly allied to *S. Scorodònia*.

Balm-leaved Figwort. Fl. July, Aug. Clt. 1823. Pl. 2 to 3 feet.

69 S. HASTA'TA (Rafin. fl. ludov. p. 44.) leaves opposite, on long petioles, oblong, hastate, serrated, canescent, hoary beneath; flowers loose, panicled. ♃. H. Native of Louisiana.

Hastate-leaved Figwort. Pl. 2 feet?

70 S. ADSCE'NDENS (Willd. enum. p. 644.) leaves lanceolate, attenuated at both ends, deeply, unequally, and doubly toothed, glabrous; racemes terminal. ♃. H. Native country unknown.

Ascending Figwort. Fl. June, July. Clt. 1816. Pl. 2 feet.

71 S. CHINE'NSIS (Lin. mant. 250. Smith, in Rees' cycl. 32.) leaves ovate-oblong, serrated, downy. ♃. H. Native of China. Perhaps belonging to a distinct genus.

China Figwort. Pl. 2 feet.

72 S. HIRSU'TA (Schott, ex Steud. nom.) ♃. H. Nothing of the plant is known but the name.

Hairy Figwort. Fl. June, Aug. Clt. 1816. Pl. 2 feet.

73 S. INCI'SA (Weim. ex Steud. nom.) ♃. H. Nothing of this plant is known but the name.

Cut-leaved Figwort. Pl. 2 to 3 feet?

Cult. The species of Figwort are plants of the most easy culture and propagation, will grow in any soil, but prefer a moist situation. All are readily increased by seeds. The shrubby species require protection in winter, by being kept in a frame. Some of the species are handsome border flowers, as *S. mellífera, canìna, grandiflòra, sambucifòlia*, &c.

IV. ALONSO'A (named by Ruiz. et Pavon, after Zanoni Alonso, formerly Spanish secretary for Santa Fe de Bogota.) Ruiz. et Pav. fl. per. syst. p. 152. Hemímeris species of authors.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx 5-parted. Corolla subrotate, resupinate; the superior segment the largest. Stamens 4, didynamous, glabrous, declinate; anthers cordate; cells confluent at top. Stigma capitate. Capsule 2-celled, one of the cells more gibbous than the other. Seeds angular.—Small shrubs and herbs, with opposite or verticillate leaves: floral ones alternate. Flowers racemose, scarlet or vermillion-coloured.

§ 1. *Shrubby. Stems and branches quadrangular.*

1 A. LINEA'RIS (Ruiz. et Pav. syst. fl. per. p. 154. fl. per. t. 503. f. b.) glabrous; leaves opposite, or 3 in a whorl, linear, entire, or remotely denticulated. ♄. G. Native of Peru. Sweet, fl. gard. n. s. 240. Hemímeris coccínea, Willd. spec. 3. p. 283. Célsia linèaris, Jacq. icon. 3. t. 497. Curt. bot. mag. 210. Hemítomus fruticòsus, Lher.? Hemímeris linariæfòlia, H. B. et Kunth, nov. gen. 2. p. 377. Young leaves fascicled in the axils of the old ones. Corolla scarlet, with a dark bottom, like most of the species. There is a variety of this with opposite leaves and peduncles. There is also a hybrid between this and *A. incisifòlia* figured in Lodd. bot. cab. 1456, called *A. intermèdia*.

Linear-leaved Alonsoa. Fl. May, Oct. Clt. 1790. Shrub 1 to 2 feet.

2 A. QUADRIFÒLIA; leaves 4 in a whorl, ovate; flowers verticillate, racemose. ♄. G. Native of Vera Cruz. Scrophulària coccínea, Lin. spec. 866. Smith, in Rees' cycl. 32. no. 10.

Four-leaved Alonsoa. Shrub 1 to 2 feet.

3 A. INCISIFÒLIA (Ruiz. et Pav. syst. fl. per. p. 154.) glabrous; leaves opposite, ovate, acute, deeply toothed, or serrated. ♄. S. Native of Chili, about Conception. Hemímeris urticifòlia, Willd. spec. 3. p. 282. Célsia urticifòlia, Curt. bot. mag. 417. Peduncles long, alternate, disposed in terminal racemes like the others. (f. 46.)

FIG. 46.

Cut-leaved Alonsoa. Fl. May, Oct. Clt. 1795. Shrub 1 to 2 feet.

4 A. PROCU'MBENS (Ruiz. et Pav. l. c.) stems procumbent; leaves opposite, ovate, serrated. ♄. G. Native of Peru, in waste places, where it is called Ricaco. Hemímeris procúmbens. Pers. ench. 2. p. 162. Corollas scarlet.

Procumbent Alonsoa. Shrub procumbent.

5 A. ACUTIFÒLIA (Ruiz. et Pav. l. c. p. 153.) leaves opposite,? ovate-lanceolate, deeply serrated. ♄. S. Native of Peru, on hills. Hemímeris acutifòlia, Pers. ench. 2. p. 162.

Acute-leaved Alonsoa. Fl. May, Oct. Clt. 1790. Shrub 1 to 2 feet.

§ 2. *Herbaceous. Stems and branches quadrangular; angles winged.*

6 A. CAULIALA'TA (Ruiz. et Pav. l. c. p. 152.) leaves ovate, acute, serrated; stems and branches winged. ♃. G. Native of Peru. Hemímeris caulialàta, Pers. ench. 2. p. 162.

Wing-stemmed Alonsoa. Fl. year. Clt. 1823. Pl. 1 foot?

7 A. PARVIFLÒRA (H. B. et Kunth, nov. gen. amer. 3. p. 376. under Hemímeris) stem herbaceous, 4-winged; leaves opposite, ovate, acute, serrated; flowers axillary, racemose. ♃. G. Native of Caraccas, in temperate places on Mount Bonavista, near Los Teques, at the altitude of 830 hexapods. Stem branched, panicled at top. Leaves glabrous, nearly an inch long. Middle segment of the lower lip of the corolla larger, and obcordate.

Small-flowered Alonsoa. Pl. 2 to 4 feet.

8 A. MUTI'SII; stem herbaceous, somewhat 4-winged; leaves opposite, oblong, acute at both ends, serrated; flowers racemose. ♃. G. Native near Santa Fe de Bogota. Hemímeris Mutísii, H. B. et Kunth. l. c. p. 376. Schrophulària Meridionàlis, Mutis and Lin. Stem panicled. Leaves glabrous, an inch long, and 5 lines broad. Corolla and stamens unknown.

Mutis's Alonsoa. Pl. 1 to 2 feet?

Cult. The species are all very showy when in blossom, and on that account are general favourites. They grow freely in any rich light soil, and are readily increased by cuttings and seeds.

V. RUSSE'LIA (so named by Jacquin, in honour of Alex-

ander Russel, M.D. F.R.S., author of a Natural History of Aleppo. London, 1756. He died in 1768. There is a second edition revised by his brother, Patrick Russel, M.D. F.R.S. 1794. Patrick Russel published a fine work upon serpents collected on the coast of Coromandel.) Jacq. amer. p. 178. t. 113. Schreb. gen. no. 1041. Juss. gen. p. 118. ed. Usteri, p. 132. H. B. et Kunth, nov. gen. amer. 2. p. 358.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx deeply 5-parted; segments acuminately subulate. Corolla tubular, swollen, and widened at top; limb bilabiate; upper lip emarginately 2-lobed: lower lip tripartite, segments nearly equal; palate convex, bearded. Stamens 4, didynamous, inclosed; cells of anthers spreading. Stigma undivided. Capsule inclosed in the calyx, nearly globose, attenuately beaked, 2-celled, 2-valved; valves bipartible; placentas central, at length free. Seeds numerous, small.—Shrubs or herbs with angular branches, and opposite, or verticillate leaves. Corymbs and racemes axillary. Flowers scarlet.

§ 1. *Leaves opposite. Stems and branches quadrangular.*

1 R. sarmentòsa (Jacq. amer. 178. t. 113. H. B. et Kunth, nov. gen. amer. 2. p. 358.) stem and branches quadrangular, glabrous; leaves opposite, ovate, rounded at the base, rather pilose above; corymbs axillary, pedunculate, 3-5-flowered. ♄. S. Native of Cuba, near Guanavacoa, in shady places, and about the Havannah. Leaves nearly sessile, crenately serrated, 8 lines long, and 5 lines broad. Corolla flesh-coloured, or fine red, about half an inch long.

Sarmentose Russelia. Shrub 4 to 6 feet.

2 R. multiflòra (Sims, bot. mag. t. 1528.) stem quadrangular, glabrous; leaves opposite, ovate, acuminated, serrately crenated; peduncles cymose, many-flowered, verticillate. ♄. S. Native of the mountainous tract between Vera Cruz and Mexico. Racemes terminal, verticillate. Leaves glabrous. Corollas scarlet.

Many-flowered Russelia. Fl. June, Aug. Clt. 1812. Shrub 4 to 6 feet.

3 R. rotundifòlia (Cav. icon. 5. p. 9. t. 415. Pers. ench. 2. p. 164.) downy or tomentose; stem and branches erect, tetragonal; leaves opposite, sessile, cordate-roundish; peduncles racemose, subsecund, many-flowered. ♄. S. Native of Mexico, near Acapulco. Corollas scarlet. Leaves crenately serrated.

Round-leaved Russelia. Shrub 4 to 6 feet.

4 R. syringæfòlia (Cham. et Schlecht. in Linnæa, 6. p. 376.) scandent, glabrous; branches tetragonal: angles acute; leaves opposite, on short petioles, cordate-ovate, acuminated, acute, mucronulate; cymes terminal and axillary, many-flowered. ♄. ⏑. S. Native of Mexico at Papantla. Leaves $2\frac{1}{2}$ to 3 inches long. Branches and pedicels of cyme downy. Calyx glabrous, with ovate, acuminated, acute, short segments. Corolla 8 lines long, scarlet; throat bearded. Capsule ovate, acute.

Syringa-leaved Russelia. Shrub climbing.

5 R. floribu'nda (H. B. et Kunth, nov. gen. 2. p. 359.) stem and branches quadrangular, glabrous; leaves opposite, ovate, cordate, smoothish; corymbs axillary, sessile, many-flowered. ♄.? ♃.? S. Native of Mexico, between the river Papagallo and Venta de Tierra Colorado, at the altitude of 120 hexapods, Humb. et Bonpl.; near Hacienda de la Laguna, Schiede and Deppe. Leaves on short petioles, serrately crenated, downy on the midrib beneath, 9-10 lines long, and 8-9 lines broad. Corymbs about the length of the leaves, downy, sessile, ex Kunth, l. c.; pedunculate, ex Cham. et Schlecht, in Linnæa, 5. p. 106. Corolla scarlet. Seeds minute, oblong, angular, brown, a little wrinkled.

Bundle-flowered Russelia. Fl.? Clt. 1824. Shrub 4 to 6 feet.

6 R. ala'ta (Cham. et Schlecht, in Linnæa, 3. p. 3.) stem quadrangular, winged, pilose; leaves opposite, acuminated, running into the short, winged, ciliated petioles; peduncles axillary, solitary. ♃. S. Native of tropical Brazil, Sello. Old stems decumbent, rooting at the joints, from which rise erect branches about 1 or $1\frac{1}{2}$ foot high. Wings of stem ciliated. Leaves bluntly serrated, pilose beneath, $2\frac{1}{2}$ inches long, and $1\frac{3}{4}$ broad. Limb of corolla ciliated.

Winged-stemmed Russelia. Pl. 1 to 2 feet.

§ 2. *Leaves verticillate. Stem and branches many-angled.*

7 R. ternifòlia (H. B. et Kunth, nov. gen. amer. 2. p. 359.) stem and branches 6-angled, hairy, or downy; leaves 3 in a whorl, obovate, or ovate, cuneated at the base, hairy above, and pubescent beneath; corymbs pedunculate, many-flowered. ♄.? ♃.? S. Native of Mexico, on the declivities of the burning mount Jorulla, at the altitude of 450 hexapods. Leaves on short petioles, coarsely serrate-toothed, 2 or $2\frac{1}{2}$ inches long, and 16-24 lines broad. Corolla scarlet.

Tern-leaved Russelia. Fl.? Clt. 1818. Shrub 4 to 6 feet.

8 R. verticilla'ta (H. B. et Kunth, l. c. p. 360.) branches somewhat 10-angled, glabrous; leaves and corymbs verticillate. ♄. S. Native of New Spain, in temperate places near Puente de la Madre de Dios, at the altitude of 880 hexapods. Branches verticillate. Floral leaves roundish-ovate, obtuse, cuneated at the base, serrately crenated, hairy. Corollas scarlet.

Whorled-leaved Russelia. Shrub 4 to 6 feet.

9 R. equisetifórmis (Cham. et Schlecht. in Linnæa, 6. p. 377.) suffruticose; branches twiggy, almost leafless, angular, verticillate, or opposite; flowers pedicellate at the tops of the branches; leaves elliptic, acute, coarsely serrated. ♄. S. Native of Mexico, at Papantla. Stem 12-8-angled. Leaves 4 lines long, and one broad. Calycine segments triangular, acute. Throat of corolla beardless. Corolla scarlet, 6 lines long. Genitals equal in length to the corolla. Capsule globose.

Horsetail-formed Russelia. Shrub 3 to 4 feet.

Cult. All the species are showy when in blossom. Any light rich soil answers them; and they are readily propagated by cuttings, which strike root freely in heat under a hand-glass.

Tribe II.

ANTIRRHI'NEÆ (this section agrees with the genus *Antirrhìnum* in the characters given below.) Chav. antirrh. D. Don, in edinb. phil. journ. 19. p. 110. Calyx deeply 5-parted, imbricate in æstivation. Corolla tubular; limb 5-lobed, personate or ringent, bilabiate. Stamens 4, didynamous, sometimes with the rudiment of a fifth. Cells of anthers distinct at apex. Stigma 2-lobed. Capsule crustaceous; dissepiment undivided. Placentas spongy, adnate. Seeds with a thick, spongy, corrugated, or cellular testa. Albumen fleshy. Embryo almost the length of the seed.—Herbs or shrubs inhabiting the temperate regions of the globe. Leaves opposite, or alternate. Flowers disposed in terminal, spicate racemes, or axillary and solitary.

VI. ANTIRRHI'NUM (*ανδιρρινον*, of Theophrastus and Dioscorides; from *αντι*, *like*; and *ῥίν*, rhin, a snout; in allusion to the form of the flowers; hence also it is called in English Snap-Dragon, and Calves' Snout.) Juss. gen. 120. ed. Usteri. p. 134. Vent. tabl. 2. p. 362. D. C. fl. fr. p. 592. t. 3. Gærtn. fruct. 1. p. 249. t. 53. Chav. mon. p. 79.—Antirrhìnum species, Lin. gen. no. 750. Schreb. gen. no. 1007. Lam. ill. t. 531. f. 1—2. Antirrhìnum and Asarìna, Tourn. inst. p. 167. and 171. t. 75 et 76. Oróntium, Pers. ench. 2. p. 158. Ten. fl. neap. 2. p. 53, but not of Lin.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx 5-parted, oblique. Corolla personate; tube ample, a little compressed, saccate at the base, and furnished with 2 parallel and interrupted lines of hairs inside beneath the palate; lobes of the upper lip erect, and often adpressed to the back by turns: lower lip spreading, having the middle lobes smaller than the lateral ones, with an ample bearded palate, which closes the throat. Stamens compressed, rather hairy at the base, having the sterile or fifth one very short or wanting. Stigma 2-lobed. Capsule 2-celled, woody, ovate, or pear-formed, incurved at top, opening by 3 holes, or an irregular foramen, under the top. Seeds oblong, truncate, minute; testa black, more or less engraven, or wrinkled.—Perennial or annual, rarely suffruticose plants. Stems or branches erect or procumbent. Leaves feather-nerved and entire, rarely palmate-nerved and lobed, sessile or petiolate: lower leaves opposite, but sometimes 3 in a whorl: superior ones usually alternate. Flowers showy, in terminal racemes, or solitary and axillary.

SECT. I. ASARI'NA (meaning unknown to us.) Tourn. inst. 171. t. 76. Chav. antirrh. p. 80. t. 3. f. 12. Leaves palmate-nerved, lobed, opposite. Capsule membranous, sub-globose; each cell opening by a broad, irregular foramen under the apex.

1 A. ASARI'NA (Lin. spec. 860.) plant clammy and villous; branches procumbent; leaves opposite, on long petioles, 5-nerved, 5-lobed, cordate, and crenated; flowers axillary, solitary; calycine segments linear-lanceolate, acute, hairy. ♃. H. Native of the South of France, Eastern and Central Pyrenees; near Montpelier, Cevennes, &c. Sims, bot. mag. 902. Orón-tium Asarìna, Pers. ench. 2. p. 159. Asarìna cordifòlia, Mœnch, meth. suppl. p. 172. Antirrh. asarìnum, Lam. fl. fr. 2. p. 348. Asarìna procúmbens, Mill. dict. edit. 8. no. 1. Asarìna, Lob. icon. t. 601. f. 2.—Mor. hist. 3. p. 432. sect. 11. t. 21. f. 1. Sabb. hort. rom. 3. t. 3. Asarìna Lobèlii, Dalech. hist. p. 915. *χαμαικισσος*, Diosc. 4. p. 126. Plant canescent. Corolla 1½ inch long, white, sometimes tinged with red; palate yellow; tube glabrous, compressed on the back, marked by purple spots on the ventre, and bearded by yellow hairs inside.

Asarina or Heart-leaved Snap Dragon. Fl. June, July. Clt. 1699. Pl. trailing.

SECT. II. ANTIRRHINA'STRUM (from Antirrhìnum and astrum, an affixed signification, like.) Chav. antirrh. p. 81. Antirrhìnum, Tourn. inst. p. 167. t. 75. Leaves pinnate-nerved, quite entire: lower ones opposite, rarely 3 in a whorl: superior ones for the most part alternate. Capsule woody, or chartaceous, nearly pear-shaped, very oblique at the base, incurved at top, and opening by 3 holes.

§ 1. *Lobes of calyx much shorter than the corolla.*

2 A. MÓLLE (Lin. spec. p. 860.) villous; branches procumbent, slender, clothed with woolly villi; leaves opposite, petiolate; flowers few, at the tops of the branchlets; calycine lobes lanceolate, erect. ♃. F. Native of the Pyrenees, on the confines of Spain; on rocks in the valley de La Segre, between Bellwor and La Seo d'Urgel; in the valley of Andorrea; and on the mountains of Granada. Lam. dict. 4. p. 366. exclusive of the syn. of Tourn. Chav. antirrh. p. 81. Leaves clothed with glandular and clammy hairs, 5-6 lines long, and 4-5 broad. Corolla an inch long, whitish, with a yellow palate; the upper lip striped with purple. Capsule ovate-globose, pilose.

Soft-leaved Snap Dragon. Fl. July, Oct. Clt. 1752. Pl. procumbent.

3 A. SEMPERVI'RENS (Lapeyr. fl. pyr. 1. p. 7. t. 4. abr. p. 354. Chav. antirrh. p. 82.) stem short, suffruticose, ascending, branched; leaves petiolate, opposite, elliptic, or oblong-ovate, evergreen, rather downy; flowers few, in loose racemes; calycine lobes lanceolate, acute, reflexed at top. ♄. F. Native of the South of France; of the Pyrenees, in calcareous places near Gerdres; in the valleys of Oo, and Venas, &c.; and in Portugal, near Oporto. A. mólle, St. Am. bouq. pyr. no. 151. but not of Lin. A. meonánthum, Hoffm. et Link, fl. port. 1. p. 261. t. 51. Branches nodose. Leaves decussate: floral ones usually alternate, all obtuse, and rather fleshy. Corolla smaller than that of *A. mólle*, white, having the upper lip and tube marked with purple, and the palate yellowish; tube beset with short hairs. The plant is usually rather downy in every part, but sometimes entirely glabrous.

Evergreen Snap Dragon. Fl. June, Sept. Clt. 1817. Shrub 1 to 3 feet.

4 A. HISPA'NICUM (Chav. antirrh. p. 83.) villous; branches erect, rather woody, and branched again; leaves oblong-lanceolate, contracted at the base, bluntish: lower ones opposite: superior ones alternate, narrower; bracteas linear-lanceolate, much longer than the pedicels; flowers in loose spikes; calycine segments oblong, acutish. ♃. F. Native of Spain. Antirrhìnum Hispánicum villosum origani folio, Tourn. inst. p. 168. Plant clothed with glandular hairs. Calycine segments reflexed a little at apex. Corolla hardly an inch long, purple, with a golden yellow palate; tube villous. Capsule small, ovate-oblong, elongated, downy.

Spanish Snap Dragon. Pl. 1 to 1½ foot.

5 A. LATIFÒLIUM (D. C. cat. hort. monsp. 7. fl. fr. 5. p. 411. Chav. antirrh. p. 84. t. 3. f. 28.) caudex thick, twisted; branches ascending, or erect, villous; leaves ovate, or ovate-lanceolate, petiolate, broadly mucronate at apex, downy; flowers racemose; rachis villous; lobes of calyx elliptic, pilose, ciliated. ♃. H. Native of the South of France; in the Eastern Pyrenees, near Villa Franca, and Saint Martin du Canigon; Nice; near Arti, in Piedmont. Nocc. and Balb. fl. ticin. 1. p. 28. t. 42. A. diffùsum, Bernh. A màjus, *β*, latifòlium, Duby, bot. gall. 1. p. 343. A. màjus, var. *α*, Lin. spec. p. 858. Vill. dauph. 2. p. 441. Willd. spec. 3. p. 256. D. C. fl. fr. 3. p. 593. Bertol. amœn. p. 382. Poll. fl. ver. 2. p. 336.—Lob. icon. 405.—Bocc. mus. p. 49. t. 41.—Barrel. icon. t. 655. A. luteo flore, Bauh. pin. 211. Branches fistular, beset with capitate pili. Leaves 1-2 inches long, and 6-10 lines broad, obsoletely spotted with purple. Bracteas and pedicels pilose. Corolla 1 to 1½ inch long, usually yellow, with a deeper coloured palate; tube villous, elongated, very gibbous at the base. Capsule pilose, elongated. Seeds ovate, truncate at apex; testa foveolate.

Var. β, hýbridum (Chav. antirrh. p. 84.) leaves longer; flowers purplish, or marked by purple lines; lobes of calyx ovate-elliptic. ♃. H. Native of the Pyrenees, betwixt Rousse and Rodome, &c.; and of Portugal, near Lisbon. A. hýbridum, Benth. pl. pyr. p. 60. A. latifòlium, *β*, striàtum, D. C. fl. fr. 5. p. 411. A. latifòlium, Mill. dict. ed. 8. no. 4. fig. 1. t. 28. Hoffm. et Link, fl. port. 1. p. 260. t. 50. exclusive of the syn. of Tourn. This appears to be a hybrid between *A. latifòlium* and *A. màjus*.

Broad-leaved Snap Dragon. Fl. July, Oct. Clt. Pl. 1 to 3 feet.

6 A. MA'JUS (Lin. spec. p. 859. var. *β*. Gærtn. fruct. 1. p. 249. Chav. antirrh. p. 86. t. 3. f. 26.) caudex thick, twisted; branches erect, usually branched again; leaves oblong-lanceolate, attenuated at both ends, glabrous; flowers racemose, approximate; rachis pubescent; lobes of calyx broad-ovate, obtuse, clothed with glandular pili. ♃. H. Native of South and middle Europe, indigenous every where, generally upon old

walls; also of Barbary, about Algiers, and near Mustapha-Pacha frequent; and in Persia. In Britain on old walls, as about London, and other places, but probably an escape from gardens. Smith, engl. bot. t. 129. Schkuhr, handb. 2. p. 193. t. 172. A. grandiflòrum, Stok. bot. mat. med. 3. p. 384. A. muràle, Sal. prod. p. 100. Oróntium màjus, Pers. ench. 2. p. 158.—Bauh. hist. 3. p. 162. with a figure.—Riv. mon. irr. t. 82. f. 1.—Lob. icon. t. 404. f. 2.—Besl. hort. eyst. 1. t. 9, 10. Branches glabrous, rarely downy. Leaves 1-3 inches long: upper ones narrower. Rachis leafless, beset with glandular hairs, as well as the calyxes. Corolla 1-2 inches long, purple, red, scarlet, or white, or variegated with these colours; palate yellow at top, very prominent; tube downy outside. Capsule downy, oblique at the base, incurved at apex. Seeds oblong, ovate. This is a very polymorphous plant, varying considerably in habit, and much in the colour of the flowers. There is also a variety with double flowers. The leaves in some varieties are variegated.

Var. β, angustifòlium (Chav. antirrh. p. 86.) leaves very narrow, often revolute, sometimes approximate by threes; corolla large, purple. ♃. H. Native upon walls about Constantinople. A màjus, Oliv. et Brug. herb. mus. par.

Var. γ, Montevidénse; leaves long, all opposite, dark green; flowers usually white, or yellow, and not so much crowded. ♃. H. Native of Monte Video. A. montevidénse, Hort. berol. This does not appear to be more than a slight variety of the species.

Greater, or Common Snap Dragon. Fl. June, Oct. Britain. Pl. 1 to 2 feet.

7 A. tortuòsum (Bosc, mss. Lam. dict. 4. p. 365. Chav. antirrh. p. 87.) plant altogether glabrous; branches erect or ascending, flexuous, twisted at the base; leaves linear, acute, opposite, or 3 in a whorl; flowers racemosely spicate, approximating by threes and fours, the raceme is therefore interrupted; lobes of calyx oblong-ovate, obtuse. ♃. H. Native of Italy, on rocks, and in waste places by the sea side, as near Rome; also in the South of France, near Fréjus; and of Sicily. Guss. fl. sic. 2. p. 169. exclusive of many synonymes. Ten. syll. p. 304. Oróntium Sículum, β. tortuòsum, Pers. ench. 2. p. 158. A. capitàtum, Presl. del. prag. p. 74.—Sabb. hort. rom. 3. t. 2.—Barrel. icon. 638. Leaves 1-nerved, 2 inches long, attenuated at both ends: upper ones very narrow. Corolla the largest of the genus, purple; tube short; upper lip large. Capsule smaller than that of the preceding, and glabrous. This species is often confounded with *A. Sículum*, but appears to be more nearly allied to *A. màjus*.

Twisted-branched Snap Dragon. Fl. June, Oct. Clt.? Pl. 1 to 1½ foot.

8 A. Sículum (Ucria pl. and Lin. op. addenda, no. 17. Chav. antirrh. p. 88. t. 3. f. 24.) branches erect, flexuous, downy at top, and branched; branchlets diffuse; leaves linear-lanceolate or linear, opposite, alternate, or 3 in a whorl, narrowed into the petioles at the base; flowers in loose racemes; lobes of calyx lanceolate, acute, downy. ♃. H. Native of Sicily, on walls, and in waste places about Palermo and Ragaza; of Calabria, on walls about Reggio and Trucoli, &c. Mill. dict. no. 6. Pers. ench. 2. p. 158. exclusive of var. β. Guss. pl. rar. p. 253. fl. sic. 2. p. 170. Tenor. syll. p. 304. A. angustifòlium, Poir. suppl. 4. p. 27. Branches woody. Leaves 1 to 1½ inches long. Flowers solitary, twin, or 3 in a whorl. Corolla hardly an inch long, white or yellowish, rarely purple; tube rather pilose; lobes of the upper lip, and the middle lobe of the lower lip emarginate. Capsule downy. Seeds oblong, subquadrangular.

Var. β, glandulòsum (Chav. antirrh. p. 88.) leaves broader; branches and calyxes beset with glandular hairs; corollas yellowish. ♃. H. Native of Sicily, Gussone. A. Sículum, var. γ. Guss. fl. sic. t. 309. f. 2.

Var. γ, elàtum (Chav. antirrh. p. 88.) plant taller and firmer; corolla purplish-yellow. ♃. H. Native of Spain and the Archipelago. A. angustifòlium, D'Urv. enum. pl. arch. no. 549. exclusive of the syn. of Lam. et Bocc. A. satureiæfòlio, Vaill. herb. A. Hispanicum, altissimum, angustissimo folio, Tourn. inst. p. 168.

Sicilian Snap Dragon. Fl. July, Aug. Clt. 1804. Pl. 1 to 2 feet.

§ 2. *Segments of the calyx exceeding the corolla, or about equal in length to it.*

9 A. Oróntium (Lin. spec. 860. Chav. antirrh. p. 89. t. 3. f. 18. and 19.) stem glabrous, erect or ascending, branched; leaves oblong-lanceolate or linear, acutish, attenuated at both ends, glabrous; flowers distant; calycine segments linear-lanceolate, large, and as if they were digitately pilose. ⊙. H. Native almost throughout Europe, along way sides and in waste fields and vineyards; of Barbary, abundant about Algiers; islands of Madeira, and Scio; Virginia, ex Pursh, but probably introduced from Europe; in Britain it is to be found in corn-fields, on a light soil; but hardly indigenous. Curt. fl. lond. fasc. 4. t. 45. Gærtn. fruct. 1. p. 249. t. 53. Lam. ill. t. 531. f. 2. Smith, engl. bot. 17. t. 1155. Schkuhr, handb. 2. p. 193. t. 173. A. hùmile, Salisb. prod. p. 98. Oróntium arvénse, Pers. ench. 2. p. 158.—Barrel. icon. t. 651. and 652.—Rivin. mon. irr. t. 83. f. 2.—Mor. hist. sect. 5. t. 14. f. 5.—Besl. hort. eyst. 1. p. 9. f. 3.—Lob. icon t. 405. f. 2. *Αντιρρίνον*, Theoph. hist. pl. 9. p. 23. Stem glabrous or pilose. Leaves 1-3-nerved, 2 inches long. Flowers axillary, distant. Corolla rose-coloured or white, striped with purple; tube furnished with a few glandular hairs; palate veined with purple. Capsule pilose. Seeds irregularly ovate, cuneiform, keeled on the back, and concave in front.

Var. β, I'ndicum (Chav. antirrh. p. 90.) leaves narrower; flowers reddish, smaller; bracteas and floral leaves very long, spreading a little. ⊙. H. Native of India, in the province of Delhi. A. I'ndicum, Royle, mss.

Var. γ, grandiflòrum (Chav. l. c. t. 4.) flowers larger, paler, and more approximate; leaves broader; plant firmer and more glabrous; corolla almost the length of the calyx, whitish, marked with purple or rose-coloured veins. ⊙. H. Native of Portugal, in fields. A. calycìnum, Lam. dict. 4. p. 365. Brot. fl. lus. 1. p. 100. Hoffm. et Link, fl. port. p. 262. t. 52. A. Oróntium, β, álbum, Roth, fl. germ. ed. 1st. vol. 2d. p. 65. Oróntium calycìnum, Pers. ench. 2. p. 158. A. Jamaicénse, Fisch. et Hort. A. élegans, Tenore, viag. in abbruz. 1830. p. 35. syll. p. 304.—Barrel. icon. 656. A. arvénse màjus, flore albo, Tourn. inst. p. 168.—Sabb. hort. rom. 3. t. 1.

Orontium Snap-Dragon, or Calves'-Snout. Fl. June, Sept. Britain; β. 1810. Pl. ½ to 1 foot.

10 A. rytidoca'rpum (Fisch. et Meyer. in ind. sem. hort. petrop. 1836. p. 27.) annual, rather pilose; leaves oblong or linear; flowers distant, nearly sessile; calycine segments linear, longer than the corolla; seeds prismatic, wrinkled on all sides. ⊙. H. Native of Caucasus, on the Talusch Mountains, in corn-fields. Corollas small, bluish. Capsule nearly globose. Seeds black, subtetragonally prismatic. This comes nearer to *Ant. Oróntium* than any other, but is very distinct.

Wrinkled-fruited Snap-Dragon. Clt. 1836. Pl. ½ to 1 foot.

† *Species doubtful, or not sufficiently known.*

11 A. corda'tum (De Buch. besch. der. can. ins. ex Chav. antirrh. p. 181.) Native of the Canary Islands. We know nothing of this plant but the name.

Cordate-leaved Snap-Dragon. Pl.

12 A. Ita'licum (Mill. dict. ed. 7th. no. 5.) ♃. H. Native of Italy. This is nothing but a variety of *A. màjus.*

Italian Snap-Dragon. Pl. 1 to 2 feet.

13 A. Osy'ris (Ræusch. Fisch. ex Steud. nom. ex Chav. antirrh. p. 181.) ☉. H. This is probably a variety of *A. Oróntium.*

Osyris Snap-Dragon. Pl. 1 foot.

14 A. varia'bile (Link, ex Steud. nom. ex Chav. antirrh. p. 181.) A. multibracteàtum, Brot. ex Steud. This is probably a variety of *A. Oróntium.*

Variable Snap-Dragon. Pl. 1 foot.

N.B. A. porcìnum, Lour. coch. 2. p. 467. A. aquáticum, Lour. l. c., and A. papilionàceum, Burm. fl. ind. p. 131. t. 39. f. 2. certainly do not belong to this genus, and it is difficult to say what they really are.

Cult. All the species of Snap-Dragon are showy, and worth cultivating for ornamenting flower-borders and rock-work. The species are readily increased, either by cuttings of the young branches or by seeds. The 4 first species will require protection in winter, by placing them in a frame or greenhouse. *A. Oróntium*, being an annual plant, the seeds only require to be sown in the open ground in spring.

VII. LINA'RIA (from λινον, *linon*, flax; similarity in the leaves.) Vent. tabl. 2. p. 360. Juss. gen. p. 120. edit. Usteri, p. 134. D. C. fl. fr. 3. p. 582. Chav. antirrh. p. 91. Linària and Elátine, Mœnch. meth. p. 522. and 524. Antirrhìnum, Lin. gen., Lam. ill. t. 531. f. 3—4. and other authors. Elátine, Dill. nov. gen. p. 116. t. 6. but not of Lin. Linària species, Tourn. inst. p. 168.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted. Corolla personate, almost like that of *Antirrhìnum*, but furnished with a spur at the base; tube short, inflated; palate more or less bearded, usually prominent at the throat, but sometimes depressed, and not closing the throat; lobes of upper lip plicate at the base, often reflexed; lobes of the lower lip spreading, or a little deflexed: the middle lobe of the lower lip generally the smallest. The rudiment of the fifth stamen very small or wanting. Capsule ovate or spherical, a little compressed, 2-celled; each cell more or less drawn out into 3-5 valves, or dehiscing by a single operculum or one valve. Seeds egg-shaped, or somewhat prismatic, or compressed and discoid, girded by a membranous margin.—Annual or perennial plants, very rarely small shrubs. Roots of the perennial kinds rhizomatose. Leaves alternate, verticillate, or opposite, quite entire, or lobed. Flowers beautiful, racemose, or spicately racemose at the tops of the branches, or solitary and axillary.

Sect. I. Chænorrhìnum (from χαινω, *chaino*, to gape; and ῥιν, *rhin*, a snout; the palate of the flower is depressed, therefore the throat appears wider than in those of other sections.) D. C. fl. fr. 5. p. 410. Duby. bot. gall. 1. p. 343. Chav. antirrh. p. 92. Corolla having the palate more or less depressed; the upper lip drawn out in front, not erect; spur shorter than the corolla. Seeds oblong-ovoid, truncate; testa furrowed lengthwise, or foveolate or echinated.—Herbs usually clothed with pili. Leaves opposite and alternate, quite entire. Flowers axillary, or loosely racemose.

§ I. *Capsule chartaceous; superior cell usually much larger than the other, dehiscing by one valve at apex; the lower cell dehiscing slowly by a transverse chink towards the base, or altogether indehiscent.* Chav. antirrh. t. 5. f. 8.

1 L. tene'lla (D. C. fl. fr. 5. p. 410. Chav. antirrh. p. 92.) villous; branches procumbent, slender; leaves cordate-ovate, opposite, acute: floral ones alternate; calycine segments linear, acutish. ☉. H. Native of Spain, in the province of Valentia, near the top of Mount Ayora, in shady humid places, where it is generally hidden by other plants. Leaves distant, 3-4 lines long. Flowers axillary; pedicels capillary, much longer than the leaves. Corolla white, with a short, blunt, bent spur, and rounded, quite entire lobes. Seeds oblong; testa furrowed.

Slender Toad-Flax. Pl. procumbent.

2 L. villòsa (D. C. fl. fr. 5. p. 410. Chav. antirrh. p. 93.) villous; leaves ovate or orbicular, obtuse, on short petioles, all opposite; flowers opposite, on long pedicels; calycine segments linear-oblong, somewhat spatulate. ♃. F. Native of Spain, about Gibraltar; and near Vejez de la Frontera, not far from Gibraltar. Ait. hort. kew. ed. 2. vol. 4. p. 15. L. muràlis, Saltzm. in herb. D. C. Ant. oppositiflòrum, Poir. suppl. 4. p. 23. Ant. serpyllifòlium, Pourr. in herb. Desf. Ant. villòsum, Lin. spec. p. 852. Linària Hispánica nummulariæ folio villoso, Tourn. inst. p. 169.—Barrel. icon. t. 597. Branches diffuse, clothed with simple, spreading hairs, woody at the base, 5-10 inches high. Leaves villous. Pedicels hairy, 2 or 3 times longer than the leaves. Corolla white or pale blue, marked by more intense lines; lobes emarginate at top; spur straight, widened above the base. Capsule downy, ovate. Seeds oblong, truncate at top; testa furrowed lengthwise.

Villous Toad-Flax. Fl. July, Aug. Clt. 1786. Pl. diffuse.

3 L. origanifòlia (D. C. fl. fr. 3. p. 591. exclusive of the syn. of Magn. Chav. antirrh. p. 94. t. 6.) pubescent or glabrous; leaves oblong or obovate, on short petioles: lower ones opposite: upper ones alternate; flowers alternate, distant; calycine segments linear, or linear-spatulate, villous. ♃. F. Native of the South of France, on walls and rocks; in the Pyrenees; about Narbonne; on old walls near Bagneres-de-Luchon; in Sicily; in Portugal, on La Serra d'Arrabida, and on Monte Junto, among high rocks and in calcareous places. Ait. hort. kew. ed. 2d. vol. 4. p. 15. Benth. cat. pl. pyr. p. 96. exclusive of var. rubrifòlia. Ant. origanifòlium, Lin. spec. 852. Linària saxátilis serpyllifòlia, Tourn. inst. p. 169. This is a very polymorphous plant. Branches branched, ascending or procumbent. Flowers in the axils of the superior leaves, distant, forming a loose raceme. Calyx beset with glandular hairs. Corolla like the preceding, but smaller, bluish-violet, rarely white; throat yellow; lobes emarginate, striped with red. Seeds oblong, ovate, truncate at top; testa furrowed lengthwise.

Var. β, grandiflòra (Benth. cat. pl. pyr. p. 96. Chav. antirrh. p. 94.) plant more villous and larger; flowers larger. ♃. F. Native of the higher Pyrenees, at Font de Comps, Crabère, &c. Ant. villòsum, Lapeyr. fl. pyr. p. 353. but not of Lin.

Var. γ, crassifòlia (Chav. antirrh. p. 94.) leaves ovate, acutish, quite glabrous, thickish; flowers large. ♃. F. Native of Spain, on the mountains. L. crassifòlia, D. C. fl. fr. 5. p. 410. Anarrhìnum crassifòlium, Willd. spec. 3. p. 261. Pers. ench. 2. p. 159. Ant. crassifòlium, Cav. icon. 2. p. 11. t. 114.—Barrel. icon. t. 1313.

Marjoram-leaved Toad-Flax. Fl. June, Sept. Clt. 1785. Pl. ascending.

4 L. flexuòsa (Desf. fl. atl. 2. p. 47. t. 139. Chav. antirrh. p. 95.) quite glabrous; branches filiform, flexuous, interwoven, procumbent; leaves petiolate, spatulately-elliptic or oblong: lower ones usually opposite: upper ones alternate; flowers distant; pedicels twice or thrice as long as the leaves; calycine segments linear, bluntish. ♃. F. Native of Barbary, in fissures of rocks on Mount Hamamelif, near Tunis. Ant. flexuòsum, Willd. spec. 3. p. 250. Plant prostrate, diffuse. Corolla like that of *L. mìnor*, but longer, small, bluish; tube a little elongated; spur obtuse, recurved; lobes entire. Cells of cap-

sule nearly equal. Seeds ovate, truncate at both ends; testa black, full of small pits.

Flexuous Toad-flax. Pl. prostrate.

5 L. rubrifòlia (Robil. et Cast. diss. ined. ex D. C. fl. fr. 5. p. 410. Chav. antirrh. p. 96.) stem erect, branched from the base, flexuous, downy: lower leaves ovate, opposite, approximate, deep red beneath, glabrous; upper leaves oblong, alternate; calycine segments linear-spatulate, obtuse, villous. ⊙. H. Native of the South of France, near Draguignan, Duby; Marseilles, Robill; about Telon; Pyrenees; and Sardinia. L. origanifòlia, var. rubrifòlia, Benth. cat. pl. pyr. p. 96. Ant. filiforme, Poir. suppl. 4. p. 27. Ant. origanifòlium, Gouan, hort. monsp. 301. but not of Lin.—Magn. bot. 25. icon. t. 24. Stems beset with capitate pili; branches villous. Flowers loose; pedicels pilose, about equal in length to the flowers, but lengthening at last. Floral leaves ciliated. Corolla small, purplish blue, marked with 2 yellow spots at the mouth, downy; lobes entire; spur slender, acute, diverging.

Var. β, hùmilis (Chav. antirrh. p. 96.) leaves oblong, nearly sessile; calyx about equal in length to the corolla; corolla small, with a straight spur. ⊙. H. Native of Sicily, on arid rocks of Montallegro, Mineo, &c.

Red-leaved Toad-Flax. Fl. June, Aug. Clt. 1826. Pl. ½ to ¾ foot.

§ 2. *Capsule membranous; cells equal in size; each cell dehiscing by 3 teeth at apex.*

6 L. mi'nor (Desf. fl. atl. 2. p. 46. Chav. antirrh. p. 97.) stem erect, much branched, downy; leaves oblong-linear, obtuse, downy: lower ones opposite; pedicels twice or thrice as long as the calyx; flowers small, distant; calycine segments linear-spatulate, clothed with glandular hairs. ⊙. H. Native of Europe, in sandy corn-fields frequent; as of France, Switzerland, England, Germany, Barbary, and Caucasus, &c. D. C. fl. fr. 3. p. 591. L. Antirrhìnum, Chevall, fl. gen. des env. de Par. t. 2. L. víscida, Mœnch. meth. p. 524. Ant. mìnus, Lin. spec. p. 852. Oed. fl. dan. t. 502. Gærtn. fruct. 1. p. 249. t. 53. f. 1. Smith, engl. bot. 28. t. 2014.—Hall. hist. p. 335. Linària pumila vulgatior arvensis, Tourn. inst. p. 169.—Riv. mon. irr. 1. t. 85. f. 2.—Bauh. hist. 3. p. 465. icone. Plant beset with clammy glandular hairs. Flowers in the axils of the superior leaves. Corolla small, whitish, having the tube and upper lip pale violet; the palate beset with yellow hairs; lower lip white; spur very short, obtuse. Seeds truncate at apex; testa marked by longitudinal furrows.

Smaller Toad-Flax. Fl. June, Nov. England. Pl. ½ to ¾ foot.

7 L. littora'lis (Willd. enum. p. 641. Chav. antirrh. p. 98.) downy; stem erect, branched; leaves usually alternate, oblong, obtuse; pedicels shorter than the calyx; flowers in loose racemes; calycine segments linear, acutish. ⊙. H. Native of Austria, on the banks of rivers; and in the South of Istria. Ant. pubéscens, Pers. ench. 2. p. 156. but not of Tenore. L. pubéscens, Desf. herb. but not of Presl. Ant. littoràle, Bernh. ex D. C. fl. fr. 5. p. 410. Corolla bluish, with a straight spur. This is very nearly allied to *L. mìnor*, but the plant is larger, less branched, and the pedicels shorter.

Sea-shore Toad-Flax. Fl. June, Nov. Clt. 1820. Pl. ½ to 1 foot.

Sect. II. Cymbala'ria (from κυμβη, *kymbe*, a boat; in reference to the shape of the leaves.) Chav. antirrh. 98. Elátine species, Mœnch. Cymbalària species, Baumg. and Gray. Leaves palmate-nerved, usually lobed, on long petioles. Flowers axillary, supported by long pedicels. Corolla having the throat closed by the palate; spur obtuse, much shorter than the corolla. Capsule dehiscing by 6 valves at the apex. Seeds oblong; testa much wrinkled (Chav. antirrh. t. 5. f. 16.)—Hypocarpogeous perennial plants, usually growing in the fissures of rocks and walls.

8 L. Cymbala'ria (Mill. dict. ed. 8th. no. 17. Chav. antirrh. p. 98.) quite glabrous; leaves for the most part alternate, cordately reniform, 5-7-lobed: lobes rounded or cuneiform, mucronulate; floriferous pedicels longer than the leaves; calycine segments linear-lanceolate, acute, smaller than the capsule. ♃. H. Native of Europe, on old walls frequent; especially in Italy and Sicily, where it is alone indigenous; it is also found in France, Germany, Switzerland, Britain, apparently wild, but has probably been introduced. D. C. fl. fr. 3. p. 583. Tenore, syll. p. 302. Cymbalària hederàcea, Gray, brit. pl. 2. p. 322. Ant. hederàceum, Lam. fl. fr. 2. p. 338. Cymbalària muràlis, Baumg. trans. 2. p. 208. Elátine Cymbalària, Mœnch. meth. p. 525. Ant. quinquélobum, Stok. bot. mat. med. 3. p. 385. Ant. Cymbalària, Lin. spec. p. 851. Bull. herb. t. 395. Smith, engl. bot. 7. t. 502.—Hall. hist. no. 339. Linària hederaceo folio glabro seu Cymbalària vulgàris, Tourn. inst. 1. p. 169.—Lob. icon. t. 615.—Riv. mon. irr. t. 86. f. 2. Roots rhizomatose, emitting fibres. Branches prostrate, creeping and rooting, purplish-green. Corolla bluish-purple, with a yellow palate; spur a little curved. Capsule globose, ventricose, glabrous. There is a variety of this with white flowers, and pale green branches and leaves, and another variety with variegated leaves. Parkinson calls the plant Italian Bastard Navel-wort.

Var. β, acutángula (Chav. antirrh. p. 99.) leaves smaller, cordate, 5-9-lobed: superior leaves hastately 5-lobed: lobes cuneiform, acute; floriferous pedicels much longer than the leaves; calycine segments linear, bluntish; corolla a little smaller. ♃. H. Native of Italy, in the fissures of rocks, about Naples, Abruzzo, St. Angelo, &c. L. acutángula, Tenore, syll. p. 302. Ant. acutángulum, Tenore, cat. 1819. p. 52. fl. neap. 2. p. 47. t. 59.

Var. γ, hederæfòlia (Chav. antirrh. p. 99.) leaves usually 3-lobed, thick: lobes broader; calycine segments linear, obtuse; flowers a little larger than the species. ♃. H. Native of Auvergne, on the Golden Mountain. Ant. hederæfòlium, Poir. suppl. 4. p. 18. but not of Saltzm. under *Linària*.

Var. δ, Siebèri (Chav. l. c.) leaves smaller: some of the lower ones entire, and some cordate-roundish: lobes less obtuse; flowers smaller; spur twice as long, and thicker than in the species. ♃. H. Native of Candia, near Perivoglio, Sieber. Ant. Cymbalària, Sieb. herb. cret.

Cymbalaria, or Ivy-leaved Toad-Flax. Fl. May, Nov. Britain. Pl. creeping and trailing.

9 L. hepaticæfòlia (Duby, bot. gall. 1. p. 344. Chav. antirrh. p. 100.) glabrous; leaves opposite, usually reniform, 3-5-lobed: lobes rounded and mucronulate: intermediate lobe large; floriferous pedicels longer than the leaves; calycine segments linear, acutish, exceeding the capsule. ♃. H. Native of Corsica, on the mountains, Saltzm.; near Ajaccio, Thom.; and at Lake Iria. L. hederæfòlia, Saltzm. exsic. Ant. Cymbalària, var. β, Lois. fl. gall. 2. p. 373. Ant. hepaticæfòlium, Poir. suppl. 4. p. 19. Branches purplish, much shorter than those of *L. Cymbalària*. Leaves deep green, usually 3-lobed, but sometimes quite entire. Corollas almost twice the size of those of *L. Cymbalària*, bluish-purple; spur usually straight. Capsule globose, glabrous.

Liverwort-leaved Toad-Flax. Fl. June, Nov. Pl. trailing.

10 L. pa'llida (Tenore, fl. nap. 1. p. 32. et add. fl. nap. t. 159. f. 2. syll. p. 302. Chav. antirrh. p. 101.) pubescent; leaves opposite, cordately reniform, 3-5-lobed: lobes rounded, hardly mucronate; floriferous pedicels shorter than the leaves;

calycine segments linear-lanceolate, acutish. ♃. H. Native of Abruzzo, in gravelly places, and among rocks on the mountains; and on the mountains of Magella. Ant. pubéscens, Tenore, fl. neap. prod. p. 36. Branches slender, diffuse. Leaves sometimes quite entire, rarely crenated, dark green. Corolla pale blue, sweet-scented; spur straight. Capsule globose, smoothish.

Pale-flowered Toad-Flax. Fl. July, Sept. Clt. 1820. Pl. 4 to 6 inches.

11 L. pilòsa (D. C. fl. fr. 3. p. 584. Tenor. syll. p. 302. Chav. antirrh. p. 101.) leaves opposite and alternate, cordately rounded or reniform, villous, 5-11-lobed: lobes rounded, mucronulate; floriferous pedicels about equal in length to the leaves; calycine segments narrow-lanceolate, acute, shorter than the capsule. ♃. H. Native of Sicily, on the mountains, or in the fissures of shaded humid rocks, particularly near Palermo; and about Naples, &c. L. pubéscens, Presl. del. prag. p. 74. Guss. prod. fl. sic. 2. p. 158. Ant. pilòsum, Lin. mant. p. 749. Jacq. obs. 2. p. 29. t. 48.—Cup. pamph. sic. t. 214.—Mich. pl. ital. ed. germ. no. 108. Linària hederaceo folio villoso seu Cymbalària alpìna, Tourn. inst. 1. p. 169. Branches prostrate, radicant, clothed with white hairs. Leaves soft, villous, purplish beneath. Calyx pilose. Corolla purplish blue, with a yellow palate, and rather incurved spur. Capsule downy, globosely ventricose.

Var. β, *pùmila* (Chav. antirrh. p. 101.) leaves smaller, thick; plant hardly 4 inches long.

Pilose Toad-Flax. Fl. June, Sept. Clt. 1800. Pl. creeping.

12 L. æquitrí'loba (Duby, bot. gall. 1. p. 304. Chav. antirrh. p. 102.) plant rather pilose, very slender; leaves opposite, small, cordately reniform, 3-lobed: lobes rounded, shortly mucronulate; floriferous pedicels longer than the leaves; segments of calyx linear-lanceolate, shorter than the capsule. ♃. H. Native of Corsica, on Monte della Trinita, among rocks; about Saint Antoine, in high, shady, rocky places; and near Speluncato. Ant. æquitrílobum, Viv. fl. cors. p. 10. fragm. fl. lyb. p. 68. Hook. bot. mag. t. 2941. Branches slender, creeping or pilose. Leaves very numerous, shining, green, often smoothish: lower ones on long villous petioles. Corolla purplish-blue, with a short straight spur. Capsule small, globose. This species is very nearly allied to the preceding, but is readily distinguished by the smaller membranous leaves; by the filiform branches; and by the slender flexuous pedicels.

Equal-lobed-leaved Toad-Flax. Fl. June, Sept. Clt. 1829. Pl. creeping.

Sect. III. Elatinoi'des (this section contains species agreeing with *L. Elátine* in the characters indicated below.) Chav. antirrh. p. 103. Elátine species, Mœnch. and Gray. Cymbalària species, Baumg. Leaves feather-nerved, usually on short petioles, alternate (the lower ones sometimes opposite, rarely wanting), toothed or lobed, sometimes entire. Flowers axillary, distant. Corolla with a prominent palate at the throat; and an acute spur, which is about equal in length to the corolla, but never longer. Capsule nearly spherical, dehiscing at the sides by 2 lids, or operculi; or ovate, and dehiscing by 2 valves at the apex. Seeds ovate, truncate or roundish; testa full of irregular little pits, or granular from tubercles. (Chav. antirrh. t. 4. f. 19—21.) Annual or suffrutescent plants, commonly procumbent.

§ 1. *Capsule nearly spherical, dehiscing by 2 circular lids or operculi at the sides.* Chav. antirrh. t. 5. f. 9—10.

13 L. scariòsa (Desf. fl. atl. 2. p. 38. t. 131. Chav. antirrh. p. 103.) villous; leaves oblong, or ovate-oblong, petiolate: lower ones opposite, angularly toothed above the base: superior leaves alternate, quite entire; pedicels much shorter than the corolla; calycine segments ovate-oblong, scarious. ⊙. H. Native of Tunis, on arid hills; and in corn-fields near Kervan; and probably of Spain. Ant. dentàtum, Vahl, symb. 2. p. 66. t. 37. Willd. spec. 3. p. 234. but not of Poir. Ant. scariòsum, Lam. dict. 4. p. 349. Pers. ench. 2. p. 156. Branches prostrate, densely clothed with simple spreading pili, like the rest of the plant. Leaves 1-3 inches long. Flowers numerous, approximate. Corolla large, yellow, downy; spur arched; filaments rather hispid. Seed oblong-ovate; testa pitted.

Scarious Toad-flax. Pl. prostrate.

14 L. elatinoi'des (Desf. fl. atl. 2. p. 39. t. 132. Chav. antirrh. p. 104.) downy; leaves alternate, ovate and elliptic, obtuse: lower ones dentately angular, on short petioles: superior ones sessile, quite entire; pedicels shorter than the corolla; calycine segments oblong, acute, with membranous edges. ⊙. H. Native of Habra, in cultivated fields near Mascar. Ant. elatinoìdes, Willd. spec. 3. p. 235. Pers. ench. 2. p. 155. but not of Tenore. Branches 1-2 feet long, procumbent and prostrate; branchlets spreading, slender. Leaves glabrous or downy: lower ones 1-2 inches long. Flowers in the axils of the superior leaves. Corollas size of those of *L. vulgàris*, yellow; spur a little arched, sometimes straight. Capsule glabrous. Seeds a little curved; testa brown, foveolate.

Elatine-like Toad-Flax. Fl. July, Sept. Clt. 1821. Pl. prostrate.

15 L. dealba'ta (Hoffm. et Link, fl. port. p. 231. t. 34. Chav. antirrh. p. 104.) hairy; leaves ovate, or ovate-lanceolate, sessile, acute: lower ones toothed: superior ones entire; pedicels very short; calycine segments lanceolate, acute. ⊙. H. Native of Portugal, near Thomar; and in the Algarves and Alentejo, Brot. Ant. lanígerum, Brot. fl. lus. 1. p. 189. but not of Willd. Branches slender, 2-3 feet long; branchlets stiff, spreading. Lower leaves an inch long. Flowers small, in the axils of the superior leaves. Corolla small, referrible in shape to those of *L. spùrium;* upper lip violaceous: lower ones white; palate pale, and marked with blue dots. Seeds ovate; testa finely foveolate.

Whitened Toad-Flax. Fl. July, Sept. Clt. 1820. Pl. trailing.

16 L. lani'gera (Desf. fl. atl. 2. p. 38. t. 130. Chav. antirrh. p. 105.) clothed with woolly villi; leaves alternate, cordate, or cordately rounded, mucronulate, woolly: lower leaves on short petioles, and sometimes vaguely toothed: superior ones nearly sessile, quite entire; pedicels longer than the leaves; calycine segments linear-lanceolate, acute. ⊙. H. Native about ancient Carthage, in cultivated fields. Ant. lanígerum, Willd. spec. 3. p. 235. but not of Brot. Plant 1-3 feet long; branches prostrate, slender. Lower leaves 5-6 lines long. Corolla villous, small, yellowish, a little incurved. Capsule glabrous. Seeds egg-shaped; testa pitted.

Wool-bearing Toad-Flax. Fl. June, Sept. Clt. 1818. Pl. prostrate.

17 L. spu'ria (Mill. dict. ed. 8. no. 15. D. C. fl. fr. 3. p. 584. Chav. antirrh. p. 105.) plant pilose; leaves cordate-ovate or ovate, mucronate at apex: lower ones sometimes opposite, on short petioles, and obsoletely toothed: superior ones quite entire, nearly sessile; pedicels longer than the leaves; calycine segments ovate-lanceolate, cordate at the base, acute. ⊙. H. Native throughout Europe, in corn-fields. Ait. hort. kew. ed. 2d. vol. 4. p. 11. L. lanígera, Hoffm. et Link, fl. port. 1. p. 231. t. 34. exclusive of the syn. of Desf. Elátine ovàta, Gray, brit. pl. 2. p. 321. Ant. spùrium, Lin. spec. p. 851. Brot. fl. lus. 1. p. 188. Smith, engl. bot. 10. t. 691.

Oed. fl. dan. t. 913. Labr. et Heg. icon. helv. 5. t. 1. Cymbalària spùria, Baumg. trans. 2. p. 209.—Hall. helv. no. 341. Linària segetum nummulariæ folio villoso, Tourn. inst. 1. p. 169.—Bauh. hist. 3. p. 372. f. 1.—Tabern. 2. t. 413. f. 1.—Mor. hist. sect. 5. t. 14. f. 27. Plant a foot or more long, clothed with spreading articulated hairs. Branches usually procumbent. Leaves 1-3 inches long. Corolla yellow; upper lip dark purple; spur incurved. Capsule downy. Seeds ovoid, compressed; testa foveolate.

Var. β, dentàta (Chav. antirrh. p. 106.) lower leaves, and sometimes also the upper ones toothed; flowers larger; plant firmer, erectish. ⊙. H. Native of France and Switzerland, rather frequent.

Var. γ, microphýlla (Chav. l. c. t. 8.) leaves much smaller, roundish, woolly. ⊙. H. Native about Montpelier. Pelòria comm. gœtt. 1. p. 351. t. 15. f. 4. Stœhel, in act. helv. 2. p. 25. t. 4.

Spurious Toad-Flax. Fl. June, Sept. England. Pl. pros.

18 L. Ela'tine (Mill. dict. ed. 8. no. 16. Chav. antirrh. p. 107.) pilose; leaves usually ovate-hastate, mucronulate at top, alternate: lower ones sometimes opposite, and often denticulated; pedicels longer than the leaves; calycine segments lanceolate, very acute. ⊙. H. Native of Europe, North of Africa, frequent in corn-fields; and of the Island of Madeira. It is also to be found in North America, but has, most probably, been introduced from Europe. D. C. fl. fr. 3. p. 584. Tenore, syll. p. 302. L. commutàta, Bernh. in Reichb. pl. crit. 19. t. 815. f. 1101. Ant. elatinoìdes, Tenore, fl. nap. 2. p. 48. Ant. auriculàtum, Lam. fl. fr. 2. p. 339. Cymbalària Elátine. Baumg. trans. 2. p. 208. Elátine hastàta, Mœnch, meth. p. 524. Gray. brit. pl. 2. p. 321. Ant. Elátine, Lin. spec. p. 851. Oed. fl. dan. t. 426. Bull. herb. t. 245. Smith, engl. bot. 10. t. 692. Gaud. fl. helv. 3. p. 147. but not of Sibth, herb.—Hall. hist. no. 340. Linaria segetum nummulariæ folio aurito et villoso, flore luteo, Tourn. inst. 1. p. 169.—Mor. hist. 2. sect. 5. t. 14. f. 28.—Lob. icon. 470.—Blackw. herb. t. 170. Ελατινη, Diosc. 4. p. 40. This species comes very near the preceding, but it is readily distinguished by its slender habit, and the usually smaller hastate leaves, with acute auricles; and in the segments of the calyx being less cordate at the base. The flowers are the same, but sometimes bluish.

Var. β, cærùlea (Chav. antirrh. p. 107.) flowers blue, larger; leaves broader, usually toothed. ⊙. H. Native of Egypt and Mauritania. Linària ségetum nummulariæ folio aurito et villoso, flore cæruleo, Tourn. inst. p. 169. Elátine folio acuminato, flore cæruleo, Bauh. pin. 253. Magn. bot. p. 89.

Var. γ, Siebèri (Chav. l. c.) very villous; leaves smaller, usually cordate-ovate, not hastate: calycine segments narrower. ⊙. H. Native of Candia.? L. Elátine, Sieb. in herb. Gay. L. Siebèri, Rchb. fl. germ. sect. 2. p. 374.

Var. δ, hamòsa (Chav. l. c. p. 108.) flowers pale blue, larger; spur hooked; calycine segments almost linear. ⊙. H. Native of the Island Ischia, on rocks; and of Calabria and Camaria. Ant. hamòsum, Passy, in herb. D. C. et Merat.

Var. ε, pelòria (Chav. l. c.) flowers shape of those of *L. vulgàris*, var. *pelòria*. ⊙. H. Hegets, in descript. *L. spúria*, in icon. helv. 5. no. 1.

Elatine, or Halbert-leaved Toad-Flax. Fl. June, Nov. Britain. Pl. trailing.

19 L. Græ'ca (Chav. antirrh. p. 108.) villous; lower leaves ovate-oblong, or ovate, opposite: superior ones ovate-lanceolate, hastate, alternate, on short petioles; pedicels capillary, much longer than the leaves; segments of calyx linear, very acute, hardly exceeding the capsule. ⊙. H. Native of the Grecian Islands, and the neighbouring continent; Corsica and Sardinia. Ant. Græ'cum, Bory, et Chaub. fl. pelop. no. 796. t. 21. L. Elátine, D. Urv. enum. p. 74. Sibth. et Smith, fl. græc. icone. but not of Mill. Branches slender at first, erectish, but at length prostrate, nearly simple. Pedicels stiff, bent, or twisted at apex, quite glabrous. Corolla downy, citron coloured; spur arched, at length straight, rather longer than the corolla. Capsule glabrous. Testa of seeds brown, granularly tubercled.

Grecian Toad-Flax. Fl. July, Oct. Pl. prostrate.

20 L. cirrho'sa (Willd. enum. p. 689. D. C. fl. fr. 5. p. 407. Chav. antirrh. p. 109.) pilose, very slender; leaves lanceolate, or linear-lanceolate, hastate, alternate, petiolate; pedicels longer than the leaves, here and there twisted like tendrils; calycine segments linear-lanceolate, acute, shorter than the capsule. ⊙. H. Native of the South of France, in corn fields; in Camaria; Stoechades; Corsica, near Ajaccio; and on the mountains about Bola; Island of Ischia, in hedges; Candia; and Egypt. Ten. syll. p. 302. Elátine tènuis, Mœnch, meth. suppl. 171. Ant. cirrhòsum, Lin. mant. 249. Jacq. hort. vind. t. 82. Tenore, fl. neap. 2. p. 49. Linaria supina villosa, folio sagittato, Till. pis. t. 32. f. 2. Habit of plant slender, prostrate. Corolla small, bluish; palate white, marked with purple dots; spur almost straight, shorter than the corolla. Capsule downy. Seeds ovate-truncate; testa black, tubercular.

Tendrilled Toad-Flax. Fl. June, Sept. Clt. 1771. Pl. prostrate.

21 L. alsinæfo'lia (Spreng. syst. 2. p. 729. Chav. antirrh. p. 110.) leaves quite entire, downy: lower ones ovate, opposite, on long petioles: superior ones ovate-cordate, mucronate, petiolate; pedicels shorter than the petioles; calycine segments linear-lanceolate, very acute, with membranous edges. ⊙. H. Native of the small Islands between Corsica and Sardinia; and on the north-west shore of Sardinia; and in the desert near the Red Sea. Ant. alsinifòlium, Viv. fl. cors. p. 10. The whole herb is clothed with short white glandular hairs. Branches erectish. Lower leaves 1 inch long. Calyx villous, ciliated. Corolla small, yellow, with a straight, short, acute spur. Capsule smoothish. Seeds roundish; testa brown, granularly tubercled.

Chickweed-leaved Toad-flax. Pl. 1 foot.

22 L. Ægypti'aca (Dum. Cours. bot. cult. ed. 1st. t. 11. p. 92. Chav. antirrh. p. 110.) suffruticose, downy; leaves alternate, ovate, usually tricuspidate, petiolate; pedicels bent at top, at length ending each in a spine; calycine segments linear-lanceolate, acute. ♄. F. Native of Egypt, in arid places near Cairo; and on the mountains of Cyrenaica. Ait. hort. kew. ed. 2d. vol. 4. p. 11. Del. fl. ægypt. p. 95. t. 92. Ant. spinéscens, Viv. fl. libyc. p. 22. t. 27. f. 2. L. spinéscens, Spreng. syst. 2. p. 789. Ant. Ægyptìacum, Lin. syst. p. 464. Lam. dict. 4. p. 350. Forsk. ægypt. p. 112. Ελξινη, Diosc. ex Sibth. The branches rise from the neck of the plant the first year, but afterwards the neck becomes the form of a caudex, and twisted; branches 1-3 feet long. Leaves glaucous, 2-3 lines long. Corolla small, yellowish; spur blue, hooked. Capsule downy. Seeds small; testa granulately tubercled. The *L. spinescens* of Viv. is only the old state of *L. Ægyptìaca*.

Egyptian Toad-Flax. Fl. June, Aug. Clt. 1771. Shrub trailing.

23 L. frutico'sa (Desf. fl. atl. 2. p. 39. t. 133. Chav. antirrh. p. 111.) stem suffruticose, villous, branched; leaves alternate, petiolate, ovate-oblong, acutish, downy, rarely furnished with one or two teeth at the base: superior ones entire; pedicels shorter than the leaves, erect; calycine segments narrow, acute. ♄. F. Native of Barbary, on calcareous mountains near Cafsa. Ant. fruticòsum, Willd. spec. 3. p. 237. Pers. ench. 2. p. 155. Stem woody, thick, twisted; branches erect, villous. Leaves acutish, or obtuse, 3-4 lines long. Pedi-

cels glabrous. Calyx downy. Corolla yellow; spur straight, or arched; upper lip emarginate, somewhat 2-lobed; lobes reflexed. Capsule downy. Seeds small; testa tubercled.

Shrubby Toad-Flax. Shrub 1 foot.

§ 2. *Capsule ovate, dehiscing by two oblong, valve-formed lids at apex.*

24 L. ramosíssima (Wall. pl. asiat. rar. 2. p. 43. t. 153.) smoothish; caudex thick; branches elongated, woody; leaves alternate, petiolate, quite glabrous, all triangularly hastate, or the lower ones are somewhat palmate nerved, and 5-7-lobed; pedicels stiff, longer than the petioles; segments of the calyx linear-lanceolate, very acute, with membranous margins. ♄. F. Native of India, in Hindostan and Burmah, in waste and stony places, Wall.; in the province of Delhi, Royle; Coromandel, Heyne; and at Patna, Hamilton. L. hastàta, Royle, mss. L. Róylei, Chav. antirrh. p. 112. Caudex twisted; branches erect, or ascending, downy. Pedicels glabrous, bent at top, and like the petioles becoming at length stiff and spine-like. Calyx glabrous. Corolla downy, yellow; upper lip short; spur short, arched. Capsule glabrous. Seeds nearly orbicular; testa black, finely tubercled.

Much-branched Toad-Flax. Shrub 1 to 1½ foot.

25 L. inca'na (Wall. cat. no. 3910. Benth. scroph. ind. p. 20.) clothed with hoary villi; stems prostrate, woody at the base; leaves ovate, villous, rather cordate at the base, quite entire, or sub-hastate; pedicels longer than the petioles; segments of calyx linear, acute. ♄. F. Native of Nipaul, in fields, and among rubbish in the valleys. Corolla pale brown, spotted with purple inside.

Hoary Toad-Flax. Shrub prostrate.

26 L. heterophy'lla (Spreng. syst. 2. p. 790. Chav. antirrh. p. 112. but not of Desf.) suffruticose; branches slender, glabrous; leaves petiolate: lower ones oblong-hastate: superior ones linear-lanceolate, and linear, sometimes hastate, or sagittate, sometimes quite entire; pedicels longer than the leaves; calycine segments nearly lanceolate, acute. ♄. F. Native near Mogodor; and of the Canary Islands. Webb, et Berthelet, fl. can. icon. ined. Ant. heterophyllum, Willd. spec. 3. p. 234. Ant. sagittàtum, Poir. suppl. 4. p. 20. Caudex woody; branches 1-2 feet, striated. Lower leaves 8-14 lines long, glabrous above, but rather downy on the back. Corolla large, yellow, with a woolly palate, and straight spur. Testa of seed granularly tubercled.

Variable-leaved Toad-Flax. Shrub procumbent.

27 L. circina'ta (D. Don, in Sweet. fl. gard. n. s. t. 235.) suffruticose, glabrous; leaves sagittate, circinately recurved, acute behind; calycine segments lanceolate, acuminated; spur subulate, straight, length of corolla; palate with 2 prominences, densely bearded. ♄. G. Native of the Canary Islands. Corollas of a sulphur colour, larger than those of *L. vulgàris*, clothed with glandular pubescence; palate deeper coloured, clothed with dark red hairs. Leaves alternate. Peduncles filiform, axillary, solitary, thickened at top.

Circinate-leaved Toad-Flax. Fl. June, Aug. Clt. 1824. Pl. procumbent.

28 L. spartioi'des (Brouss. ex Buch. besch. der. can. p. 163. Webb. et Berth. l. c. Chav. antirrh. p. 113.) suffruticose, glabrous; branches leafless at the base, twiggy; leaves linear-lanceolate, or linear, quite entire, alternate: lower ones petiolate: superior ones nearly sessile; pedicels longer than the leaves; calycine segments nearly lanceolate, very acute. ♄. F. Native of Teneriffe, and Grand Canary, on rocks by the seaside; and of Cape Verd, upon a hill called in French Les Mamelles, and by the English the Paps. L. scopària, Brouss. in herb. D. C. Spreng. syst. 2. p. 789. Root emitting many procumbent branches. Leaves 6-12 lines long. Pedicels bent at top. Corollas size of those of *L. Græ'ca*, downy, yellow; spur ascending. Seeds ovoid; testa brown, tubercled.

Broom-like Toad-Flax. Fl. June, July. Clt. 1816. Shrub procumbent.

Sect. III. Linaria'strum (from *Linària* and *astrum*, an affixed signification like; the name is given to the section of the genus from its containing the only legitimate species of the genus.) Chav. antirrh. p. 114. Linariástrum, the greater part Duby, bot. gall. 1. p. 344. Leaves sessile, alternate, or verticillate, rarely opposite, feather-nerved, quite entire, usually glaucous. Flowers terminal, racemose, spicately racemose, and sometimes somewhat capitate. Palate at the throat of the corolla, prominent. Capsule dehiscing by 4-10 small valves or teeth at the apex. Seeds angular; or discoid, girded by a membranous border or margin, emarginate at the hilum.

§ 1. *Leaves dilated, ovate, lanceolate, or oblong, verticillate or alternate. Flowers racemose, or spicately racemose. Corolla always beyond 3 lines long, with the spur.*

* *Leaves usually 4 in a whorl. Flowers usually verticillate.*

29 L. triornithóphora (Willd. enum. p. 639. Chav. antirrh. p. 114.) branches erect, decumbent at top; leaves lanceolate, acute, quite glabrous; flowers usually 3-4 in a whorl. ♃. G. Native of Portugal, especially in the province of Minho, in gravelly, mountainous, humid places. Hoffm. et Link, fl. port. p. 244. L. Lusitánica, Mill. dict. ed. 8. no. 3. but not of Brot. Ant. triornithóphorum, Lin. spec. p. 852. Vent. malm. p. 11. t. 11. Brot. fl. lus. 1. p. 198. Curt. bot. mag. 525. Linària latissimo folio Lusitánica, Tourn. inst. 1. p. 169.—Riv. mon. irr. 1. t. 84.—Herm. lugdb. 376. t. 377. Plant glaucous, glabrous. Leaves usually 4 in a whorl, rarely 3-5, 2-3 inches long, glaucous beneath, with purplish edges. Calyxes exceeding the capsule. Corolla an inch long, pale violet, or purple; spur straight, equal to the corolla in length; palate yellow; tube inflated, and striated. Capsule dehiscing by 8 teeth at apex. Seeds discoid.

Three-birds-bearing Toad-Flax. Fl. June, Sept. Clt. 1710. Pl. 2 to 4 feet.

* * *Leaves all 3 in a whorl, or only the lower ones, or opposite; the rest alternate.*

30 L. latifòlia (Desf. fl. atl. 2. p. 40. t. 134. Chav. antirrh. p. 115.) glabrous; branches erect, almost simple, twiggy; leaves broad-lanceolate: lower ones 3 in a whorl: superior ones alternate; flowers disposed in long spicate racemes; calycine segments linear-lanceolate, exceeding the capsule. ⊙. H. Native of Barbary, in corn fields near Mascar and Tlemsen. Ant. latifòlium, Willd. spec. 3. p. 238. Pers. ench. 2. p. 155. Leaves somewhat stem-clasping, 1½ to 3 inches long, rather glaucous. Corollas size of those of *L. vulgàris*, yellow; spur straight, or a little arched, length of corolla. Capsule dehiscing by 6 small valves at apex. Seeds discoid.

Broad-leaved Toad-Flax. Fl. June, July. Clt. 1800. Pl. 1 to 2 feet.

31 L. hi'rta (Mœnch, meth. suppl. p. 170. Chav. antirrh. p. 116.) villous, erect; leaves ovate-elliptic, acutish: the lower ones 3 in a whorl, or opposite, the rest alternate; flowers crowded; segments of the calyx ovate-oblong, obtuse; upper one the largest. ⊙. H. Native of Spain, near Madrid; and about Malaga; of Portugal, in cultivated fields between Serpa and La Guadiana. L. villòsa, Mill. dict. ed. 8. no. 10. but not of D. C. L. semiglàbra, Salzm. exsic. in herb. D. C. Ant.

viscòsum, Curt. bot. mag. t. 368. Ant. hírtum, Lin. syst. p. 446. spec. p. 857. Jacq. icon. rar. 1. p. 12. t. 117. Hoffm. et Link, fl. port. p. 246. Plant clothed with clammy, glandular hairs. Leaves half stem-clasping, 1-2 inches long. Corolla yellow, showy, marked by green stripes, 9-14 lines long, with the spur, which is straight, and equal in length to the corolla; palate fulvous. Capsule opening by 6 small valves at apex. Seeds compressed, sub-discoid, obscurely triquetrous; testa grey, scrobiculate.

Hairy Toad-Flax. Fl. June, Sept. Clt. 1759. Pl. ½ to 1½ foot.

32 L. Cavanille'sii (Chav. antirrh. p. 117.) villous, erect; leaves ovate, subpetiolate, usually 3 in a whorl; flowers crowded; calycine segments oblong, contracted at the base: superior one the longest. ⊙. H. Native of Spain, on the shady mountains of la Cova Alta, near Albayda and Palomera. Ant. triphýllum, Cav. icon. 2. p. 61. t. 179, exclusive of all the synonymes. Linaria Hispanica trifolia latifolia villosa, Tourn. inst. p. 169. Branches branched at top, clothed with capitate or glandular hairs, like the rest of the plant. Leaves ½ inch long and more, 3-nerved, bluntish. Flowers crowded into a spike-formed raceme. Corolla almost like that of the preceding, pale yellow; spur a little incurved; superior lip whitish, marked with brown lines. Capsule downy, opening by 6 teeth at apex. Seed almost similar to those of the last.

Cavanilles's Toad-Flax. Fl. April, July. Pl. 1 foot.

33 L. triphy'lla (Mill. dict. ed. 8. no. 2. Desf. fl. atl. 2. p. 40. Chav. ant. p. 118.) quite glabrous, glaucous, erect, or ascending; leaves ovate and elliptic, usually 3 in a whorl; flowers disposed in dense, spicate racemes; calycine segments oblong, or ovate-lanceolate, obtuse, shorter than the capsule. ⊙. H. Native of Italy, Calabria, Spain, Portugal, Sicily, Corsica, France, &c. Tenore, syll. p. 303. L. glabràta, H. B. et Kunth, nov. gen. amer. 2. p. 362. L. neglécta, Clarke and Guss. pl. sic. rar. p. 249. fl. sic. t. 305. f. 1. Tenore, syll. p. 303. Ant. trícolor, Hort. Ant. triphýllum, Lin. spec. 2. p. 85. Lam. fl. fr. 2. p. 344. Gærtn. fruct. 1. p. 249. t. 53. Curt. bot. mag. 324. Viv. fl. libyc. 33. Tenore, fl. neap. 2. p. 49.—Sabb. hort. rom. 3. t. 4.—Plukn. t. 96. f. 4.—Barrel. pl. rar. p. 44. t. 22.—Mor. hist. sect. 5. t. 12. f. 2.—Cup. pamph. 2. t. 57.—Clus. hist. 1. p. 320. icone.—Lob. icon. 408.—Clus. hisp. 351. icon. Linària triphylla minor lùtea, Bauh. pin. 212. Tourn. inst. p. 169. Lower leaves an inch long, obtuse, or acutish: upper ones smaller, 3 in a whorl, opposite, or alternate, attenuated at both ends. Upper segment of calyx rather the largest. Corolla variegated with three colours, blue, white, and yellow; spur arched, almost the length of the corolla: upper lip pale purplish blue, lower one smaller and whitish; the palate yellow; the spur blue, or violaceous, acute. Capsule furrowed, opening by 6 valves at apex. Seeds prismatic, subtriquetrous, angular; testa brown, reticulately excavated.

Var. β, cærùlea (Chav. antirrh. p. 118.) corollas nearly all blue; leaves narrower; plant more slender. ⊙. H. Linària triphýllos cærùlea, Bauh. pin. p. 212. Tourn. inst. p. 169. Mor. hist. sect. 5. t. 12. f. 23. Linària neglécta, var. β, Guss. icon. fl. sic. t. 305. f. 2.

Var. γ, Pelòria (Rœm. arch. bot. 1. p. 125.) corollas shaped like those of Peloria, var. of *L. vulgàris*.

Three-leaved Toad-Flax. Fl. June, Sept. Clt. 1596. Pl. 1 to 2 feet.

34 L. virga'ta (Desf. fl. atl. 2. p. 41. t. 135. Chav. antirrh. p. 119.) glabrous, glaucescent; branches erect, simple, twiggy; lower leaves ovate, 3 in a whorl: superior ones ovate-lanceolate, generally alternate; flowers disposed in spicate racemes; calycine segments linear, very acute, exceeding the capsule. ⊙. H. Native of Numidia, Poir.; in corn-fields of Algiers, Desf.; in fields near Tripoli; and in the Great Syrtus, Viv. Ant. virgàtum, Poir. itin. 2. p. 192. Lam. ill. t. 531. f. 4. Viv. fl. libyc. p. 33. Branches erect, or decumbent. Leaves mucronulate, 5-9 lines long. Bracteas and calyxes hairy. Corolla blue; spur subulate, twice as long as the corolla: upper lip elongated. Capsule opening by 6 teeth at apex. Seeds subtriquetrous, angular; testa brown, scrobiculate.

Twiggy Toad-Flax. Fl. June, July. Clt. 1817. Pl. ½ to 1 foot.

35 L. refle'xa (Desf. fl. atl. 2. p. 42. D. C. fl. fr. 3. p. 585. Chav. antirrh. p. 119.) glabrous, procumbent; leaves ovate, acute, glaucous: lower ones 3 in a whorl: superior ones alternate; flowers in loose racemes; pedicels longer than the leaves, reflexed after flowering; calycine segments sub-lanceolate, acute. ⊙. H. Native of Corsica, Sicily, Sardinia, Italy, Tunis, in corn-fields. Guss. prod. fl. sic. p. 162. Tenore, syll. p. 303. L. rhegìna, Spreng. syst. 2. p. 792. Ant. prostràtum, Cyr. in herb. Moricand. Ant. reflexum, Lin. syst. p. 557. spec. p. 857. All. misc. taur. 2. p. 205. t. 1. Sibth. et Smith, fl. græc. t. 593. Corolla pale blue, rarely white; palate yellow; spur straight, twice or thrice as long as the corolla, subulate, acute; upper lip erect, elongated. Capsule dehiscing by 6 valves at apex. Seeds subreniform; testa brown, pitted.

Reflexed-pedicelled Toad-Flax. Fl. May, Aug. Clt. 1810. Pl. procumbent.

36 L. pedunicula'ta (Spreng. syst. 2. p. 797. Chav. antirrh. p. 120.) quite glabrous, ascending; lower leaves ovate-lanceolate, obtuse, 3 in a whorl, and opposite: middle and upper ones oblong, alternate; flowers on long pedicels; pedicels at length firm, not reflexed; calycine segments linear-oblong, obtuse, shorter than the capsule. ⊙. H. Native of Spain, as about La Torre Gorda, Malaga, Gibraltar, &c. L. transtagàna, Spreng. syst. 2. p. 792, exclusive of the syn. of Link. Ant. spártium, Saltzm. exsic. in herb. D. C, et Gay, but not of Lin. Ant. pedunculàtum, Lin. spec. 2. p. 857. Lam. dict. 4. p. 363. Branches woody at the base, and often without leaves; young branches leafy and decumbent. Leaves 3-4 lines long, like those of *Polygònum aviculàre*. Corolla blue, marked with deeper veins, size of those of *L. origanifòlia*; palate yellow; spur straight, subulate, shorter than the corolla. Capsule opening by 6 small valves at apex. Seeds reniform; testa black, muricated. Flowers loose.

Pedunculate-flowered Toad-Flax. Fl. June, July. Clt. 1810. Pl. ½ to 1 foot.

37 L. fla'va (Desf. fl. atl. 2. p. 42. t. 136. D. C. fl. fr. 3. p. 729. Chav. antirrh. p. 121.) glabrous, erect; lower leaves ovate, or ovate-oblong, 3 in a whorl: superior ones oblong-linear, alternate: flowers terminal, few, on short pedicels; calycine segments broadly linear, obtuse, shorter than the capsule. ⊙. H. Native of Barbary, in corn-fields near La Calle; Numidia; Sardinia; Corsica, in sand by the sea near Ajaccio; and of Spain. Ant. flàvum, Poir. itin. 2. p. 191. Lam. dict. 4. p. 358. Lower leaves 4-6 lines long: superior ones smaller, all obtuse and glaucous. Corolla small, deep yellow; spur acute, about equal in length to the corolla. Capsule opening by 6 small valves. Seeds subreniform; testa black, pitted.

Yellow-flowered Toad-Flax. Fl. July, Aug. Clt. 1820. Pl. ½ to 1 foot.

38 L. creta'cea (Fisch. exsic. in herb. D. C. Spreng. syst. 2. p. 791. Chav. antirrh. p. 122.) glabrous; leaves ovate, acutish, glaucescent: lower ones 3 in a whorl: superior ones opposite and alternate; flowers spicately racemose, few; calycine segments linear-lanceolate, acute, very short. ⊙. H. Native in cretaceous places at the river Don. Branches branched at top. Leaves crowded, 4-6 lines long: upper ones smaller.

Racemes short. Flowers on short pedicels. Corolla yellow, with a short, sub-incurved spur; palate deep yellow. Capsule unknown.

Cretaceous Toad-Flax. Fl. June, Sept. Clt. 1827. Pl. ½ to ¾ foot.

39 L. thymifo'lia (D. C. fl. fr. 3. p. 587. Lois. fl. gall. ed. 2d. vol. 2. p. 792. t. 10. Chav. antirrh. p. 122.) glaucous, glabrous, procumbent, or ascending; lower leaves ovate, obtuse, 3 in a whorl: superior ones oblong, usually opposite; flowers few at the tops of the branches; calycine segments oblong-ovate, obtuse, shorter than the capsule. ⊙. H. Native of the south-west of France, on the sea-shore about Burdigala, and near Bayonne. Ant. thymifòlium, Vahl, symb. 2. p. 67. Willd. spec. 3. p. 243. Ant. glaúcum, Thore, clor. land. 265. but not of Lin. nor Lapeyr. Branches usually decumbent. Leaves 3-5 lines long: upper ones smaller. Flowers on short pedicels. Corolla like those of *L. supìnum*, yellow; spur a little arched, about the length of the corolla; palate orange-coloured. Capsule dehiscing by 6 deep valves at apex. Seeds discoid.

Thyme-leaved Toad-Flax. Fl. June, July. Clt. 1818. Pl. procumbent.

* * * *Leaves all alternate.*

40 L. Lusita'nica (Hoffm. et Link, fl. port. p. 247. t. 43. Chav. antirrh. p. 123. but not of Mill.) branches procumbent, glabrous; leaves crowded, obovate, or oblong: upper ones the larger; flowers disposed in dense racemes; calycine segments oblong, obtuse, pubescent. ♃. H. Native of Portugal, in sand by the sea side near Comporto, and at the mouth of the river Mondego. Ant. Lusitánicum, Lam. dict. 4. p. 361. Brot. fl. lus. 1. p. 193. Linària Lusitánica maritima polygalæ folio, Tourn. inst. p. 169. Root fibrous, yellowish. Leaves glabrous, glaucescent: lower ones 3-5 lines long. Corolla large, yellow; tube and spur marked with red lines; spur about equal in length to the corolla, straightish, acute. Capsule opening by 6 small valves. Seeds discoid.

Portugal Toad-Flax. Fl. June, July. Clt. 1819. Pl. proc.

41 L. Michau'xii (Chav. antirrh. p. 124. t. 7. f. B.) glaucous; branches ascending, branched; leaves broad-obovate, mucronate; flowers disposed in spicate racemes; calycine segments oblong, ovate, acutish. ♃. H. Native of Persia, near Ispahan. Plant quite glabrous. Branches furnished with a few sterile, filiform branchlets, which are sometimes reduced to spines. Leaves as if they were truncate at top, 5-7 lines long. Corolla large, purple; the spur hardly longer than it, and incurved at top; palate bearded. Capsule unknown.

Michaux's Toad-Flax. Pl. ¼ to ½ foot.

42 L. fastigia'ta (Chav. antirrh. p. 125. t. 7. f. A.) glaucous, glabrous, erect; branches fastigiate; leaves ovate-lanceolate, or oblong, adpressed to the stem at the base, mucronulate at apex; flowers disposed in dense spicate racemes, which taper to the top; calycine segments oblong-lanceolate, acute. ♃. H. Native of the Levant, Armenia, in cultivated fields near Bagdad and Kermancha, Oliv. Linària orientàlis latissimo folio, floribus linariæ vulgaris, Tourn. cor. inst. p. 9.? Leaves 1½ to 2 inches long, 5-nerved, somewhat stem-clasping at the base. Corolla yellow; spur shorter than the corolla, a little arched.

Fastigiate-branched Toad-Flax. Pl. 1 to 2 feet.

43 L. pyramida'ta (Spreng. syst. 2. p. 796. Chav. antirrh. p. 125, exclusive of the syn. of Lin.) erect; leaves oblong-lanceolate, attenuated at both ends, quite glabrous; flowers in spicate, pyramidal racemes; calycine segments ovate-oblong, obtuse, downy, much shorter than the tube of the corolla. ♃. H. Native of the Levant. Ant. pyramidàle, Lam. dict. 4. p. 360. Linària orientàlis lilii persici foliis, florum spica densissima et pyramidàta, Tourn. corol. inst. p. 9. Leaves 3-5 inches long, usually 5-nerved, a little stem-clasping at the base, mucronulate at apex. Corolla large, yellow; spur straight, acute, about equal in length to the corolla; palate densely bearded.

Pyramidal-spiked Toad-Flax. Pl. 2 to 3 feet.

44 L. grandiflòra (Desf. cor. inst. Tourn. p. 30. t. 21. Chav. antirrh. p. 126.) erect, glaucescent, glabrous; leaves ovate-lanceolate, acute, half stem-clasping; bracteas deflexed, longer than the pedicels; flowers approximate; calycine segments oblong-lanceolate, acute, quite glabrous. ⊙. H. Native of Armenia, in uncultivated fields very frequent. L. Dalmática, Rchb. pl. crit. 5. t. 438. f. 629. Ant. Dalmáticum, Lam. dict. 4. p. 360. exclusive of the syn. of Lin. and others.—Buxb. cent. 1. p. 15. t. 24. Linària orientàlis flore luteo maximo, Tourn. cor. inst. p. 9. Leaves approximate, 5-nerved, attenuated at both ends. Corolla large, yellow; spur a little shorter than the corolla, straight; palate deep yellow, villous. Capsule not seen.

Great-flowered Toad-Flax. Pl. 2 to 3 feet.

45 L. Dalma'tica (Mill. dict. ed. 8. no. 13. Chav. antirrh. p. 127.) glaucous, glabrous, branched; leaves oblong-lanceolate, acute, approximate; flowers few, and loose at the summits of the branches; segments of calyx oblong-lanceolate, or linear-lanceolate, acute, glabrous. ♃. H. Native of Candia, Armenia, and Dalmatia. Baumg. trans. 2. p. 205. Ant. Dalmáticum, Lin. spec. p. 857. exclusive of the syn. of J. Bauh. Pall. itin. p. 590. Linària latifòlia, Dalmática magno flore, C. Bauh. pin. p. 212. Tourn. inst. p. 169. Branches erect, or decumbent, densely clothed with leaves. Leaves 1-3 inches long, 3-5-nerved: upper ones 3-nerved. Flowers disposed in loose few-flowered racemes. Corolla yellow; spur straight, much shorter than the corolla; palate large, villous.

Dalmatian Toad-Flax. Pl. 3 to 4 feet.

46 L. genistæfo'lia (Mill. dict. ed. 8. no. 14. Chav. antirrh. p. 128.) glaucous, glabrous, erect; leaves lanceolate, acute, 3-5-nerved; flowers paniculately racemose; rachis flexuous, twiggy; segments of the calyx oblong-lanceolate, acute. ♃. H. Native of Austria, Hungary, Tauria, Caucasus, and Altaia; and about Constantinople, in sandy, dry places. Rchb. pl. crit. 5. t. 435. Ledeb. fl. alt. 2. p. 443. Meyer, verz. p. 109. Ant. genistæfòlium, Lin. spec. p. 858. Jacq. austr. 3. t. 244. Bieb. fl. cauc. 2. p. 74. exclusive of the syn. of Hall. Sibth. et Smith, fl. græc. t. 596. Pers. ench. 2. p. 158. but not of Sut. nor Lapeyr. Linària constantinopolitana lini sativi folio, flore luteo, Tourn. cor. p. 9. Buxb. cent. 1. p. 16. t. 25. Linària flore pallido rictu aureo, Tourn. inst. p. 170. Linària Pannónica, Clus. hist. 1. p. 321. pann. p. 308. Root white, rhizomatose. Stem branched; branches panicled. Leaves somewhat stem-clasping, an inch and more long. Flowers in loose racemes. Corolla a little smaller than those of *L. vulgàris*, pale yellow; palate yellow; spur straightish, equal in length to the corolla. Capsule opening by 6 teeth at apex. Seeds prismatic, subtriquetrous; testa brown, corrugately excavated.

Var. β, pròcera (Chav. antirrh. p. 128.) leaves broader, 5-nerved; plant larger and firmer. ♃. H. Native of Tauria, on cretaceous rocks about Karassubassa. L. chloræfòlia, Rchb. pl. crit. 5. t. 436. L. genistæfòlia, var. γ, pròcera, Hook. bot. mag. t. 2183. Ant. genistæfòlia, var. γ, Bieb. fl. cauc. 2. p. 74. Linària flore pallido rictu aureo, elatior, Tourn. inst. p. 170.

Var. γ, silenifòlia (Chav. antirrh. p. 128.) branchlets less flexuous; leaves more elongated; flowers a little larger; spur shorter than the corolla. ♃. H. Native not far from Constantinople. L. silenifòlia, Fisch. hort. gorenk. p. 25. Rchb. pl. crit. 5. t. 437.

Broom-leaved Toad-Flax. Fl. June, Aug. Clt. 1704. B. 1819. Pl. 2 to 4 feet.

§ 2. *Leaves narrow, linear, linear-lanceolate, or linear-oblong, all alternate. Flowers racemose, or spicately racemose, rather large.*

* *Seeds angular.*

47 **L. linifòlia** (Rchb. pl. crit. 5. t. 422. f. 609. fl. germ. sect. 2. p. 374. exclusive of the syn. of Rochel. Chav. antirrh. p. 129.) erect, glabrous, a little branched; leaves linear-lanceolate, acute, somewhat 3-nerved; racemes strict, rather loose; bracteas longer than the pedicels; calycine segments rather ovate at the base, acuminated, short. ♃. H. Native of the Levant, and Italy, by the sea-side. Ant. linifòlium, Lin. spec. p. 858. exclusive of the syn. of Tourn. et Buxb. Lam. dict. 4. p. 362, exclusive of the syn. Linària orientàlis, vulgari similis folio longissimo, Tourn. inst. p. 9. Leaves 1 to 1½ inch long. Corollas like those of *L. genistæfòlia*, but rather smaller, yellow, with a deeper coloured villous palate; spur straight, equaling the corolla in length. Capsule opening by 6 small teeth. Seeds subtriquetrous, scrobiculate.

Flax-leaved Toad-Flax. Pl. 1 to 1½ foot.

* * *Seeds discoid, marginate.*

48 **L. Ita'lica** (Trev. in nov. act. bonn. 13. p. 188. Chav. antirrh. p. 150.) branched; leaves linear-lanceolate or linear, 3-nerved; flowers crowded; segments of calyx linear, acute, often ciliated; capsule nearly ovate. ♃. H. Native of Switzerland, Italy, Piedmont, Tyrol, Hungary, on the alps. Rchb. pl. crit. 5. p. 13. t. 421. f. 608. L. genistæfòlia, D. C. fl. fr. 3. p. 591. exclusive of the synonymes. L. angustifòlia, Rchb. fl. germ. sect. 2. p. 375. exclusive of the syn. of Lang. L. paniculàta, Peyer et Vest. ex Rchb. l. c. L. linifòlia, Roch. pl. ban. rar. p. 60. t. 22. f. 47. and of many other authors. Ant. Bauhìni, Gaud. fl. helv. 3. p. 154. Ant. polygalæfòlium, Poir. dict. suppl. 4. p. 21. but not of Link, under Linària. Ant. genistifòlium, Vill. dauph. 2. p. 440. exclusive of the syn. of Lin. and Clus. All. pedem. no. 243. exclusive of many synonymes. Sut. fl. helv. 2. p. 34. exclusive of the syn. of Jacq. Chenal, act. helv. 8. p. 242. but not of Lin. nor Lapeyr. Ant. Linària, var. Lin. spec. p. 859.—Hall. hist. no. 337. Plant glaucescent. Leaves an inch and more long. Corollas like those of *L. vulgàris*, but not above half the size, deep yellow; palate bearded with white hairs; spur hardly exceeding the corolla, a little arched. Capsule opening by 6 small valves at apex. Seeds muricated in the centre, and girded by a broad margin.

Var. β, *angustifòlia* (Chav. antirrh. p. 131.) leaves exactly linear, very acute; capsule ovate-globose. ♃. H. Native of Piedmont, on the banks of the river La Stura, and near Superga.

Italian Toad-Flax. Pl. 1 to 2 feet.

49 **L. vulga'ris** (Mill. dict. ed. 8. no. 1.) simple or branched; leaves linear, or linear-lanceolate, usually 1-nerved; flowers disposed in dense spicate racemes; calycine segments almost lanceolate, acute; capsule almost cylindrical. ♃. H. Native throughout Europe, in sandy fields and in hedges; also of Podolia and Siberia; in America, but probably introduced from Europe. It is very plentiful in many parts of Britain. Mœnch. meth. p. 524. D. C. fl. fr. 3. p. 592. Chav. antirrh. p. 131. Ant. genistifòlium, Lapeyr, abr. p. 354.? Benth. cat. pyr. p. 69. with the leaves broader and erect, and the flowers smaller. L. Geblèri, Besser, in herb. D. C. L. ciliàta, Lang. in herb. Gay, with ciliated corollas. Ant. commùne, Lam. fl. fr. 2. p. 340. Ant. Linària, Lin. spec. p. 858. Bull. herb. t. 261. Gærtn. fruct. 1. p. 248. t. 53. f. 7. Lam. ill. t. 351. f. 3. Sturm, fl. germ. 1. fasc. 18. t. 13. Smith, engl. bot. 10. t. 63. Curt. lond. 1. t. 47. Oed. fl. dan. t. 982.—Hall. helv. no. 336.—Blackw. herb. t. 115.—Mor. hist. 2. p. 499. sect. 5. t. 12. f. 10.—Besl. hort. eyst. 1. t. 14. f. 3. Riv. mon. irr. t. 82. Osyris, Pliny, nat. hist. 349. Osyris Linària, Trag. hist. p. 357. Οσυρις, Diosc. 4. p. 138. Rhizoma creeping, tubercled. Plant glaucous. Leaves about an inch long. Corolla pale yellow or citron-coloured; palate copper-coloured; spur curved, about equal in length to the corolla. Capsule dehiscing by 6-8 teeth. Seed with tubercled centre and winged margin. In Worcestershire the plant is called Butter-and-Eggs. Gerard names it *Wild-Flax*, *Toad-Flax*, and *Flax-weed*. It abounds in an acrid oil, that is almost empyreumatic. Given inwardly it excites nausea. It is recommended in dropsical cases; but Haller and others do not much approve of it. The juice, mixed with milk, is a poison to flies.

Var. β, *glandulòsa* (Chav. antirrh. p. 132.) downy, usually procumbent; calyxes glandular. ♃. H. Native in woods about Malmedy. Ant. glandulòsum, Lejeune, fl. spa. p. 320. Ant. Linària, var. glandulòsum, Lejeune, revue, p. 124. L. prostràta, Bœnn. in Rchb. l. c. but not of Cyrill. under *Antirrhìnum*.

Var. γ, *speciòsa* (Chav. l. c.) leaves linear-lanceolate, rather coriaceous, obsoletely 3-nerved, glaucescent beneath; flowers larger; capsule elliptic-oblong. ♃. H. Native of Naples, in corn-fields on the mountains. L. speciòsa, Ten. fl. neap. 4. t. 159. f. 1. syll. p. 304.

Var. δ, *acutíloba* (Chav. l. c.) leaves narrow-oblong, or oblong-lanceolate, usually 3-nerved; calycine segments often acuminated; corolla pale yellow; palate deep orange-coloured; lobes sometimes acutish, sometimes obtuse; capsule subcylindrical. ♃. H. Native of Dahuria; and in shady dry places in the region of Altaia. L. acutíloba, Fisch. mss. Rchb. pl. crit. 5. p. 14. t. 424. f. 611.

Var. ε, *Pelòria* (Lin. amœn. 1. p. 280. Smith, engl. bot. 4. t. 260. nov. dict. sc. nat. veg. t. 31.) corolla almost regular, ending in 5 horns at the base.

Common Toad-Flax. Fl. June, Sept. Britain. Pl. 1 to 2 feet.

50 **L. Bieberste'inii** (Besser, enum. pl. pod. p. 25. Rchb. pl. crit. 5. t. 434. f. 624. and 625.) branched; leaves broad-linear, or linear-lanceolate, 3-nerved, mucronate; flowers disposed in a short crowded raceme; segments of the calyx oblong-linear, acutish, downy; capsule globose. ♃. H. Native of the South of Podolia; on the shores of the Black Sea, about Odessa; in Syria, about Damascus. Chav. antirrh. p. 134. Ant. Linària, Bieb. fl. cauc. 2. p. 75. exclusive of many synonymes. Stem furnished with fastigiate branches. Leaves 1-2 inches long. Corollas form of those of *L. vulgàris*, but a little smaller, pale yellow, with a deeper coloured, bearded palate. Capsule nearly globose, dehiscing by 6-8 valves at apex. Seeds margined, black.

Bieberstein's Toad-Flax. Fl. June, Aug. Clt. 1820. Pl. 1 to 3 feet.

51 **L. hepa'tica** (Bunge, in Led. fl. alt. 2. p. 445. fl. ross. alt. ill. t. 91. Chav. antirrh. p. 134.) branches spreading, elongated, strict; leaves oblong-linear, acute, glabrous, crowded; flowers racemose; calycine segments glabrous, obtuse, about equal in length to the pedicels; spur slender, straight, about equal in length to the corolla. ♃. H. Native of the Kirghisean steppe, on the mountains at the river Kurtschum, and on the mountains of Arkaul and Dolenkara. Plant glabrous, glaucous, rather procumbent at the base. Leaves somewhat 3-nerved. Flowers distant on the raceme. Calycine segments glabrous, rarely glandularly ciliated. Corollas rather large, liver-coloured, or dirty purple, almost like those of *Lòtus Jacobæ'us;* palate villous. Seeds black, discoid.

Liver-coloured-flowered Toad-Flax. Pl. 1 to 1½ foot.

52 **L. præ'cox** (Bunge, in Led. fl. alt. 2. p. 446. fl. ross. alt.

ill. t. 431. Chav. antirrh. p. 135. but not of Link, fl. port.) stem erect, strict, simple; leaves scattered: lower ones short, broader: superior ones linear, elongated, fleshy, glaucous; segments of the glandular calyx oblong, obtuse; spur straight, exceeding the corolla, which is also glandular; racemes subspicate. ♃. H. Native of Altaia, at the river Irtysch, and between Tscheremschanskoi and Krasnojarski, on dry mountains. Plant glabrous, glaucous. Leaves 1-2 inches long. Racemes 12-15-flowered, at length elongated. Calycine segments somewhat 3-nerved. Corolla violaceous, marked with deeper stripes; throat villous, white, furnished with 2 yellow confluent spots; the spur deeper violet. Seeds discoid.

Early Toad-Flax. Fl. April. Pl. 1 to 2 feet.

53 L. odòra (Fisch. cat. hort. gorenski, 1812. p. 25. Chav. antirrh. p. 136.) branched, erect or ascending; leaves linear-subulate, semiterete, channelled; flowers in loose racemes; calycine segments short, ovate or elliptic, obtuse; capsule globose. ♃. H. Native of Tauria, in the sand of the Ukraine; in the colony of Sarepta, Rchb.; Siberia, at the Oby, Demidow; on sandy hills between Schulbinsk and Oserski, at the river Irtysch, Ledeb.; in Calabria and Sicily rather frequent, Schouw.? L. Itálica, Fisch. mss. ex Ledeb. L. Loesèlii, Schweigg. Kœn. arch. 1. p. 228. Led. fl. alt. 2. p. 447. Spreng. syst. 2. p. 797. L. júncea, Rchb. pl. crit. 5. t. 425. f. 612—613. but not of D. C. nor Desf. L. marítima, Rchb. fl. germ. sect. 2. p. 375. but not of D. C. Ant. subulàtum, Cyrill. in herb. Ant. odoratíssimum, Giild. itin. 1. p. 111. Ant. odòrum, Bieb. fl. cauc. 2. p. 76. suppl. 414. Ant. júnceum, Pall. itin. 2. p. 332. et 3. p. 541. and 682. but not of Lin. nor Lam.—Lois. bor. p. 298. t. 39.—Buxb. cent. 4. p. 23. t. 37. Plant very polymorphous, with a slender habit, glaucescent. Leaves 1 to 1½ inch long. Racemes few-flowered, loose, clothed with white glandular hairs, and also the calyx. Corolla pale yellow, painted by 2 orange stripes beneath; palate orange-coloured; spur straight, or a little incurved, sometimes equal in length to the corolla, and sometimes shorter. Capsule large. Seeds discoid, subreniform. Ledebour gives three varieties of this species.

Sweet-scented Toad-Flax. Fl. July, Aug. Clt. 1823. Pl. 1 to 1½ foot.

54 L. macrou'ra (Rchb. pl. crit. 5. p. 20. t. 432. f. 621, 622. Chav. antirrh. p. 137.) erect, branched or simple; leaves linear, flat, glaucous, quite glabrous; those of the surculi crowded; raceme dense; segments of the calyx ovate-oblong, obtuse, clothed with glandular down, or smoothish. ♃. H. Native of Tauria and Caucasus, in dry places. Led. fl. alt. 2. p. 446. Ant. macroùrum, Bieb. fl. cauc. 2. p. 75. Ant. linifòlium, Pall. ind. taur. Habl. taur. p. 161. but not of Lin. Leaves 1-2 inches long. Flowers disposed in long, straight, dense racemes. Calyx beset with glandular hairs. Corollas large, glabrous or downy, yellow, with a more intense coloured, villous palate; spur straight, length of corolla, or a little longer. Capsule opening by 6 valves at apex.

Var. β, *Besseriàna* (Chav. antirrh. p. 137.) simple; raceme few-flowered; flowers larger; calycine segments broader and a little longer, rather downy, or sometimes quite glabrous; spur about equal in length to the corolla. ♃. H. Native of Bessarabia, in fields between Elisabetgrad and Nicolaèf; and in fields about the Don, and beyond the Volga; South of Tauria. L. Besseriàna, Rchb. pl. crit. 5. t. 433. f. 623. L. macroùra, Bieb. pl. rar. ross. 1. t. 27. Ant. macroùrum, β, Bieb. fl. cauc. suppl. p. 413. Corollas deeper yellow, and sometimes even purplish.

Var. γ, *ramòsa* (Chav. antirrh. p. 137.) branches again branched, thicker; flowers smaller, loose; calycine segments narrower; corolla golden yellow; spur long. ♃. H. Native of Altaia. L. macroùra, β, Ledeb. fl. alt. 2. p. 446. Flowers disposed in a loose, elongated raceme.

Long-tailed-racemed Toad-Flax. Fl. June, Sept. Clt. 1822. Pl. 1 to 1½ foot.

§ 3. *Leaves narrow, alternate or verticillate; those of the surculi broader, lanceolate or linear, verticillate. Flowers disposed in racemes, or spicate racemes. Corolla beyond 3 lines long, with the spur.—Usually erect herbs, furnished with sterile leafy surculi.*

* *Style forked at top; stigma 2-lobed* (Chav. antirrh. t. 5. f. 10. b.) *Seeds transverse, corrugated* (Chav. l. c. f. 28.)

55 L. aparinòides (Chav. antirrh. p. 138.) strict; leaves linear-subulate, usually alternate; those of the surculi flat, and 4-5 in a whorl; raceme villous; pedicels longer than the bracteas; segments of the calyx linear, acute. ⊙. H. Native of Sicily, on arid sandy hills and fields; and the Island of Cyprus. L. reticulàta, Rchb. pl. crit. 5. p. 19. t. 431. f. 620. but not of Desf. L. stricta, Guss. pl. rar. sic. p. 250. exclusive of the syn. of Spreng. prod. fl. sic. p. 166. Tenore, syll. p. 304. but not of Horn. nor Rchb. Ant. multicaúle, Tenore, fl. nap. prod. p. 36. but not of Lin. L. heterophýlla, Desf. fl. atl. 2. p. 48. t. 140. cat. par. 3. p. 108. exclusive of the syn. *Ant. pinifòlium*, but not of Willd. under Antirrhìnum. Ant. strictum, Sibth. et Smith, fl. græc. t. 594. Ant. aparinoìdes, Willd. spec. 3. p. 247. Poir. suppl. 4. p. 25. Pers. ench. 2. p. 157. Linària Sicula multicaulis molluginis folio, Bocc. sic. t. 19. f. 1. Tourn. inst. p. 171. Branches villous. Leaves 1-2 inches long, usually scattered: lower ones sometimes in whorls; those on the younger branches crowded, as if in fascicles. Racemes clothed with white glandular hairs. Corollas size of those of *L. vulgàris*, sulphur-coloured; palate copper-coloured, marked with brown lines; spur usually straight. Anthers ciliated. Capsule dehiscing by 6 teeth at the apex.

Var. β, *hùmilis* (Chav. l. c.) plant ascending, hardly half a foot high; sterile surculi villous. ⊙. H. L. stricta, var. β, Guss. icon. fl. sic. t. 308.

Cleaver's-like Toad-Flax. Fl. June, Aug. Clt. 1825. Pl. 1 to 3 feet.

56 L. reticula'ta (Desf. fl. atl. 2. p. 48. Chav. antirrh. p. 140.) erect, glaucous; leaves linear, channelled: lower and surculine ones verticillate: superior ones scattered; raceme short, downy, tapering upwards; bracteas longer than the pedicels; segments of the calyx broadly linear. ⊙.? H. Native of the North of Africa, on the sea shore; in Portugal, on the Douro, near Oporto, and especially about Faustua. Hoffm. et Link, fl. port. p. 251. exclusive of the synonyme of Brot. Willd. enum. 2. p. 796. Ait. hort. kew. ed. 2d. vol. 4. p. 15. but not of Rchb. Ant. reticulàtum, Smith, icon. rar. t. 2. Willd. spec. 3. p. 247. Pers. ench. 2. p. 157. exclusive of the syn. of Brot. Ant. pinifòlium, Poir. itin. 2. p. 193. Lam. dict. 4. p. 362. Plant glabrous, except the floriferous part. Leaves obtuse, an inch and more long; those of the surculi shorter and broader, 4-6 in a whorl. Flowers crowded. Corolla reticulately veined, deep purple; palate copper-coloured or yellow, marked with dark purple lines; spur shorter than the corolla. Capsule and seeds as in the preceding.

Reticulated-flowered Toad-Flax. Fl. May, July. Clt. 1788. Pl. 2 to 4 feet.

57 L. versi'color (Mœnch. meth. p. 523. D. C. fl. fr. 3. p. 586. Chav. antirrh. p. 141.) downy at top; leaves flat, broad-linear or linear-lanceolate, obtuse: lower ones usually 3 in a whorl: superior ones alternate: those of the surculi opposite, or 3 in a whorl; flowers racemose; segments of the calyx linear-oblong, bluntish. ⊙. H. Native of the South of France. Ant. bipunctàtum, Hort. but not of Lin. nor Cav. Ant. versícolor, Lin. syst. p. 466. Jacq. misc. 2. p. 336. icon. rar. 1. p. 12. t. 116. Racemes clothed with short glandular hairs. Leaves

1 to 1½ inch long. Corolla size of those of *L. vulgàris*, pale yellow, with a copper-coloured palate, which is often marked with 2 brown spots; spur violaceous or yellow, longer than the corolla. Capsule dehiscing by 6 teeth at apex. Seed a little curved, truncate at the base.

Party-coloured-flowered Toad-Flax. Fl. July, Sept. Clt. 1777. Pl. 1 to 1½ foot.

58 L. viscòsa (Dum. Cours. bot. cult. ed. 1st. p. 93. Spreng. syst. 2. p. 794. Chav. antirrh. p. 141.) downy; leaves linear, usually alternate, distant; those of the surculi linear-lanceolate or linear-oblong, 4 in a whorl; raceme short, crowded; segments of the calyx linear or linear-lanceolate, acute, vaguely ciliated. ⊙. H. Native of Spain, near Gades. Ant. viscòsum, Lin. amœn. 4. p. 319. spec. p. 855. Ait. hort. kew. ed. 2d. vol. 4. p. 14. exclusive of the syn. of Bot. mag. Root yellowish, with twisted, somewhat horizontal branches. Stem naked under the raceme. Leaves ½ to 1 inch, bluntish, quite glabrous: lower ones fascicled, or somewhat verticillate. Corolla yellowish-brown; upper lip large; spur straight, hardly exceeding the corolla. Capsule dehiscing by 6 teeth at apex. Seed black, a little curved.

Clammy Toad-Flax. Fl. July. Clt. 1786. Pl. 1 to 1½ foot.

59 L. Algarvia'na (Chav. antirrh. p. 142.) glabrous; branches almost leafless; leaves of the surculi very numerous, lanceolate or linear-lanceolate, 3-4 in a whorl; flowers on long pedicels, drooping; segments of the calyx nearly linear, acute. ⊙.? ♃.? H. Native of the Algarves. Root fusiform, fibrous, brown. Branches decumbent or erect. Leaves of the branches small. Flowers 2-4 together, at the ends of the branches. Corollas size of those of *L. alpìna*, pale yellowish-brown, or purplish, furnished with a long spur. Capsule dehiscing by 6 teeth at apex. Seeds irregular; testa variously twisted.

Algarves Toad-Flax. Pl. ¼ to ¾ foot.

60 L. spa'rtea (Hoffm. et Link, fl. port. p. 233. t. 30. Rchb. pl. crit. 9. t. 814. f. 1100. Chav. antirrh. p. 143.) plant strict, branched; leaves linear-lanceolate, erect, quite glabrous: lower ones often 3 in a whorl: superior ones alternate; those of the surculi flat, 3-4 in a whorl; flowers on long pedicels; calycine segments linear or linear-lanceolate, acute, glabrous or downy. ⊙. ex Ait. ♂. ex Willd. H. Native of Spain, near Madrid and Aranjuez; Portugal, in sandy places about Lisbon; South of France; Canary Islands; Morocco; Tripoli, on the sea shore. L. júncea, Desf. fl. atl. 2. p. 43. D. C. fl. fr. 3. p. 729. Duby, bot. gall. 1. p. 345. exclusive of *L. júnceum*, Lin. Rchb. pl. crit. 9. t. 813. f. 1099. L. præ'cox, Hoffm. et. Link, fl. port. p. 233. t. 37. exclusive of the syn. of Lin., but not of Ledeb. Ant. júnceum, Lam. dict. 4. p. 352. Pers. ench. 2. p. 156. but not of Lin. Ant. spárteum, Lin. spec. p. 854. Cav. icon. 1. p. 19. t. 32. Viv. fl. libyc. p. 33. Curt. bot. mag. t. 200. Linària ánnua angustifòlia, flore majore luteo, Mor. hist. part. 2. p. 499. Tourn. inst. 1. p. 171. Leaves 6-10 lines long. Racemes few-flowered, glabrous, or clothed with short clammy down. Corolla very variable, yellow; palate deep orange; spur straight. Capsule dehiscing by 6 small valves. Seeds oblong, truncate, black.

Broom-like Toad-Flax. Fl. June, Oct. Clt. 1772. Pl. 1 to 2 feet.

61 L. ju'ncea (Ait. hort. kew. ed. 2d. vol. 4. p. 17. Chav. antirrh. p. 144. but not of Desf. nor Rchb.) glabrous, much branched, slender; leaves linear-subulate, semiterete, usually alternate; those of the surculi linear-lanceolate, opposite or 3 in a whorl; flowers few, on long pedicels; calycine segments linear-lanceolate, short, acute. ⊙. H. Native of Spain and Portugal, near Coimbra. L. meonántha, Hoffm. et Link, fl. port. 1. p. 236. Ant. virgulàtum, Brot. fl. lus. 1. p. 193. Ant. júnceum, Lin. amœn. 4. p. 277. but not of Lam. Leaves sometimes 3-4 in a whorl, at the base of the branches. Corollas much smaller than those of *L. spártea*, yellow; palate orange-coloured; spur straight, hardly longer than the corolla. Capsule dehiscing by 6 valves. Seeds truncate, a little curved, black.

Rushy Toad-Flax. Fl. June, Sept. Clt. 1780. Pl. 1 to 1½ foot.

62 L. bipartì'ta (Willd. enum. 2. p. 640. Chav. antirrh. p. 145.) glabrous; leaves linear or linear-lanceolate, flat, alternate or verticillate: those of the surculi broader, and 3 in a whorl; flowers disposed in loose racemes; segments of the calyx almost lanceolate, acute, with membranous edges. ⊙. H. Native of Morocco, about Mogodor; Tangiers and Mauritania. Sweet. fl. gard. t. 30. L. speciòsa, Jacq. fil. eclog. 1. p. 140. t. 95. but not of Tenore. Ant. speciòsum, Donn. hort. cant. 1804. p. 178. L. cærùlea, Hort. Ant. orchidiflòrum, Hort. Ant. bipartìtum, Vent. hort. cels. t. 82. Poir. suppl. 4. p. 21. Root yellowish, branched. Leaves 1-3 inches long. Corollas showy, of a violet-purple colour; upper lip deeply bipartite; palate orange-coloured, whitish at the base; spur arched, hardly exceeding the corolla. Capsule opening by 6 teeth at apex. Seeds oblong, black, curved a little.

Bipartite-lipped Toad-Flax. Fl. June, Sept. Clt. 1815. Pl. 1 foot.

63 L. linogri'sea (Hoffm. et Link, fl. port. p. 240. t. 41. exclusive of the syn. of Tourn. Chav. antirrh. p. 146.) downy at top; leaves linear, flat, glabrous, alternate or 3 in a whorl; those of the surculi lanceolate, short, 3-4 in a whorl; flowers loose, on long pedicels; calycine segments linear, very acute, downy. ⊙. H. Native of Portugal, in sandy places about Coimbra. L. incarnàta, Spreng. syst. 2. p. 643. Ant. sapphirìnum, β, incarnàtum, Pers. ench. 2. p. 158. Ant. incarnàtum, Lam. dict. 4. p. 364. Very nearly allied to *L. bipartìta*, and perhaps only a variety of it. Leaves smaller, and more distant. Calyxes and bracteas much narrower; pedicels longer. Corolla blue; upper lip reddish; palate orange-coloured; spur arched, length of corolla.

Grey-linum Toad-Flax. Fl. June, July. Clt. 1819. Pl. 1 foot.

64 L. sapphiri'na (Hoffm. et Link, fl. port. 1. p. 241. t. 42. Chav. antirrh. p. 146.) leaves linear, flat, alternate; those of the surculi sublanceolate, 3 in a whorl; racemes very elongated; rachis downy; segments of the calyx linear, acute, downy. ⊙. H. Native of Portugal, near Coimbra, on Serra d'Arabida. Ant. sapphirìnum, Brot. fl. lus. 1. p. 197. Linària pùmila Lusitanica, floribus palato carentibus, Tourn. inst. p. 170. Leaves glabrous. Racemes loose. Corolla smaller than that of the preceding, deep blue; tube nearly cylindrical; lower lip spreadingly deflexed; palate orange-coloured, dotted; spur slender, long, arched. Capsule globose, dehiscing by 6 teeth at apex. Seeds like those of the preceding.

Sapphire Toad-Flax. Pl. ½ to 1 foot.

* * *Style thickened at the apex; stigma emarginate* (Chav. antirrh. t. 5. f. 10. a.) *Seeds angular, somewhat prismatic.*

65 L. Armeni'aca (Chav. antirrh. p. 147.) quite glabrous, firm, much branched above the base; leaves alternate, linear, obtuse, thick; flowers in loose racemes; segments of the calyx linear, acute. ♃.? H. Native of Armenia, Tourn. Root yellowish. Stem firm; lower part naked and woody. Leaves an inch long. Flowers distant. Corollas form of those of *L. Chalepénsis*, blue, with a long arched spur. Capsule a little compressed, emarginated, and dehiscing by 6 teeth at apex. Seeds large, subtriquetrous, a little curved, black, scrobiculate.

Armenian Toad-Flax. Pl. 1 foot.

66 L. Chalepe'nsis (Mill. dict. ed. 8th. no. 12. D. C. fl.

fr. 3. p. 539. Chav. antirrh. p. 148.) quite glabrous; leaves linear, flat, acute: lower ones and those of the surculi verticillate: superior ones alternate; flowers in loose racemes; segments of the calyx linear, longer than the corolla. ⊙. H. Native of the South of France, about Montpelier; Cevennes, near Florac; South of Italy; Sicily; Corsica; Dalmatia; in Syria, near Aleppo; Islands of Scio, and Cyprus; and the Peloponnesus. Tenor. syll. p. 303. Ant. álbum, Lam. fl. fr. 2. p. 345. L. álba, Mœnch. meth. p. 521. Ant. Chalepénse, Lin. spec. p. 859. Sibth. et Smith, fl. græc. t. 592. Ant. osyris, Cyr. pl. rar. 2. p. 22. t. 9. but not of Fisch. Linària ánnua angustifòlia, flosculis albis longius caudatis, Triumph. obs. 87. t. 87. f. 2. Tourn. inst. p. 171. Osyris álba, Lob. icon. t. 408.—Mor. hist. 2. p. 502. sect. 5. t. 35. f. 9.—Riv. mon. irr. t. 80. f. 2. Root white. Leaves 1-2 inches long. Flowers on short pedicels. Corolla small, white; spur slender, arched, longer than the corolla; palate yellowish, sometimes marked by a few violet lines. Capsule dehiscing by 6 deep teeth. Seeds subtriquetrous, truncate at apex, narrowed at the base, scrobiculate.

Aleppo Toad-Flax. Fl. June, July. Clt. 1680. Pl. 1 to 1½ foot.

67 L. Canade'nsis (Dum. Cours. bot. cult. ed. 1st. vol. 2. p. 96. Chav. antirrh. p. 149. Hook. bot. mag. t. 3474.) leaves linear, remote, glabrous, usually alternate; those of the surculi broader, opposite, or 3 in a whorl; raceme loose, slender, attenuated upwards; pedicels longer than the bracteas; calycine segments acute, downy. ⊙. H. Native of North America, from Canada to Florida; and South America, in Brazil, Peru, and Chili, &c. Ant. Canadénse, Lin. spec. p. 861. Vent. cels. t. 49. Ant. pauciflòrum, Poepp. in herb. D. C. with whitish flowers.—Gron. virg. p. 94. Plant with a slender habit. Leaves ½ to 1 inch, acute. Flowers distant, nutant. Pedicels downy. Corolla pale violet; lower lip deflexed; palate white, rather depressed; spur subulate, arched, acute, length of corolla. Capsule nearly globose, dehiscing by 6-8 teeth. Seeds prismatically tetragonal, furrowed, truncate at both ends, brown.

Canadian Toad-Flax. Fl. June, Aug. Clt. 1812. Pl. 1 to 1½ foot.

68 L. purpu'rea (Mill. dict. ed. 8th. no. 5. Mœnch. meth. p. 522. Chav. antirrh. p. 150.) quite glabrous, branched, erect; leaves linear, or linear-lanceolate; lower and surculine ones 4-9 in a whorl: superior ones 3 in a whorl, opposite or alternate; raceme elongated; calycine segments linear, acute, spreading a little. ♂. or ♃. H. Native of the South of Europe; at the bottom of Mount Vesuvius; Naples, in vineyards and on hills; South of Italy; Sicily; Greece; Tunis, in fields; Switzerland, but probably migrated from gardens. L. purpuráscens, Bernh. mss. Horn. hort. hafn. 2. p. 573. Ant. purpùreum, Lin. spec. p. 853. Gærtn. fruct. 1. p. 249. t. 53. Curt. bot. mag. t. 99. Sibth. et Smith, fl. græc. t. 589.—Riv. mon. irr. 82.—Mor. hist. sect. 5. t. 12. f. 16.—Barrel. icon. t. 1021. Linària purpùrea major odorata, Tourn. inst. p. 170. Root fibrous. Stems purplish-green, usually spotted with purple above. Leaves glaucescent, about an inch long. Flowers in loose racemes; pedicels 2-3 in a fascicle. Corolla purplish blue; upper lip short; spur arched, length of corolla; palate bearded with white hairs along the edges; tube striped with purple. Capsule compressed, emarginate at top. Seeds subprismatic, corrugated, black.

Purple-flowered Toad-Flax. Fl. July, Sept. Clt. 1694. Pl. 2 to 4 feet.

69 L. stria'ta (D. C. fl. fr. 3. p. 586. and 5. p. 407. Chav. antirrh. p. 152.) quite glabrous; branches erect or ascending, branched; leaves usually linear, verticillate or alternate; those of the surculi 4-5 in a whorl; flowers racemose; calycine segments linear-lanceolate or linear, acute. ♃. H. Native of France, in waste fields; Pyrenees; Switzerland; Piedmont; Dalmatia, &c. L. stricta, Horn. hort. hafn. 2. p. 675. ex Rchb. pl. crit. 5. t. 610. but not of Guss. with a yellowish corolla. Ant. striàtum, Lam. fl. fr. 2. p. 343. dict. 4. p. 351. exclusive of the syn. of Lin. Ant. rèpens, Lin. spec. p. 854. Smith, fl. brit. 2. p. 658. engl. bot. 1253. Ant. purpùreum, Schkuhr, handb. t. 172. ex Rchb. but not of Lin. L. decúmbens, Mœnch. meth. 523. Oróntium supìnum, Villem. phyt. 1. p. 408. Root rhizomatose, creeping, branched, tubercled, fibrous, yellowish. Leaves 1-2 inches long. Racemes loose. Corolla whitish-grey, rarely yellowish, striated with violet; palate yellow, bearded; spur bluntish, much shorter than the corolla. Capsule dehiscing by 6 valves at apex. Valves generally bifid. Seeds oblong, truncate, a little curved, keeled, tubercled, blackish.

Var. β, *Monspessulàna* (Chav. antirrh. p. 152.) leaves narrow, for the most part alternate, crowded, erect. ♃. H. Native of France, about Marseilles and Montpelier, in arid places. L. Monspessulàna, Mill. dict. no. 6. Dum. Cours. bot. cult. ed. 1st. vol. 2. p. 95. Ant. rèpens, β, Monspessulànum, Pers. ench. 2. p. 166. exclusive of the syn. of Lam.—Dill. elth. p. 198. t. 163. f. 197. Linària capillaceo folio odora, Tourn. inst. 170. Corollas deeper coloured than the species, and the plant much taller, and more erect.

Var. γ, *tristis* (Chav. antirrh. p. 152.) leaves stiff, triquetrous, acutely keeled on the back, and channelled in front; palate of corolla yellow; and both lips dirty white, and lined with violet. ♃. H. Native of Mauritania, near Termignon and Lans-le-Bourg.

Var. δ, *galioìdes* (Chav. antirrh. p. 152.) leaves 4-6 in a whorl; whorls sometimes distant and sometimes approximate. ♃. H. Native of the Pyrenees, in low places, &c. Ant. galioìdes, Lam. dict. 4. p. 351. Plant simple, or branched at top.

Striated-flowered Toad-Flax. Fl. July, Oct. α. England, β. and γ.? Pl. 1 to 3 feet.

70 L. corifòlia (Desf. cor. inst. Tourn. p. 32. t. 22. Chav. antirrh. 154.) quite glabrous; leaves linear-subulate, alternate; those of the surculi subverticillate; flowers racemose, on short pedicels; calycine segments linear, acute. ♃. H. Native of Asia Minor. Linària orientàlis cori folio, flore leucophœo, Tourn. cor. inst. p. 9. Root fibrous, elongated. Leaves 4-8 lines long. Corollas size of those of *L. purpùrea*, whitish-violet; lobes of the upper lip narrow; spur straight, short, acute, slender. Capsule unknown.

Coris-leaved Toad-Flax. Pl. 1 to 1½ foot.

* * * *Style thickened at top; stigma somewhat emarginate. Seeds discoid, with ciliated edges.* (Chav. antirrh. t. 5. f. 30.)

71 L. Pelisseria'na (D. C. fl. fr. 3. p. 589. Chav. antirrh. p. 154.) glabrous, nearly simple; leaves linear, usually alternate; those of the surculi ovate-lanceolate, 3-5 in a whorl; flowers subcapitate, crowded; calycine segments linear, very acute. ⊙. H. Native of the South and middle of France; Eastern Pyrenees; South of Italy, on dry hills; Sicily; Corsica, and Sardinia; Candia; Greece; about Constantinople; Syria, and Peloponnesus. Ait. hort. kew. ed. 2d. vol. 4. p. 14. Guss. prod. fl. sic. 1. p. 164. Ant. Pelisseriànum, Lin. spec. 855. Sibth. et Smith, fl. græc. t. 591.—Cup. pamph. 1. t. 229. Rafin. t. 101. f. 1. ex Guss.—Barrel. icon. 1162.—Buxb. cent. 1. p. 25. f. 2. Leaves beyond half an inch long. Corolla purplish-violet; palate white, with violet veins; spur straight, long, acute. Capsule emarginate at top, dehiscing by 6 teeth.

Var. β, *gràcilis* (Chav. antirrh. p. 155.) plant simple, very slender; flowers smaller, and pale blue. ⊙. H. Native about Montpelier and the Southern provinces of France, not far from

Hieres. L. Pelisseriàna, β, D. C. et Guss. l. c. Ant. gràcile, Pers. ench. 2. p. 156. Ant. Pelisseriànum, Mont. Font. ex Pers.

Pelisser's Toad-Flax. Fl. June, Sept. Clt. 1640. Pl. 1 foot.

§ 4. *Leaves quite glabrous, linear, linear-oblong, or nearly lanceolate: lower ones verticillate: upper ones alternate. Flowers small, usually subcapitate at the tops of the branches. Corolla hardly more than 3 lines long, with the spur.—Erect herbs.*

* *Calyx glabrous. Seeds ovate or oblong.*

72 L. minutiflòra (Meyer, verz. pflanz. p. 109.) quite glabrous, glaucous; leaves oblong, acutish, verticillate or alternate; flowers subspicate; calycine segments linear-oblong, acutish; corolla yellowish, small, hardly longer than the calycine segments; spur very short, conical, straight; seeds oblong, full of impressed dots. ⊙. H. Native of Caucasus, near Baku.

Minute-flowered Toad-Flax. Pl. 1 foot?

73 L. al'bifrons (Spreng. syst. 2. p. 793. Chav. antirrh. p. 156.) glaucous; leaves nearly lanceolate: lower ones 3-4 in a whorl: superior ones alternate; flowers subcapitate; calycine segments linear-oblong, obtuse. ⊙. H. Native of Greece, in the Island of Rhodes. Ant. álbifrons, Sibth. et Smith, fl. græc. t. 588. Leaves an inch long. Corolla white? a little longer than the calyx; spur very short, curved. Capsule opening by 6 small valves. Seeds obliquely ovoid; testa alveolate, blackish.

White-faced Toad-Flax. Pl. ½ to 1 foot.

* * *Calyx downy. Seeds discoid, marginate; disc smooth.*

74 L. micra'ntha (Spreng. syst. 2. p. 794. Chav. ant. p. 156.) glaucous; lower leaves oblong-lanceolate, 3-4 in a whorl: superior ones alternate; flowers spicately racemose; calycine segments linear-subspatulate, ciliated. ⊙. H. Native of Spain, in cultivated fields of Real Retiro; Sardinia, and Corsica; Algiers; Island of Rhodes; Levant; Caucasus, near Baku, and between Baku and Sallian. Ant. micránthum, Cav. icon. 1. p. 51. t. 69. f. 3. Willd. spec. 3. p. 246. Sibth. et Smith, fl. græc. t. 587. L. parviflòra, Desf. fl. atl. 2. p. 44. t. 137. Spreng. syst. 2. p. 793. Ant. parviflòrum, Willd. spec. 3. p. 245. Pers. ench. 2. p. 156, but not of Jacq. Plant sometimes furnished with surculi. Leaves somewhat 3-nerved, acute, an inch long. Flowers small. Calyx clothed with glandular down. Corolla pale blue; palate white; spur incurved. Capsule opening by 6 valves. Seeds somewhat kidney-shaped, surrounded by a broad margin.

Small-flowered Toad-Flax. Fl. May, July. Clt. 1820. Pl. ¼ to ¾ foot.

75 L. arve'nsis (Desf. fl. atl. 2. p. 45. D. C. fl. fr. 3. p. 588. Chav. antirrh. p. 157.) erect, branched or simple, downy at top; leaves linear, bluntish, glaucous: lower ones 4 in a whorl: upper ones usually alternate; flowers disposed in capitate racemes; bracteas deflexed; calycine segments linear-oblong, acutish, clothed with clammy down, as well as the pedicels. ⊙. H. Native of Europe, in sandy fields, particularly in the south; southern provinces of France, Sicily, Italy, Greece, Peloponnesus, Levant, Barbary. L. carnòsa, Mœnch. meth. p. 523. Ant. arvénse, Lin. spec. p. 855.? Schkuhr, handb. f. 172.—Linària arvénsis, cærulea erecta, Bauh. pin. p. 213. Tourn. inst. 170. Dill. elth. 199. t. 163. f. 198. Herb glaucescent, downy at top, and often furnished with surculi at the base. Leaves glabrous, 6-12 lines long, reflexed, and revolute: lower ones 4-6 in a whorl. Corolla small, blue; spur curved, slender; palate smoothish.

Var. β, simplex (Chav. antirrh. p. 157.) flowers subcapitate; corolla yellow, sometimes elegantly striped with purple, a little larger than the species; spur usually straight. ⊙. H. Native of the South of France, frequent; Lucania, Calabria, Spain, Sardinia; near Smyrna, and about Constantinople; Caucasus, about Baku; Barbary. L. símplex, D. C. fl. fr. 3. p. 588. L. arvénsis, var. Desf. fl. atl. 2. p. 45. Ant. símplex, Willd. spec. 3. p. 243. Tenore, fl. neap. 2. p. 50. but not of Link. Raf. t. 92. f. 2.—Column. ecphr. p. 299 and 300. icone.—Clus. hist. p. 321. icon.

Corn Toad-Flax. Fl. July, Aug. Clt.? β. 1816. Pl. 1 to 2 feet.

§ 5. *Leaves narrow, linear, linear-lanceolate, or nearly lanceolate, small: lower ones usually 4 in a whorl: superior ones alternate. Flowers usually capitately racemose at the tops of the branches, few; bracteas usually deflexed.—Commonly procumbent and diffuse herbs, furnished with numerous stem-formed branches.*

* *Seeds discoid, girded by broad, membranous margins; disk smooth.*

76 L. margina'ta (Desf. in act. soc. par. 1. p. 36. t. 7. fl. atl. 2. p. 43. Chav. antirrh. p. 159.) glabrous; leaves linear-lanceolate, or linear, glaucous: lower ones verticillate, the rest alternate; bracteas deflexed; segments of the calyx linear-oblong, acutish, quite glabrous. ♃. H. Native on Mount Atlas, in the fissures of rocks near Tlemsen. Ant. marginàtum, Lam. dict. 4. p. 355. Willd. spec. 3. p. 248. Branches decumbent. Lower leaves 4-6 in a whorl, 1 to 1½ inch long. Flowers on short pedicels. Corolla of a yellowish rust colour, striated, size of those of *L. vulgàris;* palate marked by 2 dark purple spots, bearded with white hairs on the lower margin; spur longer than the corolla, straight, acute. Seeds convex on one side, and concave on the other.

Margined-seeded Toad-Flax. Pl. decumbent.

77 L. trístis (Mill. dict. ed. 8th. no. 8. fig. 2. t. 166. Chav. antirrh. p. 160.) glaucous, downy at top; leaves linear, or linear-oblong: lower ones 3-4 in a whorl: upper ones opposite, or alternate; flowers approximate, sometimes nearly opposite; bracteas deflexed; calycine segments linear-subspatulate, obtuse, downy. ♃. F. Native near Gibraltar. Ant. tríste, Lin. syst. 465. Lam. dict. 4. p. 354. Curt. bot. mag. t. 74.—Mart. hist. pl. rar. dec. 35. f. 2.—Dill. elth. 201. t. 264. f. 199. Leaves glabrous,-obtuse. Corolla size of those of *L. vulgàris,* nearly the colour of those of *Lòtus jacobæ'us,* and all the shades from that to yellow; spur thick, striated, arched at the base, about equal in length to the corolla; palate brown at the base, or yellow; citron coloured at apex, bearded.

Var. β. tenuifòlia (Chav. antirrh. p. 160.) leaves very narrow; flowers crowded, a little smaller; corolla sometimes purplish. ♃. H. Native along with the species. Ant. ærugíneum, Gouan. ill. p. 38. Linària tenuifòlia æruginei coloris, Bauh. pin. p. 212. Tourn. inst. p. 170. Linària Hispánica II., Clus. hist. p. 320.

Sad-flowered Toad-Flax. Fl. July, Aug. Clt. 1722. Pl. decumbent.

78 L. supi'na (Desf. fl. atl. 2. p. 44. D. C. fl. fr. 3. p. 588. Chav. antirrh. p. 160.) diffuse, procumbent, or ascending; leaves linear, obtuse: lower ones 4-5 in a whorl: superior ones alternate; calycine segments linear, or linear subspatulate, pubescent. ♃. F. Native of the south and middle of France, in sandy places; Piedmont; Italy and Spain; Barbary. Ant. símplex, Link, in Schrad. journ. 1799. vol. 2. p. 300. but not of Willd. Ant. bipunctàtum, Thuill. fl. par. ed. 2. p. 311, but not of Lin. nor Cav. L. filifórmis, Mœnch. meth. p. 523, but not of Poir. under Ant. L. Thuillèri, Merat, fl. par. ed. 3d. vol.

2. p. 192. Ant. supìnum, Lin. spec. p. 856. Sibth. et Smith, fl. græc. t. 595. Linària pumila supina lutea, Bauh. pin. p. 213. Tourn. inst. p. 170.—Tab. 827.—Lob. icon. 110.—Clus. hist. 1. p. 321. icon. Plant pubescent. Leaves glaucous, green, 5-6 lines long. Corolla about the size of those of *L. vulgàris*, yellow; palate often marked with 2 brown lines or dots, bearded with white hairs; spur length of corolla, marked with blackish green stripes; middle lobe of the lower lip cut a little. Capsule obovate-globose, a little depressed at top.

Var. β, Pyrenàica (Dub. bot. gal. 1. p. 345. Chav. antirrh. p. 161.) lower leaves linear-lanceolate; tops of branches and calyxes beset with glandular hairs; flowers larger. ♃. F. Native of the Pyrenees. L. Pyrenàica, D. C. fl. fr. 3. p. 587, and 5. p. 408. icon. rar. gall. 1. t. 11. Hoffm. et Link, fl. port. p. 249. Spreng. syst. 2. p. 294, exclusive of the syn. of Forsk. et Merat. Ant. Pyrenàicum, Ramond, pyr. ined. ex D. C. Pers. ench. 2. p. 156. Ant. versícolor, Lapeyr. ex Benth, cat. pyr. p. 96, but not of Lin. Ant. glaúcum, Lapeyr. abr. p. 352, but not of Lin. nor Thore. Ant. supìnum, *β*, et *γ*, Lapeyr. abr. p. 252. Ant. dùbium, Vill. dauph. 2. p. 437.

Var. γ, marítima (Dub. l. c. Chav. l. c.) leaves generally verticillate; calycine segments ovate-oblong, much shorter than the capsule. ♃. F. Native of the west of France, and Lower Britany. L. marítima, D. C. fl. fr. 5. p. 408. icon. rar. gall. 1. t. 12, but not of Rchb. Ant. marítimum, Poir. dict. suppl. 4. p. 23.

Var. δ, glaucophýlla (Chav. l. c.) leaves linear-lanceolate, glaucous: lower ones 4 in a whorl. ♃. F. Native of Portugal, in the province of Traz dos Montes.

Trailing Toad-Flax. Fl. June, Sept. Clt. 1728. Pl. dec.

79 L. alpi`na (D. C. fl. fr. 3. p. 590. Willd. enum. p. 641. Chav. antirrh. p. 163.) quite glabrous, glaucous, diffuse; leaves linear, or linear-lanceolate, thickish, 4 in a whorl; flowers disposed in subcapitate racemes; segments of calyx linear, acute. ♃. F. Native of Switzerland, in gravelly places, and naked parts of the Alps, even to the limits of the snow; Alps of Jura; higher Pyrenees; South of Italy, on the higher mountains of Abruzzo; Austria; Transylvania. Ant. alpìnum, Lin. spec. p. 856. Jacq. austr. 1. t. 58. Curt. bot. mag. t. 207.—Manget. pharm. 2. p. 567. t. 15.—Tabern. 1208. icone. Leaves thickish, 3-5 lines long, usually leaning to one side, obtuse. Corolla fine violet, or purplish blue, rarely white; palate of a deep copper colour, seldom white; spur equal in length to the corolla, sometimes straight, and sometimes incurved, acute. Capsule dehiscing by 6 valves.

FIG. 47.

Var. β, erécta (Chav. antirrh. p. 163.) branches stem-formed, erect; leaves narrower, and more distant; flowers generally pale. ♃. H. Native of the Alps of Jura and Switzerland.

Alpine Toad-Flax. Fl. June, Nov. Clt. 1570. Pl. proc.

* * *Seeds reniform, or angular; testa wrinkled, or scrobiculate.*

80 L. Hæla`va (G. Don. in Loud. hort. brit. p. 249. Chav. antirrh. p. 164.) plant diffuse, glaucescent, branched; leaves linear, thickish: lower ones 3 in a whorl: superior ones alternate; flowers on short pedicels; bracteas deflexed; segments of the calyx oblong, acutish, ciliated, widening at last. ⊙. H. Native about Cairo, in deserts; and near Alexandria. Ant. Hælàva, Forsk. fl. ægypt. p. 111. Vahl, symb. 2. p. 66. Root yellowish. Plant glabrous. Flowers 2-4 together at the tops of the branches. Bracteas often ciliated. Pedicels more or less hairy. Corolla sulphur coloured, or bluish violet; palate copper coloured, or orange; spur straight, acute, longer than the corolla, and paler. Capsule dehiscing by 6 teeth at apex. Seeds reniform, scrobiculate. The specific name is an alteration of the Arabic name of the plant *Halàoah*.

Hælava Toad-Flax. Fl. July, Aug. Clt. 1803. Pl. proc.

81 L. laxiflòra (Desf. fl. atl. 2. p. 45. t. 138. Chav. antirrh. p. 165.) glabrous, decumbent, or ascending; leaves linear, glaucous: lower ones 4 in a whorl; the rest alternate; flowers on long pedicels; bracteas deflexed, much shorter than the pedicels; segments of the calyx ovate-lanceolate. ⊙. H. Native about Algiers, in corn-fields. Ant. laxiflòrum, Willd. spec. 3. p. 242. Viv. fl. libyc. p. 33. ? Branches decumbent at the base, and furnished with surculi. Leaves ½ an inch long, obtuse. Corollas size of those of *L. alpìna*, pale blue, or white; upper lip elongated; spur straight, nearly twice as long as the corolla; palate rather villous. Capsule dehiscing by 6 teeth at apex. Seeds angular, wrinkled.

Loose-flowered Toad-Flax. Pl. ¼ to ½ foot.

* * * *Seeds obliquely oval, attenuated at the base, convex on one side, and concave on the other, girded by a narrow margin; testa smooth, or tubercled.* (Chav. antirrh. t. 5. f. 35.)

82 L. Candóllei (Chav. antirrh. p. 165.) clothed with clammy down, procumbent, or ascending; leaves oblong-lanceolate, or ovate-lanceolate, acutish: lower ones 3-4 in a whorl; the rest alternate and opposite; flowers few, disposed in a subcapitate raceme; calycine segments ovate, acutish. ⊙. H. Native of the West of France, on rocks by the sea-side. L. saxátilis, D. C. fl. fr. 3. p. 590, and 5. p. 409. icon. rar. gall. p. 5. t. 13, but not of Lin. under *Antirrhìnum*, nor of Link, in *Flore Portugaise*. Branches glabrous at the base, and almost leafless, but downy and leafy at top. Leaves 2-3 lines long, rather downy. Corolla yellow, with a short spur; palate marked by 2 dots; lobes of upper lip obtuse.

De Candolle's Toad-Flax. Fl. June, Sept. Clt. 1819. Pl. procumbent.

83 L. arena`ria (D. C. fl. fr. 5. p. 409. icon. rar. gall. 1. p. 5. t. 14. Chav. antirrh. p. 166.) clothed with clammy down, much branched; lower leaves 4 in a whorl, oblong, obtuse: upper ones usually alternate, linear-lanceolate, acute; flowers few, disposed in racemose spikes, the raceme at length elongating; calycine segments lanceolate-linear, acute, exceeding the capsule. ⊙. H. Native of Britany, in sand by the sea-side, &c. Ant. arenàrium, Poir. suppl. 4. p. 26. Ant. pubéscens, Pers. ench. 2. p. 157, but not of Desf. cat. hort. par. Ant. saxátile, Bonam, pann. prod. p. 69, but not of Lin. Ant. viscòsum, Aubry, prog. morb. an. 9. p. 49, but not of Lin. Linària marítima, minima, viscosa, foliis hirsutis; floribus luteis, Mor. hist. 1. p. 499. Tourn. inst. p. 171. Very like the preceding species, but is much more branched, the leaves narrower, the flowers smaller, the palate of the corolla without dots, and in the whole habit. The plant is generally erect. Corolla small, yellow; spur short; lobes of the upper lip acute, pale coloured.

Sand Toad-Flax. Fl. June, July. Clt. 1823. Pl. procumbent, or erect, ½ foot.

84 L. saxa`tilis (Hoffm. et Link, fl. port. 1. p. 238. t. 40. Chav. antirrh. p. 167.) clothed with clammy down, procumbent; lower leaves 4 in a whorl, almost lanceolate: upper ones alternate, linear-lanceolate, acute; flowers subcapitate; calycine segments narrow-lanceolate, hairy. ♃. H. Native of the

middle and west of Spain, in stony sandy places; and of Portugal, in the province of Traz dos Montes, and near Setuval. L. glutinòsa, Hoffm. et Link, fl. port. 1. p. 238. t. 39, exclusive of all the synonymes. Ant. lagopodioìdes, Lin. fil. suppl. p. 279.? Pers. ench. 2. p. 158.? Ant. Tournefórtii, Poir. suppl. 4. p. 24. Ant. saxátile, Lin. mant. 416, exclusive of the syn. of Moris. amœn. 4. p. 277. spec. p. 835. Pers. ench. 2. p. 157, but not of Bonam. Linària Hispánica tenuifòlia villòsa et viscòsa, Tourn. inst. p. 171. All parts of the plant clothed with glandular hairs. Leaves thickish, 6-8 in a whorl, 6-8 lines long. Corolla yellow; palate marked with 2 fulvous spots, or lines, but sometimes without these spots or lines; spur short, arched, acute. Capsule dehiscing by 4-6 valves. Seeds compressed, blackish, tubercled.

Var. β, stricta (Chav. antirrh. p. 167.) branches erect, firm, simple; leaves strict, adpressed to the branches at the base, and nearly all alternate; flowers smaller. ⊙. H. Native of the province of Segovia.

Stone Toad-Flax. Pl. procumbent.

* * * * *Seeds discoid, orbicular, girded by a narrow margin; disk tubercled.* (Chav. antirrh. t. 5. f. 37.)

85 L. Fontanesia'na (Chav. antirrh. p. 168.) plant ascending, or erect; leaves linear, obtuse, glabrous: lower ones 3-4 in a whorl, the rest alternate; flowers subcapitate; bracteas deflexed; calycine segments ovate-oblong, acute, pilose. ⊙. H. Native of Spain, in Valentia, in sandy places. L. gràcilis, Desf. herb. but not of Spreng. Branches many from the same neck, pubescent at top; branchlets erect. Corollas size of those of *L. supìna*, deep yellow; spur pale coloured, length of corolla; palate glabrous. Capsule dehiscing by 6 valves at apex.

Desfontaines's Toad-Flax. Pl. ascending, ½ to ¾ foot.

86 L. polygonifòlia (Spreng. syst. 2. p. 795. Chav. antirrh. p. 169.) procumbent; leaves ovate-lanceolate, or oblong, glabrous: lower ones 4 in a whorl: superior ones opposite and alternate; flowers disposed in capitate racemes, on short pedicels; calyx oblique, with lanceolate, or linear-lanceolate, acute, rather hispid segments. ⊙. H. Native of Gibraltar. Ant. polygonifòlium, Poir. suppl. 4. p. 26. Branches naked, and downy under the racemes. Flowers few, on downy pedicels. Corolla white, or pale sulphur coloured; palate yellow; spur acute, straightish, about equal in length to the corolla. Capsule dehiscing by 4-6 valves at apex.

Polygonum-leaved Toad-Flax. Pl. procumbent.

87 L. Broussone'tii (Poir. suppl. 4. p. 23. Chav. antirrh. p. 169.) procumbent or ascending; leaves linear or linear-lanceolate: lower ones 4 in a whorl: superior ones alternate and opposite; flowers 2-3, at the tops of the branches; bracteas pendulous, much longer than the pedicels; segments of the calyx linear-oblong, acute. ⊙. H. Native of Barbary; and Portugal about Lisbon. Branches clothed with short glandular down at top; furnished with sterile surculi at the base. Leaves glabrous, 3-6 lines long: those on the floriferous branches the broadest. Calyx glabrous, or slightly downy. Corolla size of those of *L. alpìna*. Capsule dehiscing by 6 valves.

Broussonnet's Toad-Flax. Pl. procumbent.

88 L. pauciflòra (Bonpl. jard. malm. et nav. 1. p. 48. t. 18. Chav. antirrh. p. 170.) quite glabrous, glaucous; leaves linear, acutish: lower ones 4 in a whorl: superior ones alternate; flowers terminal, few; pedicels longer than the bracteas, which are small; segments of the calyx oval, with ciliated margins. ⊙.? H. Native country unknown; but probably of Spain or Portugal. Corolla violaceous, size of those of *L. vulgàris;* lobes of the upper lip narrow; palate white, marked with dark violet spots; spur arched, 3 times longer than the corolla. Bonpland says this species has some analogy with *L. laxiflòra*, Desf., but differs in the larger flowers; but according to Chavannes l. c. it approaches nearest to *L. amethystea*.

Few-flowered Toad-Flax. Pl.

89 L. amethy'stea (Hoffm. et Link, fl. port. 1. p. 253. t. 47. Chav. antirrh. p. 170.) plant ascending, downy at top; leaves almost linear, glabrous: lower ones 4-5 in a whorl: superior ones alternate; calyx oblique, with oblong-ovate, acute segments; racemes few-flowered, rather loose. ⊙. H. Native of Portugal and Spain, in corn-fields. Ant. bipunctàtum, Cav. icon. 1. p. 20. t. 33. f. 1. but not of Lin. nor hort. Ant. élegans, Hort. reg. par. Pers. ench. 2. p. 156. Ant. subalpìnum, Brot. fl. lus. 1. p. 196. Ant. amethýsteum, Lam. dict. 4. p. 353. Brot. fl. lus. 1. p. 196. Willd. spec. 3. p. 197. Branches clothed with short clammy hairs above. Leaves glaucescent, ½ an inch long. Corolla violaceous, and nearly white; palate pale yellow, marked with blue dots; spur purplish, straight, acute, longer than the corolla. Capsule dehiscing by 4-6 valves at apex.

Var. β, flàva (Chav. antirrh. p. 170.) corolla yellow; palate marked with dark purple spots. ⊙. H. Native of Portugal, about Lisbon, near the valley of Alcantara. L. multipunctàta, Hoffm. et Link, fl. port. 1. p. 254. t. 48. Ant. multipunctàtum, Brot. fl. lus. 1. p. 195.

Amethyst-flowered Toad-Flax. Fl. June, July. Clt. 1816. Pl. ½ to 1 foot.

90 L. glau'ca (Spreng. syst. 2. p. 796. Rchb. fl. germ. sect. 2. p. 375. Chav. antirrh. p. 171.) plant glaucous, grey, branched; leaves thickish, obtuse: lower ones linear-oblong, 4 in a whorl, the rest subulate, and for the most part alternate; flowers few, capitellate; calycine segments very short, linear-lanceolate, acute, downy. ⊙. H. Native of Spain, Portugal, and Italy, in fields. L. bipunctàta, var. glaúca, Hoffm. et Link, fl. port. 1. p. 255. Ant. glaúcum, Lin. amœn. 4. p. 277. spec. p. 856. exclusive of the syn. of Buxb. Lam. dict. 4. p. 354. exclusive of the synonymes. Willd. spec. 3. p. 248. exclusive of the syn. but not of Lapeyr. nor Thore. Linària foliis carnosis cinereis, Bauh. pin. p. 213. Tourn. inst. p. 170. Plant elegant, rather downy towards the top. Branches erect or ascending. Leaves 4-6 lines long. Calyxes downy at the base, a little ciliated. Corolla yellow; palate sometimes bipunctate; spur length of corolla, a little arched, pale, striped with violet. Capsule dehiscing by 6 valves.

Var. β, bipunctàta (Chav. antirrh. p. 172.) corolla yellow; the palate marked by 2 dark purple spots; branches and branchlets downy. ⊙. H. Native of the Algarves, between Villanova and Lagoa; also of Spain, about Aranjuez and Madrid. L. bipunctàta, Dum. Cours. bot. cult. ed. 1. vol. 2. p. 93. Ait. hort. kew. ed. 2d. vol. 4. p. 13. exclusive of the syn. of Bauh. Ant. capitellàtum, Lam. dict. 4. p. 358. Ant. glaúcum, Cav. icon. 1. p. 20. t. 33. f. 2. but not of Lin., nor Thore, nor Lapeyr. Ant. bipunctàtum, Lin. spec. p. 853. exclusive of the syn. of Bauh., but not of Cav. nor hort.

Var. γ, multicaúlis (Chav. antirrh. p. 172.) much branched; flowers a little smaller; corolla pale yellow; palate orange-coloured; spur purplish or violet. ⊙. H. Native along with the species; near Mediola, Cambess. L. multicaúlis, Mill. dict. ed. 8th. no. 7. Ait. hort. kew. ed. 2d. vol. 4. p. 14. exclusive of the syn. of Bocc. Spreng. syst. exclusive of the syn. of Brot. et Poir. Ant. trícolor, Pourr. in herb. Desf. Ant. multicaúle, Lin. spec. p. 856. exclusive of the syn. of Bocc. Lam. dict. 4. p. 357. Willd. spec. 3. p. 247. exclusive of the synonymes.

Glaucous Toad-Flax. Fl. June, Aug. Clt. 1800; β. 1749; γ. 1728. Pl. ½ to 1 foot.

91 L. diffu'sa (Hoffm. et Link, fl. port. 1. p. 257. t. 49.

Chav. antirrh. p. 173.) diffuse, downy; leaves linear, flattish: lower ones 3-4 in a whorl: superior ones scattered; flowers distant; segments of the calyx lanceolate, acute. ⊙. H. Native of Portugal, between Abrantes and Punpete. Down clammy. Leaves 6 lines long. Corolla small, blue; palate orange-coloured; spur acute, incurved, longer than the corolla.

Diffuse Toad-Flax. Fl. June, Aug. Clt. 1826. Pl. 1 foot.

† *The affinity of the two following species is uncertain, the capsules being unknown.*

92 L. Pe'rsica (Chav. antirrh. p. 175.) downy; stem erect, branched; leaves ovate-oblong, on short petioles: lower ones opposite: superior ones alternate; flowers distant, nearly sessile; calycine segments large, oblong, obtuse, ciliated. ⊙. H. Native of Persia. Stem branched from the base. Corollas form of those of *L. origanifòlium*, but larger, bluish, and striated with deeper lines; palate dotted; spur short, acute. Capsule not seen.

Persian Toad-Flax. Pl. ½ to 1 foot.

93 L. cæ'sia (D. C. mss. Chav. antirrh. p. 174.) plant glaucous, grey, quite glabrous; leaves linear, very narrow, alternate: those of the surculi somewhat verticillate, crowded; flowers spicately racemose; calycine segments short, lanceolate. ⊙. H. Native of Spain, near Cerro Negro; and on sterile hills about Madrid. Ant. cæ'sium, Lag. exsic. in herb. D. C. Pers. ench. 2. p. 157. Root brown. Branches ascending. Surculi prostrate. Leaves 2-4 lines long, obtuse. Pedicels shorter than the bracteas. Corolla size of those of *L. vulgàris*; palate much bearded. Capsule not seen.

Grey Toad-Flax. Pl. ½ to 1 foot, ascending.

† *Species hardly known.*

94 L. hia'ns (Spreng. syst. 2. p. 794.) leaves linear-lanceolate, 3 in a whorl, or scattered; stem strict, glabrous at top; flowers racemose; throat of corolla gaping; spur very short. ♃. H. Native of the South of Europe. Ant. linarioìdes, Lin. spec. p. 853. L. racemòsa, Steud. nom. Perhaps only a variety of *L. vulgàris*.

Gaping-flowered Toad-flax. Fl. June, July. Clt. 1818. Pl. 1 to 2 feet.

95 L. ocymifòlia (Spreng. syst. 2. p. 793.) lower leaves 4 in a whorl, ovate-oblong: superior ones linear-lanceolate; stem slender, humble, simple, villous, few-flowered; spur very short. ⊙. H. Native of Spain. Ant. ocymifòlium, Pourr. ex Spreng. l. c.

Basil-leaved Toad-Flax. Pl. ½ foot?

96 L. te'nuis (Spreng. syst. 2. p. 795.) leaves 3 in a whorl, and scattered, linear, rather downy; stem slender, simple, few-flowered; calyx hispid; lower lip of corolla 2-lobed; spur elongated. ⊙. H. Native of the North of Africa, in the Great Syrtus. Ant. tènue, Viv. fl. libyc. p. 33.

Slender Toad-Flax. Pl. ½ foot.

97 L. Cauca'sica (Mussin, ex Spreng. syst. 2. p. 790.) leaves scattered, oblong, mucronately toothed, pilose; peduncles axillary, elongated, filiform; calyx green, acute; stem procumbent, very pilose. ⊙. H. Native of Caucasus. Perhaps a variety of *L. spùria*.

Caucasian Toad-flax. Fl. June, Aug. Clt. 1818. Pl. procumbent.

98 L. pro'cera (D. C. hort. monsp. p. 121.) lower leaves verticillate: upper ones scattered, glabrous; stem almost simple; flowers densely racemose; spur exceeding the calyx. ♃. H. Native country unknown. Probably a variety of *L. striàta*.

Tall Toad-Flax. Fl. July, Aug. Clt.? Pl. 3 to 4 feet.

99 L. filifòlia (Lag. ex Spreng. syst. 2. p. 796.) leaves verticillate and crowded, linear-filiform, fleshy; flowers spicate; spur straight, subulate, elongated. ⊙. H. Native of Spain, about Madrid.

Thread-leaved Toad-Flax. Pl. dwarf?

100 L. dianthifòlia (Henk. adumb. pl. hort. hal. ex Chav. antirrh. p. 181.) Nothing is known of this plant but the name.

Pink-leaved Toad-Flax. Pl.?

101 L. polygonifòlia (Hoffm. et Link, fl. port. 1. p. 248. t. 44.) leaves subverticillate and opposite, sessile, ovate, glabrous as well as the prostrate stem; flowers subspicate; calyx hispid. ⊙. H. Native of Portugal.

Polygonum-leaved Toad-Flax. Pl. prostrate.

102 L. rupe'stris (Meyer, verz. pflanz. p. 110.) perennial, glabrous, glaucescent; stems slender, much branched, diffuse; leaves scattered, nearly linear, acutish; racemes few-flowered, loose; calycine segments nearly linear, obtuse, smoothish, much shorter than the corolla; spur subulate, almost erect, rather shorter than the corolla; seeds discoid, winged, very smooth. ♃. H. Native of Caucasus, on rocks at the falls of the Terek, near Darial, at the altitude of 600 to 650 hexapods. Corolla yellow.

Rock Toad-Flax. Pl. diffuse.

Cult. All the species of this genus are elegant, and therefore well fitted for decorating flower borders. They grow well in common garden earth, but prefer a dry sandy soil. The seeds of annual species require only to be sown in the open border, where they are intended to remain. The perennial kinds are readily propagated by division of the root, or by seeds. The *L. alpìna*, *L. supìna*, *L. trístis*, and some others, are well fitted for ornamenting rock-work, or to be grown on dry banks, or in pots, and placed among other alpine plants; these in winter require to be sheltered from the frost, as well as all those marked frame or greenhouse. A great part of the species are readily increased by the surculi, which will strike root readily if planted in sand; and all are to be increased by seed.

VIII. ANARRHI'NUM (from *ανα*, *ana*, without; and *ῥιν*, *rhin*, a snout; in reference to the corolla being without a spur, or furnished with a very short one.) Desf. fl. atl. 2. p. 51. D. C. fl. fr. 3. p. 594. Chav. antirrh. p. 175.—Dodártia species, Mill. dict. 1.—Antirrhìnum species, Lin. gen. Linària species, Tourn. inst. p. 169.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx deeply 5-cleft, cup-shaped at the base, contracted above the middle, incomplete in æstivation; lobes lying over each other at top. Corolla tubular, bilabiate; tube curved; spur very short or wanting; throat open; lobes of the upper lip erect, at length reflexed; lobes of the lower lip spreading, all more or less emarginate, and nearly equal. Stamens 4, fertile, with a short rudiment of a fifth; filaments equal. Anthers reniform, 1-celled from the confluence of the cells, filled with white pollen. Ovarium globose. Style thickened, and capitate at apex; stigma obtuse, conical, subemarginate, half immersed in the top of the style. Capsule chartaceous, compressedly spherical or globose; cells equal; each cell dehiscing by an oblong univalvate pore under the apex; the upper cell usually indehiscent. Seeds oval, small; testa granularly tubercled or muricated.—Biennial or perennial plants, with a slender habit. Radical leaves usually rosulate, rarely wanting; cauline and rameal leaves palmate-parted, or toothed at the apex: superior ones quite entire. Flowers small, beautiful, drooping, disposed in long spike-formed, twiggy, and interrupted racemes.

§ 1. *Corolla spurred. Rameal leaves divided.*

1 A. bellidifòlium (Desf. fl. atl. 2. p. 51. Chav. antirrh. p. 176. t. 10.) glabrous; radical leaves spatulate or obovate-lanceolate, deeply toothed, rosulate: rameal ones deeply 3-7-parted; divisions linear; racemes very slender, elongated. ♂.

H. Native of France, among rubbish, and in humid places; Pyrenees; Piedmont; Portugal; Switzerland; Germany; Syria, near Damascus; and Arabia, on Mount Kurma. Hoffm. et Link, fl. port. 1. p. 226. t. 32. Linària bellidifòlia, Dum. Cours. bot. cult. 3. p. 3. Antirrhìnum, bellidifòlium, Lin. spec. 860. mant. 417.—Hall. helv. no. 342. Dodártia, &c., Mill. dict. ed. 8th. no. 2.—Dodon. pempt. 184. f. 1.—Dalech. hist. lugd. 115. f. 2.—Bauh. prod. p. 106. icone.—Bauh. hist. 3. p. 459. f. 2.—Chabr. sciagr. 481. f. 5. Root fusiform. Bracteas linear. Corolla white or pale blue, variegated with violet; spur slender, acute, arched, very short. Testa of seed muricated.

Daisy-leaved Anarrhinum. Fl. June, Aug. Clt. 1629. Pl. 1 to 1½ foot.

2 A. Durimi'nium (Brot. fl. lus. 1. p. 199. Chav. antirrh. 177.) villous; radical leaves subspatulate, deeply toothed: rameal ones usually tripartite; middle lobe large, lanceolate, more or less denticulated. ♂. H. Native of the North of Portugal, in humid places. A. pubéscens, Hort.? A. hirsùtum, Hoffm. et Link, fl. port. 1. p. 224. t. 33. Linària Lusitánica bellidis folio ampliore et villoso, Tourn. inst. p. 169. Branches erectish, usually fastigiate. Radical leaves pubescent. Bracteas oblong-lanceolate, quite entire. Corollas a little larger than those of the preceding, rather pilose, of a whitish sulphur colour; spur incurved, about equal in length to the tube. Testa of seeds brown, wrinkled. Perhaps only a downy variety of the preceding.

Douro Anarrhinum. Fl. June, Sept. Clt. 1818. Pl. 1 to 1½ foot.

3 A. peda'tum (Desf. fl. atl. 2. p. 51. t. 141. Chav. antirrh. p. 178.) glabrous at bottom, villous above; radical leaves oblong, deeply toothed, pilose, erectish; rameal leaves deeply and palmately 5-9-parted (pedate, Desf.) glabrous: divisions broad-linear, acute; racemes short, tapering upwards. ♂.? H. Native of Algiers, on arid hills. Flowers on short pedicels, somewhat horizontal. Bracteas linear-lanceolate, villous, ciliated. Calyx hairy. Corolla hairy, white; spur short, slender, incurved.

Pedate-leaved Anarrhinum. Pl. 1 to 1½ foot.

§ 2. *Corolla without a spur. Rameal leaves quite entire or toothed.*

4 A. fruticòsum (Desf. fl. atl. p. 52. t. 142. Chav. antirrh. p. 179.) glabrous; stem short, suffruticose, branched; branches elongated, twiggy; lower leaves cuneiform or spatulate, for the most part tridentate at apex: superior ones oblong or oblong-linear, quite entire; raceme elongated, interrupted. ♄. F. Native of Mount Atlas, near Tlemsen, Mascar, and Cafsa. Stem sometimes reduced to a short caudex. Racemes twiggy. Flowers small. Bracteas linear, acute. Corolla white, glabrous. Seeds scabrous from elevated dots.

Shrubby Anarrhinum. Fl. July, Sept. Clt. 1826. Shrub 2 to 3 feet.

Cult. Plants of the most easy culture; except that, if the winter prove severe, they require protection from frost. They are all increased by seeds.

IX. GALVE'ZIA (named by Dombey, after D. Galvez, of Lima.) Domb. mss. Juss. gen. p. 119. but not of Ruiz. et Pav.—Dodártia species, Ruiz. et Pav. prod. fl. per. p. 56. Agassízia, Chav. antirrh. p. 180. t. 11.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx 5-parted; segments ovate-oblong, acute, with a quincuncial æstivation. Corolla tubular, bilabiate; tube elongated, subcylindrical, ventricose at the base; lobes of the upper lip erect, ovate; of the lower lip spreading, ovate-roundish, nearly equal. Stamens 4, fertile, didynamous, without any rudiment of a fifth; filaments terete; anthers 2-celled, replete with yellow pollen. Ovarium roundish; style terete, thickened at top; stigma emarginate, somewhat 2-lobed. Capsule globose, ventricose, a little depressed; each cell opening by an irregular hole towards the apex. Seed numerous, oblong, truncate, small, fixed to a round placenta; testa ribbed lengthwise, engraven by small pits.—Plant suffruticose. Leaves feather-nerved, petiolate, alternate and opposite, quite entire. Flowers beautiful, axillary, on long pedicels.

1 G. Lime'nsis (Domb. mss. ex Juss. gen. p. 119.) ♄. G. Native of Peru, near Lima. Agassízia Liménsis, Chav. antirrh. p. 180. t. 11. Plant much branched. Branches clothed with glandular down. Leaves ovate-lanceolate, referrible in form to those of *Mýrtus commùnis*, 1 to 1½ inch long, mucronate, downy: lower ones usually opposite: upper ones alternate, and more distant: those on the branches are nearly all opposite, more approximate, and much smaller. Pedicels bent above the middle. Corolla scarlet, 6-8 lines long, downy. Filaments furnished with glandular hairs, especially at base and apex. Anthers glabrous or downy.

Lima Galvezia. Shrub 1 to 3 feet.

Cult. This is a very curious and rather pretty shrub. It will grow well in light rich soil; and may be propagated by cuttings and seeds.

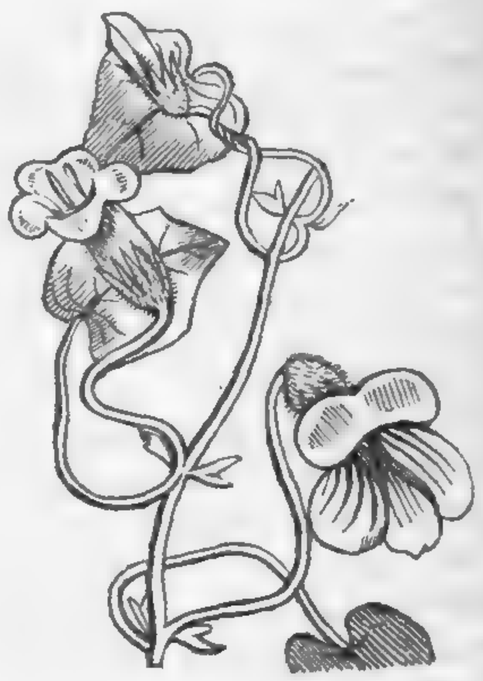
X. MAURA'NDYA (named in honour of Dr. Maurandy, the botanical professor at Carthagena.) Ortèga, nov. gen. hort. matr. dec. 11. p. 21. Jacq. schoenbr. 3. p. 20. t. 288. H. B. et Kunth, nov. gen. amer. 2. p. 291. Chav. antirrh. p. 77.—Ustèria, Cav. icon. 2. p. 15. but not of Willd.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx 5-parted, with a quincuncial æstivation. Corolla personate; tube obscurely tetragonal, saccate at the base, ventricose downwards; lobes roundish or ovate, emarginate or entire; those of the upper lip erect, and those of the lower lip spreading; palate closing the throat, or filled up by 2 plicæ, which are drawn out nearly to the base of the tube. Stamens 4, fertile, didynamous, with the short rudiment of a fifth. Filaments of fertile stamens villous at the base, and dilated; anthers 2-celled; cells oblong. Ovarium ovoid; style subulate; stigma obtuse, emarginate. Capsule ovate-globose, oblique at the base, rather compressed, membranous; each cell dehiscing at top by 5 reflexed valves. Seeds nearly ovate, truncate at apex; testa black, furnished with tubercles.—Climbing, evergreen, suffruticose herbs; branches slender, elongated. Leaves alternate, on long petioles; petioles twining; limb cordate, 5-7-nerved; nerves palmate. Flowers large, showy, solitary from the axils of the leaves, on long twining pedicels.

§ 1. *Throat of corolla pervious.*

1 M. Barclaya'na (Lindl. bot. reg. t. 1108. Sweet, fl. gard. icone. Chav. antirrh. p. 77.) leaves cordate, acuminated: young ones somewhat hastate; calycine segments linear-lanceolate, very acute, clothed with glandular hairs. ♄. ◡. G. Native of Mexico. Branches and leaves glabrous. Lower and middle leaves obscurely 5-lobed; lobes acuminated. Corolla 1½ to 2 inches long; tube downy, greenish, curved; lobes ovate, roundish, emarginate, of a violet purple colour. Filaments subclavate at top, furnished with short glandular hairs. Capsule hidden by the calyx, (fig. 48.)

FIG. 48.



Barclay's Maurandya. Fl. Year. Clt. 1825. Sh. climbing.

2 M. SEMPERFLÒRENS (Ort. nov. gen. hort. madr. dec. 11. p. 21.) leaves for the most part cordate-hastate; calycine segments lanceolate-subulate, glabrous. ♄. ◡. G. Native of Mexico. Jacq. hort. schœnbr. 3. p. 20. t. 288. Curt. bot. mag. 460. Chav. antirrh. p. 78. M. scándens, Pers. ench. 2. p. 160. Ustèria scándens, Cav. icon. 2. p. 15. t. 116. Andr. bot. rep. t. 63. Plant quite glabrous. Margins of calycine segments rather scarious. Corolla 1½ inch long, pale violet or reddish, with emarginate lobes; tube variously furrowed; limb violaceous, or purplish-violet; plicæ white, occupying the place of the palate. Filaments rather villous at the base. Capsule about equal in length to the calyx.

Ever-flowering Maurandya. Fl. Year. Clt. 1796. Shrub climbing.

§ 2. *Palate prominent in the throat of the corolla.*

3 M. ANTIRRHINIFLÒRA (Willd. hort. berol. 2. t. 83. Chav. antirrh. p. 78.) leaves for the most part triangularly hastate; calycine segments long, triangular, acute, quite glabrous. ♄. ◡. G. Native of Mexico, among bushes between Salamanca and the valley of St. Jago, at the altitude of 930 hexapods. Sims, bot. mag. 1643. H. B. et Kunth, nov. gen. amer. 2. p. 291. M. personàta, Sesse, mss. Lag. elench. hort. matr. 1805. nov. gen. 19. Ustèria antirrhiniflòra, Poir. suppl. 5. p. 105. Plant quite glabrous. The side lobes of leaves or auricles acute, sometimes unidentate towards the petioles. Corolla hardly an inch long, bluish, glabrous, with quite entire lobes; palate straw-coloured, furnished with short hairs, and marked by brown lines. Capsule shorter than the calycine segments; one of the cells often smaller than the other.

Snapdragon-flowered Maurandya. Fl. Year. Clt. 1814. Shrub climbing.

Cult. This, like the next genus, is composed of elegant, climbing, evergreen, ever-flowering, herbaceous, or suffruticose plants; for which the species are very generally cultivated in gardens. A light rich soil suits them best; and they are readily increased by seeds, which generally ripen in abundance; or by young cuttings, which strike root readily under a hand-glass. All the species do very well during summer, and flower freely planted against a wall in the open air, or at the bottom of trellis-work, to which they should be trained; but in winter they require the protection of a greenhouse.

XI. LOPHOSPE'RMUM (from λοφος, *lophos*, a crest; and σπερμα, *sperma*, a seed; in reference to the seed being furnished with a crest-like wing, which is emarginate at both ends.) D. Don, in. Lin. trans. 15. p. 349. Chav. antirrh. p. 75. t. 1. Sweet, fl. gard. n. s. t. 68. and 75.—Beslèria species, Sesse et Mocino, mss.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx 5-parted; segments large, ovate-lanceolate, with a quincuncial æstivation. Corolla bilabiate, tubular; tube campanulate, a little curved, contracted above the base, elongated, gibbous forward at the base, dilated at the throat, and furnished with 2 rows of interwoven yellow hairs; upper lip almost erect; lower lip spreading. Stamens 4, didynamous, with a short rudiment of a fifth. Filaments of fertile stamens terete, glandular at top, and clothed with glandular hairs and scales at the base; cells of anthers elliptic. Ovarium clothed with long, capitate, white hairs. Style glabrous; stima bilamellate. Capsule globose, covered by the calyx, bursting irregularly under the apex. Seeds very numerous, ovate-truncate, tubercled, black, fixed to large placentas, girded by a membranous reticulate margin, which is emarginate at both base and apex, referrible in form to a crest.—Evergreen, perennial, herbaceous, or suffruticose climbing plants. Stems flexuous; branches alternate, Leaves usually alternate, petiolate, lobed. Flowers large, pendulous, axillary, solitary, showy, on long, twisted, terete pedicels.

1 L. SCA'NDENS (D. Don, in Lin. trans. 15. p. 349.) leaves cordate, acuminated, deeply serrated, hairy, 5-nerved; peduncles bractless; stem herbaceous. ♄. ◡. G. Native of Mexico. Beslèria scándens, Sesse et Mocino, mss. Branches clothed with soft viscid hairs. Leaves 3-4 inches long, and 2-3 broad. Flowers pendulous. Peduncles and calyx hairy. Corolla large, showy, purplish-violet.

Climbing Lophospermum. Clt. 1834. Shrub climbing.

2 L. ERUBE'SCENS (D. Don, in Sweet, fl. gard. n. s. t. 68.) branches clothed with articulated, short, viscid hairs; leaves cordate, more or less distinctly 5-lobed, downy; middle lobe large: lobes mucronate, crenated or deeply serrated: pedicels villous, bractless. ♄. ◡. G. Native of Mexico, about Jalapa. L. scándens, Hook. bot. mag. 3037. and 3038. Sweet, fl. gard. n. s. t. 68. Lindl. bot. reg. 1381. Chav. antirrh. p. 75. t. 1. but not of D. Don. Leaves large, canescent. Calycine segments entire, and sometimes furnished with one or two teeth: the 2 outer ones the largest. Corolla large, showy, rose-coloured, beset with capitate hairs; tube whitish beneath, marbled in various ways inside; lobes of limb generally subemarginate. Capsule downy.

Reddish-flowered Lophospermum. Fl. June, Oct. Clt. 1830. Shrub climbing.

3 L. ATROSANGUI'NEUM (Zucc. abhandl. acad. wiss. 1829, 1830. p. 305. t. 13.) leaves cordate, acuminated, coarsely and dentately serrated; calyx semiquinquefid, spreading; corolla tubular; filaments simple. ♄. ◡. G. Native of Mexico. L. rhodochìton, D. Don, in Sweet, fl. gard. n. s. t. 250. Rhodochìton volùbile, Zucc. Lindl. bot. reg. t. 1755. Plant clothed with shining jointed hairs. Young branches purple. Leaves 5-nerved, slimy to the touch, purple beneath, about 3 inches long, and nearly the same in breadth; petioles purple. Flowers pendulous. Peduncles frequently twisted, finally becoming glabrous and shining, as well as the calyx. Calyx spreading, pale purple, deciduous to the middle. Corolla funnel-shaped, of a dark purple colour, clothed with white glandular hairs; throat cylindrical, hardly ventricose; lobes of limb oval, connivent, obtuse: the lower one the longest. Capsule spherical.

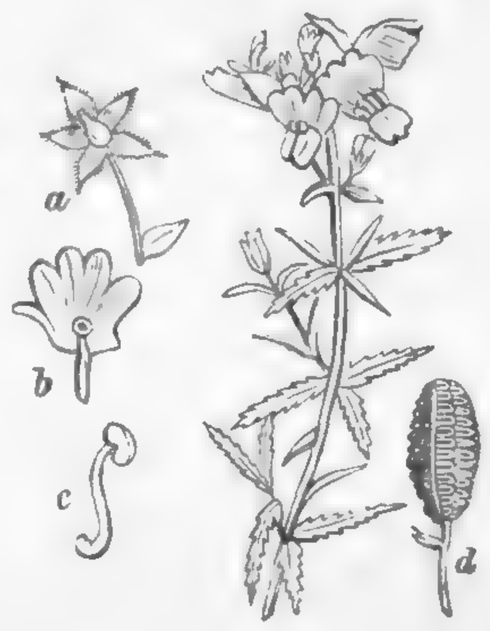
Red-coated Lophospermum. Fl. May, Aug. Clt. 1832. Shrub climbing.

Cult. For culture and propagation see *Maurándya*, above.

XII. NEME'SIA (a name applied by Dioscorides to a kind of Antirrhìnum.) Vent. malm. p. 41. t. 41. Pers. ench. 2. p. 159.—Antirrhìnum, species of Lin. and Thunb.—Linária species, Spreng.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx 5-parted. Corolla personate, furnished with a spur at the base; upper lip 4-cleft: lower one emarginate; palate prominent. Stamens 4, didynamous. Capsule compressed, truncate, oblong, 2-celled, 2-valved; valves keeled. Seeds numerous, linear, girded by a membrane.—Annual or perennial herbaceous plants; with opposite or verticillate leaves, and terminal racemes of flowers. Corollas usually purple.

FIG. 49.



1 N. FÆ'TENS (Vent. malm. l. c.) leaves opposite, lanceo-

late, acute, denticulated: upper ones entire, glabrous; flowers in terminal bracteate racemes. ♄. G. Native of the Cape of Good Hope. Antirrhìnum frùticans, Thunb. fl. cap. 2. p. 483. Linària frùticans, Spreng. syst. 2. p. 789. Corolla nearly white; palate yellow, (fig. 49.)

Stinking Nemesia. Fl. April, Sept. Clt. 1798. Shrub 1 to 2 feet.

2 N. linea'ris (Vent. l. c. Pers. ench. 2. p. 159.) leaves opposite, linear, quite entire; flowers disposed in corymbose racemes. ♃. ? G. Native of the Cape of Good Hope. Corollas of a coppery red colour.

Linear-leaved Nemesia. Pl. 1 foot?

3 N. chamædrifòlia (Vent. l. c.) glabrous; leaves opposite, ovate, serrated, petiolate; peduncles axillary, 1-flowered. ♃. G. Native of the Cape of Good Hope. Antirrhìnum macrocárpum, Ait. hort. kew. 2. p. 335. Willd. spec. 3. p. 249. Ant. scàbrum, Thunb. prod. p. 1051. fl. cap. 2. p. 483. Linària scàbra, Spreng. syst. 2. p. 792. Corollas purple? Stem tetragonal. Leaves an inch long. Peduncles shorter than the leaves.

Germander-leaved Nemesia. Pl. 1 to 2 feet.

4 N. bicórne (Pers. ench. 2. p. 159.) leaves opposite, ovate-oblong, serrated; stem erect; flowers racemose; capsule 2-horned, subdivaricate. ⊙. G. Native of the Cape of Good Hope. Antirrhìnum bicórne, Lin. amœn. acad. 6. afr. p. 17. syst. 14. p. 559. Thunb. prod. p. 105.—Burm. afr. 211. t. 75. f. 3. Leaves numerous. Stem erect.

Two-horned-capsuled Nemesia. Fl. July, Aug. Clt. 1774. Pl. 1 to 2 feet.

5 N. barba'tum; leaves opposite, ovate, serrated; stem erect, herbaceous; peduncles axillary, 1-flowered; nectary didymous; corolla bearded. ⊙. ? G. Native of the Cape of Good Hope. Antirrhìnum barbàtum, Thunb. fl. cap. 2. p. 482. prod. p. 105.

Bearded Nemesia. Pl.

6 N. Thunbe'rgii; leaves opposite, linear, glabrous; branches elongated; racemes terminal.—Native of the Cape of Good Hope. Antirrhìnum Capénse, Thunb. fl. cap. 2. p. 481. Linària Capénsis, Spreng. syst. 2. p. 796.

Thunberg's Nemesia. Pl. 1 to 2 feet.

7 N. pa'tens; leaves opposite, nearly sessile, lanceolate, acute, nearly entire, glabrous; flowers terminal, solitary. ♃. G.? Native of the Cape of Good Hope. Antirrhìnum pàtens, Thunb. fl. cap. 2. p. 482. Linària pàtens, Spreng. syst. 2. p. 793.

Spreading Nemesia. Pl.?

8 N. denta'ta; leaves sessile, linear, toothed, alternate; flowers racemose, on long peduncles, terminal; spur obtuse; stem nearly simple. ⊙. G. Native of Monomotapo. Antirrhìnum dentàtum, Poir. suppl. 4. p. 22. Flowers pale purple.

Toothed-leaved Nemesia. Pl. 1 to 1½ foot.

Cult. For culture and propagation see *Dopàtrium*, p. 536.

XIII. LEUCOPHY'LLUM (from λευκος, *leukos*, white; and φυλλον, *phyllon*, a leaf; in reference to the whiteness of the leaves.) Humb. et Bonpl. pl. æquin. 2. p. 95. t. 109. H. B. et Kunth, nov. gen. 2. p. 361.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted, equal. Corolla tubularly campanulate, exceeding the calyx; limb bilabiate; upper lip 2 lobed: lower one trifid; the middle segment the broadest; palate convex? spotted. Stamens 4, didynamous, inclosed; cells of anthers divaricate. Stigma undivided. Capsule 2-celled; cells many-seeded.—A much branched shrub, densely clothed with white tomentum. Leaves alternate, quite entire, or almost so. Flowers axillary, solitary, violaceous.

1 L. ambi'guum (Humb. et. Bonpl. l. c.) ♄. G. Native of Mexico, near Actopan, at the altitude of 1050 hexapods. Branches scattered, retroflexed. Leaves elliptic, obtuse, acutish at the base, 6-11 lines long. Corolla violaceous; palate spotted with orange colour.

Ambiguous Leucophyllum. Shrub 5 to 8 feet.

Cult. For culture and propagation see *Galvèzia*, p. 532.

Tribe III.

GRATIO'LEÆ (this tribe contains plants agreeing with the genus *Gratiòla* in the characters given below.) D. Don, in edinb. phil. journ. vol. 19. july, 1835. Calyx usually tubular, 5-cleft. Corolla tubular, ventricose, sometimes personate; limb 5-lobed, bilabiate, or nearly equal. Stamens 4, didynamous, inclosed, sometimes 2 of which are sterile; cells of anthers diverging, distinct at apex. Stigma usually bilamellate. Capsule often membranous, rarely subunilocular. Dissepiment membranous, formed by the inflexed margins of the valves; placentas spongy, at length free. Seeds with a somewhat crustaceous testa. Albumen fleshy. Embryo almost the length of the seed. Herbs, rarely under-shrubs, natives of the temperate parts of the globe; or in marshy places within the tropics. Leaves opposite or verticillate. Flowers axillary or terminal, usually yellow or purple.

§ 1. *Stamens 4, 2 of which are sterile.*

XIV. GRATIOLA (from *gratia*, grace; on account of the supposed medicinal good qualities.) R. Br. prod. p. 435. Lam. ill. 116. f. 1. Gratìola species of Lin. and other authors.

Lin. syst. *Diándria, Monogýnia.* Calyx 5-parted. Corolla tubular, bilabiate; upper lip 2-lobed: lower one trifid, equal. Stamens 4, 2 of which bear anthers, and 2 or 3 are sterile. Stigma bilamellate. Capsule 4-valved; dissepiment contrary, separable but slowly from the inflexed edges of the valves.—Glabrous herbs, with opposite leaves, and axillary, usually bibracteate flowers.

* *Species natives of Europe.*

1 G. officina'lis (Lin. spec. 24.) glabrous; leaves lanceolate, serrated, somewhat 3-nerved; flowers pedunculate. ♃. H. Native of France, Switzerland, Denmark, &c., in humid places. Oed. fl. dan. t. 363. Hayne, term. bot. t. 1. f. 47. Bull. t. 130.—Plenck. off. t. 15.—Sabb. hort. rom. 2. t. 87.—Mor. hist. 2. p. 479. sect. 5. t. 8. f. 7.—Riv. mon. t. 157.—Blackw. t. 411. Root creeping, articulated. Stem tetragonal above. Leaves decussate, 3-5-nerved, sometimes entire. Corollas whitish or pale yellow, striated with purple. Fertile filaments bearded. Calyx often 7-cleft. Capsule ovate, acuminated. The whole plant has a strong, bitter, nauseous taste, and is much recommended by several eminent medical writers in cases of dropsy. It is a powerful cathartic, but is said generally to occasion vomiting. On account of its bitterness cattle reject it; insomuch that Haller assures us that there are meadows about Yverdun entirely useless from the abundance of it.

Officinal Hedge-Hyssop. Fl. May, Aug. Clt. 1568. Pl. 1 foot.

2 G. linifòlia (Vahl, enum. 1. p. 89.) glabrous; leaves lanceolate-linear, quite entire; flowers pedunculate. ♃. H. Native of Portugal. G. officinàlis, Brot. fl. lus. 1. p. 15. Hoffm. et Link, fl. port. p. 225. t. 31. Stems ascending, branched a little. Leaves stem-clasping, acute, 3-nerved. Corolla purplish-white.

Flax-leaved Hedge Hyssop. Pl. ½ foot.

* * *Species natives of America.*

3 G. au'rea (Pursh, fl. amer. sept. 1. p. 12.) glabrous; leaves broad-linear, sessile, obscurely toothed, 3-nerved, dotted above; peduncles hardly the length of the leaves. ♃. H. Native of New England, New York, and Carolina, in marshy places. Lodd. bot. cab. 1399. G. Caroliniénsis, Pers. ench. 1. p. 14. G. officinàlis, Michx. fl. amer. 1. p. 6. Stem bisulcate, terete, branched at the base. Leaves half stem-clasping. Calycine segments glandular at top, equal. Corolla golden yellow, downy.

Golden-flowered Hedge Hyssop. Fl. May, June. Clt. 1820. Pl. prostrate.

4 G. Peruvia'na (Vahl, enum. p. 89. Willd. enum. 1. p. 105.) glabrous; leaves ovate-oblong, somewhat 5-nerved, serrated; flowers sessile. ♃. G. Native of Peru, Chili, and South of Brazil. Stemòdia glàbra, Spreng. syst. 2. p. 811. —Feuill. per. 3. p. 23. t. 17. Very like *G. officinàlis*, but the leaves are shorter, the flowers smaller, and white. Capsule size of a pepper berry.

Peruvian Hedge Hyssop. Pl. ½ to 1½ foot.

5 G. Florida'na (Nutt. in journ. acad. sc. phil. 7. p. 103.) glabrous, erect; leaves lanceolate, obsoletely denticulated, acutish; peduncles longer than the leaves; flowers rather large, with emarginate segments. ☉. H. Native of Florida. Leaves narrower than those of *G. Virgínica*, which it closely resembles, but the flowers are much larger, of a pale yellow colour. The calyx and bracteas are small.

Florida Hedge Hyssop. Pl. ½ to 1 foot.

6 G. Virgi'nica (Lin. mant. 317. spec. p. 25.) glabrous; leaves oval or lanceolate, attenuated at bottom, remotely-toothed, nerved; peduncles very short. ♃. H. Native from Pennsylvania to Carolina. Pursh. fl. amer. sept. 1. p. 12. G. acuminàta, Vahl, enum. 1. p. 92, exclusive of the synonymes. G. neglécta, Torr. cat. pl. new york, p. 89. Conòbea boreàlis, Spreng. new entd. 2. p. 205. Stem terete, rooting at the joints. Calyx equal. Corolla yellowish white. Capsule acuminated, longer than the calyx.

Virginian Hedge Hyssop. Fl. Aug. Clt. 1759. Pl. creeping, ½ to 1 foot.

7 G. quadridenta'ta (Michx. fl. bor. 1. p. 6. Pursh, fl. 1. p. 12.) pubescent; leaves linear-lanceolate, remotely few-toothed; peduncles length of leaves. ♃. H. Native of Carolina, in sandy fields. G. ramòsa, Walt. fl. car. p. 61. G. Virgínica, Lam. ill. 1. p. 54. t. 16. f. 2. Vahl, enum. 1. p. 89. Habit of *G. officinàlis*, but all the parts are smaller. Stems terete. Flowers bractless. Calyx unequal. Corolla with a yellowish tube, streaked with purple; limb white. Capsule 3 times shorter than the calyx.

Four-toothed-leaved Hedge Hyssop. Fl. May, Aug. Pl. procumbent.

8. G. pilòsa (Michx. fl. bor. amer. 1. p. 95.) stem erect, pilose; leaves cordate-oblong, remotely denticulated, rather pilose; flowers nearly sessile. ♃. H. Native of Carolina and Georgia, in watery places. Vahl, enum. 1. p. 94. G. Peruviàna, Walt. fl. car. p. 62. Stem terete. Leaves half stem-clasping. Calyx unequal. Corolla white, tinged with purple, villous inside.

Pilose Hedge Hyssop. Pl. 1 to 2 feet.

9 G. tetrago'na (Elliott, car. p. 15.) glabrous; stems procumbent, tetragonal; leaves lanceolate, sparingly toothed; segments of calyx nearly equal. ♃. H. Native of South Carolina, in ditches. Flowers bractless. Corolla white, streaked. Capsule length of calyx.

Tetragonal-stemmed Hedge Hyssop. Pl. procumbent.

10 G. megaloca'rpa (Ell. car. 1. p. 13.) leaves lanceolate, serrated, downy; peduncles opposite, longer than the leaves; calycine segments linear, as long as the capsule, which is globose. ♃. H. Native from Pennsylvania to Carolina, in ditches and pools. G. acuminàta, Pursh, fl. 1. p. 12, exclusive of the synonymes. Flowers pale yellow. Capsule larger than those of other species.

Large-capsuled Hedge Hyssop. Pl.

11 G. sphæroca'rpa (Elliot, car. p. 14.) glabrous; stem procumbent, terete; leaves obovate, attenuated at the base, serrated; capsule globose. ♃. H. Native of South Carolina. Perhaps a species of *Nelsònia*. Flowers nearly sessile. Sterile filaments wanting.

Round-fruited Hedge Hyssop. Pl. procumbent.

* * * *Species natives of New Holland.*

12 G. latifòlia (R. Br. prod. p. 435.) leaves ovate, obtuse, obsoletely crenated, and quite entire; flowers sessile. ♃. G. Native of New South Wales, about Port Jackson; and of Van Diemen's Land. Corollas white. ?

Broad-leaved Hedge Hyssop. Fl. July, Aug. Clt. 1822. Pl. 1 foot.

13 G. pube'scens (R. Br. prod. p. 435.) clothed with glandular pubescence; leaves lanceolate, toothed; flowers nearly sessile. ♃. G. Native of New South Wales; south coast of New Holland and Van Diemen's Land.

Downy Hedge Hyssop. Pl.

14 G. peduncula'ta (R. Br. l. c.) clothed with powdery down; leaves lanceolate, toothed above, the middle hardly longer than the peduncles. ♃. G. Native of New South Wales, about Port Jackson.

Peduncled Hedge Hyssop. Pl. 1 foot.

Cult. The species of *Gratiòla* are free growing plants, but require a moist soil; and they are readily increased by dividing at the root. Those species, natives of New Holland and North America, require protection in winter, by placing them in a frame or green-house.

XV. BEYRI'CHIA (named after Charles Beyrich, who brought many living plants from Brazil to the Continent of Europe.) Cham. et Schlecht, in Linnæa. 3. p. 21.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx deeply 5-parted; segments unequal, the hind one small; the 2 lateral ones larger than the one in front. Corolla tubular, bilabiate. Stamens 4, the 2 posterior ones fertile, the 2 anterior sterile. Style thickened at apex; stigma cup-shaped, terminal. Capsule 2-celled, 2-valved, with a septicidal dehiscence; placenta central, at length free. Seeds numerous, scrobiculate.—Herbs beset with articulated hairs, with almost opposite leaves; tetragonal stems. Flowers solitary, axillary, opposite, spicate; calyx tribracteate.

1 B. ocymoi'des (Cham. et Schlecht, in Linnæa, 3. p. 21.) downy; leaves ovate, serrated from the middle to the top; rameal ones elliptic, smaller; spike dense, leafy; both lips nearly equal, entire; fertile filaments exserted. ♃. S. Native of Brazil, in the province of Rio Janeiro, in humid places.

Bazil-like Beyrichia. Pl. 1½ foot.

2 B. ajugoi'des (Benth. scroph. ind. p. 9.) flowers spicate; upper lip of corolla retuse: lower one tricrenate; genitals inclosed. ♃.? S. Native of Brazil, in the province of Bahia.

Ajuga-like Beyrichia. Pl. 1 foot.?

3 B. Scutellarioìdes (Benth, l. c.) downy; leaves small, petiolate; flowers axillary; upper lip of corolla bifid: lower one trifid. ♃.? S. Native along with the preceding.

Skull-cap-like Beyrichia. Pl. 1 foot.?

4 B. villòsa (Benth, l. c.) villous all over; leaves nearly sessile; flowers axillary; upper lip of corolla emarginate, lower one shortly trifid. ♃.? S. Native along with the preceding.

Villous Beyrichia. Pl. 1 foot.

Cult. For culture and propagation see *Montìra* below.

XVI. ACHETA'RIA (meaning unknown to us.) Cham. et Schlecht, in Linnæa, 2. p. 566.—Herpéstis species, Spreng.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx bibracteate, 5-cleft, the fifth segment large; the rest linear and equal. Corolla tubular, ringent; upper lip entire, erect; lower one longer, and 3-lobed. Stamens 2, fertile in front, and inclosed, without any rudiments of sterile ones. Style inclosed; stigma drooping, emarginate. Capsule girded by the permanent calyx, 2-celled, with a septicidal dehiscence; valves bipartite; placenta occupying the whole dissepiment, permanent, at length free. Seeds irregularly angular, scrobiculate.—Herb erect, hairy, glandular, with the habit of *Melissa Calamíntha*, with opposite leaves. Stems obsoletely tetragonal. Flowers axillary, opposite at the tops of the stems. Corolla pilose and glandular.

1 A. Sprenge'lii (Cham. et Schlecht, l. c.) ♃.? S. Native of tropical Brazil, Sello. Herpéstis erécta, Spreng. syst. 2. p. 801.

Sprengel's Achetaria. Pl. 3 to 4 feet.

Cult. For culture and propagation see *Montìra* below.

XVII. MONTI'RA (named by Aublet after M. de Monti, of Cayenne.) Aubl. guian. 2. p. 637. t. 257. Juss. gen. p. 122. ed. Usteri. p. 137.

Lin. syst. *Diándria, Monogýnia.* Calyx 5-parted, spreading. Corolla funnel-shaped; limb spreading, 5-cleft, equal. Stamens 4, didynamous, all fertile; anthers oblong. Ovarium didymous. Stigma furrowed. Capsule didymous, 2-celled, 4-valved, many-seeded. Seeds fixed to the inner angle of the cells.—Herbs with tetragonal stems, opposite leaves, and terminal 1-3-flowered peduncles.

1 M. Guiane'nsis (Aubl. l. c.) ⊙. S. Native of Guiana. Stem quadrangular, marginate. Leaves oval-oblong, acute, glaucous, sessile. Flowers 3 in the bifurcation of the branches, and between the terminal leaves: lower one sessile: the other pedicellate, and the third on a longer pedicel, all white.

Guiana Montira. Pl. ½ foot.

Cult. A plant of easy culture; grows best in light rich earth kept moist, and is readily increased by division.

XVIII. DOPA'TRIUM (meaning unknown to us.) Hamilt. mss. ex Benth. scroph. ind. p. 31.

Lin. syst. *Diándria, Monogýnia,* Calyx short, membranous, semiquinquefid. Corolla funnel-shaped; tube exserted; limb obliquely widened, 5-cleft, somewhat bilabiate; lower lip larger. Stamens very short, the 2 upper fertile; anthers cohering, 2-celled; cells parallel; the 2 lower stamens small and sterile. Stigma bilamellate, dilated. Capsule hardly furrowed, 4-valved; margins of valves flattish; dissepiment at length free, with adnate placentas.—Slender glabrous herbs, natives of bogs. Leaves opposite; radical and lower leaves few, obovate, quite entire; cauline ones minute, distant. Pedicels filiform, opposite, or alternate from abortion, 1-flowered. Corollas blue.

1 D. nudicau'le (Benth. in scroph. ind. p. 31.) humble, much branched; cauline leaves small, very acute; capsule oblong. ⊙. S. Native of the coast of Coromandel, in wet places. Gratìola nudicáulis, Willd. act. berol. 4. p. 192. Gratìola aphýlla, Roth, nov. spec. p. 7. Gratiòla cuneifòlia, Roxb. fl. ind. 1. p. 142.

Naked-stemmed Dopatrium. Pl. 2 to 3 inches.

2 D. lobelioìdes (Benth. in scroph. ind. p. 31.) stem elongated, a little branched; cauline leaves small, obtuse; capsule globose; corollas about 4-5 times longer than the calyx. ⊙. S. Native of Coromandel, growing in wet places during the rainy season. Gratìola lobelioìdes, Retz. obs. 4. p. 7. Roxb. fl. ind. 1. p. 143. Habit of *Lobèlia Dortmánna.* Flowers on longish pedicels, racemose at the tops of branches. Leaves sessile.

Lobelia-like Dopatrium. Pl. ¼ to ½ foot.

3 D. ju'nceum (Hamilt. ex Benth. scroph. ind. p. 31.) stem elongated, a little branched; cauline leaves small, obtuse; capsule globose; corollas hardly 3 times longer than the calyx. ⊙. S. Native of Coromandel, delighting in wet situations, where it flowers during the rains. Gratìola júncea, Roxb. cor. 2. p. 16. t. 129. Very like *D. lobelioìdes;* but the flowers are much smaller, and the pedicels shorter, the lower pedicels generally very short. Leaves stem-clasping: floral ones minute, triangular. Corollas small, rose-coloured.

Rushy Dopatrium. Pl. ½ to 1 foot.

Cult. The seeds of the species of *Dopàtrium* require to be reared on a hot-bed in spring; and the plants may be planted out in the open ground in the month of May in a warm, sheltered situation, where they will flower and ripen their seeds.

XIX. MICROCARPÆ'A (*μικρος, micros;* and *καρπος, karpos,* a fruit; in reference to the smallness of the capsules.) R. Br. prod. p. 435. Benth. in Lin. trans. p. 435. Hook, bot. misc. 2. p. 101.

Lin. syst. *Diándria, Monogýnia.* Calyx short, campanulate, 3-5-toothed. Corolla small: tube equal in length to the calyx; limb sub-bilabiate, 5-cleft; segments all flat, and nearly equal. Stamens 2, fertile; filaments straight, entire; anthers approximate, 2-celled; cells parallel; vestiges of sterile or lower stamens wanting. Stigma bilamellate, dilated. Capsule 2-valved; valves entire, septiferous in the middle; dissepiment at length free; placentas adnate.—Small, mossy, glabrous herbs, with the habit of *Limosélla.* Leaves opposite. Flowers pedicellate, axillary, small, bractless.

1 M. muscòsa (R. Br. prod. p. 436.) creeping; leaves oblong, entire; calyx 5-toothed; teeth hairy inside. ⊙.? G. Native of India and New Holland, within the tropic. Pæderòta mínima, Kœn, in Retz. obs. fasc. 5. p. 10. M. alternifòlia, Blum. bijdr. p. 744. Nearly allied to *Hedyòtis marítima,* but that plant has a valveless capsule, ex R. Br. l. c.

Mossy Microcarpæa. Pl. small.

2 M. spatula'ta (Hook. bot. misc. 2. p. 101. suppl. t. 4.) creeping; leaves linear-spatulate; calyx 3-toothed. ♃. G. Native of the Peninsula of India. Peplídium Capénse, Spreng. syst. 1. p. 43. Limosélla diándra, Lin. mant. p. 252.

Spatulate-leaved Microcarpæa. Pl. creeping.

Cult. For culture and propagation see *Montìra* and *Dopàtrium* above.

XX. PEPLI'DIUM (from *πεπλος, peplos,* purslane; and *ιδεα, idea,* form; plants with the habit of *Purslane.*) Delile, fl. ægypt. p. 4. t. 4. f. 2. Benth. scroph. ind. p. 32.—Microcarpæ'a, spec. Smith.—Pederòta, spec. Kœn. Oldenlándia and Hedyòtis, species Lin.

Lin. syst. *Diándria, Monogýnia.* Calyx campanulate, 5-toothed. Corolla small; tube equalling the calyx in length; limb 5-cleft, hardly bilabiate; segments all flat, nearly equal. Stamens 2, fertile; filaments gibbous at the base, somewhat appendiculate, incurved; anthers approximate, 2-celled; cells parallel. Vestiges of sterile stamens none. Stigma dilated,

simple.? Capsule globose, bursting irregularly; valves hardly loosened; dissepiment parallel.

1 P. HUMIFU'SUM (Delile, fl. egypt. p. 4. t. 4. f. 2. Benth. scroph. ind. p. 32.) ♃. S. Native of India, and North of Africa. Microcarpæ'a cochlearifòlia, Smith, in Rees' cycl. Hook. bot. misc. 3. p. 95. suppl. t. 29. Pæderòta cochlearifòlia, Kon. et Rottl. Wall. cat. no. 3920. Hedyòtis marítima, Lin. suppl. p. 119. Oldenlándia marítima, Roth, nov. spec. p. 97. Herb creeping, glabrous, with the habit of *Pèplis*. Leaves opposite, obovate, quite entire. Flowers axillary, opposite, solitary, on very short pedicels.

Trailing Peplidium. Pl. creeping.

Cult. For culture and propagation see *Montìra*, p. 536.

XXI. BONNA'YA (named by Link after Bonnay, a German botanist.) Link, et Otto. abbild. t. 2. p. 25. t. 11. Benth. scroph. ind. p. 32.

LIN. SYST. *Diándria, Monogýnia.* Calyx 5-parted, nearly equal. Corolla with an exserted tube, and a bilabiate, 5-parted limb; upper lip the shortest. Stamens 4, 2 superior ones fertile, inclosed, the 2 sterile ones inserted at the base of the lower lip; anthers cohering. Stigma flattened, bilamellate. Capsule globose, oblong, or usually linear, 2-valved; valves entire, membranous, with flat margins; dissepiment parallel, placentiferous, at length free.—Usually glabrous, rarely pilose, creeping, slender, or erectish herbs. Leaves opposite, quite entire, or toothed. Flowers axillary, opposite, or alternate from abortion, usually pedicellate, the upper ones sometimes racemose.

§ 1. SILIQUÒSÆ (from *Siliqua*, a long pod; from the long narrow capsules.) Capsules linear. Allied to the siliquose species of *Vandéllia*.

* *Capsule erectly spreading. Flowers racemose. The species of this section are very variable, and are readily confounded with each other,* ex Benth.

1 B. BRACHIA'TA (Link et Otto, abbild. 2. p. 25. t. 11.) erect, much branched; leaves oblong, sharply serrated; flowers racemose; capsule erectly spreading, twice as long as the calyx. ⊙. S. Native of the Indian Peninsula and Bengal; Manilla, Luçon, &c. Gratìola serràta, Roxb. fl. ind. 1. p. 140. Gratìola oppositifòlia, Herb. Willd. no. 376. Gratìola grandiflòra, Herb. Willd. no. 383. Ruéllia antipòda, Lin. part.—Rheed. mal. 9. t. 59. Flowers racemose at the tops of the branches. Corolla pink coloured.

Armed Bonnaya. Fl. Aug. Clt. 1823. Pl. ½ foot.

2 B. RE'PENS (Spreng. syst. 1. p. 41. Benth. scroph. ind. p. 32.) stem creeping; leaves roundish-oblong, narrowed into the petioles, sharply serrated; flowers racemose; capsule erectly spreading, 2-3 times as long as the calyx. ⊙. S. Native of Nipaul, Silhet, and the Moluccas, &c. Gratìola réptans, Roxb. fl. ind. 1. p. 140. Gratìola ruellioìdes, Kœn. Colsm. grat. p. 12. Vahl. symb. 1. p. 99. Bonnàya ruellioìdes, Spreng. syst. 1. p. 41. Gratìola ciliàta, Colsm. grat. p. 14.? Bonnàya ciliàta, Spreng. syst. 1. p. 41. Henckèlia Roxburghiàna, Link. Schwægr. et Dietr. spec. 1. p. 572. Corolla large, of a pale bluish colour. Capsule longer than in *B. brachiàta*, usually 8-10 lines.

Creeping Bonnaya. Pl. creeping.

3 B. VERONICÆFÒLIA (Spreng. syst. 1. p. 41. Benth. scroph. ind. p. 33.) stem creeping; leaves oblong: lower ones petiolate: superior ones serrated, thickish; flowers racemose; capsule erectly spreading, 2-3 times longer than the calyx. ⊙. H. Native of Hindostan, Nipaul, Silhet, Birman Empire. Bonnàya rígida, Benth. in Wall. cat. no. 3859. B. procúmbens, Benth. in Wall. cat. no. 3860. Gratìola veronicæfòlia, Retz. obs. 4. p. 8.? Roxb. cor. 2. p. 30. t. 154. Gratìola marginàta, Colsm. grat. p. 11.? Bonnàya marginàta, Spreng. syst. 1. p. 4.? Gratìola grandiflòra, Retz. obs. 41. p. 8. but not of Roxb. Gratìola racemòsa, Roth, nov. spec. p. 9. Bonnàya Ròthii, Link, Schwægr. et Dietr. spec. pl. 1. p. 556. Corolla reddish. Capsule 6-7 lines long. Stem tetragonal.

Speedwell-leaved Bonnaya. Fl. June, Sept. Clt. 1798. Pl. ½ foot.

4 B. VERBENÆFÒLIA (Spreng. syst. 1. p. 42. Benth. scroph. ind. p. 33.) stems erect or ascending; leaves lanceolate, quite entire or serrated; flowers racemose; capsules erectly spreading, 2-3 times longer than the calyx. ⊙. S. Native of Hindostan, Silhet, Birmann Empire; and of China, Nelson. Tittmánnia Colsmánni, Benth. in Wall. cat. no. 3952. Gratìola verbenæfòlia, Colsm. grat. p. 9. Gratìola racemòsa, Roxb. fl. ind. 1. p. 139. but not of Roth. Gratìola ciliàta, Commers. in Colms. grat. p. 14.? Gratìola Roxburghiàna, Rœm. et Schultes, syst. 1. p. 123. Bonnàya Roxburghiàna, Link, Schwægr. et Dietr. spec. 1. p. 559. This species hardly differs from *Vandellia*, unless in the stamens.

Vervain-leaved Bonnaya. Pl. ½ foot.

5 B. PUSI'LLA (Benth. in Wall. cat. no. 3861. scroph. ind. p. 33.) stem diffuse, much branched; leaves ovate-oblong, sessile, thickish, serrated; flowers small, racemose; capsules erectish, linear, scarcely exceeding the calyx. ⊙.? S. Native of Singapore.

Small Bonnaya. Pl. diffuse.

** *Capsules erectly spreading. Flowers axillary.*

6 B. GRANDIFLÒRA (Spreng. syst. 1. p. 41. Benth. scroph. ind. p. 33.) stem diffuse, subrepent; leaves ovate or ovate-lanceolate, sessile, serrated; flowers axillary, opposite; capsules linear, erectly spreading, hardly twice as long as the calyx. ⊙.? S. Native of the Indian Peninsula, in wet places. Bonnàya Wíghtii, Benth, in Wall. cat. no. 3864. Gratìola grandiflòra, Roxb. cor. 2. p. 42. t. 179. fl. ind. ed. Car. 1. p. 137. but hardly of Retz. Henckèlia grandiflòra, Link, Schwægr. et Dietr. spec. pl. 1. p. 573. Ruéllia antipòda, Lin. spec. part.—Rumph. amb. 5. p. 460. t. 170. f. 2. Flowers light blue, very like those of *Vandéllia pedunculàta*. The specific name is not very apt, other species having equally large flowers.

Great-flowered Bonnaya. Pl. creeping, ¼ foot.

7 B. PEDUNCULA'RIS (Benth. in Wall. cat. no. 3865.) stems elongated, slender; leaves remote, oblong-lanceolate, nearly quite entire; flowers axillary, solitary, on long peduncles; capsules linear, spreading, hardly twice as long as the calyx. ⊙. S. Native of Silhet, Wall. Nearly allied to *Gratìola pulegiifòlia*, Vahl. enum. 1. p. 98. but the flowers are very rarely opposite.

Peduncular-flowered Bonnaya. Pl. creeping, ½ to 1 foot.

8 B. PULEGIIFÒLIA; leaves oblong, serrated; peduncles axillary, opposite, length of leaves; capsule subulate. ⊙. S. Native of the East Indies. Gratìola pulegiifòlia, Vahl, enum. 1. p. 98. Stems filiform. Leaves sessile.

Pennyroyal-leaved Bonnaya. Pl. creeping.

*** *Capsules reflexed.*

9 B. OPPOSITIFÒLIA (Spreng. syst. 1. p. 41.) erect; leaves oblong or lanceolate, a little serrated; peduncles opposite the leaves; capsules linear, reflexed. ⊙. S. Native of Coromandel. Gratìola oppositifòlia, Roxb. cor. 2. p. 30. t. 155. fl. ind. ed. Car. 1. p. 139. and probably of Retz. obs. 4. p. 8. Henckèlia oppositifòlia, Link, Schwægr. et Dietr. spec. pl. 1. p. 573. Flowers small, blue. Capsule linear, twice the length of the calyx. Sterile filaments white.

Opposite-leaved Bonnaya. Pl. ¼ to ½ foot.

10 B. TENUIFÒLIA (Spreng. syst. 1. p. 42.) erect? leaves linear, quite entire; peduncles opposite the leaves; capsule linear, reflexed. ⊙. S. Native of Coromandel; Birmann Empire, at Tavoy; Ceylon and China, in wet places. Gratìola tenuifòlia, Colsm. grat. p. 8. Corollas blue?

Thin-leaved Bonnaya. Pl. ¼ to ½ foot.

§ 2. BRACHYCA'RPÆ (from *βραχυς, brachys*, short; and *καρπος, karpos*, a fruit.) Capsules ovate, exceeding the calyx a very little. Plants with the habit of *Lindérnia*.

11 B. HYSSOPIOI'DES (Benth. in Wall. cat. no. 3866. scroph. ind. p. 34.) stem elongated, loose; leaves oblong or lanceolate, remote; peduncles axillary, elongated, filiform; corolla 3 or 4 times longer than the calyx. ⊙. S. Native of Hindostan, Silhet, China, Tranquebar. Gratìola hyssopioìdes, Lin. mant. p. 174. Kœn. in Retz. obs. 4. p. 8. Roxb. cor. 2. p. 16. t. 128. fl. ind. ed. Car. 1. p. 142. Morgània hyssopioìdes, Spreng. syst. 2. p. 803. Corollas pale blue. Sterile stamens bearded. Habit of a species of *Dopàtrium*.

Hyssop-leaved Bonnaya. Pl. ½ to 1 foot.

12 B. PARVIFLÒRA (Benth. in Wall. cat. no. 3867. scroph. ind. p. 34.) humble, branched; leaves oblong or lanceolate; flowers axillary or subracemose; corolla twice the length of the calyx. ⊙. S. Native of Hindostan, Silhet, and the Birmann Empire. Gratìola parviflòra, Roxb. corom. 3. p. 3. t. 203. Flowers small, usually blue, but sometimes white. Sterile filaments capitate at apex.

Small-flowered Bonnaya. Pl. ½ foot.

§ 3. SPHÆROCA'RPA (from *σφαιρα, sphaira*, a sphere; and *καρπος, karpos*, a fruit; in reference to the capsules being roundish.) Benth. scroph. ind. p. 34. Capsules roundish, shorter than the calyx. Similar to the species of *Vandéllia*, with roundish capsules.

13 B. ROTUNDIFÒLIA (Benth. scroph. ind. p. 34.) diffuse; leaves sessile, broad-ovate, subcordate; peduncles axillary; capsules roundish, shorter than the calyx. ⊙. S. Native of the Indian Peninsula and Ceylon, in moist places. Gratìola rotundifòlia, Lin. mant. p. 174. Roxb. fl. ind. ed. Car. 1. p. 138. Gratìola dèbilis, Hayne, in Wall. cat. no. 3946. Morgània rotundifòlja, Spreng. syst. 2. p. 803.—Rheed. mal. 9. p. 111. t. 57. Flowers white.

Round-leaved Bonnaya. Pl. ½ foot.

14 B. BRACHYCA'RPA (Cham. et Schlecht. in Linnæa, 2. p. 568.) stem decumbent; leaves oblong, bluntish, generally tridentate on both sides, narrowed at the base; peduncles shorter than the leaves; capsule about equal in length to the calyx. ⊙. S. Native of the East Indies. Glabrous. Habit of *B. grandiflòra*.

Short-fruited Bonnaya. Pl. decumbent.

15 B. MI'NIMA; stem filiform, erect, simple; leaves oblong, sessile, remote, serrulated, and are, as well as the calycine segments, ciliated; capsule oblong, rather longer than the pedicels. ⊙. S. Native of the East Indies. Gratìola mínima, Roth, nov. spec. p. 8.

Least Bonnaya. Pl. ¼ foot.

† *Species doubtful or hardly known.*

16 B. PUNCTA'TA; leaves lanceolate, serrated, nerveless, dotted beneath; flowers sessile. ⊙. S. Native of Java. Gratìola punctàta, Colsm. grat. Vahl, enum. 1. p. 90. Stem erect, creeping at the base, quite simple. Leaves sessile, half an inch long. Flowers solitary, opposite. Capsule roundish, a little compressed, length of calyx.

Dotted Bonnaya. Pl. ¼ to ½ foot.

17 B. VA'HLII; leaves oval, sessile, serrated, with cartilaginous edges, glabrous; stem hispid; peduncles axillary, opposite. ⊙. S. Native of the East Indies, in springs. Gratìola pusílla, Willd. spec. 1. p. 105. Vahl, enum. 1. p. 105. Stem simple or branched. Peduncles twice as long as the leaves. Segments of the calyx linear, acute. Flowers small, blue. Capsule globose.

Vahl's Bonnaya. Pl. creeping.

18 B. HISPI'DULA; leaves oval, sessile, crenated, and are, as well as the stem, pilose; peduncles axillary, opposite. ⊙. ? S. Native of Java. Gratìola hispídula, Commers. in Vahl. enum. 1. p. 94. Stem filiform, bifid at apex. Leaves a nail in length, acute, 5-nerved beneath. Peduncles glabrous, longer than the leaves. Calycine segments linear-lanceolate. Capsule globose, almost the size of a coriander seed.

Hispid Bonnaya. Pl. filiform.

19 B. OCYMIFÒLIA; leaves oblong, quite entire: lower ones petiolate; flowers racemose. ⊙. S. Native of the East Indies. Gratìola ocymifòlia, Vahl, enum. 1. p. 96. Stem branched at bottom. Lower leaves petiolate: upper ones remote, sessile. Capsule globose.

Ocymum-leaved Bonnaya. Pl. ¼ to ½ foot.

Cult. The seeds of all the species should be reared on a hotbed; and when the plants are of sufficient size, they should be planted in separate pots, which should be either kept in a hotbed, or placed in the stove, in deep pans filled with water.

XXII. HYDRO'TRICHE (from *ὑδωρ ὑδρος, hydor hydros*, water; and *θριξ τριχος, thrix trichos*, a hair; in reference to the hair-like, submersed leaves, and habitation of the plant.) Zucc. abhandl. acad. wiss. 1829, 1830. vol. I. p. 308.

LIN. SYST. *Diándria, Monogýnia.* Calyx 5-parted, nearly equal. Corolla regular, funnel-shaped; limb 5-cleft. Stamens 2; anthers connected by hairs. Ovarium 2-celled; placentas one in each cell, adnate to the dissepiment, many-ovulate. Stigma bilabiate, or bilamellate. Capsule unknown.—An aquatic herb. Lower or submersed leaves verticillate, capillaceously multifid, setosely serrated: superior ones opposite, lanceolate, obtuse. Flowers disposed in few-flowered racemes. This genus is distinguished from *Limnóphila* in the absence of the 2 sterile stamens, or even the rudiments of them.

1 H. HOTTONIÆFLÒRA (Zucc. l. c.) ♃. S. Native of Madagascar, in stagnant water.

Hottonia-flowered Hydrotriche. Pl. aquatic, 1 to 2 feet.

Cult. See *Limnóphila*, p. 543. for culture and propagation.

XXIII. HEMIA'NTHUS (from *ἐμι, hemi*, half; and *ανθος, anthos*, a flower; in reference to the upper lip of corolla being obsolete.) Nutt. gen. amer. 2. p. 42. journ. acad. nat. sc. phil. 1. p. 119. t. 6. f. 2.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx tubular, 4-toothed, cleft on the under side. Upper lip of corolla obsolete: lower one 3-parted; middle segment ligulate and truncate, much longer, closely incurved. Stamens 2; filaments bifid; lateral clefts antheriferous. Style bifid. Capsule 2-valved, many-seeded. Seeds ovate, even, and shining.—A small creeping plant, growing in marshes. Leaves entire, opposite and verticillate. Flowers solitary, alternate, pedicellate, minute.

1 H. MICRANTHEMOI'DES (Nutt. l. c.) ♃. H. Native on the borders of the Delaware.

Micranthemum-like Hemianthus. Pl. creeping.

Cult. For culture and propagation see *Herpéstis*, p. 544.

XXIV. PTEROSTI'GMA (from *πτερον, pteron*, a wing; and *στιγμα, stigma*; in reference to the stigma being generally girded by a wing.) Benth. scroph. ind. p. 20.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx 5-parted, or deeply 5-cleft: upper segment the largest. Corolla bilabiate;

upper lip emarginate: lower one 3-lobed. Stamens 4, the 2 superior ones fertile, and the 2 lower ones sterile, or, if fertile, the anthers are only half; anthers of the fertile filaments 2-celled: cells separate, stipitate. Style simple; stigma a little thickened, entire, usually girded by a membranous wing on all sides. Capsule rostrate, bisulcate, 2-valved, with a loculicidal dehiscence; valves bifid; dissepiment formed by the inflexed margins of the valves, duplicate, at length free. Placentas adnate to the dissepiment, or at length free. Seeds small, naked, striated.—Hard villous herbs, usually blackish when dried. Leaves opposite, wrinkled, crenulated. Flowers capitate, racemose, scattered, or the lower only are axillary; pedicels short, usually bibracteate at apex. The odour of the species is that of the *Labiàtæ*, even in the dried state.

1 P. GRANDIFLÒRUM (Benth. scroph. ind. p. 21.) leaves ovate; corollas amply tubular, more than twice the length of the calyx; flowers racemose. ⊙. S. Native at Macao, Vachell.

Great-flowered Pterostigma. Pl. 2 to 3 feet.

2 P. VILLÒSUM (Benth. l. c.) leaves ovate, acuminated, or ovate-lanceolate, crenated, wrinkled, villous; corolla one half longer than the calyx; flowers racemose. ⊙. Native of Silhet and Tavoy, on the mountains. Adenósma villòsum, Benth. in Wall. cat. no. 3851. Corolla 3-4 lines long.

Villous Pterostigma. Pl. 2 to 3 feet.

3 P. MACROPHY'LLUM (Benth. l. c.) leaves ovate, acuminated, serrately-crenated, narrowed at the base, flaccid, smoothish; corollas one half longer than the calyx; flowers racemose. ⊙. S. Native of the Birman Empire, on the banks of the Irrawaddy. Adenósma macrophýllum, Benth. in Wall. cat. no. 3853.

Long-leaved Pterostigma. Pl. 1 to 3 feet.

4 P. SPICA'TUM (Benth. l. c.) leaves nearly sessile, oblong, bluntly serrated; flowers disposed in dense oblong spikes, subcapitate; calyx distinctly 5-parted; capsule beaked. ⊙. S. Native of the Peninsula of India and Ceylon. Stemòdia capitàta, Benth. in Wall. cat. no. 3926.

Spicate-flowered Pterostigma. Pl. 1 to 3 feet.

5 P. CAPITA'TUM (Benth. l. c.) leaves ovate or oblong; flowers disposed in globose or oblong heads; calyx hispid, somewhat 5-parted; capsule oblong. ⊙. S. Native of the mountainous parts of India, Nipaul, Kamaon, Hindostan, Birmann Empire, Penang, &c. Stemòdia capitàta, Benth. in Wall. cat. no. 3926. Very like the preceding, but the capsule is intermediate between *Lindenbérgia* and *Pterostígma*.

Capitate-flowered Pterostigma. Pl. 1 to 2 feet.

Cult. For culture and propagation see *Bonnàya*, p. 538.

§ 2. *Stamens 4, all fertile.*

XXV. LINDENBE'RGIA (in honour of J. B. Lindenberg, author of a Synopsis of European Hepaticæ.) Link et Otto, abbild. p. 95. Benth. scroph. ind. p. 21.—Stemòdia, Brachýcoris, Adenósma, and Bòvea species of authors.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx campanulate, shortly 5-cleft; segments ovate, often leafy. Corolla ringent; upper lip emarginate: lower one 3-lobed. Stamens 4, didynamous, inclosed: lower ones the longest; anthers approximating by pairs, free; cells separate, stipitate, all fertile. Style simple; stigma a little thickened, entire, dilated. Capsule oblong, bisulcate, 2-valved, with a loculicidal dehiscence; dissepiment duplicate, from the connate inflexed margins of the valves, at length free; placentas adnate to the dissepiment, or at length free. Seeds small, naked, striated.—Branched herbs, sometimes scandent or divaricate, scentless, usually becoming blackish on drying. Leaves opposite, toothed. Flowers sessile, sometimes axillary and opposite, sometimes disposed in terminal or axillary racemes or interrupted spikes.

1 L. SINA'ICA (Benth. scroph. ind. p. 22.) hard, divaricately branched, villous; leaves small, roundish-ovate, coarsely toothed: floral ones shorter than the calyx; racemes elongated, axillary and terminal; flowers opposite, secund; corolla twice the length of the calyx. ♃.? H. Native of Sinaica, in deserts, Bove. Bòvea Sinàica, Decassne in ann. sc. nat. par. 2. ser. 2. p. 253.

Sinai Lindenbergia. Pl. 1 to 2 feet.

2 L. GRANDIFLÒRA (Benth. l. c.) climbing, and villously downy; leaves large, unequally ovate, acuminated, toothed: floral ones shorter than the corolla; racemes axillary, loose; flowers opposite, secund; corollas 4 times the length of the calyx. ♃.? S. Native of Nipaul. Stemòdia grandiflòra, Hamilt. in D. Don, prod. fl. nep. p. 89. Leaves 3-6 inches long. Corolla more than an inch long, purple.

Great-flowered Lindenbergia. Pl. 2 to 3 feet.

3 L. MACROPHY'LLA (Benth. l. c.) somewhat scandent, hard, smoothish; leaves oblong, very acutely serrated: floral ones ovate-lanceolate, shorter than the calyx; racemes elongated, many-flowered, axillary and terminal; flowers subalternate; corollas twice the length of the calyx. ⊙. S. Native of Oude, Serpur; Martaban, at Prome. Stemòdia macrophýlla, Benth. in Wall. cat. no. 3925. Adenósma cuspidàtum, Benth. in Wall. cat. no. 3852. Leaves hardly 1½ inch. Herb always becoming black on drying.

Long-leaved Lindenbergia. Pl. 2 to 3 feet.

4 L. URTICÆFÒLIA (Lehm. in Link et Otto, abbild. 95.) erect or ascending, annual, villous; leaves ovate: floral ones similar; flowers solitary, axillary; corolla 3 times the length of the calyx. ⊙. H. Native of the mountainous parts of India, as of Nipaul, Hurdwar, Oude, Silhet, Birman Empire, Sansedarra, and Mussooree. Stemòdia ruderàlis, Vahl, symb. 2. p. 69. Benth. in Wall. cat. no. 3923. Brachýcoris parviflòra, Schrad. Much branched, usually purplish. Leaves ovate, purplish beneath. Flowers nearly sessile, secund, yellow, purplish outside.

Var. β, màjor (Benth. scroph. p. 22.) stems elongated, and more branched. ⊙. H. Native of Martaban, on the banks of the Irrawaddi.

Nettle-leaved Lindenbergia. Pl. ½ to 1½ foot.

5 L. POLYA'NTHA (Royle, mss. ex Benth. scroph. ind. p. 22.) erect or ascending, annual, villous; leaves ovate: lower floral ones similar: superior ones shorter than the calyx; racemes many-flowered; flowers opposite, secund; corollas twice the length of the calyx. ⊙. H. Native at Delhi, along the river Jumna, Royle. Allied to *L. urticæfòlia*, but the inflorescence is distinct.

Many-flowered Lindenbergia. Pl. 1 to 2 feet.

Cult. For culture and propagation see *Bonnàya*, p. 538.

XXVI. STEMO'DIA (said to be from στημων, *stemon*, a stamen; and δις, *dis*, double; in reference to each stamen bearing 2 anthers, or 2 distinct lobes.). Lin. gen. no. 777. Schreb. gen. no. 1043. Gærtn. fruct. t. 52. Juss. gen. p. 118. ed. Usteri, p. 133. Lam. ill. t. 534. f. 1. Benth. scroph. ind. p. 23.—Stemodiàcra, Browne, jam. t. 22. f. 2. Jacq. amer. p. 181.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx tubularly campanulate, 5-parted, nearly equal. Corolla ringent; upper lip emarginate: lower one 3-lobed. Stamens 4, didynamous, inclosed: lower ones the longest; anthers approximating by pairs, free; cells separate, stipitate, all fertile. Style simple; stigma entire, a little dilated. Capsule oblong, or nearly globose, bisulcate, 2-valved; valves bifid; dissepiment duplicate

from the inflexed margins of the valves, at length free; placentas adnate. Seeds small, naked.

Sect. I. Mode'stia (from *modestia*, humility; in reference to the humble growth of the plants.) Cham. et Schlecht, in Linnæa, 3. p. 5. Benth. scroph. ind. p. 23. Capsule with a luculicidal dehiscence; valves bifid at the dissepiment.—Usually glabrous herbs, almost with the habit of *Gratìola* or *Limnóphila*, becoming blackish on drying. Leaves opposite or verticillate, sessile or on short petioles. Flowers axillary, or the superior ones approximate into a head or raceme, usually blue.

* *Flowers nearly sessile.*

1 S. mentha'strum (Benth. in Wall. cat. no. 3927. scroph. ind. p. 23.) erect, smoothish; leaves nearly sessile, ovate-oblong, narrowed at both ends: floral ones similar, longer than the calyx; flowers sessile: superior ones collected into a glabrous, nearly globose head; calycine segments lanceolate-subulate. ⊙.? H. Native of the Monghyr mountains, Hamilt.

Mint-like Stemodia. Pl. 1 foot.

2 S. hypericifòlia (Benth. in Wall. cat. no. 3934. scroph. ind. p. 23.) glabrous, rooting at the base, ascending; leaves sessile, ovate-oblong, obtuse, cordately stem-clasping at the base: floral ones smaller; racemes terminal or axillary; flowers sessile, remote; segments of the calyx lanceolate. ♃. G. Native of Nipaul, at Narainhetty. Cybbanthèra connàta, Hamilt. in D. Don, prod. fl. nep. p. 23. Corollas blue. Flowers tribracteate.

St. John's-wort-leaved Stemodia. Pl. 1 to 1½ foot.

3 S. balsa'mea (Benth. in Wall. cat. no. 3928. scroph. ind. p. 23.) stem procumbent; branches rather hairy; leaves ovate, obtuse, narrowed into the petioles, glabrous: floral ones similar in shape; flowers axillary, sessile, solitary, or 2-3 on both sides, glomerate; segments of calyx lanceolate-subulate. ♃.? G. Native of the Birman Empire, at Tavoy, Wall.

Balsameous Stemodia. Pl. procumbent.

4 S. se'ssilis (Benth. in Wall. cat. no. 3939. scroph. ind. p. 23.) procumbent, glabrous; leaves sessile, oblong, obtuse, crenated, narrowed at the base: floral ones similar in shape; flowers solitary, axillary, nearly sessile; calyxes glabrous, with lanceolate-subulate, strict segments; corolla hardly longer than the calyx. ♃.? G. Native at Goalpara, Moolmyne, and of Ceylon.—A humble rooting herb, native of bogs. Flowers hardly 4 lines long.

Sessile-flowered Stemodia. Pl. creeping.

5 S. tenuiflòra (Benth. in Wall. cat. no. 3940. scroph. ind. p. 23.) procumbent, glabrous; leaves sessile, lanceolate, acute, serrated, rounded at the base: floral ones similar in shape; flowers solitary, axillary, almost sessile; calyx glabrous, with lanceolate-subulate, strict segments; corollas hardly longer than the calyx. ♃. S. Native of the Birman Empire, near Prome. Very nearly allied to the preceding; but the plant is smaller, as well as the flowers. Habit of *Lythrum hyssopifòlium*.

Thin-flowered Stemodia. Pl. procumbent.

6 S. micra'ntha (Benth. in Wall. cat. no. 3936. scroph. ind. p. 23.) small, diffuse, much branched, glabrous; leaves sessile, oblong-lanceolate, acute, narrowed at the base: floral ones similar in shape; flowers sessile, solitary, axillary; calyx glabrous, with lanceolate-subulate, recurvedly spreading segments; corolla twice the length of the calyx. ♃. S. Native of Silhet, Wall. Nearly allied to the preceding; but differs from it in the calyxes being shorter, and nearly globose; and in its segments being recurvedly spreading. Stems hardly 3-4 inches high. Habit of *Anagállis tenélla*.

Small-flowered Stemodia. Pl. diffuse, 3-4 inches high.

7 S. re'pens (Benth. in Wall. cat. no. 3935. scroph. ind. p. 24.) creeping, glabrous, rather clammy; leaves sessile, oblong-lanceolate, narrowed at the base, acute, serrated: floral ones hardly longer than the calyx; flowers nearly sessile, racemose or glomerate; calyxes nearly glabrous, with lanceolate segments, which are subulate and recurvedly spreading at apex; corolla twice the length of the calyx. ♃. S. Native of the Indian Peninsula, about Madras. Stems elongated, generally more than a foot. Racemes rather loose, terminal and axillary.

Creeping Stemodia. Pl. creeping.

8 S. camphora'ta (Vahl, symb. 2. p. 69.? Benth. scroph. ind. p. 24.) erect, clothed with clammy pubescence; leaves petiolate, ovate-oblong: floral ones linear-lanceolate; racemes axillary, rather shorter than the leaves; flowers almost sessile; calyxes downy, with lanceolate-acute segments; corolla almost 3 times as long as the calyx. ♃.? S. Native of Hindostan, and of the Birman Empire, at Prome; and of Ceylon. S. cimínica, Benth. in Wall. cat. no. 3933. Stems floriferous at the base. Racemes numerous, short, loose, leafy. "Leaves 1½ inch long, sharply and unequally serrated. Corolla of a greenish citron colour," ex Vahl.

Camphorated Stemodia. Pl. 1 to 1½ foot.

* * *Flowers pedicellate; pedicels longer than the calyx.*

9 S. viscòsa (Roxb. cor. 2. p. 23. t. 163.) erect, downy, clammy; leaves sessile, ovate-oblong, acute, narrowed towards the base, and dilately cordate at the base, and stem-clasping: floral ones similar in shape; flowers axillary, solitary: upper ones racemose; calycine segments lanceolate, acute. ⊙.? S. Native of Coromandel and Bengal. S. marítima, Heyne, ex Benth. in Wall. cat. no. 3931. but not of Lin. Corolla blue.

Clammy Stemodia. Fl. July, Aug. Clt. 1818. Pl. ½ to 1 foot.

10 S. hirsu'ta (Heyne, ex Wall. cat. no. 3930. Benth. scroph. ind. 24.) stem erect, hairy; leaves nearly sessile, narrowed at the base: upper ones hardly stem-clasping, glabrous: floral ones rather shorter than the pedicels; raceme terminal; flowers solitary, opposite; segments of the calyx lanceolate-subulate. ⊙.? S. Native of the Indian Peninsula? Hindostan, and Silhet.

Hairy Stemodia. Pl. 1 to 1½ foot.

11 S. diffu'sa (Benth. in Wall. cat. no. 3937. scroph. ind. p. 24.) diffuse, glabrous; leaves sessile, oblong-lanceolate, narrowed at the base: floral ones similar in shape; flowers solitary, axillary; calyx glabrous, with lanceolate-acute segments; corolla twice the length of the calyx. ♃.? S. Native of the Birman Empire, at Tavoy. Stature of *S. micrántha*; but the flowers are pedicellate, larger, &c.

Diffuse Stemodia. Pl. diffuse, 3-4 inches.

12 S. gratioloi'des (Benth. in Wall. cat. no. 3938. scroph. ind. p. 25.) glabrous, erect; leaves sessile, oblong-lanceolate, narrowed at the base, stem-clasping: floral ones similar in shape; flowers axillary, opposite, solitary; segments of the calyx lanceolate; corolla one half longer than the calyx. ♃.? S. Native of the Birman Empire, at Tavoy.

Hedge-hyssop-like Stemodia. Pl. ½ foot.

13 S. Philippe'nsis (Cham. et Schlecht, in Linnæa, 3. p. 5.) downy; leaves falsely opposite, petiolate, lanceolate, ovate, acute at both ends, sharply serrated, quite entire at the base: floral ones similar in shape; spikes terminal, many-flowered; calyx bractless, with lanceolate, acute, ciliated segments. ♃. S. Native of the Island of Luçon, on high lands. Leaves 2½ inches long. Corolla half an inch long, downy outside.

Philippine Stemodia. Pl. erect.

14 S. mura'ria (Roxb. mss. ex D. Don, prod. fl. nep. p. 89.)

very hairy; leaves ovate, acute, petiolate, serrated: floral ones similar in shape; flowers axillary, usually solitary, pedicellate; segments of calyx ovate, mucronulate. ♃. F. Native of Nipaul. Root tufted. Stems numerous, erect, branched. Leaves like those of *Calamint*, opposite. Corolla pale rose-coloured, villous, twice the length of the calyx.

Wall Stemodia. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

SECT. II. DIAMÓSTE (an anagram of *Modéstia*, the name of sect. I.) Cham. et Schlecht, in Linnæa, 3. p. 4. Capsule with a septicidal dehiscence.—Herbs or under-shrubs. Leaves opposite, or 3 in a whorl, entire. Flowers axillary, blue, solitary.

* *Calyx bractless.*

15 S. VERTICILLA'RIS (Link, enum. 2. p. 144.) erect, clothed with clammy down; leaves opposite, or 4 in a whorl, lanceolate, or linear-lanceolate, serrated, half stem-clasping; flowers nearly sessile, solitary in the axils of the leaves, therefore verticillate. ☉. H. Native of tropical and extra-tropical Brazil. Conòbea verticillàris, Spreng. nov. prov. p. 13. Branches numerous, erect, branched in the cultivated plant; but the stem is simple, and hardly an inch long in the wild plant. Corolla small, purple. Calyx bractless.

Whorled-leaved Stemodia. Fl. July, Aug. Clt. 1825. Pl. 1 inch to 1 foot.

16 S. ARENA'RIA (H. B. et Kunth, nov. gen. amer. 2. p. 357. t. 175.) procumbent; leaves opposite, petiolate, ovate, crenately serrated; flowers axillary, solitary or twin, on short pedicels; segments of calyx linear, 3-nerved, ciliated, nearly equal. ♃. S. Native on the inundated banks of the river Magdalena, near Banco and El Penon, between Mompox and Morales. Conòbea ovàta, Hort. Conòbea pùmila, Spreng. nov. prov. p. 13. Herpéstis diffùsa, Willd. herb. no. 11444. Herb much branched; branches rather hairy. Leaves smoothish, 3-5 lines long. Corolla twice the length of the calyx, blue. Perhaps the same as *L. parviflòra*.

Sand Stemodia. Pl. procumbent.

17 S. PARVIFLÒRA (Ait. hort. kew. ed. 2. vol. 4. p. 52. Link. enum. 2. p. 144. exclusive of the syn. of Spreng.) procumbent, much branched, downy; leaves opposite, or 3 in a whorl, petiolate, ovate, crenated. ♃. S. Native of South America. Erìnus verticillàtus, Mill. dict. ed. 8th. Corollas small, white; tube incurved.

Small-flowered Stemodia. Fl. July, Aug. Clt. 1759. Pl. $\frac{1}{2}$ foot.

18 S. SUFFRUTICÒSA (H. B. et Kunth, nov. gen. 2. p. 357.) suffruticose, rather hairy; leaves 3 in a whorl, sessile, oblong, crenated; flowers axillary, usually twin, pedicellate; segments of the calyx linear, somewhat 5-nerved. ♄. S. Native of New Granada, between Ona and the river Saraguru, at the altitude of 1200 hexapods. Colúmnea trifoliàta, Link. enum. 2. p. 145. Stemòdia trifoliàta, Rchb. Leaves 9-18 lines long, and 3-6 broad. Flowers larger than those of *Thymus serpyllum*. Corolla blue, hairy outside; tube hardly exceeding the calyx. Very nearly allied to *S. durantifòlia*. Calyx bractless.

Suffruticose Stemodia. Fl. July, Aug. Clt. 1820. Shrub small.

19 S. GLA'BRA (Spreng. syst. 2. p. 811.) stem ascending, angular, glabrous; leaves opposite, stem-clasping, lanceolate, remotely toothed, scabrous; flowers axillary, opposite, sessile.—Native of Monte Video, Sello.

Glabrous Stemodia. Pl.

20 S. JORULLE'NSIS (H. B. et Kunth, nov. gen. 2. p. 358.) erect, pilose; leaves 3 in a whorl, petiolate, ovate; flowers solitary, axillary, on long pedicels; segments of calyx linear. ♃. S. Native of New Spain, at the foot of the burning Mount Jorullo, at the altitude of 490 hexapods. Stem branched. Leaves doubly and deeply crenate-serrated, entire at base, 5 lines long. Corolla twice the length of the calyx, blue?

Jorullo Stemodia. Pl. 1 to $1\frac{1}{2}$ foot.

21 S. PALU'STRIS (Aug. St. Hil. rem. bras. p. 216. mem. mus. 12. p. 314.) root creeping; stems ascending; leaves opposite, and 3 in a whorl, sessile, oblong-linear, acute, obsoletely toothed: superior ones narrower, nearly linear: upper ones, and those of the branches, linear, very narrow; flowers subspicate, on short pedicels; calyx puberulous. ♃. S. Native of the South of Brazil, on the margins of marshes, and in humid places on the banks of the Rio Negro and la Uraguay. Corolla blue; palate convex on one side, and concave on the other, white. Capsule about equal in length to the calyx. Plant puberulous at top.

Marsh Stemodia. Pl. $\frac{1}{4}$ to $\frac{3}{4}$ foot.

22 S. GRATIOLÆFÒLIA (Aug. St. Hil. pl. rem. bras. p. 217. mem. mus. 12. p. 315.) leaves opposite, sessile, linear, acute, obsoletely toothed, glabrous; flowers panicled, nearly sessile, usually solitary in the axils of the bracteas; calyx smoothish. ♃. F. Native of Brazil, in the province of Rio Grande do Sul, on the edges of woods on the banks of the Ploropasso. Corolla pale blue.

Gratiola-leaved Stemodia. Pl. $\frac{1}{2}$ to $1\frac{1}{2}$ foot.

* * *Calyx bibracteate.*

23 S. MARI'TIMA (Lin. spec. 881. Jacq. amer. p. 181. t. 174. f. 66. pict. 261. f. 48.) procumbent, hairy; leaves opposite, hastate at the base, and half stem-clasping; flowers axillary, solitary, sessile. ♂.? S. Native of Jamaica, in inundated parts by the sea side; Cuba, in humid places near Havannah; also of New Andalusia, near Bordones.—Brown. jam. 261. t. 22. f. 2.—Sloane, hist. 1. p. 175. t. 110. f. 2. Leaves viscid. Calyx bibracteate. Corolla blue. The plant has a bitterish taste, and a pleasant aromatic smell.

Sea-side Stemodia. Fl. July, Aug. Clt. 1817. Pl. 2 to 3 feet.

24 S. DURANTIFÒLIA (Swartz, obs. p. 240.) erect; leaves 3 in a whorl, and connate, serrated; flowers axillary, solitary, therefore usually 3 in a whorl, nearly sessile. ♂. S. Native of Jamaica, in marshy places by the sea side. Caprària durantifòlia, Lin. spec. p. 876. amœn. acad. 5. p. 379.—Sloane, hist. 1. p. 196. t. 124. f. 2. Branches hairy, viscid. Leaves pubescent. Calyx bibracteate, with subulate segments, shorter than the corolla. Corolla small, blue.

Duranta-leaved Stemodia. Fl. July, Aug. Clt. 1823. Pl. 1 foot.

25 S. HYPTOI'DES (Cham. et Schlecht, in Linnæa, 3. p. 8.) pubescently hairy; leaves opposite, and 3 in a whorl, ovate-lanceolate, sharply toothed, narrowed below, and auriculately stem-clasping at the base; spikes terminal, dense-flowered, panicled; calyx bibracteate, with narrow-linear, acuminated segments. ♃. G. Native of the southern provinces of Brazil. Habit of *Hyptis* or *Méntha*. Branches axillary, erect, shorter than the stem, pyramidally panicled. Root throwing out stolons. Cauline leaves $2\frac{1}{2}$ inches long. Flowers on short pedicels.

Hyptis-like Stemodia. Pl. 1 to 2 feet.

26 S. STRI'CTA (Cham. et Schlecht, l. c. p. 10.) clothed with clammy pubescence; leaves obovate, acute, toothed, narrowed at bottom, but sessile and subdilated at the base, and quite entire: lower ones opposite: superior ones 3 in a whorl; spikes terminal, verticillate; calyx bibracteate, like that of the preceding. ♃. S. Native of tropical Brazil, Sello. Flowers smaller than those of the preceding, disposed in leafy verticillate racemes, on short pedicels. Floral leaves similar to the rest in shape.

Strict Stemodia. Pl. 1 to $1\frac{1}{2}$ foot.

† *Species hardly known.*

27 S. minu'ta; annual, spreading, 4-sided; leaves sessile, ovate, cordate, serrulated; flowers axillary, on long peduncles; calyx 5-cleft; corolla ringent; capsule globular. ⊙. H. Native of various parts of India, appearing during the rainy or cold season. Colúmnea minùta, Roxb. fl. ind. 3. p. 98.

Minute Stemodia. Pl. spreading.

28 S. tomentòsa; annual, diffuse; leaves generally opposite, wedge-shaped, with gashed margins; racemes terminal; calyx ample, 5-cleft; corolla ringent. ⊙. H. Native of Bengal, appearing during the cold season. Colúmnea tomentòsa, Roxb. fl. ind. 3. p. 98.

Tomentose Stemodia. Pl. spreading.

Cult. The species grow well in a light rich soil; and are readily increased by cuttings and seeds. The annual kinds may be planted in the open border about the end of May, in a warm sheltered situation.

XXVII. DODA'RTIA (so named by Tournefort after M. Dodart, member of the Academy of Sciences at Paris, and physician to the princess dowager of Conti.) Tourn. inst. 478. itin. 3. t. 208. Lin. gen. no. 780. Schreb. gen. 1047. Gærtn. fruct. 1. p. 245. t. 53. Juss. gen. 119. ed. Usteri, p. 134. Lam. ill. t. 530. f. 1.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx campanulate, short, angular, 5-toothed. Corolla tubular; limb bilabiate; upper lip emarginate: lower lip broader and trifid, twice the length of the upper one. Stamens 4, didynamous, inclosed? anthers small, roundish, twin. Stigma 2-lobed. Capsule globose, covered by the calyx, 2-celled; placentas convex, growing to the dissepiment.—An herbaceous glabrous plant, with creeping roots; branched, or simple, solitary stems. Leaves distant: lower ones opposite: upper ones alternate, linear, entire. Branches axillary. Flowers axillary, nearly sessile, at the tops of the stem and branches, bracteate. Corollas deep purple or blue.

1 D. orienta'lis (Lin. spec. p. 883.) ♃. H. Native of Tartary; and on Mount Ararat. Mill. fig. 127. Sweet, fl. gard. t. 147. Lower leaves serrated: upper ones entire.

Eastern Dodartia. Fl. July, Aug. Clt. 1739. Pl. 1 to 1½ foot.

Cult. The plant loves a light dry soil, and a warm sheltered situation. It propagates very fast by its creeping roots; so that when once established in a garden, it will multiply fast enough.

XXVIII. MA'SUS (from μασος, *masos*, a teat; tubercles closing mouth of corolla.) Lour. coch. p. 385. R. Br. prod. p. 439. Benth. scroph. ind. p. 26.—Hornemánnia species, Link.—Gratìola species, Horn.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx campanulate, 5-cleft, nearly equal. Corolla bilabiate; upper lip bidentate or bifid: lower one longer, trifid, furnished with 2 gibbosities at the base; lobes entire. Stamens 4, didynamous, inclosed; filaments entire; anthers cohering, or approximating by pairs; cells diverging or divaricate, but at length confluent. Stigma bilamellate. Capsule 2-valved, with a loculicidal dehiscence; valves entire, bearing the dissepiment in the middle; dissepiments at length free; placentas adnate to the dissepiment.—Humble herbs, generally creeping or procumbent. Radical leaves numerous, petiolate, coarsely toothed or lobed: those of the sterile branches opposite; but those of the floral ones are few and alternate. Racemes of the floral branches, or of the scapes, naked, terminal, unilateral. Flowers alternate, pedicellate. Bracteas none, or 1-2 on a pedicel.

1 M. surculòsus (D. Don, prod. fl. nep. p. 86.) stolons creeping; leaves deeply crenated, wrinkled, hispid, and a little curled; those of the sterile branches roundish; segments of calyx shorter than its tube, ovate, obtuse; corolla hardly twice the length of the calyx. ♃. F. Native of Nipaul, Kamaon, and Mussooree. Herb hairy. Racemes radical, pilose, or scapes racemose. Corollas size of those of *Màsus rugòsus*, but the plant is more branched.

Surculose Masus. Pl. creeping.

2 M. rugòsus (Lour. coch. 385.) hardly stoloniferous; leaves all oblong, cuneated, coarsely toothed; segments of the calyx ovate-lanceolate or lanceolate, acute, equal in length to the tube; corollas hardly twice the length of the calyx. ⊙. H. Native of Nipaul, Kamaon, Silhet, Wall.; Saharanpur and Mussooree, Royle; Cochinchina, Lour.; Japan, Thunb. Sweet, fl. gard. t. 36. M. bícolor, Benth. in Wall. cat. no. 3913. Hornemánnia bícolor, Willd. enum. 634. Rchb. icon. bot. exot. 25. t. 37. Gratìola goodeniæfòlia, Horn. hort. hafn. p. 19. Lindérnia Japónica, Thunb. fl. jap. p. 253.? Corolla blue, with a yellow or white palate.

Wrinkled-leaved Masus. Fl. May, Sept. Clt. 1780. Pl. procumbent.

3 M. denta'tus (Wall. cat. no. 3914. Benth. scroph. ind. p. 27.) stolons none; leaves ovate, sinuated; corolla 3 times the length of the calyx. ⊙.? H. Native of Nipaul. Leaves larger, broader, smoother, and less lobed than the preceding; and the corolla is double the size.

Toothed-leaved Masus. Pl. ½ foot.

4 M. pumi'lio (R. Br. prod. p. 439.) superior lip of corolla deeply bifid; scapes 1-4-flowered, and are, as well as the calyxes, glabrous. ⊙.? H. Native of Van Diemen's Land. Flowers purple?

Var. α; racemes 3-4-flowered; pedicels furnished with a setaceous bracteole near the apex.

Var. β; scapes 1-flowered.

Dwarf Masus. Fl. June, July. Clt. 1823. Pl. small.

5 M. lævifòlia (Blum. bijdr. p. 753.) leaves spatulate, repand, smooth on both surfaces; racemes terminal, loose, glanduliferous. ⊙. H. Native of Java, in humid places about Buitenzorg.

Smooth-leaved Masus. Pl. trailing.

Cult. The seeds of annual species require to be reared on a gentle hot-bed; and when the plants are of sufficient size, but not before the end of May, they should be planted out in a warm sheltered situation in the open ground. *M. surculòsus*, being perennial, will require to be kept in the greenhouse during winter.

XXIX. LIMNO'PHILA (from λιμνη, *limne*, a lake; and φιλεω, *phileo*, to love; in reference to the plants loving water.) R. Br. prod. 442. Benth. scroph. ind. p. 25.—Colúmnea species, Roxb.—Gratìola species, Willd.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx tubular, 5-cleft, equal. Corolla funnel-shaped; limb somewhat bilabiate; upper lip 2-lobed: lower lip trifid; lobes all flat. Stamens 4, didynamous; filaments entire, usually abruptly incurved at apex, sometimes dilated; anthers cohering by pairs; cells parallel, distinct. Stigma oblique, dilated, bilamellate. Capsule bisulcate, 2-valved; valves with a loculicidal dehiscence, bifid, dehiscing slowly; dissepiment from the margins of the valves, at length free; placentas adnate.—Erect marsh or aquatic herbs. Leaves opposite: lower ones submersed, deeply many-parted, as in *Ranúnculus aquátilis*, with capillaceously multifid segments; emersed leaves entire, toothed or cut, often tripartite, and hence they appear as if they were verticillate. Flowers

sólitary, opposite, sometimes sessile, sometimes pedicellate, axillary or racemose; pedicels usually bibracteate at apex.

§ 1. Axillariflòræ. *Flowers axillary. Emersed leaves hardly half an inch long.*

1 L. refle'xa (Benth. in Wall. cat. no. 3904. scroph. ind. p. 25.) stem slender, glabrous; emersed leaves usually opposite, quite entire; flowers sessile, axillary; teeth of calyx short, mutic; capsule at length reflexed. ⊙.? ♃. S. Native of the Birman Empire, at Tavoy.

Reflexed-capsuled Limnophila. Pl. aquatic.

2 L. heterophy'lla (Benth. in Wall. cat. no. 3905. scroph. ind. p. 25.) stem thickish, glabrous; emersed leaves usually 3 in a whorl, serrulated; flowers sessile axillary, subverticillate; teeth of calyx subulately acuminated. ♃. S. Native of Nipaul, Wall.; at Nathpur and Gagpur, Hamilt.; Peninsula, ? Heyne. Colúmnea heterophýlla, Roxb. fl. ind. 3. p. 97.

Variable-leaved Limnophila. Pl. aquatic.

3 L. sessiliflòra (Blum. bijdr. p. 749. Benth. in Wall. cat. no. 3902. scroph. ind. p. 25.) stem hairy; emersed leaves 3-parted, cut; flowers axillary, sessile. ♃. S. Native at Goalpara, Hamilt.; Silhet, Wall.; Java, Blum. Said to be nearly allied to the following.

Sessile-flowered Limnophila. Pl. aquatic.

4 L. villòsa (Blum. bijdr. p. 750.) stem villous; leaves all opposite, lanceolate-linear, stem-clasping, serrated, rather pilose; peduncles axillary, solitary, 1-flowered, and are, as well as the calyxes, villous. ♃. S. Native of Java, in humid parts of the mountains.

Villous Limnophila. Pl. aquatic.

5 L. puncta'ta (Blum. bijdr. p. 750.) stem a little striated; leaves all opposite, or 3 in a whorl, stem-clasping, oblong-lanceolate, serrated, glabrous, full of depressed dots on both surfaces; peduncles axillary, 1-flowered, and are, as well as the calyxes, clothed with glandular hairs. ♃. S. Native of Java, in humid places near Tjiradjas, Buitenzorg, &c.

Dotted-leaved Limnophila. Pl. aquatic.

6 L. gratioloi'des (R. Br. prod. p. 442.) stem glabrous; emersed leaves opposite: lower ones tripartite, cut, or capillaceously multifid: superior ones entire, serrulated; flowers pedicellate, opposite, axillary. ♃. S. Native throughout India, in lakes, pools, and marshes, and, therefore, the habit is very variable. It is also to be found in New Holland, within the tropic. L. trífida, Spreng. syst. 2. p. 802. Hottònia I'ndica, Lin. spec. 208. Gratìola trífida, Willd. spec. 1. p. 104. Hydropítyon pedunculàtum, Ser. in D. C. prod. 1. p. 422. Colúmnea balsámica, Roxb. fl. ind. 3. p. 97.—Burm. zeyl. t. 55. f. 2.—Rheed. mal. 12. t. 36. Root creeping. Corolla blue.

Var. β, *myriophylloìdes* (Benth. scroph. ind. p. 26.) leaves almost all many-parted; segments short, capillaceously multifid. ♃. S. L. myriophylloìdes, Roth, nov. spec. 294.

Var. γ, *elongàta* (Benth. scroph. ind. p. 26.) stem elongated; submersed leaves capillaceously multifid: cauline ones distant, nearly all entire. ♃. S. L. elongàta, Benth. in Wall. cat. no. 3903.

Gratiola-like Limnophila. Pl. aquatic.

7 L. pinnati'fida (Blum. bijdr. p. 749.) stems striated, beset with glandular hairs above; leaves all verticillate, setaceously multifid; flowers axillary, nearly sessile, solitary. ♃. S. Native of Java, in rivulets near Linga Jattie, in the province of Cherebon, where it is called *Gangang*.

Pinnatifid-leaved Limnophila. Pl. aquatic.

8 L. chamædrifòlia; leaves lanceolate, ovate, toothed at top; flowers opposite, axillary; ? calyx length of tube. ♃. S. Native of Malabar, in humid places. Gratìola chamædrifòlia, Lam. ill. 1. p. 54. Grat. trífida, β, integrifòlia, Vahl, enum. 1. p. 90.—Rheed. mal. 9. p. 166. t. 85. bad. Perhaps only a variety of *L. gratioloìdes*.

Germander-leaved Limnophila. Pl. aquatic.

9 L. ? Roxbu'rghii; annual, erect, with creeping roots; leaves opposite, nearly sessile, oblong, serrated; flowers axillary, solitary, nearly sessile. ⊙. S. Native among the Circars, in rills of fresh water. Caprària gratíssima, Roxb. fl. ind. 3. p. 92.—Rheed. mal. 9. t. 78. Stems round, as thick as the little finger; all the joints under water emit many fibrous roots, or multifid, filiform leaves. Leaves $2\frac{1}{2}$ inches long, and 1 broad. Corolla campanulate, purple: upper lip broader and emarginate. It is delightfully aromatic.

Roxburgh's Limnophila. Pl. aquatic.

§ 2. Racemòsæ. *Flowers racemose. Emersed leaves usually more than an inch long.*

10 L. ? diffu'sa; suffruticose, diffuse; leaves opposite, petiolate, lanceolate, obtuse, entire; spikes axillary and terminal, shorter than the leaves. ♄. S. Native of India. Caprària diffùsa, Roxb. fl. ind. 3. p. 92. Plant spreading, young parts puberulous. Leaves 1-3 inches long, and under one in breadth. Flowers small, purple. Racemes villous, clammy.

Diffuse Limnophila. Pl. diffuse.

11 L. racemòsa (Benth. in Wall. cat. no. 3907.) emersed leaves opposite, or subverticillate, 3-nerved, serrated, or the lower ones are parted; racemes dense, many-flowered; calyxes membranous, smooth, pedicellate. ♃. S. Native of the Indian Peninsula and Bengal, Wall. Bejar Royle. Cyrílla aquática, Roxb. cor. 2. p. 47. t. 189. L. hyssopifòlia, Roth, nov. spec. 297.? Corollas purple.

Racemose-flowered Limnophila. Pl. aquatic.

12 L. grati'ssima (Blum. bijdr. p. 749.? Benth. in Wall. cat. no. 3906. scroph. ind. p. 26.) emersed leaves 3 in a whorl, lanceolate-linear, serrated, feather-nerved; raceme loose; calyx with elevated stripes, on long pedicels. ♃. S. Native at Goalpara, Hamilt.; Peninsula, Wight; Ceylon, Macrae; Java, Blume.—Rheed. mal. 10. t. 6, ex Blume. Leaves all ternate, sessile. Peduncles and calyxes clothed with glandular hairs, ex Blume.

Very grateful Limnophila. Pl. aquatic.

13 L. polysta'chya (Benth. in Wall. cat. no. 3909.) emersed leaves 3 in a whorl, 3-nerved; racemes branched, slender, many-flowered; flowers small, sessile. ♃. S. Native of the Indian Peninsula and Bengal.

Many-spiked Limnophila. Pl. aquatic.

N.B. L. campanuloìdes, Benth. in Wall. cat. no. 3908, probably belongs to Gentiàneæ.

Cult. All the species of Limnóphila being aquatic, they should be grown in a cistern placed in a stove, or warm part of a greenhouse, and treated like other tender aquatics.

XXX. MORGA'NIA (named in memory of Hugh Morgan, an apothecary of London, whose botanic garden is spoken of highly by Lobel and Gerarde in several parts of their works.) R. Br. prod. p. 441.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted, equal. Corolla ringent; upper lip 2-lobed: lower lip trifid; lobes nearly equal, obcordate. Stamens 4, didynamous, inclosed; lobes of anthers divaricate, mutic. Stigma bilamellate. Capsule 2-celled, 2-valved; valves bipartite; dissepiment from the inflexed margins of the valves.—Herbs with opposite leaves. Stems erect, tetragonal. Leaves linear. Peduncles axillary, 1-flowered, bibracteate at apex. Flowers blue. This

genus is nearly allied to *Herpéstis*, but is readily distinguished by the equal calyx, and more unequal corolla.

1 M. gla'bra (R. Br. prod. p. 441.) glabrous; leaves linear, entire, or few-toothed; flowering peduncles about equal in length to the calyx. ♃.? S. Native of New Holland, within the tropic.

Glabrous Morgania. Pl. ½ foot.?

2 M. pube'scens (R. Br. prod. 441.) downy; leaves lanceolate-linear, toothed; flowering peduncles shorter than the calyx. ♃.? S. Native of New Holland, within the tropic. Very nearly allied to the preceding, and is, perhaps, only a variety of it.

Downy Morgania. Pl. ½ foot.

Cult. For culture and propagation see *Stemòdia*, p. 542.

XXXI. HERPE'STIS (from ἑρπηστης, *herpestes*, any thing that creeps, in allusion to the creeping habit of the plants.) Gærtn. fruct. 3. p. 187. t. 214. R. Br. prod. p. 441. Benth. scroph. ind. p. 29.—Monnièra, Browne, Michx. &c. Gratìola species, Lin. and others. Calýtriplex, Ruiz. et Pav. Bràmia, Lam. Mart. pl. bras. 3. p. 16.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted; upper segment large, ovate, covering the rest: 2 lower ones narrower: 2 lateral ones linear. Corolla tubular, somewhat bilabiate: upper lip bifid: lower one trifid; segments all flat, and nearly equal. Stamens 4, didynamous, inclosed; anthers approximating by pairs; cells diverging, or divaricate, at length nearly confluent. Style simple; stigma emarginate, or bilamellate. Capsule hardly furrowed, 4-valved; margins of the valves flat; dissepiment at length free; placentas adnate.—Usually creeping, glabrous, or villous herbs. Leaves opposite, quite entire, or toothed. Flowers axillary, sessile, or pedicellate, solitary, or 2-3 together. Bracteas wanting, or furnished with 1-2 on each peduncle. Corollas generally blue.

§ 1. *Calyx bractless.*

1 H.? ama'ra (Benth. scroph. ind. p. 30.) plant almost glabrous; leaves petiolate, ovate, crenated, cuneated at the base; peduncles axillary, shorter than the leaves, 2-4-flowered, somewhat racemose; flowers pedicellate. ♃. S. Native of the Moluccas, Java. Gratìola amàra, Roxb. fl. ind. ed. Car. 1. p. 136.? Caránga amàra, Vahl, enum. 1. p. 100. Curània amàra, Juss. l. c. Blum. bijdr. 746. Serrátula amàra, Rumph. amb. 5. p. 459. t. 170. f. 1. According to Roxburgh only 2 of the filaments are fertile. Rumphius says, the leaves are exceedingly bitter, and might, no doubt, answer valuable purposes in medicine.

Bitter Herpestis. Pl. creeping.

2 H. ova'ta (Wall. cat. no. 3896. Benth. scroph. ind. p. 30.) glabrous, procumbent; leaves short, petiolate, ovate, crenated; flowers solitary, opposite, nearly sessile. ♃. S. Native of the Birman Empire at Tavoy. Habit of *H. chrysántha*, from which it hardly differs unless in the sessile flowers.

Ovate-leaved Herpestis. Pl. procumbent.

3 H. linearis (Spreng. syst. 2. p. 802.) stem humble, branched; leaves linear, quite entire, glabrous; peduncles axillary, twin, 1-flowered. ♃. S. Native of Coromandel. Lindérnia sesamoìdes, Spreng. new. entd. p. 14.

Linear-leaved Herpestis. Pl. humble.

4 H. chrysa'ntha (Cham. et Schlecht, in Linnæa, 2. p. 577.) herbaceous, glabrous; stems at first erect, but at length decumbent; leaves petiolate, ovate, serrated; peduncles opposite, a little shorter than the leaves; outer sepals ovate, nearly entire. ⊙. H. Native of Mexico. Corolla yellow.

Yellow-flowered Herpestis. Pl. decumbent.

5 H. lanceola'ta (Wight, in Wall. cat. no. 3899. Benth. scroph. ind. p. 30.) glabrous, erect; leaves lanceolate-linear, quite entire, narrowed at the base; flowers pedicellate, 1-3 together. ♃. S. Native of the Peninsula of India.

Lanceolate-leaved Herpestis. Pl. ¾ foot.

6 H. serpylloi'des (Cham. et Schlecht, in Linnæa, 2. p. 574.) suffruticose; stems radicant, tufted; leaves sessile, lanceolate, remotely and obsoletely serrated; flowers sessile, or nearly alternate and opposite; outer sepals lanceolate, acute. ♃. S. Native of Brazil, within the tropic, Sello. Habit of *Thymus serpýllum*. Flowers small.

Wild-Thyme-like Herpestis. Shrub creeping.

7 H. flagella'ris (Cham. et Schlecht, in Linnæa, 2. p. 575.) suffruticose, glabrous; stems whip-like, filiform; leaves sessile, lanceolate, nearly entire, or serrated; peduncles very long, alternate; outer sepals lanceolate, acute. ♄. S. Native of the South of Brazil, in the province of Monte Video. H. Montevidénsis, Spreng. syst. 2. p. 802. Flowers deep coloured.

Var. β, *veronicæfòlia* (Cham. et Schlecht. p. 576.) plant more slender; leaves narrower, usually serrated; serratures few, deep, rarely obsolete; flowers smaller. ♃. G. Native of Monte Video.

Whip Herpestis. Pl. creeping.

8 H. tene'lla (Cham. et Schlecht. l. c. p. 576.) herbaceous, glabrous; stems prostrate; leaves on short petioles, ovate, acutely serrated; peduncles very long, alternate; outer sepals ovate, cordate. ♃. S. Native of the South of Brazil, at Rio Pardo, Sello.

Tender Herpestis. Pl. prostrate.

9 H. callitrichoi'des (H. B. et Kunth, nov. gen. amer. 2. p. 367.) quite glabrous, prostrate; leaves oblong, acute, cuneated at the base, remotely toothed; peduncles shorter than the leaves; segments of calyx unequal, lanceolate-linear. ⊙. S. Native of sandy places near San Fernando do Apure. Morgània callitrichoìdes, Spreng. syst. 2. p. 803. Corolla pale red. Perhaps a species of *Lindérnia*.

Callitriche-like Herpestis. Pl. prostrate.

10 H. Vandellioi'des (H. B. et Kunth, l. c.) glabrous, procumbent; leaves obovate, acutish, serrated; peduncles longer than the leaves; outer segments of calyx oblong, acute, obsoletely serrated at apex. ♃. S. Native of Mexico, in the fissures of rocks between Moran and Omitlan, at the altitude of 1340 hexapods. Root perpendicular.

Vandellia-like Herpestis. Pl. procumbent.

11 H. caprarioi'des (H. B. et Kunth, l. c. p. 368.) quite glabrous, procumbent, creeping; leaves ovate, obtuse, cuneated at the base, serrately crenated; peduncles about equal in length to the leaves; outer segments of calyx oblong, acute, sub-crenated. ♃. S. Native of New Granada, in dry sandy places on the banks of the river Magdalena, near El Penon. Corolla yellow, longer than the calyx; upper lip emarginate: lower one bipartite, reflexed.

Capraria-like Herpestis. Pl. creeping.

12 H. colubri'na (H. B. et Kunth, l. c.) glabrous, procumbent; leaves oblong, acutish, cuneated at the base, serrated; peduncles twice the length of the leaves; outer segments of calyx oblong, acute, quite entire. ♃. S. Native of Peru, in humid places near Guancabamba and Sondorillo, at the altitude of 1000 hexapods, where it is called *Yerba de Coulebra* by the natives. Corolla yellow; upper lip emarginate: lower one bearded at the base. The plant is used against the bites of venomous animals.

Snake Herpestis. Pl. procumbent.

13 H. Cube'nsis (Poepp. ex Cham. et Schlecht, l. c.) this species differs from *H. tenélla* in the peduncles being opposite, and in the outer sepals being elliptic and obtuse, not as in that plant, ovate, cordate, acuminated. ♃. S. Native of Cuba.

Plant glabrous; branches twiggy. Leaves roundish-ovate, crenulated; peduncles axillary, filiform, opposite, exceeding the leaves.

Cuba Herpestis. Pl. creeping.

14 H. CHAMÆDRYOÏ'DES (H. B. et Kunth, l. c. p. 369.) glabrous, procumbent; leaves obovate, obtuse, crenately serrated; peduncles longer than the leaves; outer segments of calyx ovate-oblong, acutish, quite entire. ♃. S. Native of Quito, in temperate places near Chillo and Lulumbamba, at the altitude of 1360 hexapods. Lindérnia dianthèra, Swartz, prod. 92. fl. ind. occ. 2. p. 1058. Corolla yellow: upper lip almost entire; throat bearded. This is hardly distinct from *H. colubrìna*, H. B. et Kunth, and *H. chrysántha*, Cham. is probably the same.

Germander-like Herpestis. Pl. procumbent.

15 H. RE'PENS (Schlecht, et Cham. in Linnæa, 5. p. 107.) stems creeping, filiform; leaves sessile, roundish-ovate, entire, glabrous; peduncles downy, shorter than the leaves; outer segments of calyx ovate. ♃. S. Native of Jamaica, in watery places. Gratìola rèpens, Swartz. prod. p. 14. fl. ind. 1. p. 39. icon. t. 3. Corollas small, white.

Creeping Herpestis. Pl. creeping.

16 H. OBOVA'TA (Poepp. pl. cub. exsic. ex Schlecht, et Cham. in Linnæa, 5. p. 107.) stem woolly; leaves obovate. ♃. S. Native of Cuba. Gratìola rèpens, Willd. herb. Gratìola parviflòra and Hydrótrida Beccabúnga, Juss.

Obovate-leaved Herpestis. Pl. creeping.

17 H. CÆSPITÒSA (Cham. et Schlecht, in Linnæa, 8. p. 33.) glabrous; stems tufted, densely leafy, radicant, ascending; leaves lanceolate, quite entire, rather fleshy, 1-nerved; peduncles alternate, 3-6 times longer than the leaves; calyx somewhat unibracteate; outer segments ovate, acute. ♃. S. Native of Brazil, Sello. Habit and stature of *Verónica saxátilis*, but smaller and more slender. Leaves scarcely 2 lines long, exceeding the internodes, bluntish, subconnate. Sepals unequal, the 3 outer ones ovate, acute: the 2 inner narrower, ovate, acuminate, acute.

Tufted Herpestis. Pl. creeping.

18 H. HERNIARIOÏ'DES (Cham. et Schlecht, in Linnæa, 8. p. 34.) glabrous; stems herbaceous, tetragonal, much branched, trailing, rooting; leaves ovate, coarsely few-crenated, obtuse, narrowed into the petioles; petioles connate; flowers axillary, scattered, on short pedicels; calyx loose in the fructiferous state, not exceeding the capsule; valves of capsule entire; calycine segments obtuse; outer ones ovate-lanceolate. ♃. S. Native of Brazil, Sello. Root rather woody, nearly simple. Plant tufted. Lobes of the limb of the corolla almost equal in length, rather unequal.

Herniaria-like Herpestis. Pl. creeping, and tufted.

§ 2. *Calyx bracteate.*

19 H. FLORIBU'NDA (R. Br. prod. p. 442.) glabrous, erect; leaves linear-lanceolate, obtuse, quite entire; sepals or segments of the fructiferous calyx reticulated and subcordate; peduncles bibracteate under the apex, shorter than the leaves. ♃. S. Native of New Holland, within the tropic; and of Java, in rice fields.

Bundle-flowered Herpestis. Pl. ½ foot.

20 H. DOMINGE'NSIS (Spreng. syst. 2. p. 801.) stem erect, glabrous, branched; leaves petiolate, oblong, attenuated at the base, crenated; peduncles verticillate; fructiferous calyx reticulated. ♃.? G. Native of Hispaniola, Bertero.

St. Domingo Herpestis. Pl. erect.

21 H. ERE'CTA (Spreng. syst. 2. p. 801.) villous; stem erect; leaves ovate-oblong, subcrenulated; peduncles axillary, opposite, short, erect. ♃.? S. Native of Brazil, Sello.

Erect Herpestis. Pl. erect.

22 H. STRI'CTA (Schrad. ex Link, enum. 2. p. 142.) stem erect, glabrous, branched; leaves oblong-lanceolate, acute, running into the petioles, unequally serrated; peduncles axillary, usually solitary, short; calyxes crenulated. ♃.? S. Native of Brazil. Flowers 4-6 in a whorl, blue.

Strict Herpestis. Fl. Aug. Clt. 1824. Pl. erect.

23 H. AMPLEXICAU'LIS (Pursh, fl. amer. sept. 2. p. 418.) stems woolly; leaves short, cordate-oval, stem-clasping, entire, obtuse; peduncles shorter than the leaves. ♃. H. Native of Carolina and Georgia, in ponds and ditches. Monnièra amplexicaúlis, Michx. fl. bor. amer. 2. p. 22. Flowers blue, larger than in the other North American species.

Stem-clasping-leaved Herpestis. Fl. July, Aug. Clt. 1818. Pl. creeping.

24 H. ROTUNDIFÒLIA (Pursh, l. c.) minutely pubescent; leaves suboval-orbicular, many-nerved; peduncles opposite, about equal in length to the leaves. ♃. H. Native of Illinois and other western parts, on overflowed banks of rivers. Monnièra rotundifòlia, Michx. fl. bor. amer. 2. p. 22. Flowers small, pale blue.

Round-leaved Herpestis. Fl. July, Aug. Clt. 1824. Pl. creeping.

25 H. MICRA'NTHA (Pursh, l. c.) glabrous, succulent; leaves sessile, oval, obtuse, quite entire, striately nerved; peduncles shorter than the leaves; calyx 5-leaved; style bifid. ⊙. H. Native from Pennsylvania to Virginia, on the banks of rivers to the edge of low water mark. Flowers very small, white. This species approaches near to *Lindérnia*.

Small-flowered Herpestis. Fl. July, Aug. Clt. 1817. Pl. creeping.

26 H. MONNIE'RA (H. B. et Kunth, nov. gen. amer. 2. p. 294. Benth. scroph. ind. p. 30.) creeping, glabrous; leaves cuneiform, quite entire, or toothed at apex; flowers solitary, opposite, on long pedicels, bibracteate under the apex. ♃. S. Native throughout India, China, and the Moluccas; and throughout North and South America, West Indies, Sandwich Islands, &c. Gratìola Monnièra, Lin. amœn. acad. 4. p. 306. Jacq. obs. bot. p. 4. t. 1. Roxb. cor. 2. p. 41. t. 178. fl. ind. ed. Car. 1. p. 141. Caprària Monnièra, Roxb. in herb. Willd. no. 11526. Gratìola portulacàcea, Weinm. in syll. pl. nov. bot. zeit. 1. p. 222. Sims, bot. mag. 2557. Monnièra Brównei, Pers. ench. 1. p. 166. Monnièra cuneifòlia, Michx. fl. bor. amer. 2. p. 22. Herpéstis cuneifòlia, Pursh, fl. amer. sept. 2. p. 418. Herpéstis Bròwnei, Nutt. gen. amer. 2. p. 42. Link, enum. 2. p. 142, exclusive of synonymes. Herpéstis procúmbens, Spreng. nov. prov. p. 22. syst. 2. p. 802. Bràmia I'ndica, Lam. dict. 1. p. 459. Calýtriplex obovàta, Ruiz, et Pav. syst. fl. per. p. 164. —Ehrh. pict. t. 14. f. 2.—Browne, jam. 1. p. 296. t. 28. f. 1. —Sloan. hist. 1. p. 203. t. 129. f. 1.—Rheed. mal. 10. p. 27. t. 14. Outer segments of calyx ovate-oblong, acute, entire. Corollas small, pale blue. The natives of India use the expressed juice of this species mixed with *Petròlium* to rub on parts affected with rheumatic pains.

Monnier's Herpestis. Fl. July, Sept. Clt. 1772. Pl. creeping.

27 H. STELLARIOÏDES (Cham. et Schlecht, in Linnæa, 8. p. 32.) glabrous; stem erect, nearly simple, loose; leaves subtern, sessile, linear-lanceolate, obsoletely serrated at apex; peduncles axillary, equal in length to the leaves; calyx bibracteate: the larger segments ovate, obtuse, reticulated. ♃. S. Native of Brazil, Sello. Leaves longer than the internodes, about an inch long, rarely opposite, but usually 3 in a whorl, half stem-clasping. Bracteas and calyx as in *H. Monnièra*, but the corolla is smaller, and more deeply cleft, and the segments are narrower and longer, oblong, obtuse.

Stichwort-like Herpestis. Pl. 1 to 1½ foot.

28 H. Morane'nsis (H. B. et Kunth, nov. gen. amer. 2. p. 367.) creeping, glabrous; leaves cuneate-oblong, obtuse, obsoletely and remotely denticulated at apex, rather fleshy; peduncles longer than the leaves, bibracteate under the calyx; outer segments of calyx ovate-oblong, bluntish, quite entire. ♃. S. Native of New Spain, between Mount Ventoso and the mines of Moran, at the altitude of 1340 hexapods.

Moran Herpestis. Pl. creeping.

29 H. tomentòsa (Schlecht, et Cham. in Linnæa, 5. p. 106.) plant clothed with white wool, creeping, branched; leaves spatulate, elliptic, acutish, sessile, somewhat crenately serrated towards the apex; flowers axillary, sessile; calyx bibracteate; bracteas and calycine segments linear-acuminated and acute. ♃. S. Native of Vera Cruz, in sandy places.

Tomentose Herpestis. Pl. creeping.

30 H. lanugino'sa (Blum. bijdr. p. 747.) woolly; leaves ovate, doubly crenated; peduncles shorter than the petioles; calyx bibracteate. ♃. S. Native of humid places near Sadjram.

Woolly Herpestis. Pl. erect.?

31 H. Java'nica (Blum. bijdr. p. 743.) stems procumbent, rather villous; leaves ovate, unequally crenated, smoothish, full of depressed dots beneath; flowers nearly sessile; calyxes bibracteate. ♃. S. Native of Java, in rice fields.

Java Herpestis. Pl. procumbent.

32 H. spatula'ta (Blum. bijdr. p. 743.) quite glabrous; leaves spatulate, obsoletely serrulated above; peduncles longer than the leaves; calyx bibracteate. ♃. S. Native of Java, in bogs about Batavia and Buitenzorg.

Spatulate-leaved Herpestis. Pl. procumbent.?

N.B. Herpéstis floribúnda, Roth, nov. spec. 289, but not of R. Br., and H. rugòsa, Roth, l. c. p. 290, do not belong to this genus, or even probably to the order. They are, perhaps, Acanthaceous plants.

Cult. Most of the species require to be grown in moist soil, or in shallow water. They are readily increased by separating the rooted stems.

XXXII. MECARDO'NIA (named after Antonio Meca y Cardona, a Spanish botanist, and one of the founders of the botanic garden of Barcelona.) Ruiz. et Pav. fl. per. syst. p. 164. Mart. nov. gen. 1. p. 16. t. 208.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted, unequal; the 3 outer segments the largest, propped by adnate twin bracteas. Corolla tubular; limb short, sub-bilabiate, 5-lobed. Stamens 4, didynamous, inclosed; anthers discrete. Stigma oblique, subcapitate, on an incurved style. Capsule 2-celled, completely 2-valved; dissepiment placentiferous, at length free; valves parallel.—Small, herbaceous, decumbent plants, with tetragonal stems, and opposite leaves on short petioles; and axillary and terminal flowers. This genus is nearly allied to *Herpéstis* and *Morgània.*

1 M. pusílla (Mart. pl. bras. 1. p. 16. t. 208.) leaves lanceolate, or broad-lanceolate, obsoletely serrated. ♃. S. Native of Brazil, in the provinces of St. Paul and Bahia, in sandy desert fields.

Least Mecardonia. Pl. decumbent.

2 M. ova'ta (Ruiz, et Pav. syst. veg. per. p. 164.) leaves ovate, serrated. ♃. S. Native of Peru.

Ovate-leaved Mecardonia. Pl. decumbent.

Cult. For culture and propagation see *Herpéstis* above.

XXXIII. BRA'MIA (*Brami* is the Malabar name of *Herpéstis Monnièra*, according to Rheed. mal. 10. p. 27. t. 14.) but not of Lam. nor Mart. Herpéstis, Mart. pl. bras. 3. p. 13, but not of Gærtn. and R. Br. Mèlia, Vand.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx unequal; the 3 outer segments the broadest, and subcordate: the 2 inner ones keeled. Corolla ringent, bilabiate; upper lip 2-lobed: lower lip 3-lobed. Stamens 4, didynamous; anthers discrete. Ovarium girded by a long, toothed disk. Stigma bifid. Capsule 2-celled; dissepiment placentiferous; valves bipartite.—Herbs with opposite leaves. Peduncles axillary, bibracteate.

1 B. lanígera; ♃. S. Native of tropical Brazil, Sello. Herpéstis lanígera, Cham. et Schlecht, in Linnæa, 2. p. 572. Verónica rotundifòlia Brasiliénsis, Spreng. syst. 1. p. 67. Stem creeping, woolly. Leaves sessile, ovate, orbicular, entire, feather-nerved; peduncles equal in length to the leaves and longer, bibracteate under the calyx.

Wool-bearing Bramia. Pl. creeping.

Cult. For culture and propagation see *Herpéstis*, above.

XXXIV. SPHÆROTHE'CA (from σπαιρα, *spaira*, a sphere; and θηκη, *theke*, a case, or sheath, in reference to the globular capsule.) Cham. et Schlecht, in Linnæa, 2. p. 608.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx deeply 5-parted, equal, permanent. Corolla tubular; limb unequal, 5-lobed, bilabiate; upper lip 2-lobed: lower one stretched out, and 3-lobed; lobes entire, obtuse. Stamens 4, didynamous, inclosed; filaments filiform, glabrous, short, inserted a little beneath the throat: lower ones the longest; anthers 2-celled, roundish, mutic, naked, approximating by pairs. Style inclosed; stigma bilamellate. Capsule globose, 2-celled, dehiscing slowly at the dissepiment, as also in the middle of the cells, and, therefore, the capsule appears 4-valved; dissepiment wholly placentiferous Seeds numerous, minute, oblong, angular, striated, and as if they were foveolate.—Glabrous herbs with opposite dotted leaves; axillary, 1-flowered peduncles, and bibracteate calyxes.

1 S. scoparioìdes (Cham. et Schlecht, l. c. p. 606.) ♃. H. Native of equinoctial Brazil. Root creeping.? Stem tetragonal, erect, ornamented with flowers and leaves from the base to the apex, as well as the branches. Leaves lanceolate, acute, obsoletely, unequally, and sharply serrated, feather-nerved, 2 inches long; margins and teeth cartilaginous; petioles short. Flowers small. Segments of calyx linear-lanceolate, 3-nerved. Corollas small, downy outside, bluish in the dried state.

Scoparia-like Sphærotheca. Pl. 2 to 3 feet.

Cult. For culture and propagation see *Herpéstis* above.

XXXV. DI'CEROS (from δις, *dis*, twice; and κερος, *keros*, a horn; in reference to the bicornute anthers.) Lour. coch. p. 381. Blum. bijdr. p. 751.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx bractless, 5-parted, equal. Corolla funnel-shaped; limb bilabiate, sometimes nearly equal. Stamens 4, didynamous; filaments ascending: longer ones callous at the base; cells of anthers diverging, conniving in a cruciate manner. Stigma bilamellate. Capsule nearly globose, 2-celled, 2-valved; valves undivided; dissepiment parallel; placentas adnate to the dissepiment.—Herbs with opposite leaves, and with generally terminal racemes of flowers.

Sect 1. *Corolla subcampanulate; limb 4-lobed, nearly equal.*

1 D. Cochinchine'nsis (Lour. coch. p. 381.) leaves 3 in a whorl, ovate-lanceolate, serrated, fleshy, glabrous; peduncles solitary, axillary, 1-flowered, villous. ♃. G. Native of Cochinchina, in marshy places. Root creeping. Flowers pale violet.

Corolla campanulate; segments of the limb cordate, one of them larger than the others. Stigma spoon-shaped, inflexed.

Cochinchina Diceros. Pl. 1 foot.

Sect. 2. *Limb of corolla bilabiate: upper lip emarginate: lower lip 3-lobed.*

2 D. latifo'lius (Blume, bijdr. p. 752.) leaves opposite, nearly sessile, elliptic, obtuse, cuneated at the base, bluntly toothed, rather scabrous; racemes terminal, elongated; stem nearly simple. ♃.? S. Native of Java, in humid places on the mountains.

Broad-leaved Diceros. Pl. 1 tò 2 feet?

3 D. monta'nus (Blum. bijdr. p. 752.) leaves opposite, ovate, bluntly toothed, rather pilose on both sides, as well as the stem; peduncles axillary, solitary, sub-umbellate, 3-5-flowered. ♃.? S. Native of Java, on Mount Salak.

Mountain Diceros. Pl. 1 to 2 feet?

4 D. glandulíferus (Blum. bijdr. p. 752.) downy; leaves opposite, sessile, ovate, obtuse, crenulated; raceme terminal, clothed with glandular hairs. ♃.? S. Native of Java, in grassy places near Buitenzorg, and about Batavia.

Gland-bearing Diceros. Pl. 1 to 2 feet?

5 D. cæspito'sus (Blum. bijdr. p. 753.) downy; leaves sessile, opposite, ovate, serrulated; peduncles 1-flowered, usually solitary, extra-axillary. ♃.? S. Native of Java, in the western provinces, among grass. There is a pilose and a glabrous variety of this species.

Tufted Diceros. Pl. tufted.

Cult. For culture and propagation see *Herpéstis*, p. 546.

XXXVI. LOXOPHY'LLUM (from λοξος, *loxos*, a bow; and φυλλον, *phyllon*, a leaf; in reference to the oblique leaves.) Blum. bijdr. p. 750.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx bilabiate; lip 3-parted: lower lip bipartite. Corolla bilabiate; tube ventricose: upper lip erect, emarginate: lower one larger, trifid, equal; throat papillose. Stamens 4, didynamous, exserted; anthers connected. Style inclosed; stigma obtuse, emarginate. Capsule globose, 2-celled, 4-valved; placenta central, 4-parted, at length free.—Herb downy, with a branched, nodose stem. Leaves alternate, the opposite ones being stipular, oblong, oblique; peduncles racemose, axillary.—This genus differs from *Conòbea* in the calyx being bilabiate, but the structure of the fruit and anthers are similar, as well as the habit.

1 L. racemo'sum (Blum. bijdr. p. 751.) ♃.? S. Native of Java, among stones at the foot of Mount Menari, in the province of Buitenzorg.

Racemose-flowered Loxophyllum. Pl.

Cult. For culture and propagation see *Herpéstis*, p. 546.

XXXVII. MATOU'REA (the meaning of this word is not explained by Aublet.) Aubl. guian. 2. p. 641. t. 253.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 4-parted. Corolla tubular, incurved; limb bilabiate: upper one erect, bifid: lower one deflexed, trifid, unequal. Stamens didynamous. Stigma bilamellate. Capsule 1-celled, ex Aubl., but probably 2-celled, 2-valved, many-seeded; placenta central, seminiferous. Seeds minute.—Herbs with tetragonal, nodose branches, and opposite leaves, and axillary, almost solitary flowers.

1 M. nigre'scens (Benth. scroph. ind. p. 16.) glabrous; stem erect, branched; leaves lanceolate, bluntish, toothed towards the apex. ♃. H. Native from Pennsylvania to Carolina, in ditches and wet places. Gratìola acuminàta, Walt. fl. carol. p. 61. Ell. fl. carol. p. 15. Gerárdia cuneifòlia, Pursh, fl. amer. 2. p. 422. Flowers large, pale yellow.? Calyx 5-parted.

Blackish Matourea. Pl. 1 to 1½ foot.

2 M. prate'nsis (Aubl. guian. 2. p. 642. t. 259. under M. Guianénsis.) leaves petiolate, ovate-oblong, acute, crenated. ☉. S. Native of the Island of Trinidad, and of Brazil, on road-sides. Vandéllia praténsis, Vahl, eclog. 2. p. 48. Willd. spec. 3. p. 343. Tupeicàvi, Pis. bras. 249. Corollas blue.

Meadow Matourea. Pl. 2 feet.

3 M.? du'bia; leaves lanceolate, acutely serrated, attenuated at the base, and somewhat auricled; flowers nearly sessile, subspicate. ♃. G. Native of Buenos Ayres. Gratìola tetragòna, Hook. bot. mag. t. 3134. Flowers blue.

Doubtful Matourea. Fl. Aug. Clt. 1830. Pl. 1 foot.

Cult. For culture and propagation see *Herpéstis*, p. 546.

XXXVIII. CACONA'PEA (meaning unknown to us.) Cham. et Schlecht, in Linnæa, 8. p. 28.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted, unequal; upper segment the largest. Corolla tubular: limb 4-cleft, bilabiate: upper lip shorter, emarginate: lower one trifid, equal. Stamens 4, didynamous, inclosed; anthers roundish, 2-celled, emarginate at the base. Stigma compressedly bilamellate, bent a little forward. Capsule cylindrical, inclosed, 2-celled, 4-valved; dissepiment separating slowly from the inflexed valves.—An herb with the habit of *Gratìola amàra.* Leaves opposite, decussate, quite entire, full of pellucid or glandular dots. Flowers small, in axillary contracted cymes, falsely verticillate. Calyx bibracteate.

1 C. gratioloìdes (Cham. et Schlecht, l. c. p. 29.) ♃.? S. Native of Brazil, Sello; Bahia, Lhotski, in marshes. Plant glabrous, or rather pilose on the midrib and margins of the leaves. Stem purplish. Leaves complicate, linear, or linear-lanceolate, acute, longer than the internodes. Bracteas setaceous.

Gratiola-like Caconapea. Pl. 1½ to 3 feet.

Cult. For culture and propagation see *Herpéstis*, p. 546.

XXXIX. RANA'RIA (from *rana*, a frog, in allusion to the habitation of the plant, in inundated places.) Cham. et Schlecht, in Linnæa, 8. p. 30.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted; segments of equal length; outer 3 the broadest. Corolla ventricosely tubular; limb 4-cleft, nearly equal. Stamens 4, didynamous, almost erect; anthers sagittate, obtuse within the throat; cells elliptic. Stigma capitellately emarginate. Capsule inclosed, 4-valved; dissepiment membranous, thin, free, seminiferous at the axis.—A small, marsh, creeping herb. Leaves opposite, decussate, quite entire, full of pellucid dots. Flowers small, axillary, fascicled, on short pedicels. Calyx bibracteate; bracteas minute.

1 R. monnierioìdes (Cham. et Schlecht, in Linnæa, 8. p. 31.) ♃. S. Native of Brazil, in inundated places, Sello. Leaves half stem-clasping, from ovate, scarcely subcordate, narrowed at the base, bluntish, rather fleshy, shorter than the internodes.

Monniera-like Ranaria. Pl. creeping.

Cult. For culture and propagation see *Herpéstis*, p. 546.

XL. VANDE'LLIA (so named by P. Browne, in honour of Dominico Vandelli, professor of natural history at Lisbon.) Lin. mant. p. 89. Schreb. gen. no. 1040. Juss. gen. p. 122.

ed. Usteri. p. 136. Lam. ill. t. 522. f. 4. Benth. scroph. ind. p. 35.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx tubular, or campanulate, nearly equal, 5-toothed, or 5-parted. Corolla with an exserted tube, and a 5-cleft, bilabiate limb; upper lip the shortest. Stamens 4, didynamous: the 2 superior ones short; filaments entire: the 2 lower ones inserted at the base of the lower lip; filaments elongated, arched, furnished with a tooth-formed or filiform appendage each at the base; anthers cohering by pairs, 2-celled; cells diverging or divaricate, confluent at apex. Style simple; stigma flattened, bilamellate, or simple.? Capsule globose, oblong, or linear, 2-valved; valves entire, membranous, with flat margins; dissepiment parallel, placentiferous, at length free.—Glabrous or hairy herbs, sometimes with the habit of species of *Torènia*, and sometimes with the habit of species of *Bonnàya*. Stems tetragonal. Leaves opposite, usually toothed. Flowers axillary, opposite, or fascicled: the upper ones generally racemose.

§ 1. BRACHYCA'RPÆ. (from βραχυς, *brachys*, short; and καρπος, *karpos*, a fruit.) Benth. scroph. ind. p. 35. Capsule nearly globose, or ovate-oblong, shorter than the calyx, or hardly longer.

* *Calyx 5-toothed before florescence. Capsule shorter than the calyx.*

1 V. OBLÓNGA (Benth. scroph. ind. p. 35.) glabrous, erectish; leaves oblong, or lanceolate, narrowed at the base, quite entire, thickish; peduncles few, elongated, subracemose; calyx tubular, almost equally 5-toothed, or semiquinquefid; capsule globose, shorter than the calyx. ⊙. H. Native of China, near Macao, Vachell.

Oblong-leaved Vandellia. Pl. ½ to 1 foot.

2 V. MOLLUGINOÌDES (Benth. l. c.) glabrous; leaves nearly sessile, ovate-oblong, cuneated at the base, with scabrous margins; peduncles stiff, fascicled, hardly longer than the calyx; calyx narrowed at the base, 5-toothed at apex, at length cleft irregularly; capsule ovate-oblong, shorter than the calyx. ⊙.? S. Native of the Birman Empire. Torènia molluginoìdes, Benth. in Wall. cat. no. 3960. Calyxes stiff, 2 lines long. Corolla a little longer.

Mollugo-like Vandellia. Pl. ½ to 1 foot.

3 V. A'LBA (Benth. l. c.) diffuse, nearly glabrous; leaves on short petioles, ovate, rounded at the base, or cuneated; peduncles slender, fascicled, much longer than the calyx; calyx slender, somewhat 5-toothed at apex, at length hardly cleft; capsule oblong, shorter than the calyx. ⊙.? S. Native of the East Indies, at Nathpur. Torènia álba, Hamilt. in Wall. cat. no. 3961.

White-flowered Vandellia. Pl. creeping.

4 V. CRUSTA'CEA (Benth. l. c.) diffuse, glabrous; leaves ovate; peduncles axillary, or subracemose, 2-3 times as long as the calyx; calyx 5-toothed before florescence, but at length becoming 5-parted, exceeding the ovate capsule. ⊙. S. Native throughout India; in the Peninsula; at Macao in China; and at Saharumpur. Caprària crustàcea, Lin. mant. p. 87. Torènia crustàcea, Cham. et Schlecht, in Linnæa, 2. p. 570. Gratìola lùcida, Roxb. cor. 3. p. 2. t. 202. fl. ind. ed. Car. 1. p. 138. Morgània lùcida, Spreng. syst. 2. p. 802. Torènia lùcida, Hamilt. in Wall. cat. no. 3962. Gratìola áspera, Roth, nov. spec. p. 11. Hornemánnia ovàta, Link, et Otto, abbild. 1. t. 9. Tittmánnia ovàta, Rchb. icon. exot. 1. p. 27. Antirrhìnum hexándrum, Forster, prod. p. 43. no. 235.—Rheed. mal. 9. p. 113. t. 58. Morgània áspera, Spreng. syst. 2. p. 803. Calyx 2 to 2½ lines long. Corolla deep blue.

Crustaceous Vandellia. Fl. June, July. Clt. 1816. Pl. trailing.

* * *Calyx 5-parted before florescence. Capsule shorter than the calyx.*

5 V. ERE'CTA (Benth. l. c. p. 36.) erectish, glabrous; leaves nearly sessile, ovate or oblong, narrowed at the base; peduncles axillary or racemose, 2-5 times as long as the calyx; calyx 5-parted, or deeply 5-cleft before florescence; segments of the calyx lanceolate, membranous, exceeding the capsule, which is ovate. ⊙. S. Native of India; as of the Peninsula, Deyra Doon, Munghyr, Nipaul, Silhet, Birman Empire, &c. Tittmánnia trichótoma, Benth. in Wall. cat. no. 3943. Very nearly allied to *V. crustàcea*, but distinct.

Erect Vandellia. Pl. ½ foot.

6 V. ELA'TA (Benth. l. c.) glabrous, or sparingly pilose; leaves petiolate, ovate, subcordate at the base; pedicels racemose, at length hardly twice the length of calyxes; calyx 5-parted before florescence; segments lanceolate-subulate, exceeding the ovate capsule. ⊙. S. Native of the Birman Empire, at Tavoy, Wall. Tittmánnia elàta, Benth. in Wall. cat. no. 3942.

Tall Vandellia. Pl. ½ foot.

7 V. HIRSU'TA (Hamilt. mss. ex Benth. scroph. ind. p. 36.) hairy; leaves ovate: lower ones petiolate, narrowed at the base: superior ones nearly sessile, cordate at the base; pedicels racemose, at length 2-3 times as long as the calyx; calyx 2-parted before florescence; segments lanceolate, subulate, exceeding the nearly globose capsule. ⊙. H. Native of India, at Goalpara, Silhet, Peninsula, and Ava. Tittmánnia ovàta, Benth. in. Wall. cat. no. 3942. but not of Rchb. Gratìola viscòsa, Horn. hort. hafn. p. 19. Hornemánnia viscòsa, Willd. enum. p. 654. Tittmánnia viscòsa, Rchb. icon. bot. exot. 1. p. 26. t. 38. Corolla blue.

Hairy Vandellia. Fl. June, July. Clt. 1823. Pl. ½ foot.

8 V. SCA'BRA (Benth. l. c.) diffuse, hairy, or almost glabrous; leaves nearly sessile, broad-ovate, subcordate at the base, or rounded; peduncles axillary or racemose, 2-5 times as long as the calyx; calyx 5-parted before florescence: segments lanceolate, exceeding the nearly globose capsule. ⊙. S. Native of the Indian Peninsula, and at Tavoy; and of the Island of Luçon. Torènia hírta, Cham. et Schlecht, in Linnæa, 2. p. 36. Tittmánnia pusílla, Benth. in Wall. cat. no. 3945. exclusive of letter C. Tittmánnia sulcàta, Benth. in Wall. cat. no. 3946. Habit of *V. crustàcea;* but the plant, and especially the calyx, becomes black on drying. It is also like *Bonnàya rotundifòlia*, but differs in the inflorescence and stamens.

Scabrous Vandellia. Pl. diffuse, ½ to 1 foot.

9 V. LA'XA (Benth. l. c.) diffuse, hairy; leaves nearly sessile, rounded at the base, or subcordate; pedicels axillary or racemose, 2-3 times as long as the calyx; calyx 5-parted before florescence; segments subulate, very hairy, exceeding the capsule, which is nearly globose. ⊙. S. Native of the Peninsula of India, Wight. Perhaps only a variety of *V. scàbra*, but the habit and calyx are distinct.

Loose Vandellia. Pl. diffuse, ½ foot.

10 V. MÓLLIS (Benth. l. c.) hairy; leaves nearly sessile, oblong-ovate or ovate-lanceolate, clothed with soft villi; pedicels axillary or racemose, 2-4 times as long as the calyx; calyx 5-parted before florescence, very hairy, with subulate segments, exceeding the capsule, which is oblong. ⊙. S. Native of Silhet. Tittmánnia hírta, Benth. in Wall. cat. no. 3948. Segments of calyx at length 4 lines long, but in most of the other

species contained in the present section hardly more than 2 lines long.

Soft Vandellia. Pl. ½ to 1 foot.

* * * *Calyx 5-toothed or 5-cleft. Capsule ovate, a little longer than the calyx.*

11 V. SESSILIFLÒRA (Benth. l. c.) leaves nearly sessile, roundish, subcordate at the base; flowers sessile, fascicled; calyx 5-toothed, at length cleft a little; capsule oblong, exceeding the calyx a little. ⊙. S. Native of the Birman Empire, at Mount Taong Dong, Wall. Torènia sessiliflòra, Benth. in Wall. cat. no. 3959.

Sessile-flowered Vandellia. Pl. ½ foot.

12 V. MI'NIMA (Royle, mss. ex Benth. l.c.) small, simple, erect, nearly glabrous; leaves almost sessile, rounded at the base, subcordate; flowers sessile, fascicled; calyx semiquinquefid; capsule ovate, exceeding the calyx. ⊙. S. Native of Mussooree, Royle.

Least Vandellia. Pl. small.

13 V. NUMMULARIÆFÒLIA (D. Don, prod. fl. nep. p. 86.? Benth. scroph. ind. p. 37.) erect, branched; leaves nearly sessile, rounded; peduncles axillary, subfasciculate, 1-flowered or branched; capsule ovate or oblong, about twice as long as the calyx. ⊙. S. Native of Nipaul, Wall. Mussooree, Royle. Flowers small.

Money-wort-leaved Vandellia. Pl. ¼ foot.

§ 2. SILIQUÒSÆ (from *siliqua*, a long pod; in reference to the elongated capsules.) Capsule oblong-linear, longer than the calyx.

14 V. DIFFU'SA (Lin. mant. p. 89. Benth. l. c.) diffuse, downy; leaves broad-ovate, nearly sessile; flowers axillary, almost sessile; calyx subquinquefid, one half shorter than the capsule, which is oblong. ⊙. S. Native of Brazil, Mauritius, and the Peninsula of India; Islands of Montserrat and Santa Cruz. Gratìola origanifòlia, Vahl, enum. 1. p. 99.? Bonnàya origanifòlia, Spreng. syst. 1. p. 42.—Marcgr. bras. t. 32. f. 1. Habit of *Verónica serpyllifòlia*. Corolla white.

Diffuse Vandellia. Fl. July, Aug. Clt. 1824. Pl. diffuse.

15 V. PEDUNCULA'TA (Benth. l. c.) smoothish, loosely procumbent; leaves ovate; pedicels axillary, solitary, elongated; calyx 5-parted, about one half shorter than the capsule, which is oblong-linear. ⊙. S. Native of the Peninsula of India; Ceylon, Silhet, &c. Tittmánnia grandiflòra, Benth. in Wall. cat. no. 3949. Hardly distinguishable from *Bonnàya grandiflòra*.

Pedunculate-flowered Vandellia. Pl. procumbent.

16 V. ANGUSTIFÒLIA (Benth. l. c.) glabrous, loosely diffuse; leaves oblong-linear; pedicels axillary, elongated; calyx 5-parted, one half shorter than the capsule, which is oblong-linear. ⊙. S. Native of Nipaul, Wall.; at Nathpur, Hamilt. Tittmánnia angustifòlia, Benth. in Wall. cat. no. 3951.

Narrow-leaved Vandellia. Pl. diffuse, 1 foot.

† *Species hardly known.*

17 V. CHAMÆ'DRYS; stem dichotomous, rather pilose; leaves ovate, obtuse, tapering into the petioles, 3-nerved, coarsely and bluntly serrated, ciliated; peduncles longer than the leaves; calyx obsoletely pentagonal, 5-cleft, length of capsule, which is roundish. ⊙. S. Native of the East Indies. Gratìola chamæ'drys, Roth. nov. spec. p. 10. Flowers axillary at the tops of the branches. Calycine teeth acuminated, obtuse. Perhaps a species of *Stemòdia?*

Germander Vandellia. Pl. diffuse.

18 V. CORDIFÒLIA; leaves subcordate-ovate, petiolate, crenated; peduncles axillary; stems prostrate. ⊙.? S. Native of the East Indies, in humid grassy places. Gratìola cordifòlia, Konig. in Vahl, enum. 1. p. 97. Bonnàya cordifòlia, Spreng. syst. 1. p. 42. Stems quite simple, 1½ foot long. Upper leaves sessile, half a foot long: lower ones smaller, remote. Peduncles one half longer than the leaves. Segments of calyx linear. Corolla white, with a yellow throat. Capsule subulate, one half longer than the calyx.

Heart-leaved Vandellia. Pl. prostrate.

19 V. STRIGÒSA; stems dichotomous, and are, as well as the alternate divaricate branches, strigose; leaves opposite, ovate, acutish, running into the petioles, serrulated, glabrous; racemes terminal, nearly naked, loose; capsule ovate, acuminated, a little higher than the calyx. ⊙. S. Native of the East Indies. Gratìola strigòsa, Roth, nov. spec. p. 12. Morgània strigòsa, Spreng. syst. 2. p. 803. Flowers small. Pedicels filiform, furnished with a minute, ovate, obtuse bractea each at the base. Calyx 5-parted almost to the base, glabrous; segments linear-lanceolate, acute, unequal: upper one longer and narrower than the rest.

Strigose Vandellia. Pl. diffuse.

20 V. ROXBU'RGHII; annual, diffuse; leaves sessile, cordate, serrated; flowers solitary, on long peduncles; calyx 5-parted; superior filaments with a sterile branch. ⊙. S. Native of Coromandel, where it appears during the rainy season. Vandéllia diffùsa, Willd. spec. 3. p. 343. but not of Lin.? Torènia diffùsa, Roxb. fl. ind. 3. p. 95.

Roxburgh's Vandellia. Pl. diffuse.

21 V. VA'RIANS; annual, erect, 4-sided, smooth; leaves opposite, petiolate, cordate-ovate, serrate: flowers axillary, solitary; calyx 5-toothed; corolla ringent, longer filaments with a sterile branch. ⊙. S. Native of Coromandel and Bengal, where it appears during the rainy season. Torènia vàrians, Roxb. fl. ind. 3. p. 96.

Varying Vandellia. Pl. erect.

22 V. MULTIFLÒRA; annual, erect, 4-sided, smooth; leaves opposite, oblong, subserrated; flowers terminal; calyx 5-parted; corolla bilabiate; superior filaments with a sterile branch; capsule ovate. ⊙. S. Native of Bengal, appearing in the rainy and cool season. Torènia multiflòra, Roxb. fl. ind. 3. p. 96.

Many-flowered Vandellia. Pl. erect.

Cult. For culture and propagation see *Masus*, p. 542.

XLI. ELLO'BUM (meaning not explained by M. Blume.) Blum. bijdr. p. 746.

LIN. SYST. *Didynàmia, Angiospermia.* Calyx 5-parted, equal. Corolla funnel-shaped; limb bilabiate; upper lip retuse: lower one 3-lobed, larger; middle lobe narrower. Stamens 4, didynamous, exserted; anthers 2-celled, connected, mutic. Stigma obtuse, emarginate. Capsule silique-formed, subulate, 2-celled, many-seeded.—A radicant pilose herb, with opposite, petiolate, ovate, serrated leaves; and axillary, few-flowered racemes; fructiferous pedicels recurved.

1 E. MONTA'NUM (Blum. bijdr. p. 747.) ♃. S. Native of Java, in the province of Bantam, among the mountains.

Mountain Ellobum. Pl. creeping.

Cult. For culture and propagation see *Herpéstis*, p. 546.

XLII. ARTANE'MA (from αρταω, *artao*, to append; and νημα, *nema*, a filament; and is intended to designate the structure of the stamens.) D. Don, in Sweet, fl. gard. n. s. t. 234. Benth. scroph. ind. 39.—Díceros species, Pers. Benth.—Archimènes species, Vahl.—Colúmnea species, Lin.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx 5-parted,

nearly equal. Corolla funnel-shaped or campanulate; limb 4-cleft, sub-bilabiate; upper segment broader; tube furnished with 4 scales inside. Stamens 4, didynamous: the 2 upper ones short, with entire filaments: and the 2 lower ones inserted at the base of the lower lip, with elongated arched filaments, which are furnished each with a short blunt appendage; anthers cohering by pairs: with divaricate confluent cells. Capsule nearly globose, 2-valved; valves entire, with flat edges; dissepiment parallel, placentiferous, at length free.—Glabrous herbs, with the habit of *Sésamum;* and with the character almost of *Torènia*. Stems tetragonal. Leaves opposite, subserrated. Flowers disposed in terminal racemes, opposite, on short pedicels. Corollas generally blue.

1 A. fimbria'ta (D. Don, in Sweet, fl. gard. 234.) leaves lanceolate, acute, serrated; corolla large, tubularly funnel-shaped; calycine segments lanceolate, mucronulate; bracteas ovate. ♃. G. Native of New Holland, on the banks of the Brisbane river at Moreton Bay. Torènia? fimbriàta, Graham, in edinb. phil. journ. sept. 1831. Torènia scàbra, Graham, in bot. mag. 3104. Racemes terminal, 4-16-flowered. Corolla large, blue, clothed with minute glandular pubescence outside; lobes of corolla unequally serrated. Stem smooth, glossy. Leaves rough to the touch from numerous elevated dots.

Fringed-flowered Artanema. Fl. June, Nov. Clt. 1830. Pl. 2 to 3 feet.

2 A. 'angustifòlia (Benth. scroph. ind. p. 39.) leaves narrow-lanceolate; corollas nearly funnel-shaped, twice the length of the calyx. ♃. S. Native of Singapore. Díceros angustifòlius, Benth. in Wall. cat. no. 3885.

Narrow-leaved Artanema. Pl. 2 to 3 feet.

3 A. sesamoi'des (Benth. l. c.) leaves oblong or ovate-lanceolate; corollas subcampanulate, twice the length of the calyx. ♃. S. Native of the Peninsula of India. Colúmnea longifòlia, Lin. mant. p. 90. Archimènes sesamoìdes, Vahl, symb. 2. p. 71. Sésamum Javánicum, Burm. ind. p. 133. Retz, obs. 4. p. 28. Díceros longifòlius, Pers. ench. 2. p. 164. Blum. bijdr. p. 751.—Rheed. mal. 9. p. 169. t. 87.

Sesamum-like Artanema. Pl. 2 to 3 feet.

Cult. The species grow freely in light rich soil, and are readily increased by cuttings.

XLIII. TORE'NIA (so named by Linnæus after Olof Toreen, a Swedish clergyman, who discovered *T. Asiática*, with other plants, in China. His voyage to Suratte, China, &c. from 1750 to 1752, is printed with Osbeck's Voyage to China.) Lin. gen. no. 754. Schreb. gen. no. 1011. Juss. gen. p. 122. ed. Usteri, p. 136. Benth. scroph. ind. p. 38. Lam. ill. 523. f. 1.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx tubular, plicate, obliquely 5-toothed or bilabiate; lips 2-3-toothed. Corolla ringent; upper lip bifid: lower one trifid; segments almost flat. Stamens 4, didynamous: the 2 upper ones short, with entire filaments: the 2 lower ones inserted at the base of the lower lip; with arched elongated filaments, which are each furnished with a tooth-formed or filiform appendage at the base; anthers approximating or cohering by pairs, 2-celled: cells diverging or divaricate, confluent at apex. Style simple. Stigma flattened, bilamellate or simple? Capsule oblong, shorter than the calyx, 2-valved; valves entire, with flat margins; dissepiment parallel, placentiferous, at length free.—Branched, glabrous, or villous herbs, diffuse at the base. Stems tetragonal. Leaves opposite, usually toothed. Flowers axillary, opposite, or fascicled, sometimes racemose.

1 T. racemòsa (Benth. in Wall. cat. no. 3957. B. C. scroph. ind. p. 38.) hairy; leaves ovate, acute, wrinkled; flowers opposite, racemose; corolla more than a half longer than the calyx. ♃. S. Native of Silhet and Penang. Fructiferous calyx 7-8 lines long. Corollas blue.

Racemose-flowered Torenia. Pl. 1 to 2 feet.

2 T. fla'va (Hamilt. in Wall. cat. no. 3957. Benth. scroph. ind. p. 38.) rather hairy; leaves ovate-oblong, obtuse, wrinkled; flowers opposite, racemose; corolla hardly exceeding the calyx. ♃. S. Native at Goalpara, Hamilt. Fructiferous calyx 6-7 lines long. Corolla yellow.

Yellow-flowered Torenia. Pl. 1 foot.

3 T. Asia'tica (Lin. spec. p. 862. amœn. 3. p. 25. Lam. ill. t. 523. f. 1.) leaves ovate or ovate-lanceolate; peduncles axillary, subfasciculate; corolla twice the length of the calyx, which is oblong, and attenuated at the base. ♃. S. Native throughout India, especially in the mountainous parts. Benth. scroph. ind. p. 38. T. cordifòlia, Benth. in Wall. cat. no. 3945. but not of Roxb. T. diffùsa, D. Don, prod. fl. nep. p. 86. T. pedunculàris, Benth. in Wall. cat. no. 3956. T. álba, Hamilt. ex Benth. in Wall. cat. no. 3961. T. hiàns, and T. vàgans, Roxb. fl. ind. 3. p. 96. T. hirsùta, Willd. spec. 3. p. 266. Gratìola alàta, Roxb. fl. ind. ed. Car. 1. p. 137.? Bonnàya alàta, Spreng. syst. 1. p. 41. Henckèlia alàta, Link et Schwægr. et Dietr. spec. pl. 1. p. 573.—Rheed. mal. 9. p. 103. t. 53.—Plukn. amalth. 85. t. 373. f. 2. This species varies in hairiness, form of leaves, and size of corollas, as it now stands; but there are probably several species confused under the name. The original plant is said to have been quite glabrous. Fructiferous calyx 8-10 lines long. Calyx 5-winged. Stems creeping, 1 foot.

Asiatic Torenia. Fl. July, Aug. Clt. 1823. Pl. 1 to 2 feet.

4 T. obtu'sa (Blum. bijdr. p. 754.) stem creeping; leaves nearly sessile, ovate, bluntish, obsoletely and repandly serrated, smoothish; peduncles axillary, terminal, 1-flowered; upper lip of corolla obtuse; capsule longer than the calyx. ♃. S. Native of the western provinces of Java, in humid places.

Obtuse-leaved Torenia. Pl. creeping.

5 T. minu'ta (Blum. bijdr. p. 755.) stem creeping; leaves on short petioles, ovate, setaceously serrated, subciliated; peduncles axillary and terminal, 1-flowered; superior lip of corolla emarginate; capsule equal in length to the calyx. ♃. S. Native of Java, in humid grassy places about Buitenzorg.—Rheed. mal. 10. t. 50. Said by Blume to be allied to *T. hirsùta.*

Minute Torenia. Fl. Year. Pl. creeping.

6 T. cordifòlia (Roxb. cor. 2. p. 32. t. 161.) leaves ovate-cordate; peduncles axillary, subfascicled, or solitary; corollas about twice the length of the calyx, which is ovate and rounded at the base. ♃. S. Native of the Circars, Roxb.; Mussooree, Royle. Fructiferous calyx broadly winged, hardly 4 lines long. Corollas bluish purple. Plant rather hairy.

Cordate-leaved Torenia. Pl. ½ foot.

7 T. parviflòra (Hamilt. in Wall. cat. no. 3958.) leaves ovate; flowers axillary, somewhat fascicled; corolla hardly exceeding the linear calyxes, which is attenuated at the base. ♃.? S. Native at Goalpara, Hamilt.; Birman Empire, Wall.; and of Brazil, near Bahia and Rio Janeiro; and in the Mauritius and Madagascar. Nortènia Thouársii, Cham. et Schlecht, in Linnæa, 3. p. 18. Torènia pedunculàta, Willd. herb. no. 11547. Torènia veronicæfòlia, Willd. herb. no. 11546.

Small-flowered Torenia. Pl. ½ to 1 foot.

8 T. polygonoi'des (Benth. scroph. ind. p. 39.) procumbent; leaves roundish; peduncles axillary, umbellately 3-4-flowered; calyx campanulate, broadly 3-winged; tube of corolla shortly exserted. — Native of Singapore. Herpéstis polygonoìdes, Benth. in Wall. cat. no. 3897.

Polygonum-like Torenia. Pl. procumbent.

9 T. sca'bra (R. Br. prod. p. 440.) leaves lanceolate-ovate, serrated, scabrous; stem erect, pubescent; calyx 5-toothed, equal. ♃. S. Native of New Holland, within the tropic. Tittmánnia scàbra, Spreng. syst. 2. p. 800.

Scabrous Torenia. Pl.?

10 T. fla'ccida (R. Br. l. c.) leaves broad-ovate, obtuse, crenated, and are, as well as the stem, glabrous; peduncles 3-4 times longer than the flowers. ♃. S. Native of New Holland, within the tropic.

Flaccid Torenia. Pl.?

Cult. For culture and propagation see *Herpéstis*, p. 546.

XLIV. HETERA'NTHA (from ἑτερος, *heteros*, variable; and ανθος, *anthos*, a flower; flowers variable.) Nees et Mart. in nov. act. bonn. 11. p. 42. t. 3. Vrolíkia polygaloìdes, Spreng. syst. 3. p. 165. and 4. p. 222.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx membranous, campanulate, 5-cleft. Corolla bilabiate; upper lip smaller, oblong, entire: lower one broader, concave, 3-lobed; middle lobe larger and emarginate. Stamens 4, didynamous; anthers cordate; cells contiguous; lobes of the upper ones clasping the style. Capsule 2-celled, 2-valved, with a septicidal dehiscence. Placentas fixed to the middle of the dissepiment.—A perennial creeping plant, with ascending branches. Branches terete, downy from fascicles of small hairs. Leaves alternate, nearly orbicular, obtuse, with a small point, quite entire, running into the petioles, rather hairy. Flowers disposed in simple, erect, subsecund, naked racemes, rising from the upper internodes, extrafoliaceous. Calyx blue. Corolla white. Capsule ovate, a little compressed, acute, smooth, white.

1 H. decípiens (Mart. l. c. p. 42.) ♃. S. Native of Brazil, on the road to Felisbert.

Deceiving Heterantha. Pl. ½ creeping at the base.

Cult. For culture and propagation see *Herpéstis*, p. 546.

XLV. LINDE'RNIA (so named by Allioni, from Franc. Balthasar à Lindern, physician at Strasburgh, author of "Hortus Alsaticus." 1747.) Allion. misc. taur. 3. p. 178. t. 5. pedem. no. 203. Schreb. gen. no. 1031. Lin. mant. p. 141. Juss. gen. p. 122. 540. ed. Usteri, p. 137. Lam. ill. t. 522. f. 3. R. Br. prod. p. 440.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted, equal. Corolla ringent; upper lip retuse: lower one trifid, bicarinated at the base. Stamens didynamous; lower filaments bifid; anthers cohering by pairs. Stigma bilamellate. Capsule 2-celled, 2 valved; valves entire; dissepiment parallel, free, placentiferous.—Slender herbs. Leaves opposite. Peduncles axillary and terminal, bractless, deflexed while bearing the fruit, but upright after the dehiscence of the capsule.

§ 1. Ve'ræ. *Filaments* 4, *all fertile*, 2 *longer ones forked.*

1 pyxida'ria (Lin. syst. p. 475.) leaves oblong-ovate, quite entire, 3-nerved, sessile; peduncles axillary, 1-flowered; stems procumbent. ⊙. H. Native of Alsatia, Silesia, Germany, Carinthia, Piedmont, &c., in bogs. Lam. ill. t. 522. Pyxidaria repens annua, flosculis monopetalis unilabiatis, Lindern. als. 1. p. 152. t. 1. and 2. p. 267. Caprària gratioloìdes, Lin. spec. 876. Anagalloìdes procúmbens, Krok. siles. 2. no. 1001. t. 26. Peduncles shorter than the leaves; but the upper ones are usually longer. Corolla pale purple.

Pyxidaria Lindernia. Fl. June, Aug. Clt. 1789. Pl. procumbent.

2 L. Kitaibe'lii; lower leaves obovate: superior ones oblong-ovate, all obtuse and quite entire, nerveless; peduncles axillary, 1-flowered, exceeding the leaves; stem creeping. ⊙. H. Native of Pannonia, in marshes. Gratìola inundàta, Kit. in Schultz, austr. fl. 2. p. 32. Spreng. pug. 1. p. 1. Leaves 3, nerved beneath. Perhaps the same as *Lindérnia pyxidària*.

Kitaibel's Lindernia. Pl. creeping.

3 L. alsinoi'des (R. Br. prod. p. 441.) leaves ovate, entire or few-toothed: cauline ones distant: floral ones minute; tube of corolla a little longer than the calyx; stem erect. ⊙.? S. Native of New Holland, within the tropic. Tittmánnia alsinoìdes, Spreng. syst. 2. p. 800.

Chickweed-like Lindernia. Pl. erect.

4 L. scapi'gera (R. Br. l. c.) leaves broadly ovate, almost quite entire: lower ones crowded: cauline ones very few, smaller: floral ones minute; tube of corolla twice as long as the calyx. ⊙.? S. Native of New Holland, within the tropic. Tittmánnia scapígera, Spreng. syst. 2. p. 800.

Scape-bearing Lindernia. Pl. small.

5 L. subula'ta (R. Br. l. c.) leaves linear, subulate, entire. ⊙.? S. Native of New Holland, within the tropic. Tittmánnia subulàta, Spreng. syst. 2. p. 800.

Subulate-leaved Lindernia. Pl. small.

§ 2. America'næ. Filaments 4, the 2 longer ones forked and sterile.

6 L. Montevide'nsis (Spreng. syst. 2. p. 769.) stem procumbent, branched; leaves spatulate, linear, nerveless; peduncles axillary, 1-flowered; calyxes foliaceous. ⊙. H. Native of Monte Video, Sello.

Monte Video Lindernia. Pl. small, procumbent.

7 L. monti'cola (Nutt. gen. 1. p. 9.) stem erect, dichotomous; radical leaves spatulate: cauline ones linear, remote; peduncles elongated: fructiferous ones deflexed. ♃. H. Native of North Carolina. Tittmánnia monticola, Spreng. syst. 2. p. 800.

Mountain Lindernia. Pl. ¼ foot.?

8 L. grandiflòra (Nutt. gen. amer. 2. p. 43.) leaves almost round, thickish, entire and nerveless, somewhat stem-clasping; peduncles very long, axillary and terminal; sterile filaments forked; stem creeping. ♃. H. Native of Georgia, on the spongy margins of sandy springs and ponds betwixt Savannah and Augusta, in many places. Leaves crowded. Segments of the calyx linear-subulate. Corolla large, of a violet blue: lower lip paler, 3-lobed: upper lip very short, bidentate. The lateral forks of the sterile filaments producing an imperfect 1-celled anther. Capsule ovate.

Great-flowered Lindernia. Pl. creeping.

9 L. dilata'ta (Muhl. cat. ex Elliott, fl. car. 1. p. 16.) leaves dilated at base, stem-clasping, sparingly toothed; peduncles longer than the leaves. ⊙. H. Native from New York to Virginia, Carolina, &c. on the banks of rivers, in gravelly soil. L. pyxidària, Pursh, fl. 2. p. 419. Gratìola inæquàlis, Walt. car. p. 61. Gratìola anagallídea, Michx. fl. bor. amer. 1. p. 6. Leaves obscurely 3-5-nerved. Calyxes pubescent, ciliated. Corolla purple.

Dilated-leaved Lindernia. Pl. procumbent.

10 L. attenua'ta (Muhl. cat. ex Elliott, l. c. p. 17.) leaves lanceolate and obovate, attenuated at the base; peduncles one half shorter than the leaves. ⊙. H. Native of Georgia, in wet places. Leaves serrulated, villous. Calyxes ciliated. Sterile filaments villous.

Attenuated-leaved Lindernia. Pl. procumbent.
Cult. For culture and propagation see *Herpéstis*, p. 546.

XLVI. LIMOSE'LLA (a dim. of *Limus*, mud, in which the plants delight to grow.) Lin. gen. no. 776. Schreb. gen. no. 1039. Gærtn. fruct. 1. p. 228. t. 50. Juss. gen. p. 96. ed. Usteri, p. 108. Lam. ill. t. 535. f. 2. R. Br. prod. 443.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-cleft, equal. Corolla short, campanulate, 5-cleft, equal. Stamens didynamous, or rarely equal; sometimes only 2. Stigma capitate. Capsule semibilocular, 2-valved; valves entire; dissepiment incomplete. —Small marsh creeping herbs. Leaves fascicled; petioles dilated at the base, half sheathing. Scapes 1-flowered, bractless. In the natural series this genus comes near *Pinguícula.*

1 L. aqua'tica (Lin. spec. 881.) leaves lanceolate-spatulate, longer than the scapes; flowers didynamous, rarely diandrous. ⊙. W. H. Native of the North of Europe, in inundated places; in some parts of Britain, in like situations. Smith, engl. bot. 357. Oed. fl. dan. t. 69. L. ánnua, Lindern. als. 266. t. 5. Plantaginélla, Hall. jen. 23. t. 6. f. 2. Plantaginélla palústris, Bauh. pin. p. 190. Mor. hist. 3. p. 605. sect. 15. t. 2. f. 1. Petiv. brit. t. 65. f. 12.—Loes. pruss. 261. t. 81.—Plukn. alm. 20. t. 74. f. 4.—Mentz. 2. t. 7. f. 6. Corollas small, whitish without, and reddish within.

Var. β, *Limosella diándra*, Krock. fl. sil. 2. no. 1006. t. 27. f. β. flowers diandrous.

Aquatic Mudwort. Fl. July, Sept. Britain. Pl. creeping.

2 L. Austra'lis (R. Br. prod. p. 443.) leaves spatulate-linear, longer than the scapes; flowers didynamous, rarely diandrous. ⊙. W. G. Native of Van Diemen's Land, and the south coast of New Holland, in marshes.

Southern Mudwort. Pl. creeping.

3 L. tenuifòlia (Nutt. journ. acad. sc. phil. 1. p. 115. gen. amer. 2. p. 43.) leaves linear and very narrow, scarcely dilated at the points; scapes 1-flowered, about equal in length with the leaves; flowers tetrandrous. ⊙. W. H. Native of Germany, and North America, on the banks of the Delaware. Corolla white, externally blue, 4-5-lobed.

Fine-leaved Limosella. Pl. creeping.

Cult. The species being hardy, aquatic annuals, the seeds may be sown by the edge of a pond, or cistern.

XLVII. HYDRANTHE'LIUM (from ὕδωρ, *hydor*, water; and ανθηλιον, *anthelion*, a little flower.) H. B. et Kunth, nov. gen. 7. p. 202. Willíchia, Mutis.

Lin. syst. *Triándria, Monogýnia.* Calyx deeply 4-parted, bractless, permanent; segments opposite, by pairs, 2 of which are oblong, obtuse, 3-nerved; and the other 2 are lanceolate, acutish, 1-nerved. Corolla funnel-shaped; limb trifid; the third lobe twice the breadth of the others, and emarginate. Stamens 3, inserted in the throat of the corolla, and alternating with its lobes, and shorter than them; anthers oblong, 2-celled. Stigma 2-lobed. Capsule ovate-roundish, mucronate, membranous, 2-celled? 2-valved? dissepiment placentiferous on both sides, at length free. Seeds many, subcylindrical, a little arched, exalbuminous, striated, pendulous. Embryo cylindrical, 2-lobed. Radicle superior looking to the hilum.—A small, floating, glabrous, radicant herb. Leaves opposite, quite entire, 7-nerved. Flowers axillary, solitary, alternate, pedicellate, minute, white. This genus comes very near to *Lindérnia* and *Limoséllа*; but is distinguished from them in the structure of calyx, corolla, and number of stamens.

1 H. callitrichoi'des (H. B. et Kunth, l. c. 7. p. 203. t. 644.) ⊙. W. S. Native in the Missions of the Orinoco, in the cataract of Atures.

Callitriche-like Hydranthelium. Pl. aquatic.

Cult. For culture and propagation see *Limnóphila*, p. 543.

XLVIII. CONO'BEA (meaning not explained by Aublet.) Aubl. guian. 2. p. 639. t. 257. Juss. gen. p. 97. ed. Usteri, p. 109. Lam. ill. t. 522. f. 2.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx tubular, 5-toothed, bibracteate at the base. Corolla tubular, bilabiate; upper lip erect, emarginate; lower lip 3-lobed, unequal. Stamens 4, didynamous; anthers sagittate. Stigma 2-lobed. Capsule pea-formed, girded by the calyx, 1-celled, 4-valved, many-seeded; placenta central, free.—A creeping marsh herb. Stems tetragonal. Leaves opposite. Flowers solitary, axillary, pedicellate.

1 C. aqua'tica (Aubl. l. c.) stems procumbent, nodose; leaves reniform, toothed, half stem-clasping; peduncles longer than the leaves, solitary.—Native of Guiana, on the edges of rivers. Flowers blue. Plant glabrous. Calyx 5-toothed.

Aquatic Conobea. Pl. creeping.

2 C. puncta'ta (Mart. in act. bonn. 11. p. 43.) stem ascending, rooting at the base; leaves ovate, acute, serrated, dotted, scabrous above; flowers axillary, twin, a little shorter than the petioles. ↄ. G. Native of Brazil, on the road to Felisbert. Leaves 1 to 1½ inch long. Calyx 5-parted; segments ovate-lanceolate, acuminated, with membranous edges. Corolla twice as long as the calyx. Segments of the lower lip oblong, undulated.

Dotted Conobea. Pl. 1 foot, procumbent at the base.

3 C. viscòsa (Spreng. syst. 2. p. 771.) stem erect, clammy at top; leaves lanceolate, sharply serrated, quite glabrous; peduncles usually twin, shorter than the leaves.—Native of Brazil.

Clammy Conobea. Pl. erect.

Cult. For culture and propagation see *Herpéstis*, p. 546.

XLIX. MI'MULUS (from μιμω, *mimo*, an ape or actor; so named from the ringent corollas of the species.) Lin. gen. no. 783. Schrad. gen. no. 1049. Gærtn. fruct. 1. p. 245. t. 53. Juss. gen. 122. ed. Usteri, 137. R. Br. prod. 439. H. B. et Kunth, nov. gen. 2. p. 369. Benth. scroph. ind. 27.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx tubular, 5-angled, 5-toothed. Corolla ringent; upper lip 2-lobed: lower one trifid, usually bi-gibbous at the base; segments all flat. Stamens 4, didynamous, inclosed; cells of anthers diverging or divaricate, at length subconfluent. Stigma bilamellate. Capsule hardly furrowed, 2-valved, with a loculicidal dehiscence; valves entire, with flat margins; dissepiment at length free; placentas adnate.—Erect or procumbent, glabrous, rarely villous herbs; with usually tetragonal stems. Leaves opposite, usually toothed, rarely quite entire. Flowers axillary, solitary, pedicellate: superior ones sometimes racemose.

§ 1. *Stems erect. Leaves feather-nerved. Calyx tubular.*

1 M. linea'ris (Benth. scroph. ind. p. 27.) plant suffruticose, very clammy; stem erect, branched; leaves linear, quite entire, with revolute edges; peduncles subracemose; calyxes elongated, plicate, with lanceolate-linear, obtuse, unequal teeth. ♄. F. Native of California, Douglas.

Linear-leaved Monkey-flower. Shrub erect.

2 M. glutinòsus (Wendl. obs. p. 51.) shrubby, clammy; stem erect, downy; leaves glabrous above, oblong or lanceolate,

narrowed at the base, erosely toothed or quite entire; peduncles shorter than the leaves; calyx elongated, plicate, with lanceolate-linear, unequal segments. ♄. F. Native of California, Menzies and Douglas. M. aurantìacus, Curt. bot. mag. 354. Flowers orange-coloured, generally growing in pairs from the axils of the leaves.

Clammy Monkey-flower. Fl. Year. Clt. 1794. Shrub 2 to 4 feet.

3 M. rí'ngens (Lin. spec. 884.) quite glabrous; stem erect; leaves oblong or lanceolate, a little toothed, dilated at the base, cordately stem-clasping; calyx tubular, a little incurved, plicate, with lanceolate-linear unequal teeth. ♃. H. Native of North America, from Virginia to Canada. Curt. bot. mag. 283.—Lin. hort. ups. 176. t. 2. act. ups. 1741. p. 82.—Plukn. amalth. 83. t. 393. f. 3.—Mor. hist. 2. p. 479. sect. 5. t. 8. f. 6. Corolla violaceous or purple.

Gaping-flowered Monkey-flower. Fl. July, Aug. Clt. 1759. Pl. 1½ foot.

4 M. ala`tus (Ait. hort. kew. 2. p. 361.) glabrous; stem erect; leaves large, oblong-elliptic, acuminated, narrowed into the petioles at the base; calyx tubular, plicate, truncate, with linear teeth. ♃. H. Native of North America. Lodd. bot. cab. 410. Habit of the preceding. Stem 4-winged from the decurrence of the leaves. Corolla blue or purple. Leaves unequally serrated.

Winged-stemmed Monkey-flower. Fl. July, Aug. Clt. 1783. Pl. 1 foot.

5 M. stri'ctus (Benth. in Wall. cat. no. 3918. scroph. ind. p. 28.) erect, glabrous; leaves oblong-lanceolate, obtuse, almost quite entire, hardly narrowed at the base, cordately stem-clasping; peduncles longer than the leaves; calyx ovate-tubular, hardly plicate, with ovate, short, nearly equal teeth. ♃. H. Native of India, in Rajemahl, Wall.; and at Kheeree Pass, Royle.

Strict Monkey-flower. Pl.

6 M. hirsu`tus (Blum. bijdr. p. 756.) hairy; leaves petiolate, ovate-lanceolate, serrated; pedicels racemose, opposite; stem erect, sharply tetragonal. ♃. S. Native of Java, in the province of Bantam.

Hairy Monkey-flower. Fl. Feb. Pl. erect.

§ 2. *Stems generally procumbent or creeping, rarely erect. Leaves 3-5-nerved, toothed. Calyx ovate or tubular, usually inflated.*

7 M. bre'vipes (Benth. scroph. ind. p. 28.) downy; stem erect, clammy; leaves oblong-lanceolate or linear, a little toothed, narrowed at the base and nearly sessile; or the upper ones are stem-clasping; flowers nearly sessile; calyx ovate, plicate, cleft on one side: teeth lanceolate, unequal. ♃. F. Native of California, Douglas.

Short-peduncled Monkey-flower. Pl. erect.

8 M. Lewísii (Pursh, fl. amer. sept. 2. p. 427. t. 20.) plant small, erect, downy; leaves sessile, oblong-lanceolate, acute, nerved, mucronately denticulated; flowers few, terminal, on very long pedicels; teeth of calyx acuminated. ♃. H. Native on the head springs of the Missouri, at the foot of Portage Hill. Flowers large, beautiful pale purple.

Lewis's Monkey-flower. Fl. Aug. Clt. 1824. Pl. ½ to ¾ foot.

9 M. cardina`lis (Dougl. mss. ex Benth. scroph. ind. p. 28.) villous; leaves stem-clasping, ovate, with erosely toothed margins; peduncles longer than the leaves; calyx large, inflately tubular, hardly plicate, with ovate-acute teeth; anthers villous. ♃. F. Native of California, Douglas. Corollas large, red.

Cardinal Monkey-flower. Fl. June, Aug. Clt. 1835. Pl. 1 to 2 feet.

10 M. ròseus (Dougl. mss. Lindl. bot. reg. t. 1591. Benth. scroph. ind. p. 28.) pubescent; leaves stem-clasping, oblong, a little toothed, 5-nerved; peduncles shorter than the leaves; calyx large, subinflately tubular, with ovate-acute, nearly equal teeth; anthers glabrous. ♃. F. Native of North West America, along the Columbia river. Corollas rose-coloured.

Rose-coloured-flowered Monkey-flower. Fl. July, Aug. Clt. 1831. Pl. 1 foot.

11 M. lu`teus (Lin. spec. 884.) glabrous; leaves erosely toothed: lower ones on long petioles, ovate, or somewhat lyrate: superior ones rounded, cordately stem-clasping; calyx ovate, but campanulate in the fructiferous state, with ovate-acute teeth: the upper tooth larger. ♃. F. Native of Chili. Lindl. bot. reg. t. 1030. 1796. Hook. bot. mag. t. 3336. 3353. and 3363.—Feuill. per. 2. p. 745. t. 34. Corolla yellow, with a dark mark in the mouth. There are several hybrids reared from the seeds of this species, which vary much in the colour and size of the flowers, some of which are very showy.

FIG. 50.

Var. β, rivulàris (Lindl. bot. reg. no. 1030.)

Yellow-flowered Monkey-flower. Fl. June, Sept. Clt. 1826. Pl. ¾ foot.

12 M. lyra`tus (Benth. scroph. ind. p. 28.) glabrous at the base, and downy at top, clammy; leaves erosely toothed, cordately stem-clasping; calyx ovate, but inflately campanulate in the fructiferous state, with ovate-acute teeth: the upper tooth the largest. ♃. F. Native of California, Douglas.

Lyrate-leaved Monkey-flower. Pl. ¾ foot. ?

13 M. gutta`tus (D. C. cat. hort. monsp. p. 127.) glabrous; leaves almost quite entire: lower ones on long petioles: superior ones rounded, cordately stem-clasping; calyx ovate, inflated in the fructiferous state, with a contracted mouth: teeth of calyx ovate: the upper one very broad; corolla twice as long as the calyx. ♃. H. Native of California, and North America. M. lùteus, Sims, bot. mag. 1501. Pursh, fl. amer. sept. 2. p. 426. Corolla yellow, spotted in the mouth. Surculi creeping.

Spotted-flowered Monkey-flower. Fl. June, Sept. Clt. 1812. Pl. 1 to 1½ foot.

14 M. rivula`ris (Nutt. in journ. acad. nat. sc. phil. 7. p. 47.) leaves oval, obtuse, crenated: cauline ones sessile; flowers axillary and terminal; calycine teeth very short. ♃. H. Native in the valleys of the Rocky Mountains. Stoloniferous, quite glabrous. Leaves oval, sharply crenated, petiolate; cauline leaves similar, sessile. Flowers large, bright yellow.

Rivulet Monkey-flower. Pl. ¾ foot. ?

15 M. parvifòrus (Lindl. bot. reg. t. 874. Benth. scroph. ind. p. 28.) glabrous, or hardly downy; leaves broad-ovate, erosely toothed, broadly and truncately cordate at the base: lower ones petiolate: superior ones sessile; calyx ovate, but broadly campanulate in the fructiferous state: teeth broad, short: upper tooth large; corolla one half longer than the calyx. ⊙. H. Native of Chili. Flowers small, yellow.

Small-flowered Monkey-flower. Fl. Year. Clt. 1824. Pl.

16 M. glabra`tus (H. B. et Kunth, nov. gen. 2. p. 370.) glabrous, or scarcely pubescent; leaves broad-ovate, obtuse, erosely toothed, broadly and truncately cordate at the base:

lower ones petiolate: superior ones sessile; calyx ovate, inflately campanulate in the fructiferous state; teeth of calyx broad, short: upper tooth large; corolla one half longer, or hardly twice as long as the calyx. ♃. H. Native of Mexico, near Moran, at the altitude of 1338 hexapods, and near Jalapa, and at the foot of Mount Orizaba. M. propínquus, Lindl. bot. reg. 1330. Corolla yellow. Surculi creeping.

Smooth Monkey-flower. Fl. April, Oct. Clt. 1827. Pl. ¾ foot.

17 M. Andi'colus (H. B. et Kunth, l. c.) quite glabrous; leaves petiolate, ovate, obtuse, toothed, subcordate or cuneated at the base; calyx campanulate, 5-toothed: upper tooth the largest; corolla longer than the calyx. ♃. F. Native on the declivities of the burning Mount Pichincha, near Chorro de Cantuna, at the altitude of 1730 hexapods. Stems creeping, branched, 2-3 inches. Peduncles longer than the leaves. Corolla yellow?

Andicolous Monkey-flower. Pl. creeping.

18 M. pilosiu'sculus (H. B. et Kunth, l. c.) rather pilose; leaves petiolate, roundish-ovate, obtuse, subcordate at the base, toothed; peduncles shorter than the leaves; calyx sub-campanulate, 5-toothed, the upper tooth the largest; corolla twice as long as the calyx.. ♃. F. Native of Peru, near Patibilca, in shady places. Stems creeping. Leaves 3-5-nerved. Corolla yellow.

Rather-hairy Monkey-flower. Pl. creeping.

19 M. moscha'tus (Dougl. in bot. reg. t. 1118.) stems diffuse, clothed with woolly villi; leaves petiolate, ovate, or ovate-lanceolate, a little toothed, rounded at the base, rather pilose, and somewhat clammy; calyx tubular, but oblong in the fruit-bearing state, with lanceolate, unequal teeth. ♃. H. Native about the Columbia river, on the north-west coast of America. The plant exhales a strong scent of musk. Flowers small, yellow. Plant diffuse, rooting at the base.

Musk-scented Monkey-flower. Fl. June, Sept. Clt. 1826. Pl. diffuse.

20 M. floribu'ndus (Dougl. in bot. reg. 1125.) diffuse, loosely pilose, clammy; leaves petiolate, broad-ovate, a little toothed, truncate at the base, or rounded; calyx small, ovate-tubular, almost equally truncate, with very short, acute teeth. ⊙. H. Native of California, and the north-west coast of America, at the Columbia river. Corollas yellow.

Bundle-flowered Monkey-flower. Fl. Aug. Clt. 1826. Pl. ¾ foot.

21 M. alsinoìdes (Doug. mss. ex Benth. scroph. ind. p. 29.) glabrous, diffuse; leaves on long petioles, ovate, a little toothed, cuneated or rounded at the base; calyx small, tubularly-ovate, obliquely truncate, with short teeth. ⊙.? H. Native of the north-west coast of America, Douglas; and California, Menzies. Corollas yellow.?

Var. α, paniculàtus (Benth. l. c.)

Var. β, minimus (Benth. l. c.) peduncles 1-3-flowered.—Native at the Columbia river, Douglas and Scouler.

Chickweed-like Monkey-flower. Pl. diffuse.

22 M. primuloìdes (Benth. scroph. ind. p. 29.) glabrous, stoloniferous; floriferous branches short; leaves nearly sessile, obovate, obscurely toothed, and quite entire; peduncles elongated, solitary, terminal; calyx tubular, with short teeth. ⊙.? H. Native of the north-west coast of America, Douglas.

Primrose-like Monkey-flower. Pl. creeping.

23 M. peduncula'ris (Dougl. mss. ex Benth. scroph. ind. p. 29.) plant downy, humble; leaves petiolate, ovate, acute, a little toothed, cuneated or rounded at the base; calyx small, tubularly ovate, with short, acute, nearly equal teeth. ⊙.? H. Native of the north-west coast of America, Douglas.

Peduncular Monkey-flower. Pl. dwarf.

24 M. Java'nicus (Blum. bijdr. p. 755.) stem creeping; leaves petiolate, ovate, toothed, rather scabrous; peduncles axillary, solitary, or terminal, subfastigiate. ♃. S. Native of Java, in grassy places in the western provinces, where it is called *Dinkut-matta-Kujup*. Plant downy. There is also a *var. β, pusílla*, Blum. bijdr. 756.

Java Monkey-flower. Pl. creeping.

§ 3. *Stems diffuse. Leaves feather-nerved, thin, toothed. Calyx tubularly ovate.*

25 M. Nepale'nsis (Benth. in Wall. cat. no. 3917.) glabrous, diffuse; leaves petiolate, ovate, serrated, cuneated at the base, or rounded; calyx ovate-tubular, with short, acute teeth: the upper tooth a little larger than the rest.—Native of Nipaul.

Nipaul Monkey-flower. Pl. diffuse.

§ 4. *Stems creeping. Leaves thickish, quite entire, and quite glabrous.*

26 M. orbicula'ris (Wall. cat. no. 3919.) Benth. scroph. ind. p. 29.) glabrous, creeping; leaves petiolate, orbicular, quite entire, thickish; calyx ovate-tubular, truncate, with very short teeth.—Native of the Birmann Empire, at Rangoon and Tavoy, Wall.

Orbicular-leaved Monkey-flower. Pl. creeping.

27 M. re'pens (R. Br. prod. p. 439.) glabrous, creeping; leaves ovate, obtuse, quite entire, half stem-clasping, thickish; calyx ovate-tubular, truncate, with very short teeth. ♃. F. Native of Van Diemen's Land, Gunn.; and New South Wales. Habit of *Hèrpéstis Monnièra*.

Creeping Monkey-flower. Pl. creeping.

28 M. gra'cilis (R. Br. l. c.) quite glabrous, erect; leaves linear-oblong, or oblong, obtuse, entire; peduncles elongated. ♃. G. Native of New South Wales, about Port Jackson.

Slender Monkey-flower. Pl. erect.

Cult. Most of the species are showy, and worth cultivating for ornament. The shrubby kinds grow well in a light rich soil; and cuttings of them strike root readily under a hand-glass in the same kind of soil. The perennial herbaceous kinds are well adapted for decorating flower-borders, thrive in any common garden soil, and all prefer a moist shady situation. All of them require some protection in severe weather: they are readily increased by division and seeds. The seeds of annual species may either be sown where the plants are intended to remain, or they may be reared on a hot-bed, and afterwards planted out into the open ground.

L. LEUCOCA'RPUS (from λευκος, *leucos*, white; and καρπος, *karpos*, a fruit; in reference to the white baccate fruit.) D. Don, in Sweet, fl. gard. n. s. t. 124. Conòbea species, Graham. Mímulus species, Kunth.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx campanulate, 5-toothed, 5-angled, or 5-ribbed; teeth nearly equal. Corolla tubular, ringent; throat furnished with 2 elevated bearded plicæ; limb bilabiate; lobes roundish, with revolute edges. Stamens 4, didynamous: the 2 superior ones the shortest; lobes of anthers divaricate, inserted into a hemispherical connective. Stigma bilamellate; lobes or lamellæ ovate, acuminated, papillose above. Berry roundish, succulent, spongy, 2-celled, indehiscent, many-seeded; placentas 2, large, succulent, fixed to the dissepiment, which is contrary, with revolute edges. Seeds disposed in a single series, not cumulated, reticulately wrinkled, hardly scrobiculate.—An erect, branched, green, annual? herb. Angles of the stem and branches winged, acute. Leaves opposite, stem-clasping, perfoliate, lanceolate, acuminated, sharply serrated, membranous, varicose and paler beneath, a hand to a span long. Flowers axillary, cymose. Cymes usually twice trifid, many-flowered, rarely 3-flowered: the middle flower

generally solitary: the rest by threes, or sevens. Corolla sulphur coloured, hardly an inch long. Bracteoles subulate, adpressed. Berries white, size of those of *Symphoricárpus racemòsus*, with a nauseous bitter sweet taste.

1 L. ALA'TUS (D. Don, l. c.) ⊙.? H. Native of Mexico, by the sides of streams at Cuesta Grande de Chiconquiera, in the province of Vera Cruz. Conòbea alàta, Graham, in edinb. phil. journ. oct. 1830. Mímulus perfoliàtus, H. B. et Kunth, nov. gen. 2. p. 271. Graham, in bot. mag. t. 3067.

Winged-stemmed Leucocarpus. Fl. Clt. Pl. 2 to 3 feet.

Cult. The seeds of this plant should be reared on a hot-bed, and when the plants are of sufficient size, or about the end of May, they should be planted out into the open border in a warm sheltered situation, where, if the summer prove fine, they will flower and ripen seed.

LI. UVEDA'LIA (named by the author in memory of —— Uvedale, L.L.D., who had a fine botanic garden near Enfield, where he cultivated many exotic plants, on which account he is much lauded by Plukenet and Petiver.) R. Br. prod. p. 440.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx prismatic, 5-toothed. Corolla ringent: upper lip 2-lobed: lower one trifid, having the middle segment unlike the lateral ones, bigibbous at the base. Stamens didynamous; lobes of anthers divaricate. Stigma flattened. Capsule inclosed, 2-celled, 4-valved; dissepiment formed from the inflexed margins of the valves, inserted in the central placenta.—Herbs with opposite leaves. Peduncles axillary and terminal, 1-flowered, bractless. Corollas blue.

1 U. LINEA'RIS (R. Br. l. c.) leaves linear, much shorter than the peduncles. ↄ ? G. Native of New Holland, within the tropic.

Linear-leaved Uvedalia. Pl. 1 foot.?

Cult. For culture and propagation see *Leucocárpus* above.

LII. HEMIPHRA'GMA (from ἡμισυς, *hemisus*, half; and φραγμος, *phragmos*, a dissepiment; in reference to the dissepiment being bifid at the apex.) Wall. tent. fl. nep. 17. t. 8. Benth. scroph. ind. p. 47.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx 5-parted. Corolla tubular; limb 5-cleft, sub-bilabiate; lower segments rather the broadest. Stamens 4, inserted in the base of the corolla, nearly equal, distant; anthers 2-celled; cells parallel. Style simple; stigma hardly thickened. Capsule baccate, 2-celled, 2-valved; valves bipartite; dissepiment parallel, bifid at apex; placentas adnate. Seeds numerous, naked.

1 H. HETEROPHY'LLUM (Wall. tent. fl. nep. p. 17. t. 8.) ↄ.? G. Native of Nipaul, Wall.; and at Jumnotri, Royle. Herb procumbent; branches flagelliform. Cauline leaves roundish-cordate, crenated, rather pilose. Axillary branches short, covered with short, linear, quite entire, ciliated leaves. Flowers sessile, solitary, within the leaves. Capsule size of a pea, shining.

Variable-leaved Hemiphragma. Pl. procumbent.

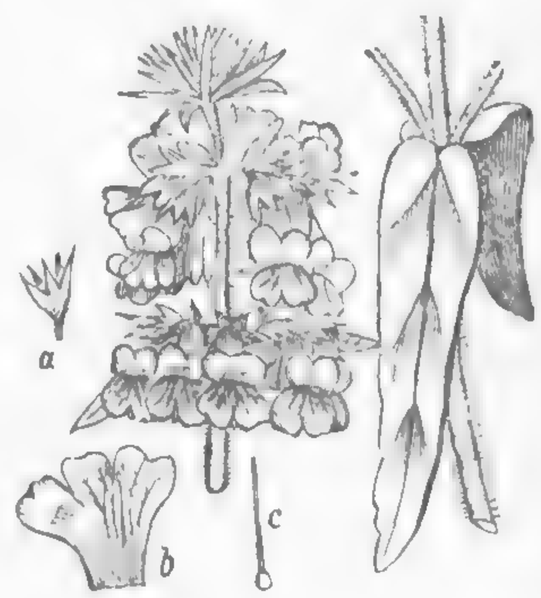
Cult. For culture and propagation see *Leucocárpus* above.

LIII. COLLI'NSIA (named by Nuttall, in honour of Zaccheus Collins, a vice-president of the Academy of Natural Sciences of Philadelphia.) Nutt. in journ. acad. nat. sc. phil. 1. t. 9. gen. amer. 2. p. 45.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx campanulate, 5-cleft, equal. Corolla bilabiate; orifice closed; tube gibbous on the back; upper lip erect, bifid: lower one trifid: the middle segment cucullate, and clasping the stamens. Stamens didynamous, with the rudiment of a fifth. Anthers glabrous. Ovarium 2-celled; placenta fleshy. Ovula peltate. Capsule globose, partly 2-celled, 2-valved; valves bipartite. Seeds few, umbilicate.—Annual plants, with entire, opposite and verticillate leaves and pedicels. Corolla party coloured.

1 C. VE'RNA (Nutt. in journ. acad. nat. sc. phil. 1. t. 9. gen. amer. 2. p. 46. Sweet, fl. gard. t. 220.) stem erect, a little branched; leaves lanceolate; pedicels axillary, solitary, much longer than the flowers; calyx downy, about equal in length to the corolla. ⊙. H. Native of north-west America, upon inland rocks; banks of the Missouri and Mississippi; on the Alleghanies; and on the borders of Lake Erie. Antirrhìnum tenéllum, Pursh, fl. amer. sept. 2. p. 421. Corolla white, except the lower lip, which is blue (fig. 51).

FIG. 51.



Spring Collinsia. Fl. May, July. Clt. 1826. Pl. 1 foot.

2 C. GRANDIFLÒRA (Lindl. bot. reg. 1107.) stem erect, branched; lower leaves spatulate: superior ones oblong-linear; pedicels verticillate, shorter than the flowers; segments of corolla dilated, retuse; calyx glabrous, about half the length of the corolla. ⊙. H. Native of the dry banks of the Columbia river. Stem downy. Leaves glabrous, entire, or denticulated. Corolla pale purple, except the lower lip, which is blue.

Great-flowered Collinsia. Fl. May, July. Clt. 1826. Pl. 1 foot.

3 C. BÍCOLOR (Benth. in hort. trans. n. s. vol. 1. p. 480. Lindl. bot. reg. 1734.) stem erect, downy; leaves glabrous, ovate-lanceolate, subcordate at the base; pedicels verticillate, racemose. ⊙. H. Native of California. Leaves nearly sessile, serrated: upper ones smaller, and quite entire. Calyx clothed with glandular down. Corollas twice the size of those of *C. grandiflòra:* upper lip and tube white: lower lip of a rosy purple colour.

Two-coloured-flowered Collinsia. Fl. Aug. Sept. Clt. 1833. Pl. 1 foot.

4 C. VIOLA'CEA (Nutt. in amer. phil. trans. n. s. vol. 5. p. 179.) puberulous; leaves ovate-lanceolate, remotely denticulated; corolla almost of one colour: upper lip one half smaller than the lower one: segments bifid at apex; capsule about 10-seeded. ⊙. H. Native of North America, on hills and upland woods of the Arkansas and Red rivers. Stems purplish. Radical leaves oblong-ovate: cauline ones sessile, opposite: uppermost ones 3 in a whorl. Corolla bright violet, like that of many species of *Phlòx;* upper lip paler. Allied to *C. grandiflòra.* Seeds smaller than those of *C. vérna.*

Violaceous-flowered Collinsia. Pl. ¼ to 1 foot.

5 C. MI'NIMA (Nutt. in journ. acad. nat. sc. phil. 7. p. 47.) leaves opposite, cuneate-oblong, obtuse, somewhat denticulated; segments of the calyx hardly half so long as the corolla. ⊙. H. Native of North America, at Flat Head river, flowering early in spring. Peduncles axillary, longer than the leaves. Flowers smaller than in *C. vérna,* but larger than in *C. parviflòra.* The upper lip of corolla is white, the lower blue. Very closely allied to *C. violàcea,* Nutt.

Least Collinsia. Fl. Spring. Pl. 1 to 2 inches.

6 C. PARVIFLÒRA (Lindl. bot. reg. 1082.) stem prostrate,

downy; leaves ovate-oblong, nearly entire, downy; pedicels axillary, solitary, much longer than the flowers; segments of corolla acutish, entire; calyx downy, about equal in length to the corolla. ⊙. H. Native of America, in the vicinity of the river Columbia. Corollas small, purple and blue.

Small-flowered Collinsia. Fl. June, July. Clt. 1826. Pl. procumbent.

7 C. sparsiflòra (Fisch. et Meyer. cat. sem. hort. petrop. 2d. 1836.) diffuse; leaves all opposite; flowers solitary; pedicels a little longer than the calyx; capsule globose. ⊙. H. Native of California, about the Russian colony, Ross. Smoothish, much branched. Stems and branches filiform. Leaves all, or only the upper ones opposite, on which account it is distinguished from the other species. The flowers are solitary, rarely opposite, of a size intermediate between those of *C. grandiflòra* and *C. parviflòra*. Corolla pale violet: lateral segments of the lower lip deep purple.

Scattered-flowered Collinsia. Fl. June, July. Clt. 1836. Pl. diffuse.

Cult. All the species being showy, they are well fitted for decorating flower borders, or to be grown in beds or large patches. The seeds only require to be sown where the plants are intended to remain in March or April.

Tribe IV. GERARDIE'Æ (this tribe contains plants agreeing with *Gerárdia* in the characters indicated below.) D. Don, in edinb. phil. journ. vol. 19. p. 111. July, 1835. Benth, in bot. reg. under no. 1770. Calyx tubular, 5-toothed. Corolla campanulate, funnel-shaped, or tubular; limb 5-lobed, bilabiate. Stamens 4, didynamous; anthers approximate, 2-celled, often bearded; cells diverging, distinct at apex, for the most part spurred at the base. Stigma clavate, undivided. Capsule bipartible; dissepiment composed of 2 connate lamina; valves entire, or bifid; placentas narrow, spongy. Seeds angular, with a thick favosely cellular, loose testa. Albumen fleshy. Embryo sub-foliaceous, almost the length of the seeds. Radicle short, obtuse.—Herbs or under shrubs, for the most part natives of America. Leaves opposite, scabrous. Flowers axillary, solitary, or disposed in terminal, spicate racemes, yellow or purple.

LIV. GERA'RDIA (a name originally given by Plumier to a plant now hardly known, and intended by him to commemorate our old English botanist, John Gerarde, author of the Herbal, 1597, folio, and a great cultivator of exotic plants, of which he published a catalogue in 1596.) Lin. gen. no. 747. Schreb. gen. no. 1004. Juss. gen. p. 119. ed. Usteri. p. 134. Benth, in Hook. comp. 1. p. 204. Virgulària, Ruiz. et Pav.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx campanulate, 5-toothed, or 5-cleft. Corolla campanulate, or ventricosely and tubularly-campanulate: limb 5-cleft, with roundish, half-spreading segments. Stamens didynamous, or rarely nearly equal, shorter than the corolla, sometimes all antheriferous, and sometimes the 2 smaller or shorter ones sterile. Capsule acute, or obtuse, without a beak.—Herbs or under shrubs natives of America. Flowers solitary, axillary, sessile, or pedicellate; pedicels generally bractless. Corollas yellow, or of a rosy purple colour.

Sect. I. Cyrtocòdon (from *κυρτος, kyrtos*, a curve; and *κωδων, kodon*, a little bell.) Benth. in Hook. comp. 1. p. 204. Calyx deeply 5-cleft. Corolla yellow; tube usually short and incurved. Anthers mutic. Species natives of North America.

1 G. serpyllifòlia (H. B. et Kunth, nov. gen. 2. p. 343.) procumbent; leaves ovate, obtuse, quite entire; flowers axillary, solitary, sessile; calycine segments entire. ♄. G. Native of New Spain, near Carpio, and on the borders of Lake St. Christopher, at the altitude of 1180 hexapods. Plant glabrous in every part. Leaves about 2 lines long. Corolla pale yellow, almost funnel-shaped; tube 3 times as long as the calyx. Stamens and ovarium glabrous.

Wild-Thyme-leaved Gerardia. Shrub procumbent.

2 G. prostra'ta (H. B. et Kunth, l. c.) prostrate; leaves pinnatifid: segments linear, acutely mucronate: lower ones cut; flowers axillary, solitary, sessile; calycine segments pinnatifidly cut. ♄. G. Native of New Spain, between Pachuca and Mount Ventosa, at the altitude of 1320 hexapods. Plant glabrous, tufted, 2-3 inches long. Leaves 3-4 lines long. Corolla an inch and a half long.

Prostrate Gerardia. Shrub prostrate.

3 G. virga'ta (H. B. et Kunth, l. c. p. 344.) erect, pubescent; leaves pinnatifid: segments linear, obtuse, entire, or cut; calycine segments oblong, entire, and toothed; tube of corolla incurved; stamens nearly equal; anthers erect, glabrous; capsule ovate, acute. ♄. G. Native of Mexico, between Guanaxuato and Santa Rosa, at the altitude of 1330 hexapods. Leaves 5-6 lines long, and 2-3 lines broad. Flowers pedicellate. Corolla campanulate, yellow, glabrous. Filaments woolly. Tube of corolla longer than in *G. macrophýlla*.

Twiggy Gerardia. Pl. erect.

4 G. macrophy'lla (Benth. ger. in Hook. comp. 1. p. 205.) pubescent; leaves deeply toothed, pinnatifid, or the lower ones are bipinnatifid: segments ovate, or oblong-lanceolate: upper leaves almost quite entire; flowers nearly sessile; calyx hairy, with ovate, subdentate segments; tube of corolla short, incurved, villous inside; stamens didynamous; anthers rather pilose. ♃. H. Native of the United States; Ohio; Kentucky; Arkansas. Seymèria macrophýlla, Nutt. gen. amer. 2. p. 49. The form and colour of the corolla connect this species with the following. The shorter stamens have smaller anthers than the longer ones.—Habit nearly that of *G. grandiflòra*. Capsule small, ventricose, with a compressed point, somewhat 4-valved.

Large-leaved Gerardia. Pl. 4 to 5 feet.

Sect. II. Otophy'lla (from *ους ωτος, ous otos*, an ear; and *φυλλον, phyllon*, a leaf; in reference to the auriculately lobed leaves.) Benth. ger. in Hook. comp. 1. p. 205. Calyx deeply 5-cleft. Corollas purple, campanulate. Stamens didynamous; anthers of the longer ones fertile, of the shorter ones smaller, and bearded.

5 G. auricula'ta (Michx. fl. bor. amer. 2. p. 48.) ♃. H. Native of the United States, chiefly in the Western ones. Seymèria auriculàta, Spreng. syst. 2. p. 810. An erect herb. Leaves oblong-lanceolate, generally auriculately lobed at the base. Flowers almost sessile.

Auricled Gerardia. Pl. ½ to 1 foot.

Sect. III. Pedicularioìdes (so called by reason of the plants having the habit of the species of *Pediculàris*.) Benth. ger. in Hook. comp. 1. p. 205. Calyx semi-5-cleft. Corolla yellow, tubularly campanulate. Stamens didynamous; anthers nearly equal; cells twin, fertile, spurred at the base.—Herbs natives of North America. Leaves broadish, usually cut. Lobes of corolla often ciliated.

6 G. fla'va (Pursh, fl. amer. sept. 2. p. 423. Benth. l. c. but not of Lin.) downy; leaves ovate-lanceolate, or oblong, obtuse, quite entire, or sinuately lobed; calyx downy, with oblong, obtuse segments, which are rather shorter than the tube. ♃. H. Native of the United States, common. Plukn.

almalth. t. 389. f. 1. Corolla about an inch and a half long, glabrous, yellow.

Yellow-flowered Gerardia. Fl. July, Aug. Clt. 1796. Pl. $1\frac{1}{2}$ to 2 feet.

7 G. QUERCIFÒLIA (Pursh, l. c.) quite glabrous; lower leaves large, bipinnatifid: superior ones oblong-lanceolate, pinnatifid, or quite entire; calyx a little inflated, with lanceolate, acute segments, which are shorter than the tube. ♃. H. Native of the United States, common. G. flàva, Lin. spec. 848, but not of Pursh. Rhinánthus Virgínicus, Gron. virg. 192. Lin. spec. p. 841. Corolla rather larger than that of the preceding. Calyx larger. The leaves vary much, but are always more divided than in *G. flàva*, ex Benth.

Oak-leaved Gerardia. Fl. July, Aug. Clt. 1812. Pl. 3 to 4 feet.

8 G. GRANDIFLÒRA (Benth. ger. in Hook. comp. 1. p. 206.) downy; leaves ovate-lanceolate, acute, serrated at top, pinnatifid at the base; calyxes longer than the pedicels; calycine segments obtuse, entire, or toothed; corolla 4 times as long as the calyx. ♃. H. Native of Mexico, in the province of Texas. Corolla 20 lines long. Capsule coriaceous, large, pointed.

Great-flowered Gerardia. Pl. 2 to 3 feet. ?

9 G. PEDICULA'RIA (Lin. spec. p. 849.) smoothish, or pubescent; leaves ovate-lanceolate, obtuse, pinnatifid, with toothed segments; calyxes shorter than the pedicels, with toothed segments; corolla 3 times as long as the calyx. ♃. H. Native of the United States, common. Corolla 15 lines long. Capsule coriaceous, pointed. Plant drying black like *Pediculàris*.

Pedicularis-like Gerardia. Pl. 1 to 2 feet. ?

10 G. PECTINA'TA (Torrey, mss. ex Benth. ger. in Hook. comp. 1. p. 206.) hairy; leaves pectinately pinnatifid; lobes a little toothed; pedicels very short; calyx very hairy, deeply 5-cleft, with toothed segments; corolla 3 times as long as the calyx. ♃. H. Native of Carolina and Georgia, in sandy forests, Nuttall; Rocky Mountains, Torrey. G. pediculària, β, pectinàta, Nutt. gen. amer. 2. p. 48. Corolla as in *G. pediculària*, from which it differs in being more hairy, the leaves usually smaller, and more divided, and in the pedicels being much shorter.

Pectinate-leaved Gerardia. Pl. 1 to 2 feet. ?

11 G. DENSIFLÒRA (Benth. ger. in Hook. comp. p. 206.) scabrous and hispid; leaves pinnatifid, with narrow-linear, stiff, ciliately scabrous segments; flowers secund, spicate; calycine segments lanceolate, very acute; tube of corolla attenuated at the base, and dilated at top; capsule obtuse. ♃. H. Native of Mexico, in the province of Texas. Corolla an inch long. Filaments hairy. Anthers like those of the next section *Eugerárdia*, but more pointed, and slightly pilose at the base.

Dense-flowered Gerardia. Pl. ?

SECT. IV. EUGERA'RDIA (from *eu*, well or good, and *Gerárdia*; this section contains what are considered the genuine species of the genus.) Benth. l. c. Calyx 5-toothed, rarely half 5-cleft. Corolla purple, campanulate, or tubularly campanulate, rarely ventricosely tubular. Anthers nearly equal; cells twin, fertile, mutic.—Herbs or under shrubs natives of America. Leaves linear, rarely lanceolate, quite entire, or the lower ones are a little cut.

12 G. DIGITA'LIS (Benth. l. c.) glabrous; leaves linear, smoothish; flowers nearly sessile; teeth of calyx short, truncate, mutic, with very villous edges; corolla amply campanulate, villous, 4-5 times longer than the calyx. ♃. G. Native of South America, at Maldonado. Flowers disposed in terminal interrupted spikes; the floral leaves being very small. Calyx of *Sopùbia*. Corolla above an inch long, very open.

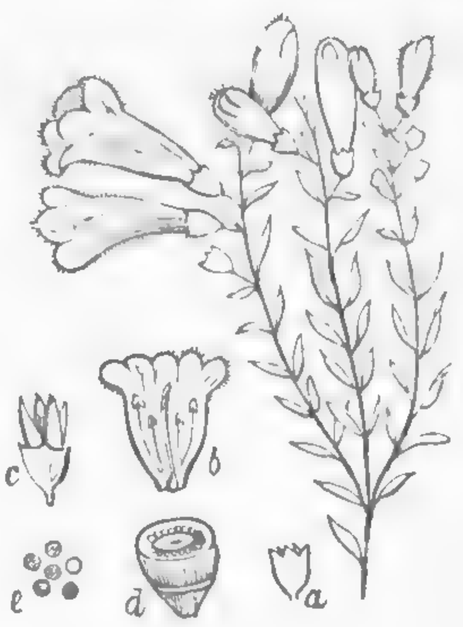
Fingered Gerardia. Pl. ?

13 G. RÍGIDA (Gill. mss. ex Benth. l. c.) glabrous and scabrous; leaves linear, very acute; flowers racemosely spicate; calyx longer than the pedicels, truncate: teeth short, acute; corolla amply and tubularly campanulate, villous, 4-5 times longer than the calyx. ♃. G. Native of South America, in the province of San Louis, Gillies. Flowers the same size, but more hairy than in *G. linarioìdes*.

Stiff Gerardia. Pl. ?

14 G. BRACHYPHY'LLA (Cham. et Schlecht, in Linnæa, 3. p. 15.) shrubby, glabrous, smooth; leaves small, narrow-lanceolate, mucronulate; flowers pedicellate; teeth of calyx short, acute, shorter than the ovoid calyx. ♄. S. Native of Tropical Brazil. Esterhàzya alpéstris, Spix. et Mart. reise in bras. 1. p. 397. Virgulària alpéstris, Mart. nov. gen. 3. p. 10. t. 205. Leaves rather fleshy, 4 lines long. Pedicels shorter than the leaves. Corollas like those of *G. linarioìdes*, but rather smaller. Filaments with a few hairs at the base. Valves of capsule at length split. (fig. 52.)

FIG. 52.



Short-leaved Gerardia. Pl. 1 foot.

15 G. LANCEOLA'TA (Benth. l. c. p. 207.) glabrous, smooth; leaves oblong-linear, mucronate, narrowed at the base; flowers on short pedicels; calycine teeth short, acute; corolla amply and tubularly campanulate, villous, 4 times as long as the calyx. ♃. G. Native of Peru, between Huariaco and Huanuco, Mathews. Virgulària lanceolàta, Ruiz. et Pav. syst. fl. per. p. 161. Virg. revolùta, Ruiz. et Pav. l. c. Closely allied to the preceding, of which it may be a variety. It differs chiefly in the leaves being rather broader, especially near the apex, and longer. The anthers and filaments are perfectly glabrous.

Lanceolate-leaved Gerardia. Pl. 1 to 2 feet.

16 G. LINARIOÌDES (Cham. et Schlecht. in Linnæa, 3. p. 13. Benth. l. c.) glabrous, rather scabrous; leaves linear, acute, 1-nerved; flowers racemose; calyx shorter than the peduncles: teeth ovate, truncate, or lanceolate acuminated, much shorter than the tube; corolla amply and tubularly campanulate, downy, 4-5 times as long as the calyx. ♃. G. Native of South America; at Banda Oriental, Tweedie; southern provinces of Brazil, Sello. Differs chiefly from the preceding by its narrower leaves.

Toad-flax-like Gerardia. Pl. $1\frac{1}{2}$ to 2 feet.

17 G. GENISTIFÒLIA (Cham. et Schlecht. l. c. p. 15. Benth. l. c.) glabrous and rather scabrous; leaves lanceolate, acute, sub-trinerved; flowers racemose; calyxes shorter than the peduncles: teeth ovate, truncate, or lanceolate, acute, much shorter than the tube; corolla ample, tubularly campanulate, downy, 4-5 times as long as the calyx. ♃. F. Native along with the preceding, Tweedie and Sello. Plant woody at the base. Corolla almost $1\frac{1}{2}$ inch long. Leaves and branches 3 in a whorl. Largest cauline leaves $2\frac{1}{2}$ inches long.

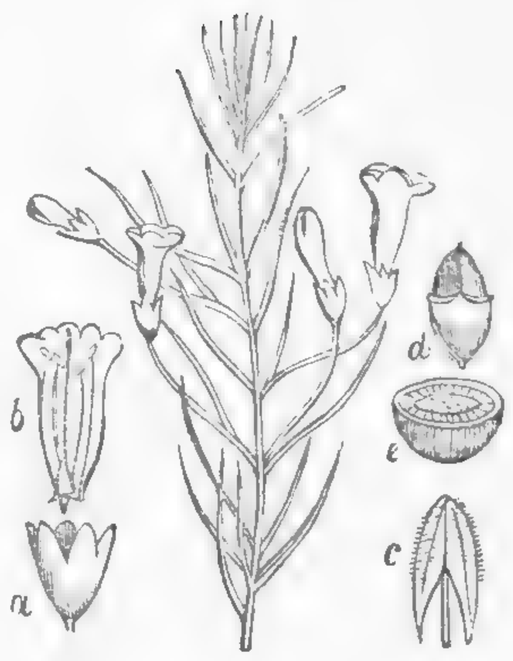
Genista-like Gerardia. Pl. 1 to 2 feet.

18 G. ANGUSTIFÒLIA (Mart. bras. 3. p. 12. t. 206. Benth. l. c.) quite glabrous; stem erect, virgately branched; leaves

more than an inch long, narrow linear, acute, erectly spreading; peduncles bractless, about equal in length to the leaves; teeth of calyx equal, mucronulate; corolla 5 times as long as the calyx. ♃. G. Native of Brazil, in the province of Minas Geraes. Habit of *G. pedunculàris*, but with a tubular corolla a little dilated at the top, and about an inch long (fig. 53.)

Narrow-leaved Gerardia. Pl. 1 to 2 feet.

FIG. 53.



19 G. HISPÍDULA (Mart. bras. 3. p. 13. t. 207.) plant beset with spreading hairs; stem fastigiately branched; leaves beyond an inch long, linear, acute, spreading, papillose, especially along the margins; peduncles bibracteate, exceeding the leaves; calyx equal, with acute teeth; corollas 3 times as long as the calyx. ☉. G. Native of Brazil, in the provinces of Pianhia and Para. No other species of this genus has bracteate peduncles. Corolla form of the preceding, but about half the size.

Hispid Gerardia. Pl. 1 to 2 feet.

20 G. COMMU'NIS (Cham. et Schlecht, in Linnæa, 3. p. 12.) glabrous, smooth; leaves linear, cartilaginously marginate; flowers nearly sessile; teeth of calyx longer than its tube; corolla tubularly campanulate, exceeding the calycine teeth a little. ☉. G. Native of the South of Brazil, from Rio Janeiro to the Banda Oriental. Corolla downy, $\frac{1}{2}$ an inch long. Filaments and anthers slightly hairy. Capsule truncate, or emarginate.

Common Gerardia. Pl. 1 to 2 feet.

21 G. DASYA'NTHA (Schiede, et Deppe, ex Cham. et Schlecht, in Linnæa, 5. p. 104.) stem bifariously pubescent; leaves linear, glabrous; teeth of calyx a little longer than its tube; corolla downy outside, about twice as long as the calyx. ♃. G. Native of Mexico, in the Terra Fria, Schiede et Deppe. Said to resemble *G. purpùrea* in its appearance.

Thick-flowered Gerardia. Pl. 1 to 2 feet.

22 G. HETEROPHY'LLA (Nutt. in amer. phil. trans. n. s. 5. p. 180.) glabrous; radical leaves broad, cut: cauline ones linear, or linear-lanceolate, acute, stiff, with scabrous margins; flowers almost sessile; calyx angular, with lanceolate-linear, very acute teeth, which are a little shorter than the tube; corolla amply campanulate, clothed with pubescent tomentum outside, 3-4 times as long as the calyx. ♃. H. Native of the Arkansas territory, in prairies near the great salt river, Nuttall. Texas, Drummond. Corollas very open, from 8 lines to 1 inch long, purple, crowded towards the summits of the branches. The lower leaves are described as trifid, or laciniated, by Nuttall and Drummond.

Var. β, grandiflòra (Nutt. l. c.) flowers larger.

Variable-leaved Gerardia. Pl. 2 feet.

23 G. FASCICULA'TA (Elliott. bot. car. 2. p. 115.) very scabrous; stem stiff, branched at top; leaves narrow-linear, acute; peduncles very short; calyx truncate, with short acute teeth; corolla ample, campanulate, downy, 5 times as long as the calyx. ♃. H. Native of Jacksonville, Drummond; South Carolina and Georgia, Elliott. Corolla 10-11 lines long. Young leaves sometimes fascicled in the axils of the stem leaves. Perhaps only a variety of *G. purpùrea*.

Fascicled-leaved Gerardia. Pl. 1 to 2 feet.

24 G. DOMINGE'NSIS (Spreng. syst. 2. p. 817.) finely hispid; stem strict, erect, somewhat fastigiately branched; leaves about an inch long, narrow-linear, acute, erectish, 3 times as long as the short peduncles; calyx equal, with acute teeth; corolla 3 times as long as the calyx. ♃. S. Native of St. Domingo. Appears to be allied to *G. purpùrea* and *G. fasciculàta*, but the flowers are described as but 4 lines long. ex Benth.

St. Domingo Gerardia. Pl. 1 to 2 feet.

25 G. MARÍTIMA (Rafin. new york med. rep. 2. p. 361.) humble, glabrous, fleshy; leaves linear, obtuse; racemes terminal; peduncles short; calyx truncate, with short, obtuse, mutic teeth; corollas glabrous, campanulate, 3-4 times as long as the calyx. ♃. H. Native of New Jersey and New York, in salt marshes. G. crinìta, Eddy. G. purpùrea, β, crassifòlia, Pursh, fl. amer. sept. 2. p. 422. Plant usually 2-3 inches high. Corolla scarcely 8 lines long.

Var. β, grandiflòra (Benth. l. c. p. 208.) plant 4-6 inches high, with few leaves on the upper part; corolla about 8 lines long. ♃. H. Native of Texas.

Sea-side Gerardia. Pl. 2 to 6 inches.

26 G. PLUKENE'TII (Ell. bot. car. 2. p. 114.) quite smooth; leaves small, remote, filiform, sub-fascicled; peduncles shorter than the leaves and calyxes; calyx truncate, with short, acute teeth; corolla finely pubescent, 3 times as long as the calyx. ♃. H. Native of Carolina and Georgia, Elliott; of the Cherokee country, Banks herb. Said by Mr. Bentham to come near to var. γ, of *G. tenuifòlia*, but the leaves are still more slender, and the peduncles constantly very short.

Plukenet's Gerardia. Pl. 1 foot.

27 G. PURPU'REA (Lin. spec. 848.) leaves linear, acutish, flat, with scabrous edges; flowers on short peduncles; calyx almost nerveless, with acute teeth, which are one half shorter than the tube; corolla glabrous, amply campanulate, with a short, tubular base. ♂. H. Native of the United States, common in marshes; and of Mexico, in the Hacienda de La Laguna. Sims, bot. mag. 2048.—Plukn. phyt. t. 12. f. 2. mant. t. 388. f. 1.

Var. α, parviflòra (Benth. l. c. p. 208.) corolla hardly 7-8 lines long. ♃. H.

Var. β, grandiflòra (Benth. l. c.) corolla an inch long. ♃. H. Native of New Jersey. The two varieties at first sight appear different, Benth.

Purple-flowered Gerardia. Fl. July, Aug. Clt. 1772. Pl. $1\frac{1}{2}$ foot.

28 G. LONGIFÒLIA (Nutt. in amer. phil. soc. trans. n. s. 5. p. 180.) leaves narrow-linear, with scabrous edges: the floral ones exceeding the flowers; peduncles much longer than the calyx; calyxes almost nerveless; teeth lanceolate, acute, hardly shorter than the tube; corollas glabrous, ample, campanulate, shortly tubular at the base. ☉. H. Native on the banks of the Arkansas, Nutt.; Red River, on the north-west coast, Douglas. Leaves $1\frac{1}{2}$ to 2 inches long. Corolla of *G. purpùrea*, var. β, which it resembles in many respects, (Benth.)

Long-leaved Gerardia. Pl. 1 to $1\frac{1}{2}$ foot.

29 G. LINIFÒLIA (Nutt. gen. amer. 2. p. 47.) stem twiggy, smooth, much branched; branches floriferous at apex; leaves linear, acute, smooth or roughish, longer than the peduncles; calyx truncate, campanulate, minutely toothed; corolla ample, campanulate, with a downy throat, and ciliated segments. ♃. H. Native of North Carolina to Florida, Nuttall; Alabama, Dr. Gates. Root creeping. Leaves smooth according to Nuttall; but according to Bentham they are rough on the margins.

Flax-leaved Gerardia. Pl. 2 to 3 feet.

30 G. PEDUNCULA'RIS (Benth. l. c. p. 209.) leaves linear, with revolute edges, and are, as well as the stem, very scabrous; racemes panicled; peduncles long; calyx angular, truncate, with

short acute teeth; corolla amply campanulate, downy, furnished with long cilia on the edges, 4 times as long as the calyx. ♂.? G. Native of Mexico, Tate. This species chiefly differs from *G. purpùrea*, by the narrow leaves and long peduncles. Capsule globose, longer than the calyx. (Benth.)

Long-peduncled Gerardia. Pl. 1 to 2 feet.

31 G. FILIFÒLIA (Nutt. gen. amer. 2. p. 48.) leaves filiform, for the most part alternate, subfasciculate, and are, as well as the stem, scabrous, ex Benth, smooth, ex Nutt.; racemes panicled; floriferous peduncles much longer than the leaves; calyx truncate, with short acute teeth; corolla ample, ventricosely campanulate. ♃.? F. Native of West Florida, Nuttall; Jacksonville, Louisiana, and Texas, Drummond. Intermediate between *G. pedunculàris* and *G. tenuifòlia*, γ; and is distinguished from the first in the slender stem and filiform leaves, which are often fascicled; and from the last in the large flowers and long peduncles. (Benth.)

Thread-leaved Gerardia. Pl. 1 to 2 feet.

32 V. STRICTIFÒLIA (Benth. l. c. p. 209.) leaves linear, stiff, very acute, and are, as well as the stem, much branched, and rather scabrous; racemes subpanicled; peduncles longer than the leaves; calyx truncate, with setaceous teeth; corolla campanulate, about 4 times longer than the calyx. ♂.? F. Native of Texas. Habit and foliage almost of *G. heterophýlla*, with the corolla of *G. tenuifòlia*, but larger; the peduncles are nearly as long as those of *G. filifòlia*. The anthers are very woolly, as in *G. tenuifòlia*.

Strict-leaved Gerardia. Pl. 1 to 2 feet.

33 G. TENUIFÒLIA (Vahl, symb. 3. p. 79. Benth. l. c. p. 209.) stem angular, smoothish; leaves linear, more or less scabrous from pili above; racemes panicled; peduncles at length a little longer than the leaves; calyx truncate, with very short acute teeth; corolla campanulate, smoothish, about 3 times longer than the calyx; capsule nearly globose, not exceeding the calyx. ⊙. H. Native of the United States, common in dry sandy forests. G. erécta, Walt. fl. carol. 170.—Plukn. alm. p. 34. t. 12. f. 4. The following varieties may perhaps be species, especially the last; but the characters are very slight. They all differ from *G. pedunculàris*, by the glabrous, hardly ciliated corolla; from *G. setàcea*, by the short capsule, and habit; and from *G. longifòlia*, by the truncate calyx with minute teeth. They have all the same slender branching habit; the stems always marked with decurrent lines from the base of the leaves; the anthers with long, white, woolly hairs. (Benth.)

Var. β, parviflòra (Nutt. in amer. phil. trans. n. s. 5. p. 179.) flowers smaller; tube of calyx equal in length to the corolla; teeth acuminated; fruit larger. ⊙. H. Native in the prairies of the Arkansas, above the Verdigris river. Apparently a distinct species. The stem is less branched, and inclined to grow taller than the species, whose flowers are larger, with a much smaller calyx.

Fine-leaved Gerardia. Fl. July, Aug. Clt. 1812. Pl. ½ to 1 foot.

34 G. SETA'CEA (Walt. fl. car. p. 170.) branches slender, and are, as well as the setaceous leaves, rather scabrous; flowers few, on long peduncles; teeth of calyx short, setaceous; capsule ovate, longer than the calyx. ⊙.? F. Native from Pennsylvania to Carolina, in sandy forests. Allied to *G. tenuifòlia*.

Var. β, parvifòlia (Benth. l. c. p. 210.) leaves distant, 3-6 lines long; flowers racemose. ♂.? F. Native of Jacksonville. This has some resemblance to *G. aphjlla*, but the leaves are never reduced to scales. It does not dry so black as other species of the genus.

Setaceous-leaved Gerardia. Pl. 1 foot.

35 G. APHY'LLA (Nutt. gen. amer. 2. p. 47.) branches elongated, filiform, nearly naked, scabrous; leaves short, remote, linear, or all minute and scale-formed; flowers pedunculate; calyx truncate, with very short acute teeth; capsule globose, exceeding the calyx. ⊙. F. Native from North Carolina to Florida, Nuttall; Jacksonville, Drummond.

Var. β, filicaúlis (Benth. l. c. p. 210.) branches very slender, few-flowered; flowers small.

Var. γ, grandiflòra (Benth. l. c.) branches stiff; flowers racemose, rather large.

Leafless Gerardia. Pl. 3 to 4 feet.

SECT. V. DARGERIA (an anagram of *Gerárdia*.) Benth. ger. in Hook. comp. 1. p. 210. Calyx 5-toothed. Corolla purple; segments emarginately bifid. Stamens didynamous; anthers all equally 2-celled, fertile. An Indian herb, with pinnate leaves, and linear segments. Perhaps a proper genus.

36 G. PARVIFLÒRA (Benth. in Wall. cat. no. 3888. scroph. ind. p. 48.) stems tall, acutely tetragonal; racemes numerous, disposed in an ample panicle; flowers on short pedicels; corolla hardly 2 lines long; capsule ovate-globose, retuse, a little compressed; valves recurved at maturity, entire.—Native of the Himalaya Mountains. Leaves subpinnatifid. Teeth of calyx short, acute.

Small-flowered Gerardia. Pl. tall.

Cult. All the species of *Gerardia* are elegant when in blossom, but are difficult to cultivate. The hardy species require to be planted in a bed of peat soil, as they will not grow in pots; and they are only to be increased by seeds, and then with much difficulty. The tender species may be grown in pots, in peat earth, should any of them hereafter be introduced to our gardens.

LV. SOPU'BIA (*Sopubi swa* is the Nawaricè name of the first species.) Hamilt. mss. ex D. Don, prod. fl. nep. p. 88. Gerárdia, sect. VI. Sopùbia, Benth. ger. in Hook. comp. 1. p. 210.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx campanulate, 5-toothed. Corolla campanulate, tubular at the base; limb spreading, 5-lobed, nearly equal; lobes rounded, entire. Stamens 4, exserted, nearly equal in length, somewhat didynamous, glabrous. Cells of anthers free, spurred at the base; the one fertile, erect; and the other sterile, small, and diverging, tubular. Stigma undivided. Capsule 2-celled, 2-valved; valves usually bifid. Dissepiment complete, continuous, parallel, placentiferous on both sides. Seeds numerous.—African and Indian perennial herbs. Leaves narrow, generally cut. Peduncles 1-flowered, solitary, in the axils of the upper leaves, opposite or alternate, therefore racemose, bibracteate. Corollas purple or yellow.

1 S. TRI'FIDA (Hamilt. mss. ex D. Don, prod. p. 88.) stiff, branched; leaves pinnate, with linear scabrous segments; teeth of calyx ovate, with ciliately membranous edges, much shorter than the tube. ♃. F. Native of the Himalaya range of mountains, Common; Upper Nipaul, at Suembu; Ceylon, Macrae; Madagascar, Lyall. Gerárdia scàbra, Wall. cat. no. 3889. Benth. scroph. ind. p. 49. but not of Lin. Gerárdia Sopùbia, Benth. ger. in Hook. comp. p. 210. Manùlea Sopùbia, Hamilt. mss. Leaves pinnate, simple or trifid. Flowers purple, ex D. Don, l. c.; yellow? Benth. l. c.

Trifid-leaved Sopubia. Pl. ½ to 1 foot.

2 S. STRI'CTA; rough, stiff, a little branched; leaves lanceolate-linear, toothed or cut; teeth of calyx lanceolate, acute, naked, much shorter than the tube. ♃. S. Native of Martaban and Prome, Wall. Gerárdia stricta, Benth. in

Wall. cat. no. 3889. scroph. ind. p. 49. ger. l. c. Corollas pale purple, like those of *S. delphinifòlia*. Capsule globose at the base, but compressed at top.

Strict Sopubia. Pl. 2 to 3 feet.

3 S. DELPHINIFÒLIA; much branched, smooth; leaves pinnatifid, with narrow-linear segments; calycine teeth linear-subulate, longer than the tube. ♃. S. Native of India, chiefly in the Peninsula, and as far North as Lohargan, Royle, always in wet soil, and sometimes even in water. Gerárdia delphinifòlia, Lin. spec. p. 848. Roxb. cor. 1. t. 90. Benth. scroph. ind. p. 49. ger. in Hook. comp. 1. p. 211. t. 11. Euphràsia Coromandeliàna, Rottl. in Spreng. syst. 2. p. 775.—Plukn. alm. 17. t. 358. f. 3. Leaves simple, trifid or tripinnatifid. Corolla 7-8 lines long, reddish, with a deep coloured spot on the under lip. Lower pair of anthers united.

Var. β, parviflòra (Benth. in scroph. ind. p. 49. ger. l. c. p. 211.) ♃. S. Gerárdia Heyneàna, Benth. in Wall. cat. no. 3891. Corolla 5-6 lines long.

Lark-spur-leaved Sopubia. Fl. June, July. Clt. 1800. Pl. 3 to 4 feet.

4 S. SCA'BRA; glabrous; leaves oblong-lanceolate, entire, cuneately 3-5-cleft, with rather scabrous edges; teeth of calyx lanceolate, scarcely shorter than the tube; corolla tubularly campanulate, more than 3 times longer than the calyx. ♃. F. Native of the Cape of Good Hope. Gerárdia scàbra, Lin. suppl. 279. Benth. ger. in Hook. comp. p. 211. Stems usually simple. Flowers almost sessile, near together. Corolla an inch long, apparently purple. Filaments hairy.

Scabrous Sopubia. Pl. ½ to 1 foot.

5 S. OBTUSIFÒLIA; stem hairy at top; leaves oblong-lanceolate, entire, or a little toothed, obtuse, scabrous, glabrous; calycine teeth broad-lanceolate, obtuse, scarcely shorter than the tube, which is a little inflated; corollas tubularly campanulate, twice as long as the calyx. ♃. S. Native of Madagascar. Gerárdia obtusifòlia, Benth. ger. l. c. p. 211. Flowers similar to those of *S. scàbra*, but the calyx is larger. Filaments almost glabrous. Empty cells of anthers terminated by a long point.

Obtuse-leaved Sopubia. Pl. 1 to 2 feet.

6 S. FILIFÓRMIS; leaves filiform, scabrous; peduncles opposite, short, 1-flowered, subsolitary. ♃. S. Native of Guinea, near Pramprom and Ningo, Thonning. Gerárdia filifórmis, Schum. pl. guin. p. 272. Root horizontal. Stem simple at bottom, and fastigiately branched at top. Corolla pale purple; throat large, campanulate. Anthers bipartite; the lobes oblong, unequal, diverging.

Filiform Sopubia. Pl. ½ foot?

Cult. The species of *Sopùbia* might be grown in pots placed in pans of water. A peat soil is that best suited to them; and they may either be increased by cuttings or seeds. They are, however, extremely difficult to cultivate.

LVI. SEYME'RIA (named by Pursh after Henry Seymer, an English naturalist.) Pursh, fl. amer. sept. 2. p. 737. Benth. ger. in Hook. comp. p. 203.—Afzèlia, Gmel., but not of Smith. Gerárdia species, Michx. and Pers.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx campanulate; segments 5, linear, longer than the tube. Corolla with a short tube, and 5 oblong segments, which are at length subrotately spreading. Stamens 4, almost equal in length, rather longer than the corolla; anthers erect, all 2-celled and fertile. Stigma slender. Capsule globose at the base, and compressed at apex. —Herbs natives of North America. Leaves pinnate, with linear or filiform segments. Flowers small, somewhat paniculately racemose. Corollas yellow.

1 S. TENUIFÒLIA (Pursh, fl. amer. sept. 2. p. 737.) clothed with fine clammy down; leaves setaceously pinnatifid; segments cut; capsule glabrous, beaked. ⊙. H. Native of Carolina, Georgia, Florida, and Louisiana, &c. Gerárdia Afzèlia, Michx. fl. bor. amer. 2. p. 20. Afzèlia cassioìdes, Gmel. syst. nat. 927. Gerárdia cassioìdes, Pers. ench. 2. p. 154. Branches slender. Leaves small, distant. Flowers ⅛ an inch in diameter. Capsule size of a grain of pepper.

Thin-leaved Seymèria. Fl. July, Aug. Clt. 1730. Pl. 1 foot.

2 S. PECTINA'TA (Pursh. l. c.) downy; leaves pinnatifid, with linear, obtuse, rather cut segments; capsule downy, obtuse. ⊙. H. Native of South Carolina, Pursh; Louisiana, Drummond; from North Carolina to Florida, Pursh. Leaves large, and their lobes much broader than in the preceding. Capsule larger, compressed, obtuse, and almost emarginate at apex.

Pectinate-leaved Seymeria. Fl. July, Aug. Clt. 1820. Pl. 1 foot.

Cult. For culture and propagation see *Gerárdia*, p. 559.

LVII. MACRANTHE'RA (from μακρος, *makros*, long; and ανθηρα, *anthera*, an anther; in reference to the long anthers.) Torrey, mss. ex Benth. ger. in Hook. comp. 1. p. 203. —Conràdia, Nutt. and Pickering, in journ. acad. nat. sc. phil. 7. p. 88. t. 12. but not of Mart.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx campanulate, with 5 linear foliaceous segments, which are longer than the tube. Corolla tubular; limb of 5 short, nearly equal, spreading segments. Stamens 4, nearly equal, exserted; anthers erect, all 2-celled, fertile. Stigma slender. Capsule nearly globose, acute.—An erect American herb. Leaves opposite, dissected. Flowers racemose, yellow.

1 M. FUCHSIOI'DES (Benth. l. c.) ♃. H. Native of the southern states of North America; Louisiana, Drummond. Conràdia fuchsioìdes, Nutt. l. c. Plant slightly downy. Segments of the leaves lanceolate: those of the lower ones divided. Racemes long, unilateral. Peduncles opposite, spreading or slightly reflexed. Flowers erect. Corolla an inch long, slightly incurved at the top; mouth oblique. Stamens downy. (Benth.) Leaves like those of *Gerárdia quercifòlia*, ex Nutt.

Fuchsia-like Macranthera. Pl. 2 to 3 feet.

Cult. For culture and propagation see *Gerárdia*, p. 559.

LVIII. ESTERHA'ZIA (probably named after some member of the family of Prince Esterhazy.) Mikan, del. pl. et faun. bras. t. 5. Benth. ger. in Hook. comp. 1. p. 203.—Virgulària species, Mart.—Gerárdia species, Cham. et Schlecht, in Linnæa, vol. 3.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx campanulate, 5-toothed. Corolla tubularly funnel-shaped; lobes of the limb ovate-roundish, nearly equal. Stamens didynamous, exserted, villous: anthers all fertile; cells very villous, acute at the base. —Much branched shrubs, natives of Brazil, naked at the base. Leaves usually opposite, quite entire, rather fleshy. Flowers disposed in short racemes, pedicellate towards the top of the branches; pedicels bracteate.

1 E. CAMPE'STRIS (Spix et Mart. reise in bras. 1. p. 397.) leaves lanceolate or oblong-lanceolate, mucronulate, contracted at the base, 1-nerved: floral ones exceeding the peduncles; racemes almost simple. ♄. G. Native of Brazil, in the province of Minas Geraes, in the Diamond district. Virgulària campéstris, Mart. gen. bras. 3. p. 7. t. 203.

Field Esterhazia. Shrub.

2 E. MONTA'NA (Spix, et Mart. l. c.) leaves linear, acute at both ends, 1-nerved, fascicled; flowers exceeding the calyxes;

racemes compound. ♄. G. Native of the province of Minas Geraes, Martius; tropical Brazil, Sello. Virgulària montàna, Mart. l. c. 3. p. 9. t. 204. Gerárdia cæsàrea, Cham. et Schlecht, in Linnæa, 3. p. 17.

Mountain Esterhazia. Shrub.

3 E. sple'ndida (Mikan, del. pl. et faun. bras. t. 5.) leaves narrow-lanceolate, acute, narrowed into the petioles at the base; racemes nearly simple, few-flowered, leafy. ♄. G. Native of tropical Brazil, Mart. and Sello. Virgulària splèndida, Mart. gen. bras. 3. p. 11. Gerárdia gnidioìdes, Cham. et Schlecht, in Linnæa, 3. p. 16. Segments of corolla ovate, very blunt, ciliated. According to Cham. et Schlecht, l. c. the 3 foregoing species run so into each other, that they may only be varieties of one.

Splendid Esterhazia. Shrub.

4 E. macrodónta (Cham. et Schlecht, in Linnæa, 8. p. 26.) leaves lanceolate, narrowed at the base, acute and mucronate at apex; panicle terminal, pyramidal, comose, composed of 2-flowered branches; peduncles exceeding the leaves and branchlets; teeth of calyx subulately acuminated. ♄. G. Native of Brazil. Corolla villous outside; segments ciliated, and glabrous on both surfaces. Filaments villous or bearded.

Long-toothed Esterhazia. Shrub.

Cult. For culture and propagation see *Gerárdia*, p. 559.

LIX. GLOSSO'STYLIS (from γλωσσα, *glossa*, a tongue; and στυλος, *stylos*, column; in allusion to the form of the stigma in *G. áspera*.) Cham. et Schlecht, in Linnæa, 3. p. 22. Benth. ger. in Hook. comp. p. 211.—Gerárdia species, Vahl. Stárbia, Pet. Th. gen. mad. p. 7.?

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx campanulate, 4 to 5-toothed. Corolla obliquely campanulate, with a short 5-lobed limb; limb the largest below. Stamens didynamous. Cells of anthers all equal and fertile, acute at the base. Seeds small, with a thin, linear-cuneated membrane. —Rough erect herbs, with the habit of *Melampyrum*, natives of America, South Africa, and South Asia. Leaves opposite, sinuately toothed: floral ones or bracteas broadest at the base, and more deeply toothed, acuminated at apex. Flowers nearly sessile, solitary, alternate, spicate.

1 G. Ave'nsis (Benth. scroph. ind. p. 49. ger. l. c. p. 211.) leaves ovate-lanceolate or lanceolate, cuneated at the base, on very short petioles, and are, as well as the stem, rough from tubercles; teeth of calyx broad, acute, with short cilia. ☉. S. Native on Taong Dong, a mountain near Ava.

Ava Glossostylis. Pl. 1 to 2 feet.

2 G. a'spera (Cham. et Schlecht, in Linnæa, 3. p. 23.) leaves nearly sessile, oblong-lanceolate, truncately cordate at the base, and are, as well as the stem, hispid and very rough; teeth of calyx broad, acute, and are, as well as the bracteas, hispid. ☉. S. Native of Brazil, at Bahia, Salzmann; and Rio Janeiro, in ditches, Chamisso. Corolla 5 lines long. Stigma lanceolate, cochleate, uncinately recurved. Capsule size of a pea.

Rough Glossostylis. Pl. 1½ to 3 feet.

3 G. Cape'nsis (Benth. scroph. ind. p. 50. ger. l. c. p. 212.) leaves nearly sessile, ovate-cordate: lower ones obtuse: superior ones acuminated, and are, as well as the stem, scabrous from minute tubercles, and smooth; calycine teeth lanceolate, very acute, and are, as well as the bracteas, nearly naked, glabrous. ☉. G. Native of the Cape of Good Hope, and Madagascar. Rhinánthus scàber, Thunb. prod. p. 98.? Bártsia scàbra, Spreng. syst. 2. p. 775. Gerárdia sessiliflòra, Vahl, symb. 2. p. 79. According to Bentham, there is a specimen in Hooker's Herbarium which appears to be a fourth species of this genus with the leaves of *G. Capénsis*, but hispid, like *G. áspera*, with larger and more foliaceous calyxes than any of the other species.

Cape Glossostyles. Pl. 1 to 2 feet.

Cult. For culture and propagation see *Sopùbia*, p. 560.

LX. PHTHEIROSPE'RMUM (from φθειρω, *phtheiro*, to corrupt; and σπερμα, *sperma*, a seed; in reference to the seeds being wrapped in a spongy reticulated membrane.) Bunge. Fisch. et Meyer, ind. sem. hort. petrop. 1835. Benth. ger. in Hook. comp. 1. p. 212.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx campanulate, 5-cleft. Corolla campanulately ringent; upper lip flat, bifid; lobes replicate: lower lip a little longer and trifid; throat gaping. Stamens didynamous, almost straight; anthers free; with mucronate parallel cells. Stigma 2-lobed. Capsule beaked, compressed, 2-valved, 2-celled, many-seeded. Seeds oblong, angular, wrapped in a spongy reticulated membrane.

1 P. Chine'nsis (Bunge, l. c.) ☉. H. Native of the North of China.—An annual or biennial herb, with the habit, leaves, calyx, and capsule of *Pedicularis palústris*; but the corolla is almost that of *Mimulus*, of a dirty red colour; throat marked by 2 yellow lines.

China Phtheirospermum. Pl. 1 to 2 feet?

Cult. For culture and propagation see *Sopùbia*, p. 560.

LXI. ESCOBE'DIA (named after George Escobedo, a Spanish naturalist.) Ruiz. et Pav. syst. fl. per. et chil. p. 158. H. B. et Kunth, nov. gen. amer. 2. p. 371. Benth. in Hook. comp. 1. p. 202.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx long, tubular, pentagonal, 5-cleft at apex; segments acute, spreading a little. Corolla funnel-shaped; with a long slender tube; and an ample, 5-lobed, oblique, spreading limb. Stamens didynamous, inclosed; anthers all fertile, linear-sagittate; cells awned at the base. Capsule covered by the calyx, 2-celled, 2-valved.—American herbs, with generally opposite leaves. Peduncles axillary, solitary, 1-flowered, bibracteate. Flowers large, showy, white.

1 E. scabrifòlia (Ruiz. et Pav. l. c. p. 159. H. B. et Kunth. nov. gen. amer. 2. p. 571. t. 174.) leaves ovate and oblong, cordate at the base, toothed, scabrous on both surfaces. ♃. G. Native of New Granada, among stones between the town of Mariquita and the mine of Santa Anna, at the altitude of 530 hexapods, Humb. et Bonpl.; Eastern declivities of the Cordillera of Peru, Mathews; Brazil, in the province of Minas Geraes, Langsdorff. Branches furrowed, hairy. Leaves sessile, 4 inches long. Both species are called *Asafran* by the natives of New Granada.

Rough-leaved Escobedia. Pl. 2 to 4 feet.

2 E. linea'ris (Schlecht, in Linnæa, 8. p. 246.) leaves long-linear, denticulated. ♃. G. Native of Mexico, in grassy places at the Hacienda de la Laguna. C. læ'vis, Cham. et Schlecht, in Linnæa, 5. p. 108. Leaves 4-5 inches long, scabrous. Tube of corolla 4 inches long, and the limb 2 inches in diameter.

Linear-leaved Escobedia. Pl. 2 feet.

Cult. For culture and propagation see *Gerárdia*, p. 559.

LXII. PHYSOCA'LYX (from φυσα, *physa*, a bladder; and καλυξ, a *calyx*; in reference to the inflated calyx.) Pohl, pl. bras. 1. p. 65. t. 53. Mart. bras. 3. p. 2, 3. t. 201, 202.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx inflated, 5-toothed, coloured. Corolla tubularly salver-shaped; limb spreading, somewhat equally 5-lobed. Stamens didynamous, inclosed. Anthers all fertile; cells shortly awned at the base.

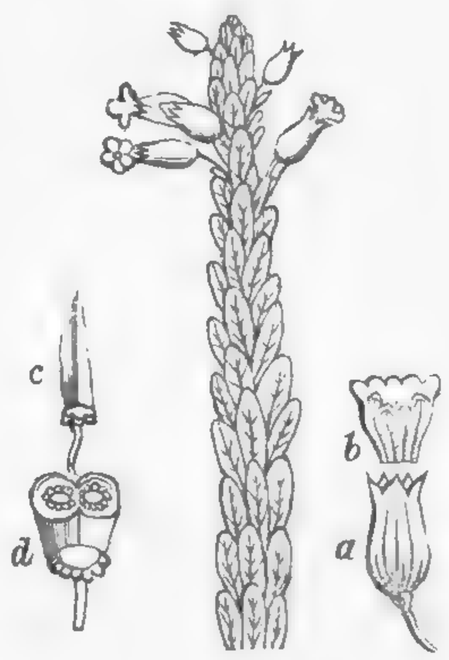
—Shrubs natives of Brazil, densely covered with erect, thickish, quite entire, opposite or alternate leaves. Peduncles axillary, 1-flowered, bibracteate, racemose at the tops of the branches. Corollas red or blood-coloured. The three species are very nearly allied, and are scarcely distinct.

1 P. ma'jor (Mart. bras. 3. p. 2. t. 201.) leaves ovate or ovate-oblong, obtuse, mucronulate; bracteoles subulately linear, beneath the flowers; filaments glabrous; anthers bearded on the back. ♄. G. Native of Brazil, in the province of Minas Geraes, in the Diamond district, Martius; on Sierra da Muela, Sello.

Larger Physocalyx. Shrub.

2 P. mi'nor (Mart. l. c. p. 3. t. 202.) leaves obovate, acutish; bracteas subulately linear under the flowers; filaments glabrous; anthers bearded on the back. ♄. G. Native along with the preceding, in the Diamond district, Martius (fig. 54.)

FIG. 54.



Smaller Physocalyx. Shrub 1 foot.

3 P. auranti'acus (Pohl, pl. bras. 1. p. 65. t. 53.) leaves obovate-elliptic; bracteas oblong-lanceolate under the flowers; filaments villous above, and the anthers on the back. ♄. G. Native of Brazil, in the province of Minas Geraes; on Serro Frio; and on the tops of mountains, in arid, gravelly, rocky places, between Rio Jetiquinhonha, on the road between Bonfin and Villa de Fanado. Leaves oval-elliptic, obtuse, sessile, ex Pohl.

Orange-coloured-calyxed Physocalyx. Shrub 1 foot.

Cult. For culture and propagation see *Gerárdia*, p. 559.

LXIII. MELA'SMA (from μελας, *melas*, black; application not evident in any way, unless from the plants turning black on drying—a circumstance common to this order.) Berg. cap. t. 3. Gærtn. fruct. t. 55. Benth. ger. in Hook. comp. p. 202. Nigrìna, Lin. mant. p. 42.—Gerárdia species, Lin. fil. suppl. 278. Physocàlyx and Lýncea species, Cham. et Schlecht, in Linnæa.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx loose, foliaceous, at length inflated, 5-cleft at apex. Corolla campanulately funnel-shaped; lobes of limb short, broad. Stamens subdidynamous, shorter than the corolla; anthers all fertile; cells apiculate at the base.—American or Cape herbs; with usually opposite leaves; and axillary, 1-flowered, bracteate pedicels, which are disposed in a subracemose manner.

1 M.? hi'spidum (Benth. l. c.) plant hispid from white pili; leaves lanceolate, a little toothed, narrowed at the base; peduncles bracteate at apex. ♃. G. Native of Mexico, near Hacienda de La Laguna, Schiede and Deppe. Lýncea híspida, Cham. et Schlecht, in Linnæa, 5. p. 108, and 8. p. 24. Leaves alternate or falsely opposite, on short petioles, quite entire or sinuately denticulated. Calycine segments 3-nerved. Lobes of corolla obtuse.

Hispid Melasma. Pl. 3 to 4 feet.

2 M. rhinanthoi'des (Benth. l. c.) plant very scabrous; leaves oblong, a little toothed, hardly narrowed at the base; peduncles shorter than the calyx, bracteate in the middle. ♃. G. Native of Brazil, at Rio Grande, in many places, Sello and Tweedie. Physocàlyx rhinanthoìdes, Cham. et Schlecht, in Linnæa, 8. p. 23. Floriferous calyx about half an inch long. Corolla nearly an inch long. Fructiferous calyx resembling that of *Phýsalis*. Capsule obtuse; valves apparently entire, ex Benth. Leaves linear-lanceolate, obtuse, toothed, ex Cham. l. c.

Yellow-rattle-like Melasma. Pl. a span to 2 feet.

3 M. sca'brum (Berg. fl. cap. 162. t. 3. f. 4.) leaves lanceolate, broadest at the base, toothed, scabrous; peduncles longer than the calyx, bracteate in the middle. ♃. G. Native of the Cape of Good Hope. Nigrìna viscòsa, Lin. mant. p. 42. Gerárdia Nigrìna, Lin. suppl. 278. Flowers closely resembling those of the preceding, and of the same size. Teeth of calyx rather shorter; and corolla rather fuller, ex Benth.

Scabrous Melasma. Pl.

Cult. For culture and propagation see *Gerardia*, p. 559.

LXIV. GASTROME'RIA (from γαστηρ, *gaster*, a belly; and μερις, *meris*, a part; in reference to the inflated calyx.) D. Don, in Sweet, fl. gard. n. s. vol. 1. in a note under no. 75.—Lophospérmum species, D. Don, in Lin. trans. vol. 15. p. 353.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx almost globose, membranous, inflated, 5-toothed. Corolla campanulate, nearly equal at the base; limb 5-lobed, bilabiate. Stamens 4, didynamous; filaments glabrous; anthers oblong; cells confluent at apex, loose at the base, diverging, mutic. Ovarium 2-celled; dissepiment placentiferous on both sides; ovula minute, angular, very numerous. Fruit unknown.—A Mexican shrub, scabrous from callous bristles. Leaves opposite, on short petioles, oblong, acute, toothed, pinnately nerved. Flowers axillary, solitary, pedunculate. Peduncles bibracteate. Calyx green. Corolla large, purple? an inch and a half long.

1 G. physaloi'des. ♄. G. Native of Mexico, Sesse and Mocinno. Lophospérmum physaloìdes, D. Don, in Lin. trans. 15. p. 353. Scrophulària physaloìdes, Moc. et Sesse, mss.

Physalis-like Gastromeria. Shrub erect.

Cult. For culture and propagation see *Gerárdia*, p. 559.

LXV. CENTRANTHE'RA (from κεντρον, *kentron*, a spur; and ανθηρα, *anthera*, an anther; cells of anthers mucronate or spurred.) R. Br. prod. p. 438. Benth. scroph. ind. p. 50.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx compressed, cleft on one side, entire, or at length somewhat 4-cleft. Corolla tubular or funnel-shaped; limb spreading or bilabiate; lobes 5, roundish: the lower one the largest. Stamens shorter than the corolla. Anthers approximate by pairs, 2-celled; cells parallel or transverse, mucronate or spurred. Stigma oblong, thickened. Capsule ovoid or oblong, 2-valved; valves entire. Seeds minute, with a loose aril-formed testa.—Erect or diffuse, scabrous, stiff herbs, becoming black on drying. Leaves almost sessile, opposite, oblong or lanceolate, quite entire or few-toothed. Flowers sessile, alternate, or the lower ones are opposite, usually secund: lower ones remote: superior ones sometimes spiked.

1 C. grandiflòra (Benth. in Wall. cat. no. 3880. scroph. ind. p. 850.) erect, glabrous, scabrous from tubercles; flowers secund, approximate, large; calyx oblong, inflated, cleft on one side and very acute on the other. ♃.? G. Native of Silhet, on the mountains, Wall. Calyx 9 lines long. Corolla 21 lines long, purplish.

Great-flowered Centranthera. Pl.

2 C. hi'spida (R. Br. prod. 438.) erect, clothed with hoary pili; flowers remote; calyx ovate, cleft on one side and acutely 2-3-cleft on the other. ⊙. G. Native of New Holland, within the tropic, R. Br.; East Indies, throughout Hindostan, Nipaul, Kamaon, and the mountains of Prome, Wall.; and at Kidarkonta, Royle. Wall. pl. rar. asiat. 1. p. 39. t. 45. C. Nepal-

énsis, D. Don, prod. fl. nep. p. 88. Digitàlis strícta, Roxb. fl. ind. 3. p. 99. Gumtèolis, Hamilt. mss. ex D. Don, l. c. Corollas purplish.

Hispid Centranthera. Pl. ½ to 1 foot.

3 C. Brunonia'na (Wall. cat. no. 3882. Benth. scroph. ind. p. 50.) erect, hispid; flowers remote; calyx oblong, cleft on one side and acute on the other. ⊙.? G. Native of the Birmann Empire, at Moolmyne and Martaban, Wall.

Brown's Centranthera. Pl. ½ foot?

4 C. humifu'sa (Wall. cat. no. 3883. Benth. scroph. ind. p. 50.) diffuse, humble, much branched, almost glabrous; flowers distant; calyx ovate, cleft on one side and acutish or bifid on the other. ⊙.? G. Native of the Peninsula of India, Wight; at Nathpur, Hamilt. Razumòvia Tranquebárica, Spreng. syst. 2. p. 812.? Calyx hardly 2 lines long. Corolla 4 lines long.

Trailing Centranthera. Pl. diffuse.

Cult. For culture and propagation see *Sopùbia*, p. 560.

Tribe V.

VERONI'CEÆ (This tribe contains plants agreeing with the genus *Verónica* in the characters indicated below.) D. Don, in edinb. phil. journ. vol. 19. p. 111. Benth. scroph. ind. p. 43. Calyx 4-5-parted, imbricate in æstivation. Corolla rotate or funnel-formed, 4-lobed, rarely irregularly bilabiate. Stamens 2-4, exserted, distant, nearly equal, all antheriferous. Anthers incumbent; cells parallel, distinct. Stigma capitate or slender. Capsule membranous, 2-valved, with a loculicidal dehiscence; valves usually bifid or bipartite. Dissepiment narrow, composed of 2 separable lamina; placenta short, inserted into the middle of the dissepiment. Seeds compressed, naked or inclosed in an aril-formed testa. Albumen cartilaginous. Embryo minute, terete, located in the base of the albumen.—Herbs or under-shrubs, common in the temperate zones of both hemispheres. Leaves usually opposite. Flowers axillary, terminal, or racemose, blue, white, or red.

LXVI. VERO'NICA (the derivation of this word is uncertain. Linnæus says it is changed or corrupted from Vetonica, from the Vetones, a people of Spain; but that confounds it with Betonica. Limery derives it from *ver*, the spring. There is also a Roman female saint of the name of Veronica.) Tourn. inst. t. 60. Lin. gen. no. 25. Schreb. gen. no. 32. Juss. gen. p. 99. Gærtn. fruct. t. 54. R. Br. prod. p. 434. Lam. ill. t. 13. f. 4. Benth. scroph. ind. p. 44.

Lin. syst. *Diándria, Monogýnia.* Calyx 4, rarely 5-parted, campanulate or compressed. Corolla rotate, with a very short tube, and a 4-parted spreading limb; segments all entire: upper one the broadest. Stamens 2, situated at the sides of the upper segment of the corolla, diverging, without any vestige of the lower ones. Anthers 2-celled; cells confluent at top. Stigma hardly thickened. Valves of capsule septiferous in the middle or bipartible. Seeds naked.—Herbs, under-shrubs, or shrubs. Leaves opposite, alternate, or verticillate. Inflorescence axillary, racemose, or spicate. Flowers blue, white, or red.

Sect. I. Verónica (see genus for derivation.) Reichb. Benth. scroph. ind. p. 44. Capsule swollen, emarginate at top. Seeds oblong, compressed a little.

§ 1. *Racemes terminal.*

* *Leaves verticillate, and opposite, serrated. Racemes numerous.*

1 V. foliòsa (Waldst. et Kit. hung. 2. p. 106. t. 102.) leaves 3-4 in a whorl, ovate, or ovate-lanceolate, deeply and unequally serrated. ♃. H. Native of Hungary; Galicia; about Halle, in Saxony, in humid meadows. Schrad. spic. p. 35. Willd. enum. p. 18. Spreng. fl. hal. p. 6. no. 9. t. 1. f. 2. V. brevifòlia, Bieb. cauc. 1. p. 6.? V. tríquetra, Kit. Root creeping, scaly. Leaves cuneated at the base, glabrous, shining. Racemes long, and loose. Flowers blue, or purple. Bracteas one half shorter than the pedicels. Calycine segments obtuse, shorter than the capsule.

Var. β, nítida; taller and more glabrous. ♃. H. V. nítida, Ehrh. pl. exsicc. no. 21. V. marítima, β, Willd. spec. 1. p. 55.

Var. γ, spùria. ♃. H. V. spùria, Spreng. fl. hal. t. 1. f. 1.

Leafy Speedwell. Fl. July, Sept. Clt. 1805. Pl. 2 to 4 feet.

2 V. crenula'ta (Vahl, enum. 1. p. 57. Hoffm. phyt. blat. p. 95. t. E. f. 3.) leaves 3 in a whorl, and opposite, oblong-lanceolate, subcordate; calycine segments acute; segments of corolla undulated and crenulated. ♃. H. Native country unknown. V. villòsa, Schrad. Stem downy at top. Racemes downy. Leaves villous, or downy. Capsule glabrous.

Crenulated-flowered Speedwell. Fl. July, Sept. Clt. 1814. Pl. 1½ foot.

3 V. marítima (Lin. spec. p. 13. fl. suec. no. 8. fl. lapp. p. 4.) leaves 3-4 in a whorl, ovate-lanceolate, cordate at the base, deeply and doubly serrated, and are, as well as the stems glabrous; calycine segments shorter than the capsule. ♃. H. Native of the North of Europe. Retz. obs. 1. p. 9. Hoffm. phyt. blat. t. E. f 2. Schrad. comm. ver. p. 29. t. 1. f. 1. Vahl, enum. 1. p. 57.? Vahl, fl. dan. t. 374. Racemes dense. Flowers blue, purple, or white. Leaves in some varieties opposite, and in others the flowers are white. This is a very variable plant.

Sea-side Speedwell. Fl. July, Sept. Clt. 1570. Pl. 1 to 3 feet.

4 V. Ticine'nsis (Poll. fl. veron. 3. append. p. 768.) leaves 3-4 in a whorl, and opposite, linear-lanceolate, acuminated, serrated, and are, as well as the calyxes and capsules, glabrous. ♃. H. Native about Ticin, in humid meadows. V. marítima, Noc. et Balb. fl. tic. 1. p. 6, but not of Lin. V. Hóstii, Moretti, in bibl. ital. 12. p. 369.—Tab. kreut. 2. p. 99. f. 4. Racemes terminal, numerous. Flowers azure blue.

Ticin Speedwell. Fl. July, Sept. Clt. 1819. Pl. 2 to 3 feet.

5 V. spu'ria (Lin. spec. p. 13.) leaves 3-4 in a whorl, or opposite, lanceolate, cuneated at the base, simply serrated, downy; serratures equal. ♃. H. Native of the South of Europe, Siberia, &c. Vahl, enum. 1. p. 57, exclusive of the syn. of Pollich. Schrad. ver. no. 19. t. 2. f. 4. V. amethýstina, Willd. enum. 1. p. 17. V. rubélla, Pall.—Barrel. icon. t. 891. —Gmel. itin. 1. p. 169. t. 39. This differs from *V. foliòsa* in the more slender habit, in the lanceolate, more acute, simply and equally serrated leaves, in the bracteas being about equal in length to the pedicels, not much shorter.

Spurious Speedwell. Fl. July, Sept. Clt. 1731. Pl. 2 to 3 feet.

6 V. serrula'ta (Pall. in herb. Willd. Link, jahrb. 1-3. p. 38.) stem slender, tomentose; leaves opposite, or 3 in a whorl, petiolate: lower ones oblong: superior ones alternate, lanceolate, attenuated at the base, serrulated; lower bracteas longer than the pedicels; calyx downy. ♃. H. Native of Siberia. Flowers blue, or purple.

Serrulated-leaved Speedwell. Pl. 2 to 3 feet.

7 V. Stephania'na (Rœm. et Schultes, syst. p. 96.) stem slender, tomentose; leaves opposite, and 3 in a whorl, lanceolate, attenuated at the base, acute, serrated, white from fine

tomentum; bracteas shorter than the pedicels. ♃. H. Native of Persia. V. móllis, Link, jahrb. 1-3. p. 39, but not of Zea. Very nearly allied to *V. spùria*, but differs in the whole plant being white from tomentum.

Stephan's Speedwell. Fl. July, Aug. Clt. 1821. Pl. 1 to 2 feet.

8 V. panicula'ta (Pall. itin. 1. p. 196.) downy; leaves opposite, and 3 in a whorl, lanceolate, attenuated and entire at the base, sharply and distantly serrated, stems ascending. ♃. H. Native of Tartary, Siberia, and Caucasus. Lepechin, itin. 1. p. 206. V. capitulàta, Poir. suppl. 5. p. 466. V. virgàta, Willd. herb. Link, jahrh. 1-3. p. 39. V. spùria, Gmel. itin. 1. p. 169. t. 39. Bieb. fl. cauc. 1. p. 6. V. brevifòlia, Bieb. fl. cauc. 1. p. 6. ex Stev. in mem. soc. mosc. 5. p. 338. V. angustifòlia, floribus paniculatis, Amm. ruth. p. 32. Racemes very long and loose. Flowers blue, or purple. Calyx 4-5-cleft, hairy, ciliated, ex Poir.

Var. β, leucántha; flowers white. ♃. H. Native of Altaia. V. leucántha, Helm. mem. soc. mosc. 2. p. 104. t. 8. V. Altàica, Fisch. cat. hort. gorenki, 1812.

Panicled-flowered Speedwell. Fl. June, July. Clt. 1797. Pl. 1 to 1½ foot.

9 V. complica'ta (Hoffm. phyt. blatt. p. 98. t. E. f. 4.) leaves opposite, rarely 3 in a whorl, complicate, lanceolate, toothed; teeth thickened. ♃. H. Native of Europe. Vahl, enum. 1. p. 58. Willd. enum. 1. p. 18. Radical leaves hoary, and more elliptic. Plant downy. Leaves coarsely crenate-toothed. Flowers blue, or purple. Leaves very long and narrow. Very nearly allied to *V. longifòlia*.

Complicate-leaved Speedwell. Fl. Aug. Sept. Clt 1812. Pl. 2 feet.

10 V. azu'rea (Schott, ex Link, enum. 1. p. 22.) leaves opposite, or 3 in a whorl, very long, gradually attenuated, sharply serrated even to the apex: the lower serratures deep; bracteas longer than the pedicels. ♃. H. Native country unknown. Plant downy. Leaves 3 inches long, and 4 lines broad, form of those of *V. complicàta;* the serratures are also similar, but much longer, fewer, and larger. Flowers blue, or purple.

Azure-blue Speedwell. Fl. July, Sept. Clt. 1821. Pl. 2 to 3 feet.

11 V. gla'bra (Ehrh. pl. exsic. no. 11. Vahl. enum. 1. p. 358. Link, enum. 1. p. 21.) leaves opposite, or 3 in a whorl, ovate-lanceolate, acute, attenuated at the base, quite entire at the apex, simply serrated, and are, as well as the stems, glabrous: serratures remote, nearly equal. ♃. H. Native of the South of Europe. Schrad. comm. ver. t. 1. f. 4. Willd. enum. 1. p. 17. This species is readily distinguished by its smoothness. It differs from *V. argùta* in its greater stature, in the leaves being longer, broader, and more equally serrated. Petioles ciliated. Lower leaves subcordate at the base. Flowers blue, or purple. There is also a variety with white flowers. This is, probably, nothing but a glabrous variety of *V. marítima*.

Glabrous Speedwell. Fl. July, Sept. Clt. 1804. Pl. 2 to 4 feet.

12 V. persicifo'lia (Schott. hort. vind. Link enum. 1. p. 21.) leaves opposite, or 3 in a whorl, ovate-lanceolate, or lanceolate, long-acuminated, serrated even to the apex; bracteas longer than the pedicels. ♃. H. Native country unknown. Stem glabrous at bottom. Leaves 3 inches long, and 7-8 lines broad, glabrous. Lower bracteas long. Calyx rather downy. Corollas blue. This seems to be intermediate between *V. longifòlia*, and *V. maritima*, but differs from both in the leaves being attenuated at the base.

Peach-leaved Speedwell. Fl. July, Sept. Clt. 1823. Pl. 2 to 3 feet.

13 V. ela'tior (Ehrh. pl. exsic. no. 31. Willd. enum. 1. p. 17. Bieb. suppl. p. 8.) glabrous; leaves 3 in a whorl, lanceolate, acuminated, somewhat cordate at the base, doubly and deeply serrated: the serratures at the base deeper. ♃. H. Native of the South of Europe, and Caucasus. V. marítima, Bieb. taur. no. 15, exclusive of the syn. Gorter ingr. p. 2. V. spicàta urticæ folio, Amm. ruth. no. 35.—Riv. mon. t. 97. Bases of the superior leaves cuneated, of the lower ones subcordate. Corollas blue or purple.

Tall Speedwell. Fl. Aug. Sept. Clt. 1808. Pl. 4 to 7 feet.

14 V. longibractea'ta (Link, enum. 1. p. 20.) stem smoothish; leaves opposite, and 3 in a whorl, oblong, or lanceolate, acute, serrated, gradually attenuated at the base; lower bracteas foliaceous, quite entire. ♃. H. Native country unknown. V. mèdia, Willd. enum. 1. p. 16. Leaves 3 inches long, and 5 lines broad, serrated, downy, ciliated. Lower bracteas much longer than the flowers. Corollas blue.

Var. β; stem smoothish; leaves from oblong, gradually attenuated at the base. ♃. H. V. hýbrida, Willd. diar. Schrad. 1799. p. 388. Leaves 5 inches long, and 1½ inch broad, long-acuminated.

Long-bracted Speedwell. Fl. Aug. Sept. Clt. 1817. Pl. 2 to 3 feet.

15 V. ni'tens (Link, enum. 1. p. 20, under V. nítida.) leaves opposite, or 3 in a whorl, ovate, acute, attenuated at the base, serrated in the middle, and sub-serrated at apex, glabrous. ♃. H. Native of Europe. V. argùta, Willd. enum. 1. p. 16. ex Link. Plant glabrous. Leaves 2½ inches long, and 1 broad. Bracteas longer than the pedicels. Corollas blue. This species differs from *V. argùta* in the leaves being shorter and broader, and racemes long.

Var. β, falcàta; serratures of leaves approximate, curved. ♃. H. V. falcàta. Mart. enum. hort. erl. p. 10. Corollas blue.

Shining Speedwell. Fl. July, Aug. Clt. 1817. Pl. 2 to 3 feet.

16 V. argu'ta (Schrad. comm. ver. no. 7. t. 2. f. 2.) downy; leaves lanceolate, acute, simply serrated, quite entire at base and apex, opposite, clothed with hoary down: serratures remote, equal, simple. ♃. H. Native in the groves of Ticin. Vahl, enum. 1. p. 360. Moretti, giorn. de fis. dec. 2. vol. 5. p. 41. V. mèdia, Moretti, bibl. ital. dec. 1816. t. 4. vol. 4. p. 494. Leaves cuneated at the base, deflexed, hoary, but rather naked above. Racemes numerous. Bracteas longer than the pedicels. There is a variety of this with more slender stems, and narrower leaves.

Var. β; raceme spicate, solitary; leaves not half so broad as those of the species.

Sharp-toothed Speedwell. Fl. July, Sept. Clt. 1812. Pl. 2 feet.

17 V. me'dia (Schrad. comm. ver. no. 8. t. 1. f. 2.) leaves opposite, or 3 in a whorl, lanceolate, acute, serrated, and are, as well as the stems, clothed with tomentose down: serratures approximate, unequal. ♃. H. Native of Carniola, Hungary, Bohemia, &c. in hedges and humid meadows. Vahl, enum. 1. p. 359. Link, enum. 1. p. 21. N. longifòlia, Fl. de wetter, no. 13. Roth, fl. germ. 2. p. 7. Mœnch. meth. p. 433. V. spùria and V. incàna, Schmidt. Leaves cuneated at the base. Calycine segments shorter than the capsule. Flowers blue, or purple.

Middle Speedwell. Fl. July, Sept. Clt. 1804. Pl. 2 to 4 feet.

18 V. austra'lis (Schrad. l. c. no. 9. t. 2. f. 3.) leaves opposite, or 3 in a whorl, ovate-lanceolate, simply serrated, quite entire at top, and are, as well as the stems, downy: serra-

tures approximate, unequal. ♃. H. Native of the South of Europe. Vahl, enum. 1. p. 360. Willd. enum. 1. p. 17. Link, enum. 1. p. 21. V. longibracteàta, *β*, poliocaúlis, Link, jahrb. 1-3. p. 36. Radical leaves ovate. Racemes spicate, 2-3 inches long. Bracteas linear-lanceolate, about equal in length to the calyx, or exceeding it: lower ones longer. Flowers blue, or purple.

Southern Speedwell. Fl. July, Sept. Clt. 1812. Pl. 1½ to 2 feet.

19 V. LONGIFO'LIA (Lin. spec. p. 13.) leaves opposite, or 3-4 in a whorl, cordate-lanceolate, acuminated, doubly serrated, and are, as well as the stem, clothed with downy tomentum. ♃. H. Native throughout Europe and Siberia, in humid meadows. Schrad. comm. ver. p. 26. t. 2. f. 1. Wahl. fl. lapp. p. 3. V. marítima, Hoffm. comm. gœtt. 1800. p. 118. exclusive of the synonymes. Spreng. fl. hal. t. 1. f. 3, with leaves 3 in a whorl. V. ciliàris, Hoffm. comm. gœtt. l. c. t. 5. V. marítima, Schmidt, boh. no. 5, and of many other authors. V. spùria, Schkuhr, handb. 1. p. 9. Thuill. fl. par. ed. 2d. p. 6. V. acùta, Mart. enum. hort. erl. p. 12.—Besl. eyst. vern. t. 10. f. 2. V. urticæfòlia, Amm. ruth. p. 26, with leaves 4 in a whorl. V. spicàta longifòlia altera, Amm. ruth. 34. Calyx unequal, equal in length to the capsule. Flowers blue, or purple. Lower bracteas longer than the flowers. Leaves opposite in the true specimens of Lin.

Var. α, angustifòlia (Link, enum. 1. p. 22.) leaves narrow, lanceolate. ♃. V. marítima, Willd. enum. p. 18. Wahl. fl. ups. p. 3. Ehrh. in gœtt. gel. anz. 1821. 1766.
